W. D. Pratt, local financier, a few months ago offered to establish a bus system in Kansas City, Kan., and submitted a tentative list of lines to be operated to the city commissioners, requesting a franchise. He did not ask that street cars be excluded from that city. The commissioners have delayed any definite action on his proposal until a final decision is reached by the Kansas charter board in connection with the charter for the Kansas City Public Service Company.

Apparently no agreement was reached during this latest meeting and, after setting the date for the later hearing in Topeka, Mr. Ryan returned to the capital soon after the close of the meeting.

Contract for Mozart Hill Line in Wheeling

Prospects of having the Wheeling Traction Company, Wheeling, W. Va., assume charge of the Mozart Hill line, a subsidiary of the Wheeling Public Service Company, loomed when the City Council of Wheeling adopted on Feb. 3 a contract to be presented to officials of the traction company. The contract as drafted makes many concessions as to the present franchise of the Wheeling Traction Company. The various franchises will be consolidated and unified if the contract is found favorable.

The proposition is that the Mozart Park Traction Company will be formed to serve in the capacity of a subsidiary. In exchange, the city of Wheeling, which has been operating the line since it was abandoned several months ago, will turn over all equipment for the consideration of $1. The Mozart Park company will be permitted to operate the line for a period of 75 days, and in that time, if it is found that the operation is unprofitable, the line may be again turned back to the city. The same fare as is in effect at present will be compulsory and the street cars will run between Twelfth Street and Mozart Hill, as was formerly the custom when the system was in charge of the Wheeling Public Service Company. The line will also come under the jurisdiction of the State Public Service Commission.

In connection with the operation of what was formerly a part of the City Railway system, City Manager Harvey L. Kirk in a monthly report to Council announced that during the past two months net earnings by the road had been $1,140.

City Approves Seven-Cent Cash Fare for Dallas

Increased fares for the Dallas Railway, recommended to the Council by J. W. Everman, supervisor of public utilities for the city, have been approved by the City Commission. It is his idea that the cash fare should be 7 cents with five tickets for 30 cents, with half fare and half tickets for children and school students and free universal transfer. As Mr. Everman sees it, this plan will not work hardship upon the regular riders, citizens of Dallas, as, by purchase of tickets or tokens, they will ride at the same rate as now in effect. Up to Feb. 6 the railway had not indicated its intention regarding the matter, but it was believed the company would accept the proposal. Mr. Everman says:

The 7-cent cash fare will bring increased earnings from those car riders who, of their own choice, pay the cash fare rather than purchase tickets. The 6-cent ticket fare, purchased in lots of five tickets for 30 cents, will not add to the living costs of the Dallas citizens and will be an encouragement to regular riders to purchase the tickets, thereby benefiting the company in the way of cash advanced ahead of service, more rapid movement of street cars (inasmuch as the majority of passengers will be provided with tokens or tickets), saving time making change, etc.

Mr. Everman says that for the increased fare and other considerations the Dallas Railway should be required to secure and expend new money to the amount of $1,000,000, and also to expend from the reserves for replacements the sum of about $450,000.

Mr. Everman says the Dallas Railway should agree to place an order immediately for 30 Peter Witt cars. He also says that the company, upon its acceptance of the terms and conditions of the plan, should exercise diligence in carrying out the work, promptly authorizing the City Commission to instruct paving contractors to proceed with the work of paving streets which have been, or are to be, ordered paved, as set forth in the plan, the expense of which pavement is to be partly paid by the Dallas Railway. He wants all orders for all material required for extensions placed promptly.

Mr. Everman said:

In my negotiations with the Dallas Railway the officers have expressed their desire, both now and for the future, to co-operate with your honorable body in every possible way leading up to the furnishing of a first-class transportation service for the city of Dallas, and to this end to furnish $1,000,000 new money and approximately $450,000 from reserves and to extend same to improve the property as outlined in this plan, pushing the work with all dispatch consistent with economical business methods, completing the entire plan promptly so as to give the Dallas car riders the improved service with as little delay as possible, and further to work in close harmony with the City Commission to take care of the future street car needs.

He wants this plan with the increased fare made effective immediately.

$55,000,000 Construction Budget in New Jersey

Approval of the 1926 construction budgets of public service operating companies, including Public Service Electric & Gas Company, Public Service Railway and Public Service Transportation Company, brings the total amount now authorized to be expended on the improvement of electric, gas and transportation facilities in the territory served by these utilities up to approximately $55,000,000. New authorizations for 1926 total more than $18,000,000. Construction projects already approved and to which the companies are committed make up the rest.

The completion of the great Kearny electric generation station and the Harrison gas works are the biggest single items in the program of the Electric & Gas Company, while for the railway, an order for 333 gas-electric buses, said to be the largest single order for buses ever placed at one time, heads the list.

More than half of the construction budget of the railway will be used for track reconstruction. In addition to the 333 gas-electric buses, previously provided for, the company appropriations cover new garage facilities at Camden, Hackensack and Elizabeth.

Electrification of Railroads Must Go On

Samuel Insull, president of the Commonwealth Edison Company, Chicago, in addressing the Boston Chamber of Commerce, said:

One branch of electrification must go on—that is, the electrification of the steam railroads. Only about 1 per cent of the steam railroads of the United States are electrified today. Of the 250,000 miles of steam railroad, I do not think there are more than 2,500 miles electrified. Steam railroads consume somewhere between 150,000,000 tons and 180,000,000 tons of coal a year in their operations. The figures of what they would require if electrified are so small and the saving is so great that I almost hesitate to quote them. These savings vary from about 100,000,000 tons of coal a year to 140,000,000 tons of coal a year, depending somewhat upon the conservatism of the statistician who does the figuring.

I do not mean to suggest for one moment that all the 250,000 miles of railroads in the United States can be electrified, but certainly, where there is great density of population, great density of manufacturing, and consequently great density of tonnage, they should be electrified. From the experience of electrification of the New Haven road, there should not be a steam locomotive running between Boston and New York today.

F. I. Fuller Praised by Portland Papers

Franklin Ide Fuller, first vice-president of the Portland Electric Power Company, Portland, Ore., who died on Dec. 16, was a real, constructive force in the affairs of that city. Account of this fact was taken by the Portland papers, particularly the Portland *Telegram*. That paper said editorially:

To the moral and physical growth of Portland, F. I. Fuller contributed his share. Coming here about the time Portland was discarding swaddling clothes, he grew up with the city and from the year of his arrival took an active part in its growth. Modest and unassuming in his personal and public actions, Mr. Fuller never attracted the attention many of lesser worth received, but no man with a record of 40 years of clean, upright living in a community, where tangible evidence of his moral and physical accomplishments is ever present, can entirely hide his light under a bushel.

For this reason his passing will be mourned and regretted, not only by those who worked with him in the building of the young commonwealth, but by thousands who now and in years to come will enjoy the benefits of a better Portland which Mr. Fuller helped to make.

As noted in the ELECTRIC RAILWAY JOURNAL for Dec. 19, he had been identified with the Portland Company and its predecessors since 1892.

8-Mile Road in 16,000 Town Attracts Attention

The right kind of spirit, co-operation and good fellowship was manifested recently, said the Berlin *Reporter*, Berlin, N. H., of Jan. 21 when the management of the Berlin Street Railway gave a banquet to its employees at Georges.

The interior of the room was decorated to suit the occasion, namely, to represent a street car. As one approached this room or car he was confronted with a metal blue sign that said "Car stops here," and near at hand was another, "Parking 30 minutes only." Inside was a regular carfare register, and bells completely installed, together with other street car signs, made it look like a real street car and was very appropriate. The people inside did not show much respect for the "No smoking" signs, but thought the refreshments were very satisfactory.

After the train order was run through and the fuel and ballast were put away and the headlights were shining brightly the men expressed their appreciation for the kindness shown them by the Berlin Street Railway.

Later a reporter visited the manager. He stated that the Berlin Street Railway feels that it is most fortunate in the high type of men in its service, in their devotion to public service and in the good relations that exist between the management and men.

The company is a strong believer in the principle that the public is reasonable, and even generous, when it is truly acquainted with the conditions and problems of the street railway.

The *Reporter* said:

> We wish to congratulate the officers of the Berlin Street Railway in their get-together banquet. This is a very good policy and leads to good results. A few years ago complaints in regard to the Berlin Street Railway were numerous, both in this newspaper and on the street. With their record of service as given to the public at the present time, they should be receiving at least 25 compliments to one of an adverse nature.

Jacksonville Votes on Railway Issue April 13

Voters of Jacksonville, Fla., will decide on April 13 whether they desire to own the Jacksonville Traction Company. This date was set by the City Council on Jan. 11 for the special election at which a $4,000,000 improvement program will be submitted to the people for approval. The election will determine whether the city shall acquire the railway by purchase. No mention will be made on the ballot of the price to be paid by the city.

Situation in Shreveport Acute

The Shreveport Railways, Shreveport, La., continues to face a crisis of inadequate revenues on account of a low rate of fare. The rate for adults is less than 6 cents. The company has asked the Public Service Commission for permission to increase its fares slightly to net sufficient to cover operating expenses and leave a small margin of profit. This petition is now pending. In addition to that precarious position, a jitney ordinance adopted by the City Council of Shreveport has resulted in only diminishing the number of jitneys. The Shreveport Railways system last year carried more than 11,000,000 passengers, counting adult fares, school children and transfers.

Chautauqua Institution Refuses to Finance Line

The executive board of Chautauqua Institution, at a meeting at Albany on Jan. 30, expressed the opinion that the institution would not be warranted in investing its funds in aid of the Chautauqua Traction Company with a view to continued operation of the line beyond the 60-day period arranged by the school authorities. The executive board approved the action of officers in agreeing that Chautauqua Institution pay to the school board of the Chautauqua school district No. 3 one-half of such deficit as may arise in the emergency and modified operation of the trolley line, in accordance with the guarantee agreement of the school board with the Chautauqua Traction Company, provided this sum does not exceed $1,500 over the 60-day period from Jan. 11, 1926. The officers of the institution and the trustees did not anticipate that the abandonment of the railway would have a serious effect upon the attendance at the institution or upon the convenience of its summer patrons. The institution stated that arrangements would be completed as soon as possible for readjusting the passenger, baggage and freight facilities for the changed conditions. The agreement to continue the line for 60 days has been referred to previously.

Would Make Tax Value Basis for Rates

A bill in relation to fixing rates, fares and charges to be exacted by public utility corporations has been introduced in the Senate and Assembly by Minority Leaders Downing and Bloch.

The bill adds a new section, 24-A, to the public service commission law and provides that the commission shall consider the assessed valuation of the properties of the company upon which their income, franchise, corporation and other taxes are based as such information is filed with the State Tax Commission in fixing any rate, fare or charge. It also provides that the commission may go back to all decisions rendered since Jan. 1, 1921, and reopen the same, and may give consideration to the assessed valuation of the properties of the corporations. The Tax Commission is required under the provisions of the bill to furnish all information in its possession to the commission, such information now being confidential and not available to the rate-making body.

News Notes

Rehearing on Track Work Denied.—The Public Service Commission denied on Feb. 8 the petition of the International Railway, Buffalo, N. Y., for a rehearing on its recent order directing certain track reconstruction work to be done in Buffalo.

Hearing Set on Utica Increase.—A hearing will be held before Chairman William A. Prendergast of the Public Service Commission at Albany on Feb. 17 on the petition of the New York State Railways for permission to charge an increased fare in Utica and vicinity. The company now is charging 7 cents. The petition asks permission to charge 10 cents cash or ten tickets for 75 cents.

Thrift Ideas to Be Rewarded.—The Southern Public Utilities Company, Charlotte, N. C., will offer three prizes of $5, $3 and $2 respectively to its employees for the best thrift letters to be published in the February number of the Southern Public Utilities Company's magazine. The letters should relate to a practical thrift problem.

Offices Moved.—Executive offices of the International Railway, Buffalo, N. Y., are to be moved from the Littell Building at Franklin and West Huron Streets. The main executive offices will be taken to the D. S. Morgan Building, but the claims department will be shifted to the Virginia Street carhouse in Main Street. The new locations will save the International Railway a large sum of money in rentals each month over those now paid.

Fare Increase Sought in Ironwood.—The Lake Superior District Power Company has asked the City Commission of Ironwood, Mich., to join with it in submitting a proposal to the Public Utilities Commission for adjusted street car rates in Ironwood. The City Commission will take action after giving Walter Hodgkins, general manager of the company, a hearing. According to an audit, submitted by the company, the net deficiency for the year just ended was $48,928 when consideration is given to interest on investment at 4 per cent, operating expenses and depreciation on property of 3 per cent. The company, about two years ago, rehabilitated the system in Ironwood at an expenditure of $221,465 and during 1925 was $19,749 short of meeting its operating expenses. It is now operating with a 5-cent fare in Ironwood and a 6-cent fare in Hurley, Wis., just across the state boundary.

Remodeled Cars Given Trial.—The first of 24 street cars of the Indianapolis Street Railway, Indianapolis, Ind., being rebuilt and equipped with devices so the cars may be operated by one man has been given a trial run. The cars will be equipped with stop lights in addition to other features. Passengers enter from the front but leave by the rear. When the rush hours come it will be possible for a conductor to stand at the door, collect the fares quickly and then alight and let the car proceed as a one-man car.

Digitized by Google

To Pay with Check in Louisville.—As a protection to the paymaster and the employees themselves, the Louisville Railway, Louisville, Ky., will hereafter pay its trainmen by check instead of cash. The notice announcing the change refers to the risk from highwaymen as well as the likelihood of losing the money.

Sunday Pass for Allegheny Valley.—The Allegheny Valley Street Railway, a subsidiary of the West Penn Railways system, was to install an unlimited-ride transferable Sunday pass for 50 cents effective Feb. 7. The pass will be available for any and all of the eight zones between Aspinwall (Greater Pittsburgh) and Natrona. Operation of this railway, however, is divided into a six-zone division between Aspinwall and New Kensington and a two-zone division between New Kensington and Natrona. The standard fares are 8 cents cash and 6¼-cent tickets per zone, but there is also a variety of commutation rates.

Opening of New Systems into Yonkers.—The first train was run into Yonkers, N. Y., on Feb. 7 on the recently electrified Yonkers branch of the Putnam Division of the New York Central Lines. A committee headed by Mayor William A. Walsh met the trains.

Fifth Traffic Plan Submitted in Baltimore.—The Baltimore, Md., Traffic Survey Commission held its final public hearing on Feb. 3 for the discussion of plans to reroute some of the lines of the United Railways & Electric Company. The four plans submitted by Kelker, De Leuw & Company, Chicago experts, were considered and a fifth plan was submitted to the committee. The new plan was prepared by the Retail Merchants' Bureau of the Baltimore Association of Commerce and several of the various trade organizations in the downtown section of the city. This plan was drawn with the view of eliminating some of the objections which were voiced at previous hearings and is to be considered by the commission in preparing its final draft.

Aid of Merchants Enlisted. — The question of transportation and traffic in Jamestown, N. Y., and vicinity was discussed at a dinner given by officials of the Jamestown, Westfield & Northwestern Railroad for 250 manufacturers and merchants of Jamestown on Jan. 25. Robert H. Jackson, one of the three administrators of the estate of the late Sheldon B. Broadhead, set forth in detail the serious financial situation which confronts the Jamestown, Westfield & Northwestern. He made a plea for increased passenger business and suggested that merchants divert to it a share of their freight business under the through freight rates established by the Jamestown, Westfield & Northwestern in connection with the New York Central Lines, the Pennsylvania Railroad and the Nickel Plate Road. Some few years ago the Jamestown, Westfield & Northwestern Railroad suffered a decline in its interurban passenger business and in the hope of recouping its losses in 1923 started a through system of freight handling. The plan was outlined in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 21, 1925, page 924.

Recent Bus Developments

Another Bus Report in New York City

With a recommendation that the Board of Estimate and Apportionment first determine a policy of awarding omnibus franchises on a basis of either city-wide, borough-wide or system operation, on the best possible terms for the city and satisfactory service to the traveling public, the Board of Transportation of New York City has filed with the Board of Estimate its fifth report on pending applications for bus grants.

The board makes no recommendation as to which of the petitioners should be granted a franchise, as it was not directed to do so by the Board of Estimate, but it is prepared, the report states, to make such recommendations, without delay, if the board so desires.

The report restates a summary of facts as to previous applications and as to nine new or amended applications for franchises to operate bus lines. It again points out the necessity for securing satisfactory service at a 5-cent fare as far as possible.

The report favors a franchise grant borough-wide in area or by systems made up of contiguous territory, where most of the travel is in one community, or between areas that are developing as communities.

New Haven Operates Buses Over 777 Miles of Road

President Pearson of the New York, New Haven & Hartford Railroad announces that the railroad is now operating buses over 777 miles of road and in addition to this is operating gasoline rail cars on 567 miles of rail. He says that in the development of modern transportation, automobile operation over the public highways has become a factor. At the beginning there was some doubt in the minds of the railroad officials whether the New Haven Railroad could afford, in view of its limited financial condition, to invest in this new transportation facility. As time went on it became apparent the company must be in a position to protect itself from further diminution of revenue through the taking away of passengers by automobiles. In many instances, he says, the beginning of highway operation by the railroad means better transportation service for communities than they ever had before. Until Mr. Pearson made this statement there was little realization on the part of the public of the extent to which the railroad had gone in its plans for coordinating steam, electric railway and bus transportation.

Date Set for Hearing on Buffalo Buses

Tameling, Keene & Company, New York, who are said to have completed plans for financing the 5-cent bus service in Buffalo for which Ernest M. Howe, Detroit, has secured a franchise from the municipal authorities, have informed the New York State Public Service Commission that all details of the plan will be outlined to the commission on Feb. 15. The state utilities board previously had granted two adjournments to Mr. Howe and his associates so the financing plans could be worked out.

Opposition to the Howe lines will be entered by the Buffalo Chamber of Commerce, the Buffalo Federation of Business Men's Associations and the International Railway, which is operating three bus routes in Buffalo under a subsidiary, the International Bus Corporation. The opposition contends that the 5-cent buses to be run over thirteen routes covering 71.5 miles of operation will have a very serious effect upon the local railway, which operates on an 8-cent fare or two tokens for 15 cents. The proposed bus routes would parallel many of the existing car lines.

Missouri Commission Cannot Rule on Bus Fares

The Missouri Public Service Commission ruled on Feb. 2 that it had no jurisdiction over bus lines operated in the state and under the public service law was without power to regulate such utilities. The decision was on the application of the Springfield Traction Company, Springfield, Mo., which had sought permission to increase bus fares from 5 to 7 cents to conform to the fare charged by its street cars. The application was filed on Dec. 16, last. The petition pointed out that the buses were operated at a loss of $49,003 during the period Sept. 1, 1924, to Sept. 30, last.

The application was the first of its kind ever received by the Missouri Public Service Commission. It was thought that the commission might have jurisdiction because the buses are being operated in conjunction with the railway system. The Springfield Traction Company has exclusive bus rights in Springfield under a city ordinance.

Many Applications for Bus Rights in Brooklyn

Applications of fourteen companies for franchises to operate bus lines in Brooklyn were submitted on Feb. 1 to the Board of Estimate of New York City by its division of franchises and considered by the board in committee of the whole. Action was deferred until the committee meeting on Feb. 15 to give the members time for consideration. The question of bus operation is closely allied with the general transit problem and will be considered by Mayor Walker in his conferences with the members of the Transit Commission and the Board of Transportation. So far as is known none of the companies is affiliated with any of the railways operating in the territory to be covered by the routes of the applicants.

Twin City Company Expands in Bus Field

The Twin City Rapid Transit Company, Minneapolis, Minn., through its subsidiary corporation, the Twin City Motor Bus Company, now owns all the bus lines carrying passengers between Minneapolis and St. Paul, in addition to some suburban routes. This has been accomplished by the purchase of the third and last interurban bus line, the Minneapolis & St. Paul Bus Line, Inc., operating twelve buses. With the Twin City Motor Bus Company line and the American Auto Transit Company line, previously acquired, the railway now operates buses between the Twin Cities on three major traffic routes.

The Twin City Motor Bus Company is putting seven new buses in service on interurban lines. The bodies, built at the Eckland Body Company shops, are on Mack (International) chassis. The railway company now has 84 buses.

Net revenues on the buses over the 7½ per cent return allowed on the railway investment will be turned over to the street car companies. Thus the railway has taken over bus lines that were eating into the revenues of the electric companies and may get additional revenue from the bus lines.

Indiana Decisions Apparently in Conflict

The Superior Court at Terre Haute, Ind., has handed down a decision upholding the state law enacted by the last Legislature providing that buses operating in cities must secure certificates of necessity and convenience from the Indiana Public Service Commission. The ruling came on the hearing of a petition of the Terre Haute, Indianapolis & Eastern Traction Company for an injunction against nineteen bus operators. Counsel for the bus men argued that a license issued by the City Council was a contract which took precedence over the state law, but the court ignored this construction of the statute. The railway also asked for an accounting from the operators and a judgment for the sums that were received by them for carrying passengers since the passage of the new law.

At about the same time came another decision from Hammond, Ind., in the Lake County Superior Court of a somewhat different nature. The court ruled that certificates of the Public Service Commission permitting operation of buses within cities cannot supersede city ordinances. The opinion denied the petition of the Gary Street Railway to enjoin the city from enforcing an ordinance prohibiting such transportation. The court held that cities have an inherent right to regulate transportation facilities within their own limits.

Permission Sought for New Line.—The Philadelphia Rapid Transit Company, Philadelphia, Pa., recently applied to the Public Service Commission for permission to remove its tracks from Race and Vine Streets between Second and 23d Streets, Philadelphia, to make room for an authorized bus route. Commissioner Benn, who heard the application, said he would recommend approval. The commission rejected a similar application several months ago because of a clause in the councilmanic ordinance covering the city and the P. R. T. agreement which would have given the railway the exclusive right to operate over these streets. That clause was eliminated in the application presented on Feb. 4. The company also applied for permission to establish a bus route to serve East Germantown and Logan.

Boston Bus Line Extended. — The Boston Elevated Railway, Boston, Mass., has extended its bus line being operated between Kendall Square and Bowdoin Square to Lafayette Square. This change in routing became effective on Feb. 1.

Line Discontinued—Would Run Buses.—The Grand View Railroad, a 6-mile line in Kirkwood, near St. Louis, Mo., has been discontinued. The St. Louis Bus Company, a subsidiary of the United Railways, has asked the St. Louis Board of Public Service to substitute buses for the cars. The route the bus company would operate is 2 miles. The buses would connect with the Broadway and Bellefontaine Street car lines.

Petitions for Bus Substitution.—The Menominee & Marinette Light & Traction Company has petitioned the Marinette, Wis., Common Council to replace its Hall and Pierce Avenue street cars with buses. In presenting the company's case before the Council, A. J. Goedjen, general manager, stated that traffic on this line was only about 75 per cent of the figures established three years ago and that the line had shown no profit in 1925.

Bus Line Serves Useful Purpose.—The Portland Electric Power Company, Portland, Ore., is putting on transfer buses to serve the Eastmoreland district and Reed College, joining the Error Heights car line and others. The run is about 2 miles. The bus line eliminates the railway traffic on a one-way viaduct.

New Line in Northwest St. Louis.—The St. Louis Board of Public Service on Feb. 2 voted unanimously to grant a permit to operate a bus line in Northwest St. Louis to the St. Louis Bus Company, a subsidiary of the United Railways. The bus line will use Natural Bridge, Marcus, Kingshighway Northeast and Florissant Avenues, and will provide transportation for a new territory that has not adequate street car facilities. A 10-cent fare will be charged with transfers to connecting street car lines. S. W. Greenland, representing the reorganization committee of the United Railways, presented to the board a petition signed by 900 residents of the district asking for the service. About fifty home owners were on hand to support the application.

Bus Expansion by East St. Louis Line.—The Red Line Motor Bus Company, an auxiliary of the East St. Louis & Suburban Railway, is now operating two buses each way daily between Greenville, Ill., and St. Louis, Mo., via the Eads Bridge. In addition, two other buses will run from Greenville to Collinsville each way, making connection with the suburban street cars in Collinsville.

Cross-town Line in Fond Du Lac.—Permission to operate a cross-town bus line, has been sought of the City Commission of Fond Du Lac, Wis., by the Wisconsin Power & Light Company. This proposed city bus system would work in harmony with the company's railway with interchangeable transfers. If operating conditions justify the service will be extended to other parts of the city which do not now enjoy transportation service. To obtain the sentiment of residents living in the districts on routes and schedules the company is conducting a city-wide house-to-house survey. Equipment which the company proposes to use would comprise buses of the street car type.

New Service Started. — The Los Angeles Motor Bus Company, a subsidiary of the Pacific Electric Railway and the Los Angeles Railway, started the operation of buses on Riverside Drive, Los Angeles, Cal., on Feb. 1. The line extends from Dayton Avenue and San Fernando Boulevard along Riverside Drive to Whitmore Avenue and Alessandro Street. A connection will be made with certain Los Angeles Railway and Pacific Electric cars. The line will skirt the bottom of the Elysian Park Hill. The fare is 10 cents with transfer privilege to and from the railway cars.

International Application Held Up.—Plans of the International Bus Corporation, a subsidiary of the International Railway, Buffalo, to start a bus line in Richmond Avenue on a similar basis as the other three local bus lines are being held up. The delay is due to the hearing by the Public Service Commission on the application of Ernest M. Howe, Detroit, for permission to operate thirteen bus lines over 71.5 miles of streets at a 5-cent fare under the franchise obtained from the City Council last fall. The International also plans the extension of its Delaware Avenue bus line from the Buffalo-Kenmore city line to the north village line of Kenmore at an additional 5-cent fare or the sale of round-trip tickets for 25 cents. The fare inside the city is now 10 cents.

Opposes Bus Routes.—The Hartford & Springfield Street Railway, through Harrison B. Freeman, receiver, appeared recently in opposition to the petitions of the New England Transportation Company to operate bus routes between Hartford and Broad Brook, Conn., and between Hartford and Suffield, Conn. The New England Transportation Company, however, was authorized to operate and started its service on Jan. 17. Mr. Freeman declared the lines might prove an entering wedge toward direct competition for his company.

Bus Stock Increased. — The Public Service Transportation Company, a bus subsidiary of the Public Service Railway, Newark, N. J., filed an amendment to its certificate of incorporation with the Secretary of State on Jan. 28 increasing its authorized capital stock from 1,000,000 to 1,500,000 shares of no par value. The increase was authorized at a directors' meeting Jan. 12 and ratified at a subsequent stockholders' meeting.

Financial and Corporate

Reappraisal Suit at Rochester to Be Heard in March

Trial of the reappraisal suit brought by the city of Rochester, N. Y., to determine the valuation of the Rochester lines of the New York State Railways is scheduled for the equity term of Supreme Court, Justice Stephens presiding, on March 3.

Clarence M. Platt, corporation counsel for the city, and the law firm of Harris, Beach, Harris & Matson, for the railways, already are marshaling their arguments in this long-standing legal controversy.

The Common Council rejected the compromise offer of the traction company to lop off $1,400,000 from the base valuation of $19,216,000 as originally fixed in the service-at-cost contract under which the railway operates in the city.

The city's position is that war time prices prevailed in the appraisal and that the valuation as fixed then is excessive. The decision of the Appellate Division, Third Department, in the certiorari proceeding to review the rates charged by the Peoples Gas Company of Oswego is being studied as bearing on the Rochester case.

In this decision the court held that the Public Service Commission was in error in not allowing value as a going enterprise and in not considering the good will of the properties. These points were not considered in the Rochester appraisal.

James F. Hamilton, president of the New York State Railways, contends that the proceeding will result in establishing a higher valuation for the Rochester properties. He declared that the company's offer of settlement was solely to avoid litigation costly to all parties concerned.

Mr. Fitkin Comments on Newport News Purchase

According to A. E. Fitkin, president of the National Public Service Corporation, 80 per cent of the preferred and common stocks of the Newport News & Hampton Railway, Gas & Electric Company has been acquired. The price paid for these stocks is understood to have been $110 a share. As indicated previously in the ELECTRIC RAILWAY JOURNAL the properties just taken over will be combined with the Virginia-Western Power Company, Virginia-Northern Power Company and other Virginia holdings of the Fitkin interests in a Virginia operating company which will be a subsidiary of the National Public Service Corporation.

Acquisition of the Newport News & Hampton Railway, Gas & Electric Company will add more than $2,000,000 to yearly gross revenues of the National Public Service Corporation. The Newport News company serves without competition a population of about 60,000 over a territory of 14 miles, extending from Old Point Comfort on the eastern end of the peninsula through the towns of Phoebus and Hampton to Newport News. The territory is almost entirely industrial, the largest single industry being the Newport News Shipbuilding & Dry Dock Company.

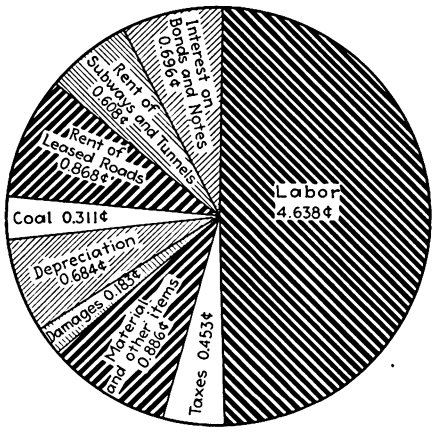
In commenting on this purchase, Mr. Fitkin said:

> Our engineers consider the Newport News & Hampton Railway, Gas & Electric Company one of the finest properties from the standpoint of physical efficiency they have examined in a long while, and we believe the territory served has recovered from the after effects of the war and is launched upon a great era of expansion and prosperity. The property has been ably managed, public relations are excellent and the company will form an important link in our Virginia operations. The company will be under management of the General Engineering & Management Corporation.

$502,195 Net for Boston Elevated

Seventh Annual Report of Public Trustees Makes a Remarkable Showing —Bus Business Growing—Statistics of Operation Deserve Careful Study—Gratifying Increase in Riding

THE Boston Elevated Railway, Boston, Mass., which is operated by public trustees, has just presented its annual report to the Massachusetts Legislature. The period covered is the year 1925. The trustees show $502,195 as the balance of receipts above cost of service. In 1924 there was a deficit of $636,696. The total receipts for the year were $34,547,379. This is the largest amount during the five years that are compared in the report. The operating expenses, such as wages, material, damages, depreciation and fuel, were $24,405,735. Added to this were



Average Receipts per Revenue Passenger, 9.464 Cents. Cost of Service, 9.327 Cents per Revenue Passenger

taxes, rents, interest and miscellaneous items to the amount of $34,045,185. The number of revenue passengers carried in 1925 was 365,036,286, a reduction of 17,852,562 from last year.

The report shows that of the loan assessment of 1919 it paid back to the contributing cities and towns only $20,581 last year, as against $1,114,557 in 1924. On this loan the sum of $2,327,816 is due to the cities and towns of Boston, Cambridge, Somerville, Brookline, Medford, Malden, Everett, Watertown, Arlington, Chelsea, Newton and Belmont. In the reserve fund there is $637,797, compared with $176,868 one year ago.

Close supervision of expenditures was necessary to reach this result. Basic wage rates of 72½ cents an hour for surface motormen and conductors, established by the 1924 arbitration award, were continued unchanged by the arbitration board of 1925, but the board increased the differential for one-man car and bus operators from 8 cents to 10 cents an hour above the basic rate.

In order to meet the situation created by the 1924 award the repair shops were operated throughout the greater part of the year on a five-day week, track reconstruction was reduced somewhat below the average amount necessary, car mileage operated was reduced 500,000, one-man car operation was considerably increased and many lesser economies were put into effect.

Reduction in cost of power and cost of accidents, together with an increase of $386,716 in operating revenues, materially assisted in reaching the favorable result shown.

The increase in bus transportation is shown by the following table of miles operated:

1922	63,937
1923	465,382
1924	890,901
1925	2,472,456

At the present time there are 25 routes in operation employing 157 buses. In connection with this business the chartering of special buses in place of special cars and supplementary to special car service is being developed. Last year the revenue from this special bus service was $15,130.

On the subject of buses the trustees say in part:

"It was early decided that the public would best be served by seeking to discover where bus service would be desirable and then supplying it in conjunction with rapid transit and surface electric lines. In large metropolitan centers better and more economical transportation can in general be supplied by electric cars, but upon lines where traffic is not sufficient to warrant the heavy investment in track and electric system or where streets are so narrow or congested by vehicular traffic that the electric car is continuously blocked and delayed in its passage the bus fills an important place.

"If competing bus lines were established within the area served by the railway system operated by this board in behalf of the commonwealth the revenue of passengers so diverted would constitute a direct loss to the

Taxes	1,652,517	1,623,995	1,688,139	1,587,186	1,546,758
Rent of leased roads (including dividend rental under chapter 159, Acts of 1918)	3,169,448	3,175,566	3,185,577	3,646,595	4,203,061
Subway and tunnel rents	2,217,470	2,125,593	2,026,936	2,008,414	1,963,737
Interest on bonds and notes	2,540,909	2,602,891	2,316,026	1,891,315	1,494,258
Miscellaneous items	59,104	61,835	70,247	65,016	54,707
Total cost of service	$34,045,185	$34,812,016	$33,417,181	$31,286,987	$32,105,580
Loss for year	.....	$636,696	.....	.....	.....
Gain for year	$502,193	.....	$679,631	$1,412,189	$1,171,444

Profit and loss items not included in above.

commonwealth, to which accrues all receipts after payment of expenses. In addition to that loss the service furnished to the public would be impaired. Consequently, this board has consistently taken the position that no competing bus lines should be permitted within the territory served by this system and has adopted the policy of standing ready to furnish bus service within that general territory wherever it appeared in the public interest that bus service should be given. By this method better transportation is supplied, since with street cars and buses under one management the service given by each can be co-ordinated and used to improve instead of to injure the service given by the other. Free transfer from car to bus and vice versa is possible under such a unified system."

During the year new garages accommodating 56 buses each were constructed at the Arborway near Forest Hills and on Salem Street, Medford, and the first unit of the Lotus Place car repair house has been practically completed.

A prepayment station has been constructed at Egleston Square and an area provided at Kendall Square for interchange between Cambridge subway trains and buses operating from this point.

During the year actual construction of the Dorchester tunnel extension was begun by the Transit Department of the city of Boston. The first section of the work has been completed and substantial progress made upon the second section.

More than 13 miles of track and special work have been rebuilt and 2.31 miles extensively repaired.

All-night service of cars in the Boylston Street subway has been started and a system of stopping cars at particular berths has been put into effect in subway stations.

In order to encourage parking of automobiles outside of the congested centers and inducing such riders to make their journey into the city by rapid transit, land located near the Everett Terminal was leased for storage purposes. Direct connection of a large garage adjacent to this land with the Kendall Square station of the Cambridge subway awaits action by the Legislature authorizing the Department of Public Utilities to act for the commonwealth in giving necessary permission.

On the subject of rolling stock the trustees say:

"It is interesting to note that of the 82,450 cars in the United States 34 per cent are more than twenty years of age, while on the Boston Elevated only 12.7 per cent of the passenger cars now in service are more than twenty years old."

Sixty cars of the Cambridge subway type have been ordered to provide for operating the Dorchester Rapid Transit extension when completed. Ninety new No. 5 type cars of an order of 100 placed in July, 1925, have been received and placed in service.

For several years past the board in its annual reports and before committees of the General Court has called attention to existing limitations upon the raising of new capital for essential improvements of the railway. The board still believes the General Court should provide means for raising new

ALLOCATION OF ASSESSMENT ON CITIES AND TOWNS OF BOSTON ELEVATED DEFICIT YEAR ENDED JUNE 30, 1919

History of the 1919 Loan Assessment on Cities and Towns (Chapter 159, Special Acts 1918)

5-cent fare previous to Aug. 1, 1918.
7-cent fare Aug. 1, 1918.
8-cent fare Dec. 1, 1918.
Pupils' tickets (5-cent) Jan. 1, 1919.
10-cent fare July 10, 1919.

First 5-cent fare line (without transfer) Aug. 23, 1919.
First 5-cent local fare line March 26, 1921.
5-cent fare for children under fourteen years (not including children under five years) June 14, 1922—discontinued Nov. 5, 1924.
6-cent local fare Nov. 5, 1924.

Note—Previous to 1908 special car passengers included with 5-cent fares.

*During the years 1922, 1923 and 1924, one passenger making a single journey for which he might pay two 5-cent fares was counted as two revenue passengers. The substitution in November, 1924, of 6-cent tickets for 5-cent cash fares has often resulted in the payment of a 10-cent fare by such a passenger with a consequent reduction in the company's figures of total revenue passengers carried, though the gross passenger revenue for the year 1925, which increased $371,269, would indicate substantially the same number of passengers carried by the railway in 1925 and 1924.

Italics denote decreases.

capital. That matter has been recently considered by a special recess commission in a report now before the state law-making body. The trustees say that pending consideration of that report by the court the board feels that it should confine itself to operating the railway at the highest efficiency possible with existing facilities and such property as can be purchased from time to time from the allowance to offset the annual exhaustion of the depreciable property.

The average pounds of coal consumed per kilowatt-hour direct-current at the cars was 1,973 in 1925 compared with 2,068 last year. This is the lowest of any year in the history of the railway. The average cost of coal per ton during 1925 was $5.22, compared with $5.921 last year, and is also the lowest since 1917. There was a reduction of 23,078 tons of coal burned as compared with 1924.

An improvement has been made during this year in the accident record. Operating charges on this account were reduced from $914,043 in 1924 to $846,235 in 1925.

The seventh full year of public operation closed on June 30, 1925, with a balance of receipts over cost of service of $20,581. This amount was repaid to the cities and towns served by the railway.

A gratifying increase in riding and revenue during the latter part of 1925 and early 1926 has permitted the resumption of full time work in the shops and a substantial increase in the number of car-trips and car-miles operated.

1916	1,050,038	1,218,749	718,804	832,962	373,577,908
1915	992,283	1,140,046	685,726	846,860	352,469,586

*Note—During the years 1922, 1923 and 1924 one passenger making a single journey for which he might pay two 5-cent fares was counted as two revenue passengers. The substitution in November, 1924, of 6-cent tickets for 5-cent cash fares has often resulted in the payment of a 10-cent fare by such a passenger, with a consequent reduction in the company's figures of total revenue passengers carried, though the gross passenger revenue for the year 1925, which increased $371,269.51, would indicate substantially the same number of passengers carried in 1925 and 1924.

Net Earnings at Springfield Improve

The Springfield Street Railway, Springfield, Mass., has announced a 5 per cent dividend on 1925 business, compared with a 2 per cent dividend for 1924. Net income for 1925 was $239,135, compared with $133,846 in 1924, a gain of $105,289. There was a loss of more than 4,000,000 revenue passengers for the year. An increase of fares to the 10-cent basis and the extension of the use of the one-man cars account for the improved showing in net income.

Bus operations of the company showed a 50 per cent increase of mileage in 1925. Two new suburban lines were added and the number of buses increased to 25. Passengers carried by bus totaled 1,356,316, out of a grand total of 39,602,870. Total passenger revenue for the year increased $55,040 over the previous year. Comparative statistics for the two years follow:

STATEMENT OF EARNINGS OF SPRINGFIELD STREET RAILWAY

	1924	1925
Gross revenue	$3,173,616	$3,228,746
Operating expenses	2,760,564	2,697,362

Dividends	*93,094	†232,735
Surplus	40,752	6,400

* 1924, 2 per cent. † 1925, 5 per cent.

Income Higher in 1925 Period.—The gross income for the last six months of 1925 for the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., was $22,463,954, against $21,448,951, in 1924. The net income after charges was $2,994,524, against $2,598,524 for the six months period ended December, 1924.

More Passengers in St. Louis.—Operating on the average 33 cars a day fewer during the last quarter of 1925 than were used in the corresponding period of 1924, the United Railways, St. Louis, Mo., carried 654,429 more passengers. A total of 66,998,669 revenue passengers was carried against 66,344,240 from October through December of 1924. The cars of the company made a total of 1,459,036 trips, or 41,018 fewer than in the last quarter of 1924. Miles traveled by the cars the last quarter totaled 9,501,723, against 9,789,677 in a similar period of 1924. The quarter ended Dec. 31, 1925, showed an increase of 4,246,379 passengers compared with the quarter ended Sept. 30, 1925.

Purchase Rumors at Portland Denied.—Persistent reports that the American Power & Light Company interests had opened negotiations for purchase of the control of the Portland Electric Power Company, Portland, Ore., have been denied by Franklin T. Griffith, president of the company.

Digitized by Google

New Director Elected.—Ed Crawford has been added to the board of directors of the Shreveport Railways, Shreveport, La.

Small Balance for Transportation Area.—The Athol & Orange Transportation Area for 1925 reports passenger revenue of $41,908 and total revenue of $43,392. Expenditures were $41,768, leaving a balance of $1,624. Only $31 was paid out for damage claims during the year. The present system of operation under special permissive legislation from the State of Massachusetts has been in force 21 months.

Bond Issue Authorized.—The Key System Transit Company, Oakland, Cal., has been authorized by the Railroad Commission to issue and sell $2,500,000 of series "C" first mortgage 5½ per cent bonds, due July 1, 1938, at not less than 94 per cent of face value, plus accrued interest. The proceeds are to be used to pay indebtedness, reimburse its treasury and for additions and betterments.

Book Reviews

Proceedings of Fifteenth Annual Convention, Pacific Claim Agents Association

This 32-page pamphlet contains the papers and a brief reference to discussions at the annual meeting of the association, held at Los Angeles July 22-24, 1925. The report of this convention was published in the issue of ELECTRIC RAILWAY JOURNAL for Aug. 8, 1925.

Second Technical Conference of the State Utility Commission Engineers

Published by the Department of Commerce, Bureau of Standards. 98 pages.

This is a report of the meeting held March 6, 1924, at the Bureau of Standards, Washington. Discussion of the subject of utility valuations and rates occupied the first day. The second day the discussion was more diversified. Perhaps the principal topic, however, was rural extensions and rural electric service.

Labor Laws of the United States

The Bureau of Labor Statistics of the United States Department of Labor has been obliged again to revise its publication of labor legislation of the United States, being the sixth compilation of this character published by this office. By summarization and abridgment, the contents of the two volumes of Bulletin 148, published in 1914, and nine succeeding annual bulletins, including also the legislation of the years 1923 and 1924, have been condensed into a single volume (Bulletin No. 370). The result is a volume of convenient size containing the substance, and in many instances the full text, of all existing labor legislation except that relating to workmen's compensation, which is incorporated in a separate series of bulletins.

Few new subjects appear, the current tendency in labor legislation being rather to elaborate the laws regarding safety, sanitation, wage payments, the right of contract, the employment of women and children, etc., than to undertake any new departures. Administrative provisions have received attention by legislatures, and the concentration of law enforcement into the hands of a single agency is a tendency that is apparent. The court decisions have been expanded in some measure, and some classes of laws have received sufficient discussion to indicate the status of the type of legislation under consideration. Thus, in the matter of state laws affecting interstate commerce by railroad, the power of Congress is shown to be exclusive where it has entered the field. Opinion seems to be divided as to the right of municipalities to engage in the ice business, the operation of fuel yards, etc., but the courts are practically of one mind as to laws forbidding the discharge of union workers on account of organization membership.

The volume affords the answer to many questions submitted almost daily to the bureau. It is an essential handbook to any one interested in industrial and economic law.

Planning Problems of Town, City and Region

Published for the International City and Regional Planning Conference by the Norman Remington Company, Baltimore, Md. 530 pages. Illustrated.

These are the proceedings of the conference held in New York, April 20 to 25, under the auspices of the International Federation of Town and Country Planning and Garden Cities and the National Conference on City Planning, reported briefly in the issue of this paper for April 25. City planning engineers and street railway engineers are realizing more than ever before that their problems are largely identical, and this view was emphasized in a number of the papers presented at the meeting in New York last April. It was also expressed in the resolutions adopted at the traffic and transportation round table of the conference which declared that the problem of traffic congestion and the development of adequate transportation must include all transportation agencies and that every city should adopt a traffic policy to encourage greater efficiency and organization in traffic and transportation.

A Century of Progress

Published by the Delaware & Hudson Railroad for private circulation. 755 pages. Illustrated.

In April, 1923, celebrations were held in New York City and in Scranton, Pa., of the 100th anniversary of the founding of the Delaware & Hudson Company. It was indeed an important historic occasion, for in this country corporations which have had a continuous existence of a century are very rare. Originally, the Delaware & Hudson Company was organized to mine anthracite and transport it to the city of New York and elsewhere in the state of New York. The coal was carried first by canal and afterward by railroad. The volume under review is an account of the activities of this historic company, which, in later years, has added a number of electric railways in the eastern part of New York State to its transportation system. A very interesting chapter in the book is that describing the results of federal control of the railroad during the years from 1918 to 1920. Those who advocate government operation of railroads can well obtain an object lesson of its results from the information given in this chapter.

Underground General Associated Tramways American Tour, 1924

This is a 46-page illustrated pamphlet containing papers read at a meeting of the directors, officers and assistants of the Underground General Associated Tramways on March 2, 1925, at Hotel Victoria, Northumberland Avenue, London, England. The book is for private circulation only.

They gave up "larffing" and the world "laffed" with them on that American Tour in 1924. So it would appear from reading the papers of Clive Leese, H. S. F. Lansdown of the London General Omnibus Company and H. C. Davy and A. W. Green of the Underground, who were chosen to take the trip to America in 1924 in search of knowledge and experience. Here is a diary replete with interesting experiences that these British railway magnates had on this side of the Atlantic. The illustrations alone throw special light on what the tourists were anxious to find out and also what made a big impression on them. Mr. Leese's paper stressed the types of buses in America with the problems of the American bus designers and operators. Mr. Lansdown gave a résumé of traffic conditions in America generally. In addition he discussed labor conditions in America. Mr. Davy referred to banking of traffic receipts and wages and Mr. Green made a comparative study of the country and its people and discussed control of receipts and expenditures on the railways. He prophesied future development of transport industry with America tackling the bus question. On this point he said: "We are preeminent in the motor bus world today, but if we are going to retain that preeminence it seems to me that we shall have to fight very hard."

An interesting feature of the pamphlet is a double-page spread showing in statistical form a comparative study of the London General Omnibus Company, the United Railways of St. Louis, Fifth Avenue Coach Company, the Chicago Motor Bus Company, the Connecticut Company and the Cleveland Railway. The questions answered in the table are on hours of duty, meal reliefs, guarantee, rates of pay, reporting allowance, traveling allowance, rest days and other points that are applicable to bus operation.

The tourists referred to the meeting of the American Electric Railway Association at Atlantic City and all joined in thanking the chairman and directors for the opportunity which was afforded them of visiting America.

Personal Items

J. N. Shannahan Still in the Industry

Sale of Property at Hampton Not to Change His Railway Status—Laudatory Newspaper Comment

Plans of John N. Shannahan for the future are somewhat uncertain, but his talents will not be lost to the industry. It will be recalled that the former president of the American Electric Railway Association and head of the Newport News & Hampton Railway, Gas & Electric Company recently concluded a deal in which control of that property passed to the Fitkin interests. In the industry interest naturally centered in the question: "What is Jack Shannahan going to do?" So far as he has made any plans it is known that Mr. Shannahan will spend the next few months and possibly longer in developing large real estate holdings of the Old Dominion Land Company in and about Newport News which he purchased recently from Henry E. Huntington. He expects to remain head of Peck - Shannahan - Cherry, Inc., which firm has long operated a number of electric railways, several of which center at Syracuse, N. Y.

Jack Shannahan's record is too well known to those in the industry to need reiteration. He represents the best there is and practices what he preaches. No amount of mere biographical facts, however complete in themselves, written from within the industry would tell half so well the story of his achievements as an operating official as do the expressions of appreciation contained in the local papers at Hampton. Daily newspapers are not given to saying nice things about men and their work, particularly public utility men, unless the men and the work they do deserve it. They have other fish to fry. Most of them would rather use vitriol than varnish.

It is no more possible to cite all the expressions of appreciation by his handling of the properties than it would be to quote from them at length. Extracts from two editorials, each nearly a column in length, suffice to indicate the tenor of the comments and emphasize the fact that the value of good public relations is a real, tangible thing. The Newport News *Times-Herald* said:

The Newport News & Hampton Railway, Gas & Electric Company has sold not only a valuable property but a good name. By square dealing, honest and efficient service, respect for the rights of the public and by identifying itself with the interests of the community it served, the company has gained the respect, the confidence and the good will of the people of the Lower Peninsula, which is a most valuable asset. The company has never attempted to dicker with the municipal bodies of this section. To the contrary, it has treated those bodies with consideration, has kept no secrets from them, has laid its case in frankness and confidence before them whenever any emergency in its affairs has arisen and has consulted them before applying to the State Corporation Commission for any increase in rates; and has never gone before the commission with such a petition without having first gained the consent and cooperation of the municipal bodies concerned. In short, the company has made itself part and parcel of the community and has heartily co-operated with the people in all movements and enterprises for the common good. It has been a good and helpful partner and has rendered service in many directions, outside of its immediate sphere of activities. The company also has been considerate of its employees, and has gained their good will, as well as that of its patrons and the general public.

We should be less than frank did we not say that the retirement of President Shannahan from the company is a matter of regret to the community. He has the full confidence and the friendly regard of this people. He has proved himself to be not only an able and honest operator of the public utilities, but a loyal, progressive, public-spirited and very valuable citizen, and his administration has given the people a sense of security. But this regret is largely alleviated by the fact that Mr. Shannahan will continue to reside here, and that he will devote his abilities and activities to the development of the Old Dominion Land Company. The *Times-Herald* is well pleased to learn that.

J. N. Shannahan

The Newport News *Press* said:

The company has given an efficient service and has dealt honestly and considerately with the entire community; with its employees as well as with its patrons, and it has gained the good will of all.

It is not in disparagement of the other officers to say that this is due, primarily, to the integrity and the fidelity of President Shannahan. He is an upright man and he is a loyal citizen. He has dealt with the community not in selfishness, but in the spirit of fairness and generosity. He has contributed liberally of his private means and the means of his company toward all public enterprises, and he has made the public utilities a strong agency in community progress. His indorsement of any enterprise is sufficient to inspire the confidence of investors. It is with keen regret, therefore, that the people see Mr. Shannahan retire from the presidency of the company, but it is gratifying to know that the sale of his holdings in the company does not involve his removal to another place of residence.

The manager of Fitkin Utilities, Inc., informs the *Daily Press* that for the present, at least, there will be no change of policy or in the personnel of the local management. That is a pleasing announcement, and the *Daily Press* hopes that the status quo may continue indefinitely. We are a very neighborly people, gentlemen, and we have a friendly spirit. We are also hospitable and kindly disposed to all genteel persons who may cast their lot with us. We are prepared to give you a warm Virginia welcome, and you may count upon fair treatment from the authorities and from the general public, and also upon our friendly co-operation, so long as you deal with us in the same spirit that characterized the old company.

Certainly there is comment indicating in no unmistakable terms that the praise bestowed upon Mr. Shannahan was well deserved!

Personnel Changes in Cincinnati

F. J. Venning, superintendent of shops, equipment and overhead of the Cincinnati Street Railway, Cincinnati, Ohio, has been appointed superintendent of power. His former assistant, E. J. Jones, has been named superintendent of equipment.

Mr. Venning will have charge of the operation and maintenance of the power houses, substations, overhead transmission and distribution system and inclined planes. Mr. Jones will have jurisdiction over the maintenance of cars, the operation of the Chester Park shops and all carhouses.

W. H. Lines in Charge of Railway Operations at Portland

W. H. Lines, assistant to the president of the Portland Electric Power Company, Portland, Ore., for the past year, was placed in charge of all railway departments and operations of the company on Feb. 1. He retains his former title. This new responsibility covers part of the executive duties of the late Franklin I. Fuller. President Griffith states, however, that it may be a month or more before a successor to Mr. Fuller is named.

Mr. Lines is an engineer of wide experience. He has been with the Portland Electric Power Company in various capacities for the last fourteen years.

F. W. Coen Leaves Lake Shore Electric Railway

After many years of service with the Lake Shore Electric Railway, F. W. Coen, Cleveland, resigned as vice-president and general manager, effective on Jan. 30. Under Mr. Coen's direction the property was developed into one of the largest passenger, freight and express carriers in the Central West. In addition to the transportation industry there has also been developed a large and rapidly growing light and power business. Mr. Coen has been active in the affairs of the American Electric Railway Association and of the Central Electric Railway Association, of which he is a past-president.

He has not decided whether he will again engage in the electric utility field or become identified with industry in some other line.

P. H. Gadsden Heads Philadelphia Chamber of Commerce

Philip H. Gadsden, vice-presiden; United Gas Improvement Company and former president American Electric Railway Association, is the new president of the Philadelphia Chamber of Commerce. In his initial address to the members of that organization Mr Gadsden expressed the hope that it might be possible during the coming

Digitized by Google

year to bring about "closer co-operation among all the commercial and business organizations of Philadelphia." As the Philadelphia *Ledger* sees it, unity of effort among the city's business organizations is the goal worth striving for. The *Ledger* says: "If it can be attained under the inspiration and tactful generalship of Mr. Gadsden, he will have performed a public service of inestimable value."

C. L. Bartlett Massachusetts Northeastern Manager

Clifton Lewis Bartlett has been appointed general manager of the Massachusetts Northeastern Street Railway, with headquarters at Haverhill. He succeeds the late Ralph D. Hood. Mr. Bartlett was born in Haverhill in 1890. He entered the employ of the Haverhill & Southern New Hampshire Street Railway, the Northeastern company's predecessor road, in 1907 as a checker of conductors' returns. In 1925 he was made chief clerk and claim agent. He has been acting as general manager since Dec. 30.

S. L. Nicholson Made Westinghouse Vice-President

At a recent meeting of the executive committee of the Westinghouse Electric & Manufacturing Company S. L. Nicholson was elected acting vice-president. This honor follows an association of more than 27 years with the Westinghouse company and is in recognition of the noteworthy services which Mr. Nicholson has rendered to the electrical industry. He became sales manager of the Westinghouse company in 1909 and held that position until 1917, when he was made assistant to the vice-president.

Mr. Nicholson assisted in the formation of the American Association of Electrical Motor Manufacturers, which is now known as the Electric Power Club, and was its first president. He also assisted in the formation of the American Gear Manufacturers Association and the Stoker Manufacturers Association. He was chairman of the Electrical Manufacturers Council, which is the co-ordinating committee of the Power Club, Electric Manufacturers Club, and the Association of American Manufacturers of Electrical Supplies.

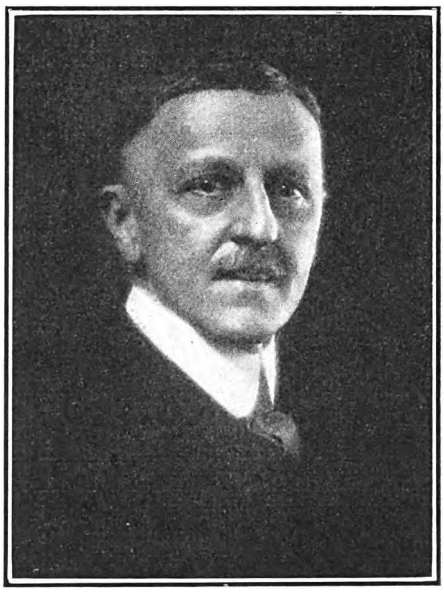
In 1921 he was chairman of the tariff committee of the council and represented the electrical industry on its National Industry Conference Board. Mr. Nicholson is also a member of the Electrical Safety Conference, the American Statistical Association, and the Bureau of Personnel Research of the Carnegie Institute of Technology. He is a native of Philadelphia and began his electrical career in 1887, serving various companies from that date until 1898, when he joined the Westinghouse company.

G. T. Lackey, vice-president and agent for the receivers of the Oklahoma Railway, Oklahoma City, Okla., has been made general superintendent of all the departments of the company, working under the direction of the two receivers. Mr. Lackey has been with the company seven years.

W. H. Woodin, Brill Chairman

Head of American Car & Foundry Now Interested in Companies Supplying All Forms of Transportation Equipment—Reared in Atmosphere of Cars and Car Construction

W. H. WOODIN, elected chairman of the board of directors of the Brill Corporation, newly organized to control the J. G. Brill Company and the American Car & Foundry Motors Company, has back of him a groundwork of experience in the railway equipment field which dates back to 1890. He was reared in an atmosphere of car design and cars. The name of Woodin has been associated with railway car building since the inception of that industry in this country. Mr. Woodin's grandfather was one of the organizers of the Jackson & Woodin Manufacturing Company, founded in 1842 and taken over by the American Car & Foundry Company at the time of its organization in 1899.



W. H. Woodin

Mr. Woodin is not only president of the American Car & Foundry Company, but last December was elected a president of the American Locomotive Company, succeeding Andrew Fletcher, deceased. Before that he had been a director and a member of the executive committee of the American Locomotive Company for many years. This affiliation is really more than that of one individual with several companies. The American Car & Foundry Company has large holdings of American Locomotive Company stock and Mr. Woodin himself is a large shareholder of the company.

The election of Mr. Woodin to the Locomotive company was in recognition of his executive ability, supplemented by his extended familiarity with the supply field in general and with the operations of the American Locomotive Company in particular. Similar considerations governed his election as chairman of the board of the new Brill corporation, control of which is lodged with the American Car & Foundry Company. Through the Brill corporation and its subsidiary, the American Car & Foundry Motors Company, the Hall-Scott Motor Car Company and the Fageol Motor Company of Ohio are owned. Thus Mr. Woodin's help and advice will be available in shaping the policies of companies supplying equipment for all forms of common carrier transportation.

The extent of the operations of these companies is shown by the fact that the American Car & Foundry Company operates four passenger car building plants, sixteen freight car building plants, six wheel foundries, eight gray iron foundries and several other plants, while the American Locomotive Company operates eight plants. The facilities of the companies just brought into the new Brill organization need no reiteration.

Director of Many Corporations

Mr. Woodin has many other business affiliations. He is chairman of the board of the Canadian Car & Foundry Company and a director of the American Exchange Security Corporation, the American Beet Sugar Company, the Westinghouse Electric & Manufacturing Company, the Montreal Locomotive Works, the Westinghouse Electric International Company, the General Motors Corporation, the Cuba Company, Cuba Railroad, the Compañia Cubana and the American Ship & Commerce Corporation. Like many other big business men, he has a hobby and rides it hard. He is a coin collector. With Edgar H. Adams he is the author of a standard book on American coins. He is a member of the American Numismatic Association and the New York Numismatic Club. During the war he served the public as fuel administrator for the State of New York.

Mr. Woodin was born in Berwick, Pa., on May 27, 1868. He received his technical education at Columbia University in the School of Mines, class of 1890. He served in the shops of the Jackson & Woodin Manufacturing Company at Berwick and in 1892 was made general superintendent of that plant. In 1895 he was elected vice-president and in 1899 president. When the company was taken over by the American Car & Foundry Company in 1899 he was made district manager of the Berwick plant. He later became assistant to the first vice-president of the new company and in 1902 was made a director and assistant to the president, with general direction of the company's affairs, under President Frederick H. Eaton. On Feb. 1, 1916, he succeeded to the presidency.

Changes at Fond du Lac

M. H. Frank, formerly manager of the railways of the Wisconsin Power & Light Company at Fond du Lac, has been promoted to general manager.

F. S. Whitely has been selected manager of the company's properties at Fond du Lac, succeeding M. H. Frank.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Large Expenditures Looked For in Ohio During 1926

Electric railways in Ohio are planning large expenditures for the purpose of bettering service during 1926. Material increases to present rolling stock are contemplated, as well as the expenditure of considerable sums for track renewals, general maintenance and improvement work on roadbeds. Figures already revealed by the budget of some of the companies total more than $6,500,000 for these types of work.

The largest figure thus far indicated is that of the Cleveland Railway, which estimates its new capital expenditure for the year as $4,500,000. Of this amount, it is estimated $2,300,000 will be spent for way and structures, $1,250,000 for modernizing existing street cars and purchasing new units, $450,000 for bus equipment and $500,000 for power. The Cincinnati Street Railway will undertake a $350,000 program in improving its bus service, including provision of structures to be used for storage and repair, and estimates the amount necessary for track reconstruction at $50,000.

Purchase of new buses, remodeling cars to the one-man type and installing new track and special work will mean an expenditure of $317,353 by the Community Traction Company, Toledo. The People's Railway, Dayton, plans to spend $181,895 for track renewals, $50,894 for new work cars, $2,525 for installment of electric switches and $2,712 for miscellaneous equipment. New interurban cars which will be ordered by the Steubenville, East Liverpool & Beaver Valley Traction Company will cost approximately $150,000.

The Cleveland Southwestern Railway & Light Company will spend $80,000. Of this amount, $30,000 will be spent in its railway department and $50,000 in its light department. The Northern Ohio Traction & Light Company will spend approximately $1,000,000 in its transportation division and $1,500,000 on its light and power department. The former total includes $350,000 for additions to the South Akron substation, $225,000 for new buses, $100,000 for a new freight house and $100,000 for new freight cars. Various sums will be spent for extending its underground system, for the purchase of new transformers and equipment and for rural line extensions and the rebuilding of lines in Akron.

Other companies expecting to make material expenditures during the current year, but which have not yet indicated how extensive these will be, are the Columbus Railway, Power & Light Company, the Lake Shore Electric Railway, the Southern Ohio Public Service Company, the Cincinnati & Dayton Traction Company, the Indiana, Columbus & Eastern Traction Company, the Pennsylvania-Ohio Electric Company and several others.

Last year electric railways in Ohio were authorized by the Ohio Public Utilities Commission to issue a total of $9,002,320 of new securities. Of this amount, $7,586,620 was authorized in bonds and $1,415,700 in common and preferred stock. Indications are that the expenditures for the present year will equal if not surpass the totals for 1925.

Manufacturers to Be Aided by Publicity Campaign

Plans are rapidly going forward in connection with the intensive publicity campaign which is contemplated by the special committee on co-operation with manufacturers of the A. E. R. A. As outlined in the issue of the JOURNAL for Feb. 6 the program, which is to impress upon the public the fact that some 500,000 workers are employed in the production of electric railway supplies in the United States, will embrace a complete layout of posters for bulletin boards, stickers for letters and packages, outdoor signs, etc. The posters, labels and stickers will be supplied by E. F. Wickwire, chairman of the committee, in any quantity desired free of charge. Outdoor signs may be obtained from George H. Tontrup.

Cost-per-Mile Basis Opposed

Manufacturers Unite Against Practice of Selling Tires to Bus Operators Under a Mileage Plan—Claim Outright Purchase Is Cheaper for Consumers

"BOTH tire manufacturers and operators of buses lose under any kind of a cost-per-mile contract per tire purchased," stated an official of one of the larger tire manufacturing companies in a recent interview with a representative of ELECTRIC RAILWAY JOURNAL. On an advancing market for crude rubber prices the operator may have a slight temporary advantage, while on a falling market the odds are all with the manufacturers. In general, the manufacturers have come to the conclusion that the purchase of tires on a mileage basis is an economic fallacy resulting in inevitable rate wars among the producers, and making it necessary for the manufacturers to establish service stations throughout the country to care for all tires sold under such an arrangement.

So much interest has been evidenced in this question by traction companies operating a co-ordinated bus and railway service that it was considered of value to obtain a general statement of the manufacturers' policies and of the conditions which have led to the adoption of those policies. Accordingly, several of the principal tire producers were questioned as to their attitude toward cost-per-mile contracts and were asked whether or not they were disposed to allow any such contracts in the future. Without an exception the answers received agreed most heartily on practically every phase of the question.

The mileage purchase plan has been tried out and has been found wanting in the estimation of the larger companies. It is true that some of the smaller producers are continuing to accept contracts on this basis. One official characterized this practice as "playing with fire." He declared that an abrupt and unexpected rise in crude rubber prices would bring many smaller companies operating on limited capital to grief with quickness and dispatch. Nor has crude rubber of late exhibited any marked tendency toward stability.

Since street cars, buses, trucks and other equipment are all purchased on an outright basis, tire manufacturers see no reason why their products should not also be considered in the same light. Of course, bus operators seized upon the cost-per-mile contract as a means of "passing the buck" on at least one item of their general maintenance work. They figured that as long as the tire manufacturers were willing to undertake the servicing of tires and to give them an attractive price for this service, there was no reason why they should not relieve themselves of this particular worry. On the other hand, the manufacturers soon discovered that selling tires is one thing and selling service quite another. Furthermore, the bus operators were not long in discovering that most exasperating delays frequently resulted under this plan, since instead of taking steps to repair a flat tire themselves they were forced to await the pleasure of the manufacturer's representative.

The most reasonable argument advanced by the tire manufacturers against the mileage purchase plan, however, was simply that the actual net cost per mile to the operator in the long run is considerably less when he buys a strictly quality tire and pays for it outright. This is demonstrated as follows: A certain company manufactures a tire the quality of which insures a life of 20,000 miles. A cost-per-mile contract would therefore be figured on this mileage. Since all of the tires not actually defective may be expected to attain this mileage, it is obvious that many of them will considerably exceed it. On the cost-per-mile basis the operating companies do not profit by this excess mileage, while on the outright purchase plan it might be said to be, in common parlance, "gravy" for them. It is thus possible for the manufacturers to demonstrate on the hard bedrock of common sense that both parties to the agreement will benefit under the outright purchase plan.

Digitized by Google

A representative of one company states:

We believe that outright purchase is preferable because for him who takes care of his tires, extra mileage, lower tire cost and fewer interruptions are his reward. And for him who is indifferent toward his tire service, low mileage, high tire cost and frequent interruptions are the penalty. To our minds, this works out fairly for everyone and such a policy should merit favor as against the plan that works a disadvantage to one or another of the parties involved. Practically all electric railway operators are buying on an outright purchase basis and we believe that they will continue to do so. Of course, outright purchase favors the quality tires as against the others because they will prove to be more trouble free and longer lived, and tires will therefore be judged more strictly on their merits.

When the cost-per-mile plan was first adopted the manufacturers had no reliable information as to tire cost on various types of buses, mileage records for equipment operating over different types of roadway and all of the countless other factors which of necessity enter into the problem. The rates given were, therefore, absurdly low in many cases, at least one contract having been awarded on a cent-per-mile basis. Naturally the producing companies lost a great deal of money in this way, and as more data became available on the aforementioned factors, the rates were materially increased. As opposed to this tendency, however, there was the equally strong inclination to cut prices in order to meet competition and to get desirable business away from rival concerns. The whole situation was therefore one of storm and strife and finally the larger manufacturers singly and as groups agreed that the end did not justify the means and declared themselves against any further sales on this basis.

One of the manufacturers stated:

Only 20 per cent of the companies operating buses in the United States are of a size which would justify our making such a contract with them in any case. Of this 20 per cent, a large number have become convinced that the mileage purchase plan is not the solution of their problem and they are now buying their tires on an outright purchase plan. We, therefore, feel that it scarcely behooves us to violate the dictates of common sense in a wild scramble for what is after all only a comparatively small percentage of the available business in the country. How much better for us to concentrate our efforts on a sane marketing of quality tires on the tried and proved outright purchase plan!

A few manufacturers still offer the cost-per-mile contract to the large operator and some of the largest fleets of buses in this country continue to be equipped under such agreements. Of course, there are two sides to every story and certain operators may have found after a thorough trial of the cost-per-mile plan that it meets their particular requirements in a satisfactory manner. No effort has been made in assembling the opinions contained in this article to get the operator's viewpoint on the question. The manufacturers alone have been consulted. However, it seems significant that the larger producers have deliberately turned their backs on a marketing plan which may be presented in an attractive light to the operating companies.

Manufacturers who still favor this plan necessarily have confidence in the quality of their product, since they can only profit as their tires attain to good mileage figures.

Business Forecasts Optimistic

Authorities See Good Outlook Immediately Ahead, but Are Loath to Attempt Distant Predictions

General business conditions in the United States continue prosperous and there is an encouraging stability in the trend of prices. However, the note of caution which was heard at the beginning of the year is still sounding on the pitch-pipes of commerce. Unprecedented as was last year's record in practically every line of industry, it cannot be safely taken as a guarantee for a continuance of this state of affairs indefinitely. This is the opinion of observers known for their more sober judgment.

The New York *Times* states:

Tangible evidence of prosperity sometimes points to past, not future, conditions. The basic influence of the 1924 grain harvests was not duplicated in 1925. Our railway traffic and industrial profits depend in large measure on unknown future conditions, notably the crops. In directions where the public's purchasing power has been extraordinary (notably the motor car industry) we have still to discover whether there may not be a saturation point. The capacity and incidental hazards of the country-wide "installment buying" have not yet been tested. As for easy money, such year-end indications as the Reserve Bank rates, the rate on Treasury short-time notes and the 6 per cent for Stock Exchange demand loans (over the year end) suggest that at least the money markets' general trend may have altered.

Broadly speaking, the trend of Stock Exchange prices during January was downward, with several notable exceptions. These were not sufficiently numerous to affect the general averages, however. There does not seem to be any reason to accept this movement as presaging anything more serious than a technical reaction, following advances in many directions which had proceeded too far. This is the opinion of the *Industrial Digest*. As the *Commercial and Financial Chronicle* points out:

Fundamentally the country is prosperous and there are ample funds for all legitimate purposes. If any such thing (as a long-continued downfall) shall come in the future it will be because of definite causes and not because of the mere advance in prices.

None of the accepted authorities, however, seems willing to make definite predictions for more than the first half of the current year. It appears certain that the very momentum of industry which has been built up during past months will carry things forward at a satisfactory rate during the coming spring and early summer. What will happen beyond that point is apparently a matter for mere conjecture, although very definite occurrences would have to manifest themselves in order to make serious inroads into the nation's industrial health this year.

Metal, Coal and Material Prices

Metals—New York	Feb. 9, 1926
Copper, electrolytic, cents per lb	14.275
Copper, wire base, cents per lb	16.00
Lead, cents per lb	9.20
Zinc, cents per lb	8.25
Tin, Straits, cents per lb	63.375
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.875
Somerset mine run, Boston, net tons	2.175
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.575
Central, Ill., screenings, Chicago, net tons	1.125
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$7.00
Weatherproof wire base, N.Y., cents per lb.	17.75
Cement, Chicago, net prices, without bags	2.10
Linseed oil (5-bbl. lots), N.Y., cents per lb.	11.30
White lead in oil (100-lb. keg), N. Y., cents per lb	15.50
Turpentine (bbl. lots), N. Y., per gal	$1.02

Babbitt Metal Consumption in December

Total apparent consumption of Babbitt metal in December, based on reports received from 27 firms, was announced by the Department of Commerce to be 5,726,703 lb. as compared with 4,954,683 in November. This consumption is calculated from sales by manufacturers and consumption by those firms (among them several important railroad systems) who consume their own production. In the accompanying table the sales of Babbitt metal are shown separately from the consumption in the producing plants:

1925	Total Apparent Consumption, Lb.	Sales, (By Manufacturers) Lb.	Consumption, (By Producers) Lb.
Jan.	5,683,183	4,620,815	1,062,368
Feb.	5,164,619	4,103,340	1,061,279
March	5,644,288	4,395,901	1,248,387
April	5,126,416	3,928,136	1,198,280
May	5,081,668	4,189,558	892,110
June	5,074,966	4,085,125	989,841
July	5,184,196	3,694,386	1,489,810
Aug.	5,441,823	4,068,706	1,373,117
Sept.	4,621,033	3,579,780	1,041,253
Oct.	5,550,247	4,169,870	1,380,377
Nov.	4,954,683	3,534,026	1,420,657
Dec.	5,726,703	4,758,057	968,646
Total	63,253,825	49,127,700	14,126,125

$9,101,909 Sales by Brill in 1925—Business Holds Up Well

For the year 1925 the combined output of the four plants of the J. G. Brill Company amounted in sales value to $9,101,909.

The combined output for each of the past seven years follows:

1919	$14,210,622
1920	17,537,293
1921	7,647,898
1922	10,177,582
1923	18,167,486
1924	8,721,726
1925	9,101,909

After deducting $560,938 from earnings for all cost of operations, including maintenance and repairs and depreciation, and after setting aside $82,791 out of earnings reserve for federal income taxes, not yet due, there was a net profit of $571,269 for the year.

The amount of work on hand on Feb. 1, 1926, was approximately $4,500,000 compared with $4,521,000 at this time last year.

In his report covering the year, presented to the stockholders at the annual meeting on Feb. 10, Samuel M. Curwen, president of the company, said that during the past year the company continued the active development of various sizes of gasoline and gas-electric self-propelled cars for steam railroads. The development cost of this new product during the year ended Dec. 31, 1925, was approximately $350,000, all of which has been charged against the profits for the year. This new branch

Digitized by Google

of the company's business is increasing. More than fifty-five steam railroads have these cars in operation or on order.

Mr. Curwen on Jan. 8 mailed a letter to all of the stockholders of the company outlining the plan and proposal for the reorganization of the company. On Jan. 13 a sufficient amount of stock had been deposited to make the plan operative and, accordingly, the Brill Corporation has been incorporated under the laws of Delaware.

At a meeting of the board of directors of the J. G. Brill Company held on Jan. 29, W. H. Woodin, president of the American Car & Foundry Company, was elected a director of the J. G. Brill Company to fill the unexpired term of W. H. Heulings, Jr., deceased.

At the meeting of the company on Feb. 10, W. M. Hagar, William Clarke Mason and C. S. Sale were elected directors to serve for three years and W. C. Dickerman was elected a director to serve for one year.

The consolidated profit and loss and earned surplus accounts of the J. G. Brill Company for the year 1925 follows:

Total net sales billed		$9,101,909
Cost of sales, including operating, selling, administration and general expenses, and depreciation for the year, less miscellaneous income		8,447,849
Operating profit		$654,060
Less estimated federal and state income taxes for 1925		82,791
Net profit to earned surplus		$571,269
Earned surplus at Dec. 31, 1924		$4,905,308
Add adjustments (credit)		1,200
		$4,906,509
Add profits as above		571,269
		$5,477,778
Less dividends paid:		
Preferred	$320,600.00	
Common	240,510.00	561,110
Earned surplus at Dec. 31, 1925		$4,916,668

Fifty New Cars for P.R.T.

Arrangements have been made by the Philadelphia Rapid Transit Company for the purchase of 50 new street cars from the J. G. Brill Company, Philadelphia. Delivery of this equipment will begin in April and end early in June. The cost of the cars will be approximately $650,000. They are to be of the single-end, center-exit type, many of which are now in service on P.R.T. lines. These cars, together with the 135 buses which have just been ordered by the company, will help to meet the transportation demand which the Sesqui-Centennial Exposition will place upon the transit system.

$687,560 Expenditures in Minneapolis

Expenditures by the Minneapolis Street Railway, Minneapolis, Minn., totaling $687,560 in 1926 as recommended by the street railway and bus committee of the City Council and now approved by the Aldermen means that the company will have to finance the difference between that amount and the budget, which was $568,000 to be taken from earnings. Expenditures will be: For the bus lines, power and mechanical improvements, $267,000; nine re-rail and paving projects, $309,500; special work, $63,000; bridge work, including some paving, $11,000; miscellaneous, $20,000.

As soon as permission has been granted by the Railroad and Warehouse Commission the company will install crosstown bus lines on Lowry Avenue North and 38th Street South and will extend the Bryn Mawr trolley line. Only one long new line is to be built, or extension of the tracks on 42d Street. One of the large paving contracts will be on Nicollet Avenue.

Rolling Stock

Dallas Railway, Dallas, Tex., if the Council approves the suggestion of the city's supervisor of utilities with respect to fares, will put through a program calling for the expenditure of about $1,000,000, an important item of which will be an appropriation for the purchase of 30 Peter Witt cars.

Pennsylvania Railroad System is building eight all-steel multiple-unit cars for suburban service on its various lines. The cars are under construction at the company's Altoona works.

Seattle, Wash.—The City Council recently passed unanimously an ordinance providing for the purchase of fourteen buses, ten to be used in the North End and the others in relief work on lines already established. The ordinance authorizes the issuance of $100,000 in railway department warrants to pay for the new buses.

Track and Line

Trenton & Mercer County Traction Corporation, Trenton, N. J., will install double-track corners at Princeton and Paul Avenues and Princeton and East Paul Avenues.

Northern Ohio Traction & Light Company, Akron, Ohio, did a considerable amount of track construction work during 1925. Right of way was secured from the Wheeling & Lake Erie Railroad for approximately 5 miles and new track was constructed. In Ravenna approximately 1,000 ft. of open track was replaced with heavy T-rail. In Barberton the single track on High Street for a distance of approximately 5,200 ft. has been replaced with double track. In New Philadelphia it was necessary, due to city repaving, to renew approximately 3,000 ft. of single track. In addition to much new construction the company had a very extensive maintenance program. In Bedford repairs were made to the paving on Broadway and approximately 35,000 ties were renewed. Worn-out rails on various curves were renewed. In Akron and Canton especially considerable trackwork was accomplished.

Los Angeles Railway, Los Angeles, Cal., has started the construction of a car track through the North Broadway tunnel. The job was made necessary by the construction of the city hall and civic center in the North Spring Street district. The Broadway tunnel job was authorized recently by the city. It will cost $70,000.

Trade Notes

Griscom-Russell Company, New York, N. Y., announces the removal of its general offices from 90 West Street, New York, N. Y., to the new Murray Hill Building, 285 Madison Avenue.

Universal Metal Box & Products Company, Inc., Newark, N. J., manufacturer of externally operated switches, safety switches, metal cut-out boxes, fuse boxes, electric signs, stair tread lights, etc., has announced the appointment of the Fred Rowell Company, Inc., New York City, as its sales agent in the metropolitan district, including northern New Jersey.

Timken Roller Bearing Company has promoted R. C. Brower to the position of assistant to H. J. Porter, vice-president in charge of sales. Mr. Brower became associated with the Timken Company in 1916, as district manager of the Bearings Service Company, with offices in Detroit. At the dissolution of this company, in 1922, the Timken Roller Bearing Service & Sales Company was organized. He then went to Canton, the headquarters of the new company, as assistant general manager. This position he held until his present promotion. The present offices will be maintained at Canton.

G. L. Hulben has been added to the sales force of the Chicago branch of the Ludlum Steel Company, Watervliet, N. Y. For years Mr. Hulben has been connected with the Chicago sales division of a large tool steel manufacturer.

Southern Wheel Company, Pittsburgh, Pa., has opened a new office in Washington, D. C., at 818-819 Munsey Building. This office will be in charge of F. C. Watkins, special representative, who has been moved from Atlanta, Ga. The Atlanta office, at 1413 Candler Building, will be in charge of C. C. Cox.

Advertising Literature

Westinghouse Electric & Manufacturing Company has issued a 112-page publication, describing the proper switching equipment for alternating-current power stations. This special publication, 1541-C, deals with the fundamentals to be borne in mind when laying out a switchboard, and describes in detail the various types of switching equipment. It is illustrated with diagrams and halftones.

Sullivan Machinery Company, Chicago, Ill., has issued bulletin 81-I, featuring two new types of Sullivan concrete breakers. These are DW-221, a 75-lb. heavy-duty buster, and DP-221, a 48-lb. light buster for concrete breaking in street openings, demolition work of many kinds, etc. The term "buster" has just been registered as a trademark to designate this type of tool. "Speed Up with Air" is the title of another bulletin of sixteen pages, which illustrates Sullivan portable air compressors and shows many applications of Sullivan rotators, hammer drills, clay spaders, concrete breakers, portable hoists, etc. Tables of capacities and specifications are given.

Car Floors Can Be Given Increased Attention

FLOOR coverings of some rubber material or linoleum are being tried by many railways to replace the ordinary wooden floor with raised slats. This improves the appearance considerably and has an added advantage in reducing noise. Some difficulties have been experienced from uneven wear and a tendency to warp and buckle. Costs of keeping such floors in good repair are not available, but definite figures as to the cost of maintaining them are looked forward to with interest.

Trapdoors are considered an eyesore by most transportation departments but a necessity by the mechanical departments. Since they are required for proper inspection of motors they should be given particular attention so as to harmonize with the remaining floor area and not create the impression on passengers that they are something to be avoided.

Whatever type of floor is used it requires careful design to prevent the openings for trapdoors from gradually showing worn and soiled edges. Of course the openings are included for a specific purpose, and if they are not used they are of no value. But care in the selection of the floor covering and care in maintaining it will do much to prevent unsightliness.

Removal of Obstructions from Car Interior Should Give More Pleasing Impression

VARIOUS arrangements of stanchions and barriers have been used on car platforms for directing passenger movement. By separating incoming and outgoing passengers less confusion and more satisfactory operation usually result. In general, however, such barriers are looked upon with disfavor by passengers. People resent the impression of being penned up or herded. Several railways have improved conditions by a removal of some of the barriers and a rearrangement of the remaining ones. The change can be made in a manner that will remove the source of annoyance and still retain most of the good features of the plan.

The problem of keeping stanchions and barriers in good condition is a difficult one, but nevertheless it should receive more attention. Porcelain enameling appears to be satisfactory only for straight lengths of pipe. It also is likely to chip, and when it does so the exposed iron is unsightly. Aluminum and brass oxidize and become unsightly, galvanizing is unsatisfactory and iron pipes with enamel paint leave much to be desired. Light colors, while they have a most pleasing appearance when kept fresh, require constant cleaning. Dark colors are easier to maintain but do not create the pleasing impression that is so desirable when a passenger boards the car. Altogether designs of stanchions and barriers leave much room for improvement.

The arrangement of railings and hand straps inside the car is another thing that may create an unfavorable impression on the passengers and give a ragged, unfinished appearance to the car that is entirely out of harmony with the modern trend toward light weight and pleasing design. A judicious arrangement of such equipment will increase the range of vision and give a more satisfactory appearance.

High-Pressure Salesmanship Needed in the Electric Railway Field

ONLY a few years ago efforts on the part of electric railway executives toward the merchandising of transportation were practically nil. The street car afforded the only convenient means of transportation for the majority of urban and interurban passengers. The electric car had no important competitor and the passenger no choice in his method of travel, as it was necessary for him to utilize such facilities as existed. Knowledge that the public was compelled to use electric cars became so firmly imbedded in the rank and file of street railway employees that it has been most difficult to change this attitude. Advent of the private automobile and later the luxurious bus created an entirely new situation. The riding public has in many cases been in a position to choose its transportation medium, and naturally its choice has been with the more attractive and pleasing vehicle. Passengers are no longer satisfied with any antiquated, noisy, hard-riding vehicle on wheels, but demand speed, comfort and cleanliness. It is only natural that the private automobile should be used extensively under unfavorable conditions.

Recognition of the existence of serious competition has served to awaken the industry from the self-satisfied attitude which has been quite prevalent. It has been said that next in importance to doing the right thing is advertising that you have done the right thing. Earnest effort to improve railway service, it is believed, exists in every street railway organization, but this effort will not produce the desired results if achievements are not effectively placed before our customers. Railways have an article to sell; the sales organization exists. It must, however, be organized and it must be made to function.

High-powered salesmanship under able leadership is required in the transportation field to the same degree that it is required in any manufacturing field. No manufacturing company, no matter how efficient the

This is the issue in February that is devoted essentially to maintenance subjects

Digitized by Google

productive organization might be, would expand and grow without a highly-trained sales department. The railways have a product to sell which is in natural demand, and this demand can be capitalized only through effective salesmanship. Every employee who comes in contact with the public should be an enthusiastic member of this organized sales force. When this has been accomplished, the private automobile will be used to a lesser extent, particularly in crowded cities, street car riding will increase and net revenues will show decided improvement.

Substitution of Car Names for Numbers Presents a Problem for Master Mechanics

SEVERAL electric railways have recently adopted the practice of bestowing names on their passenger cars in place of the old-fashioned numerical designations. This change deserves careful consideration from two angles. Will it have a beneficial effect in popularizing the transportation service? Will it add to the problems of the master mechanic by complicating the classification of rolling stock?

From the transportation standpoint results have shown that there is a real advantage in using names on cars rather than numbers, according to several railway managers who have adopted the practice. Perhaps it has a tendency to personalize the service by giving each vehicle a definite individuality. Use of local names appeals to local pride. The mere novelty of the scheme has a certain appeal. In any event the public seems to take kindly to the use of car names.

From the standpoint of the master mechanic the change undoubtedly involves some difficulties. In this connection it is interesting to consider the practices of the Erie Railroad and the Pullman Company. For a number of years past it has been the custom of the Erie to place the name of the engineer on the cab of one locomotive of each division instead of the number. This special recognition is believed to improve the morale of the engine man. The locomotive, however, retains its original number and is known by this number in all the records of the mechanical department.

Identification of the rolling stock of the Pullman Company, which is known only by name, is a more difficult problem. Every car has a plan number in addition to the name. For example, the latest twelve-section drawing room sleeping cars are known as plan 3410. A descriptive list is printed periodically and distributed to the mechanical department, showing the names, plan numbers and types of brakes, couplers, trucks, electric fixtures, water and heating systems with which the cars are equipped. Information is also given as to the exterior design of the cars. In addition, all of the different terminals are furnished with very complete catalogs of parts, illustrated with photographs of each part. This facilitates the identification of the part and reduces the liability of wrong replacement parts being furnished.

Since the number of electric railway cars identified by names is likely to be comparatively small on any one property, the method used by the Erie seems to be the easier solution of the master mechanic's problem. It will be well worth while, however, to give due consideration to this question at the very beginning, because the difficulty of keeping track of the kind of parts required will increase rapidly as the number of names increases.

The Manufacture of Parts by Railways Is Often Poor Economy

HOW often the question has been asked as to whether or not operating companies have exceeded their proper field of effort in undertaking a large-scale manufacture of parts! Walking into the erstwhile maintenance shops of some railways one is struck with the feeling that he has by accident happened upon the plant of an equipment manufacturer. Shiny new parts are to be seen in every direction.

But—and of course there must be a but—it is well to consider just where this situation is leading. To say that circumstances never justify the manufacture of parts by operating companies would be absurd. But it would be equally foolish to cast discretion to the four winds and to enter upon a period of stubborn competition with the established manufacturers. Competition in itself, if limited to proper bounds, stimulates a healthy condition in any industry. However, care must be observed in steering clear of what may at first glance appear to be a means of effecting real savings in manufacturing costs, but which may later manifest itself in its true colors as a costly anomaly.

Were it possible for individual companies to take upon themselves the task of manufacturing all of the widely diversified products needed in their operations and to carry out this task quite as cheaply and as effectively as the regular manufacturers are able to do, then would the latter firms be hard put to it to defend their economic prerogatives. But under the existing order of things this is manifestly impossible. Each year the manufacturers spend vast sums of money in research and development programs. Since the cost of such work would be far beyond the reach of individual companies, the immense value of all this engineering endeavor would be lost to the industry.

Shop superintendents and purchasing agents of the various companies are frequently deluding themselves concerning the true economies to be effected by undertaking the production of new equipment and replacement parts. It is simply a matter of accurate bookkeeping. Instead of fairly apportioning the item of shop overhead between maintenance and new parts manufacture, they have placed the entire burden upon the former. This has resulted in an absurdly small apparent cost for manufactured parts, as shown on the books.

Right Materials Essential for Armature Repairs

SO MUCH depends on the perfect functioning of a railway motor armature that it is essential to keep it in as good operating condition as possible. The modern armature is a rugged piece of apparatus, even though the wires, commutator bars and insulation are relatively delicate. Motor manufacturers go to great pains to build armatures correctly. They have done a great deal of development work covering a long period of years, and have profited greatly by study of the service records of many armatures.

Since even the best of armatures will fail in time, it is necessary to repair them so that they will once more do their work as at first. In practice, however, many railways do not put them back into their original condition. Frequently other materials are employed and

Digitized by Google

other methods of winding are resorted to than those developed by the manufacturer. While some of these substitute practices are excellent, in general it may be stated that they cannot produce results better than the original.

An article by Jesse M. Zimmerman in this issue, which gives in detail the practice of one manufacturer, is well worth the attention of the master mechanic and armature foreman. While the practice of other manufacturers may differ somewhat in detail the general principles are the same. Close adherence to such methods should result in far less failures than are common on some roads.

Hope Springs Eternal in New York City

MAYOR WALKER of New York hopes to negotiate a city-wide bus franchise with a 5-cent fare clause, it is said. Such optimism is truly remarkable. Few of the forty-odd applicants for franchises have offered to carry passengers for 5 cents, and it may be doubted if those who have offered could actually carry out any such plan. Only a short time has elapsed since the Tompkins Bus Corporation on Staten Island found that it could not operate profitably on a 5-cent fare and increased its rate to 10 cents. Operating conditions on Manhattan Island are more difficult than on Staten Island. Due to the prevailing traffic congestion the speed would necessarily be slow and the cost of operation correspondingly high. In recent years many trucking concerns in New York have substituted horse-drawn vehicles for motor trucks to cut down the expense of time wasted in traffic jams.

It is said that one of the chief advantages of a city-wide franchise would be that the operator would take the lean lines along with the fat ones. At a 5-cent fare, however, it's a safe guess that most of the lines would be lean.

A Good Name Cannot Be Measured in Dollars

PUBLIC relations men have for years been preaching the value of square dealing with the officials and residents in a community served. They point out that consistent adoption of this policy has a lasting value. But it is not so often that they have the opportunity to point to tangible results that show just how much influence such a policy has on a utility.

Seldom has there been an expression of opinion so favorable to a utility and its management as that given J. N. Shannahan and his associates on the occasion of their sale of the Newport News & Hampton Railway, Gas & Electric Company. The local newspapers have gone to great length to express editorially the sentiment of the people in the community. "The company has never attempted to dicker with the municipal bodies of this section," says the Newport News *Times-Herald.* "To the contrary, it has treated those bodies with consideration, has kept no secrets from them, has laid its case in frankness and confidence before them whenever any emergency in its affairs has arisen. . . . In short, the company has made itself part and parcel of the community and has heartily co-operated with the people in all movements and enterprises for the common good. It has been a good and helpful partner and has rendered service in many directions outside of its immediate sphere of activities."

While praising the work of the company, the same newspaper points out particularly Mr. Shannahan's leading part in it. The Newsport News *Press* goes even farther, saying, "It is not in disparagement of the other officers to say that this is due primarily to the integrity and the fidelity of President Shannahan. He is an upright man and a loyal citizen. He has dealt with the community not in selfishness but in the spirit of fairness and generosity."

Such praise is praise indeed. But the value of this mode of conduct is not overlooked by the *Press.* "His indorsement of any enterprise is sufficient to inspire the confidence of investors." That is the acid test. The results that have been obtained by Mr. Shannahan show that his methods should be studied by other operators.

Maintaining Axle Bearings of Paramount Importance

HEAT generators is the name given to bearings by one workman. This is true. The object of the manufacturer is to design the bearing to generate as little heat as possible, and that of the maintenance man to keep it running on a low production basis—as to its byproduct, heat.

Attention is again called to the information on bearing practice developed at the January meeting of the Metropolitan Section of the American Electric Railway Association. The papers, which were abstracted in this paper, issue of Jan. 16, showed that more attention should be given to the subject of bearing wear and replacement. The range in wear over a given period by different roads under quite similar conditions shows that much can be done by the average road to get less wear.

Oiling is also important. A sufficient flow to keep the bearings lubricated is an essential that never should be overlooked. Too many operators save oil at the expense of bearing metal, with the result of poor performance. The work of packing bearings is so important that good men should always be assigned to it and they should be given the best of instruction.

Perhaps the bearings most difficult to maintain are those supporting the driving motors on the car axles. Necessarily these must be split to allow easy removal of the motors. They receive a maximum of thrust from side to side as the axles are moved, due to track imperfections or curves and special work, as well as due to the shifting of the motor itself from side to side. The weight is also unsprung.

An article published in this issue shows the bad effects of excess bearing clearance on the meshing of gears. Even a slight increase in the distance between centers throws the gears out of alignment and causes excessive wear. When the bearings are worn so that the centers are ¼ in. too great, as happens frequently, conditions are far more serious.

Despite all these difficulties and opportunities for undue wear it is these bearings that determine the life of gears and pinions and the incumbent noise arising from their operation if gear centers become spread due to wear in the bearings. Care should be taken of all bearings, their lubrication and maintenance as well, but particular care should be given to the axle bearings if low gear and pinion cost is desired.

Rail Bond Maintenance

Several Types of Bonds Have Been Tried in the Electrified Sections of the Chicago, Milwaukee & St. Paul Railway—The Maintenance Methods and Organization Used Are Described

By Charles G. Lovell

Assistant Engineer, Electrification Department, Chicago, Milwaukee & St. Paul Railway, Seattle, Wash.

WHEN plans for the electrification of the mountain divisions of the Chicago, Milwaukee & St. Paul Railway were prepared, it was decided to use a bond with an expanded terminal, expansion being secured by means of a tapered pin driven through the hollow terminal of the bond. This type of bond had been in use on a number of important roads and at that time was probably the preferred form of rail bond for steam railroad electrification. The consideration which was felt particularly important in selecting this type of bond was that it provided a bond which the section crews could install readily, as most of the tools required would already be normally in their possession.

All bonds were single conductor, 250,000 circ.mil capacity, made up of 61 wires. The terminals were $\frac{7}{8}$ in. in diameter and $1\frac{1}{8}$ in. long under the head. The hole through the terminal was 0.406 in. and was expanded with a $\frac{1}{2}$-in. diameter steel pin. The bonds were installed in rails of 85 and 90 lb. standard sections on the main line, and on miscellaneous rails from 56 lb. to 85 lb. on the side tracks. In general, 100 per cent, Bonzano, angle and Weber joints are found on the 90-lb. rail; continuous and angle joints on the 85-lb. rail; and angle joints on the smaller rails.

Three forms of bonds were used, depending on the nature of the rail and joints. Where space under the splice bar was sufficient, and conditions permitted the removal of the bar, a concealed bond was used. This bond was provided with a crimp between the middle bolts to provide for expansion and flexibility. Where there was sufficient space under the splice bar, but it was undesirable to remove the bar, a bond with one welded and one detached terminal was used. One joint bolt was removed to allow the passage of the crimp, and the bond was pushed into place under the bar. The loose terminal was then soldered on and applied to the rail in the usual manner. On the remaining rails exposed bonds were used enough longer than the splice bars to provide the necessary clearance and to permit stapling the bonds to the ties.

Double Bonding Used for Large Currents

Exposed bonds were installed on the inside face of the rail, as this position appeared to result in less damage to bonds in cases of derailment. Where the contemplated current per rail was more than the carrying capacity of one bond of the standard size, double bonding (i.e., two bonds per joint) was used. In exposed bonding, one bond was identical with those used in single bonding and the second was enough longer to extend beyond the terminals of the first. When concealed and semi-concealed bonds were used, the two bonds were identical but on opposite sides of the rail. Both rails of the main line were bonded. On side tracks one rail only was bonded, but provision was always made for two connections of such tracks to the return circuit.

The concealed and semi-concealed bonds had extended lengths of approximately 20 in. and 38 in., respectively. The single exposed bond was, in general, 37 in. in length, and the second bond in double bonding was 42 in. On account of some of the angle bars on the lighter rails being six-bolt bars, special bonds of longer lengths were occasionally required

Since the contact resistance of this type of bond depends on the conditions of the contact surfaces and on the pressure obtained between surfaces, the care with which the bonds were applied was very important. Carefully prepared instructions were furnished to both the installation forces and to the operating forces that were required to take care of bond replacements. It was required that the terminals be cleaned with fine emery cloth and the hole in the rail wiped out with a piece of clean, dry cheesecloth immediately before the bond was applied. No lubricant was allowed on the drill bits. To make certain that a good fit was obtained, a plug gage was provided and all holes gaged. If holes were accidentally drilled oversize, the bonds were installed with an oversize pin. However, great care was used in regrinding the bits so as to guarantee holes of proper diameter. Careful supervision of all parts of the installation work was found very desirable.

Some Special Equipment Used for Drilling

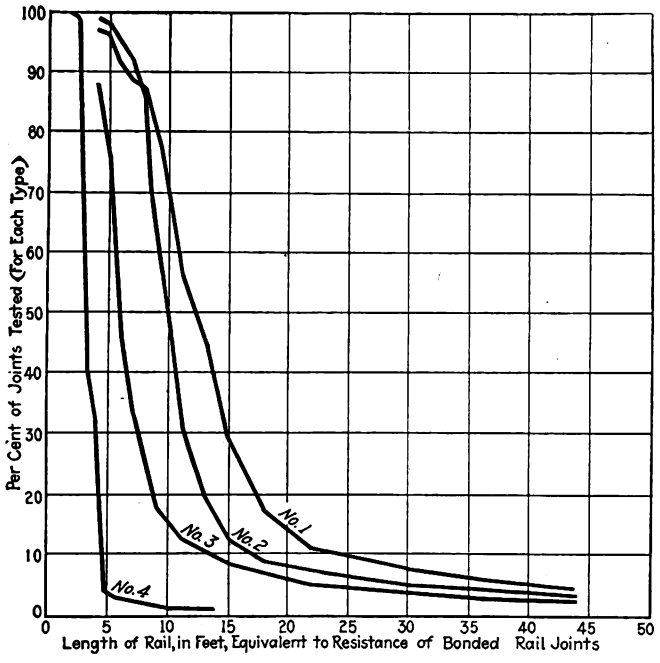
For drilling the holes for the application of the bonds, hand-operated drills were used throughout on the first two divisions electrified. On the Coast division, however, a very large proportion of the work was drilled by air-driven drills, the power being supplied from an Ingersoll-Rand air compressor. A special drill carriage was made up to hold, guide, and feed an air drill. The use of this equipment accomplished a very decided saving in the cost of application of the bonds and was used with good success. It was only when the necessity for rushing the work required establishing additional bonding crews and compressors were not available that hand drills were used on this division. The saving secured by the use of the compressor is reflected in the cost of applying bonds by the two methods, the cost per bond, using hand drills, being about 49 cents as compared with a cost of about 31 cents for bonds applied where the holes were drilled with air. These are direct labor costs only (including foreman and all men in crew) with a laborer's rate of 53 cents. Adding other labor charges such as repairing equipment, moving, etc., the above figures should be increased by 13 cents, and to this must be added tools, equipment, camps, transportation, etc.

When one compressor was being used the crew usually consisted of one foreman, two drillers, two gas-

Digitized by Google

engine men, eleven helpers, and one camp helper. The cost when applying concealed bonds was about double the above.

After the initial installation was completed by the electrification department, the roadway forces and the signal department were made jointly responsible for the maintenance of the bonds. Section crews were to replace bonds where rails were renewed, but the signal maintainer was to be notified in each case so that he could inspect the work. Full instructions in regard to installing the bonds were incorporated in the special instructions which were issued covering the electrical operation. These instructions were placed in the hands of all section foremen, as well as all other employees having to do with electrical operation. The instructions covering the installation of bonds were substantially full specifications for maintenance and renewals.



Resistance of Bonded Rail Joints—Missoula Division

Special tests were made to determine electrical resistance on 2,725 rail joints, as follows:

Curve No.	Type of Bonds	No. Joints	Bonds per Joint	Weight of Rail
1	Pin type	1,143	1	85 lb.
2	Pin type	515	1	90 lb.
3	Pin type	809	2	90 lb.
4	Welded	258	1	85 and 90 lb.

All measurements made between points 30 in. apart.

Curves show for various rail lengths, percentage of rail joints with resistance equal to, or greater than, such lengths.

Where new rail was laid or other causes required the bonds being replaced, new bonds, drawn from the storeroom, were used in every case, the bonds removed being sent to the state department for re-forming. At first these used bonds were merely inspected and strands straightened, and when again replaced in rails, special oversize pins were used. The amount of oversize of these pins was considerably more than that of the pins classed as oversize and used, where necessary, in the application of the new bonds. A method was later developed whereby the terminals of the second-hand bonds were reshaped so as to bring the tubular portion of the bond back to its original length, and inside and outside diameters. These bonds were then handled in the same manner as new bonds. A very appreciable saving in the cost of replacing bonds was secured by this practice of recovering used bonds.

This method of repairing the bonds overcame several serious objections to the use of second-hand bonds. Previously, considerable confusion had arisen through the necessity of using various sizes of pins, extra oversized pins being used in new bonds or the small oversized pins in used bonds. Even after being applied with the proper oversize pins, poor contact was secured in many cases, as the original shape of the terminal had been changed by the process of application and removal, although a tool had been especially designed for removing the terminals. It is, of course, very costly to scrap the bond when replacement is necessary. To scrap a 37-in. bond and apply a new one involved a net expenditure for material of about $1.15, whereas the cost of repairing was only 70 cents.

In addition to the inspection which was expected from track forces and signal maintainers, a bond repair crew goes over all the trackage, inspects the bonds and replaces those found defective. The latter are usually bonds which had been installed by the section crews in connection with rail replacements. The personnel of these crews is subject to rather frequent replacement and it is difficult to make even the older men appreciate that more than a mere tight connection between rail and bond is necessary. Our experience with the installation of bonds by section crews is, therefore, rather unsatisfactory.

Meanwhile, the gas weld bond had been developed to such an extent in interurban and similar service that we decided to determine its suitability for our own trunk-line conditions. Its attractive features were its relative cheapness, more reliable and permanent bond and rail contact, assuming proper installation, and greater ease of inspection.

Conditions Met by Gas-Weld Bond

Our problem was, mainly, to determine: First, whether the welding would have any deleterious effect on the steel of the rail; second, whether bond maintenance and replacements could be handled without ultimate uneconomical increase in existing maintenance forces, and third, whether the bond itself would stand up under the actual service conditions.

In order to determine the effect on the steel of welding the bond to the rail, the railway company had microscopical and chemical examinations of the steel made by a competent testing laboratory after a bond had been applied. The observations indicated that no serious injury was done to the rail as a whole. The experience of other companies was also studied, and the conclusion reached was that the welded bond could be tried safely.

In changing to this type of bond it was not possible to have the application made by the section forces and, therefore, it was arranged that the signal maintainers should be supplied with welding equipment and do the welding work. This arrangement has worked out very satisfactorily. The men have learned the operation of welding quickly and they are supplied with small tanks of welding gas, which may be carried easily on the gas cars commonly used by signal maintainers. The signal department is thus placed in charge of all bonding and bond maintenance, whether or not the bonds are on rails involving signal circuits. This removes an undesirable condition previously existing wherein the signal maintenance forces were responsible for the condition of the bonds without having direct supervision over the forces which applied the bonds. In addition to the bond maintenance work done by the signal maintainers who have

Digitized by Google

fixed headquarters, there are the bond testing crews previously mentioned that move from place to place and whose duty it is to make a routine test of all bonded joints and replace defective bonds. These crews are used also wherever there is extensive rail relaying work and the application of a number of bonds is required.

Saving Results from Use of Gas-Weld Bonds

The cost of applying the bonds varies, of course, with the conditions under which they are applied. Taking, however, for the sake of comparison, a condition where a number of bonds are to be applied in rail re-laying work it is found that the cost of the gas-weld bond is for the bond, gas, etc., about 70 cents, and for labor 38 cents, or $1.08 per bond. The cost of the 37-in. pin-type bond would be for materials $1.50 and for labor $0.45, or a total of $1.95. Thus a saving of about 87 cents per bond is realized. This saving is increased in territories where double bonding is used with the long bond, since a single bond only is required when the shorter bonds are used. This fact was determined by calculations of the relative heat conducting capacity of two types of installations, the favorable results of which were afterward confirmed by actual trial.

The welded bond, when properly applied, has a low contact resistance and this resistance does not increase with age. A defective application is usually more readily detected than with a pin-type bond, although we have had some cases where the steel sleeve of the bond was welded to the rail, but the strand was not, so that, although the bond appeared all right, the resistance was high, since the sleeve is not, in manufacture, welded to the strands. Such cases of defective welding appear to be very few and will decrease in number as the welders become more proficient.

Application of gas-weld bonds was started in 1921, since which year practically all new rail laid has been gas-weld bonded and a large part of the maintenance work, particularly in the past two years, has been done with this bond. A No. 0000 bond, 7 in. long, with pressed steel terminals is used, formed U-shape and welded to the ball of the rail.

Tests Show Results Accomplished

The experience to date with it has been very favorable, and unless there are objections not yet apparent the use of this bond will be continued. It has not been in use long enough yet to determine fully to what extent breakage of strands will be experienced or to be sure what the ultimate effect of welding will be on the rails, but these points were taken into consideration before the use of the welding process was begun, and it is not expected that sufficient trouble will be experienced from these causes to overcome the advantages of this type of bond.

In conclusion, it may be interesting to give the results of a special investigation which was made in 1924 of the bonding conditions on a considerable portion of our older electrified line. Over 3,000 bonds were tested at points so selected as to indicate the average condition of the bonds. Measurements were made by using two voltmeters, one indicating the drop in the bond and the other the drop in a fixed length of rail. The result of this study is shown on the accompanying curve, which shows the percentage of bonds with conductance less than the conductance of the stated rail lengths. The original pin bond installation, much of which still exists, was made in 1914 and 1915. The gas-weld bonds have, as already stated, all been installed within recent years.

Hot Brine Clears Car Tracks Quickly

Motorists Unconsciously Aid Snow Removal Along Lines of the Cumberland Traction Company—Tracks Cleared in One-Third Time Otherwise Needed

COLD dry snow to a depth of 14 in. covered the tracks of the Cumberland Traction Company, Bridgeton, N. J., when the blizzard of Feb. 11 ended. One plow and one sweeper, the snow-fighting equipment of this railway, had been put in service soon after the storm began and they experienced no difficulty in getting through on the 10-mile interurban line to Millville. After returning to Bridgeton the local lines were cleared. The high wind, however, drifted the dry snow badly and the rails were soon covered again to a considerable depth. The path cleared by the sweeper was immediately chosen by the local motorists when they began to operate the following morning. A slight rise in temperature softened the snow and it was soon packed down hard on the tracks to a depth of about 4 in. The railway equipment proved powerless to remove this coating from the rails.

Under similar circumstances the attitude of the former management of this company had been "the Lord put it there, let the Lord take it away." The present manager of the road, Clayton W. McPherson, remarked, however, that while he had a great deal of faith in the Lord, he was not sure just when the ice would be taken away, so the company hired laborers with scrapers to try to remove it. One gang of twelve men took six hours to clear 3,900 ft. of track. Another gang of fifteen men at the Millville end of the line took nine hours to clear 4,800 ft. Salt was sprinkled both before and after cleaning.

Progress by this means was so slow that the manager decided that some more effective means must be employed. Motor trucks were borrowed from a local ice cream plant and filled with a boiling hot mixture of salt and water. This escaped onto the tracks through the vents provided to allow melted ice to run away. The first tank wagon was started late in the afternoon in the worst downtown section. Automobile traffic continued to follow the car tracks and churn up the salty mixture. In 30 minutes the steel rails were again visible. Soon the 14 miles of the company's route was open and the cars were running. It is believed by the management that at least another 24 hours would have been required to open the lines without the use of hot brine.

Previous to the application of the brine the men cleaning the track averaged about 31 ft. per man per hour. After this treatment had been applied it is conservatively estimated that progress was three times as fast. Altogether 23 loads of brine were used by three trucks. Each load consisted of approximately 400 gal. of water and 460 lb. of salt. The total cost of ice removal by this method was approximately $1,000.

Rewinding Railway Armatures

Descriptions, Functions and Location of Armature Rewinding Insulation, Core Insulation and Banding Material Will Help Repairman to Do a Better Job

By Jesse M. Zimmerman
Engineering Department, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

EACH piece of insulation used in rewinding armatures for railway motors has a definite function to perform and accurate location is important. Insufficient insulation at some points may result in short circuits or grounds, while too much may cause the coils to build high and make winding difficult. Information regarding the material used in winding the Westinghouse type 306 railway armature has been gathered and is given to help the repairman who rewinds this and similar type armatures.

Material used for rewinding is divided into three groups, (1) core insulation, (2) winding insulation and (3) banding material. When making minor repairs on an armature, it may be necessary to use only the banding material. In rewinding an armature sometimes it is unnecessary to use the core insulation, so that the rewinding insulation and banding material only are required.

In order to present the information so that the repairman can see its proper location in the winding a diagram and halftone are used as illustrations. The numbers for the parts in the illustrations will enable the reader to follow the description more intelligently.

Core Insulation

Item 1.—Ninety-six tan-treated* cloth caps, 0.010 in. thick cut in 8 sections from a circular piece, 12 in. inside diameter and 18½ in. outside diameter. Each section has four fingers cut 1½ in. deep from the center. These caps are placed against the end bell in three layers; each layer is four strips deep. They are held against the end bell by tan tape, Item 2, which is used to cover the coil supports. On high-voltage motors micarta molded strips are used to cover the coil supports and end bell.

Item 2.—Three rolls of tan-treated cloth tape, bias cut. This tape is used to cover the coil supports and holds the tan-treated cloth caps.

Winding Insulation

Item 3—Fifty-eight fishpaper U-pieces, 0.056 in. x 3½ in. x ⅝ in. grooves are provided in both ends of the slot in the armature core for fishpaper U-pieces. These U-pieces protect the ends of the coils where they leave the slot.

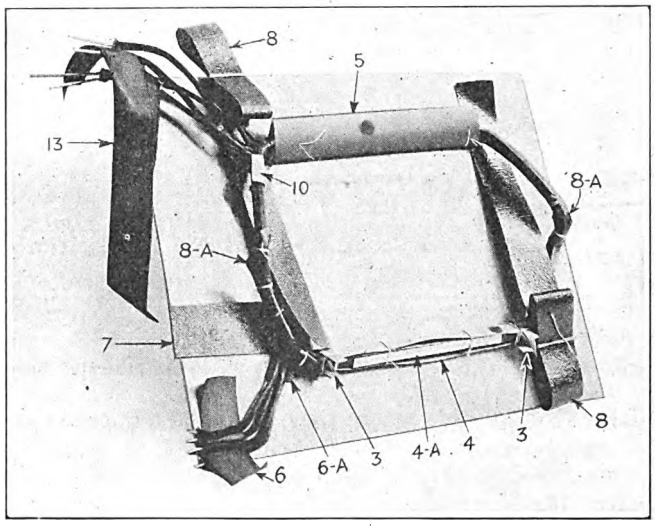
Item 4.—Twenty-nine fishpaper cells for bottom coil, 0.023 in. x 2 in. x 10 in. Separate cells are used for the coils in the bottom of the slot. This cell is placed over the coil and driven into the slot with the coil.

Item 4-A.—Twenty-nine fullerboard pieces between top and bottom of coils, 0.030 in. x ½ in. x 6 in. This strip separates the top and bottom coils in each slot.

*This is a trade name for tan-colored, oil-treated linen or other cloth.

Item 5.—Twenty-nine fishpaper cells for top coils, 0.023 in. x 4½ in. x 10 in. This cell is large enough so that it extends above the laminations. A separate cell is used for the top coil so that if the top coil has to be repaired it can be done without disturbing the insulation of the bottom coil. When the top coil is replaced a new cell is used.

Item 6.—One strip of treated surgical tape, 0.023 in. x 2 in. x 42 in. This tape is woven between the bottom leads back of the commutator neck. It keeps the leads separated at this point.



Materials Used to Insulate Armature Coils

Item 6-A.—Twenty-nine strips of treated oil duck, 0.035 in. x 1 in. x ¾ in. This strip is placed over No. 2 and 4 leads where they leave the front bottom corner of the coil. Leads Nos. 1 and 3 will lay on top of this strip. This separates the leads where they leave the coil, thus preventing the leads from shorting at this point because the leads form a double layer.

Item 7.—Twenty-nine strips of treated oil duck, tapered, 0.035 in. x 2 in. x 4½ in. short side, 6 in. long side. These strips are placed between the lower leads and the bottom half of the front diamond part of the adjacent coil. The tapered end is anchored and brought up between the bottom half of the two front diamond parts of adjacent coils. After the coils are laid and the bottom leads connected the ends of these strips are brought around the extreme end of the diamond and fastened with friction tape. This strip protects the bottom leads from the bottom of the adjacent coil besides separating the coils where they make the bend at this point.

Digitized by Google

Item 8.—Two strips of treated oil duck, 0.035 in. x 1¾ in. x 42 in. These strips are placed between the top and bottom halves of the diamond parts of the coil, for the front and rear of the armature. They serve to separate the top half of the diamond part of the coil where it crosses the bottom half of the diamond part of the lower coil, which is running in the opposite direction and is of a different potential.

Item 8-A.—Fifty-eight treated duck pieces, 0.035 in. x 2 in. x 3 in. These strips are placed over the drop loop of the diamond, both front and rear, where the top half crosses the bottom half of the preceding coil. It serves as a separator where the insulation is most apt to be damaged in winding.

Item 9.—This is a fiber wedge which fits over the coil in the armature slot.

Item 10.—Twenty-nine strips of fishpaper, 0.015 in. x 1½ in. x 1¼ in. These strips are bent to an L shape so that they will fit between the top halves of the front diamond parts of two adjacent coils. This strip insulates the top leads where they cross the adjacent coil.

Item 11.—Friction tape to hold Item 7 in place.

Item 12.—Tan-treated cloth tape used as a filler.

Item 13.—Four strips of surgical tape (not treated), 2 in. wide x 0.020 in. This strip of surgical braid is woven alternately between Nos. 2 and 4 leads of each coil, as these leads are connected first, after which it is then wound once over the top of these leads next to the commutator, then woven alternately between leads 1 and 3 of each coil. This separates adjacent leads at the top with two layers of surgical braid. This is essential because the cotton insulation is scraped from the leads when they are tinned. It must be wound tight so that it will keep the leads firm. Some types of motors have the leads taped with friction tape.

Banding Material

Item 14.—One-half pound of tan-treated cloth tape. This tape is used to cover the top leads. It must be wound tight so that it will hold the leads firmly, as vibration of the leads at this point may result in broken leads.

At this point of the winding the armature must be heated to 100 deg. C. and banded with temporary bands while it is hot, thus drawing the coils down firmly.

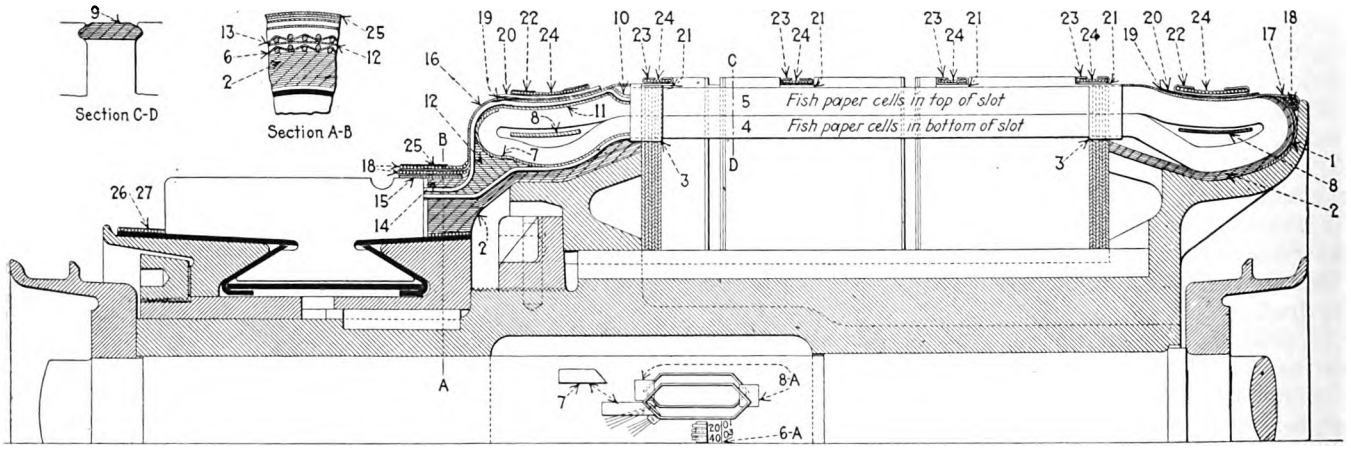
Item 15.—Seven strips of mica, 0.008 in. x 1 in. x 6 in. These strips are placed over the commutator neck to prevent the solder from flying out of the slots in case it melts. It is held in place by Items 16 and 18.

Item 16.—No. 49 drilling hood is placed over the mica strips which cover the commutator neck and is held in place by a layer of No. 12 thread, which is wound tight around the armature at this point and is painted with an air-drying varnish. It is then doubled back over the first layer of No. 12 machine thread. It is covered by a second layer, wound tight on the thread. This layer of thread should cover the drilling hood to the point where the leads bend up to go over the ends of the coil. The top lap of the coil is sewed.

Item 17.—One drilling hood, 0.017 in. x 9 in. x 48 in. The tan-treated caps (Item 1) are laid over against the ends of the coil and the one edge of the hood is firmly anchored by a tight woven band of No. 12 machine thread. The hood is doubled back over the coils.

Item 18.—Two hundred and fifty yards of No. 12 machine thread.

Item 19.—Two strips of fishpaper and mica, 0.012 in x 2 in. x 96 in. After the temporary band, which was used to draw the ends of the coils down, is removed, the drilling hood is drawn tighly over the coils. One strip of fishpaper and mica is placed around the hood.



Types of Material Used for Rewinding Armatures

Item 20.—Two layers of surgical tape, 0.020 in. x 2 in. x 4 in. A strip of surgical braid covers the fishpaper and mica strip. This braid is covered with a tight layer of No. 14 banding wire (Item 24), with twelve tin clips (Item 22) placed under the banding wire, the ends being bent over and soldered to the banding wire. The above outlined operations covering Items 19, 20, 22 and 24 are identical for banding over the front and rear coil support. The two outer core bands are used to anchor the ends of the front and rear drilling hood.

Item 21—Four strips of sheet tin, 0.012 in. x ⅞ in. x 48 in. These strips of sheet tin are placed over the coils in the banding slot on which to wrap the banding wire (Item 24).

Items 22 and 23.—Tin clips. These tin clips are placed under the bands, bent over and soldered to the wire to keep the banding wire intact.

Item 24.—Wire used for banding.

Item 25—Two layers of surgical braid wrapped tight and sewed in three places serve as a protection to the No. 12 machine thread (Item 18) against flashes.

Items 26 and 27.—Italian twine. One layer of four-ply Italian twine, saturated first with No. 3 and then No. 4 shellac and well ironed with a hot soldering iron after each application of shellac, makes an oil and moisture proof V-ring protection upon which a minimum amount of dust will adhere.

Excessive Gear Spacing Causes Trouble

Model Shows How Noise and Wear and Breakage of Teeth Follow Rapidly with Increases in Distance Between Centers of Gear and Pinion

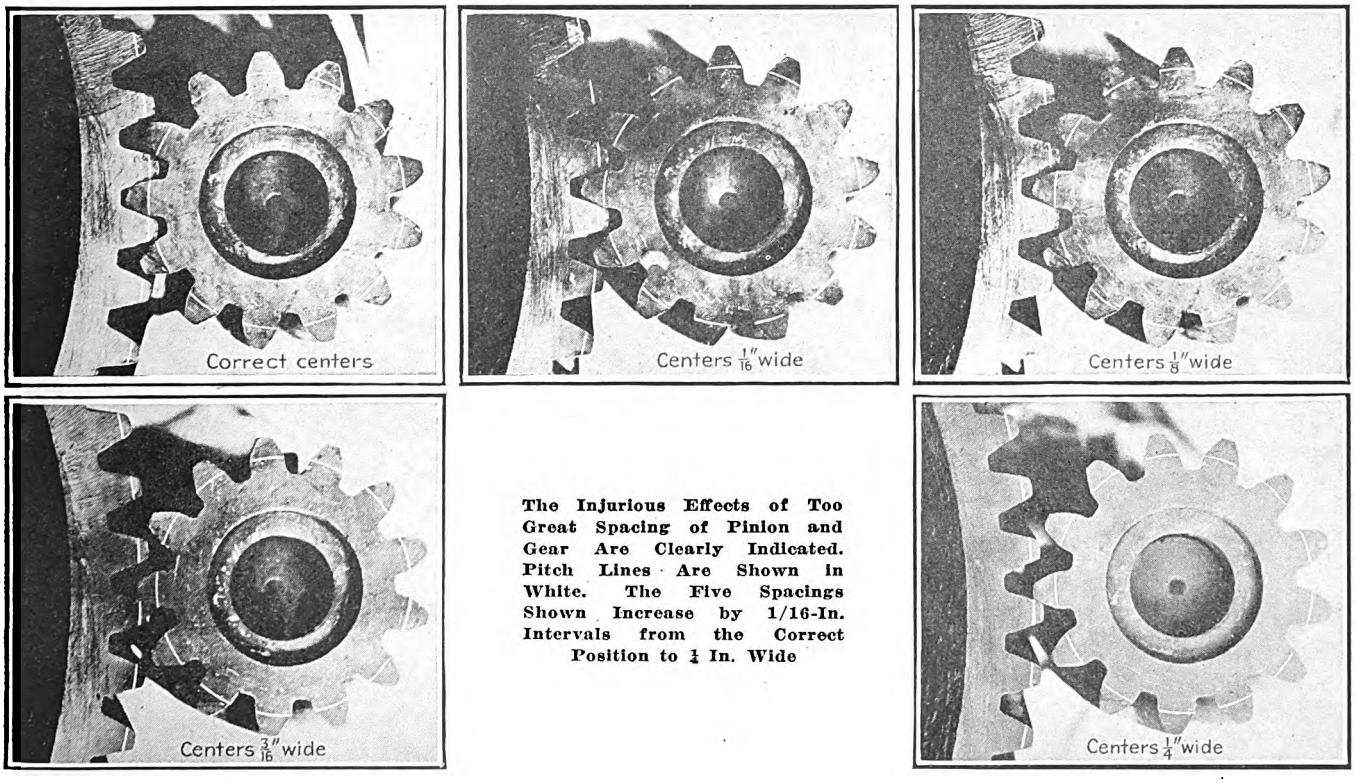
DURING the early days of electric railroading great efforts were made by motor manufacturers to design a motor whose armature could be mounted directly on the car axle. The purpose was to dispense with gearing, which in those days was a source of great expense as well as noise in car operation. These efforts to design a gearless motor have been given up, at least so far as car operation is concerned. It was found that the gearless motor has many serious objections, and as gear manufacturers have improved their product most of the defects experienced with the earlier gears and pinions have disappeared. If properly run and protected from damage, the modern gear and pinion should have a long life and give very little trouble. If their operation is not properly supervised, however, the life which they should have is greatly shortened, and they are responsible for a great deal of the noise which comes from car operation. In other ways, also, they will not give the maximum performance of which they are capable.

The principal trouble from gears of proper shape and material and properly lubricated comes from too great spacing between the gear and pinion. As the armature and motor axle bearings wear, the spacing between the pinion center and gear center tends to become greater. In consequence, the teeth of the gear and pinion, instead of touching at the pitch line, come in contact only at the outer ends of the teeth, with resulting greater wear and noise from the backlash.

The wear of the armature bearings and motor axle bearings which causes this spread of the gear and pinion can take place both in the bore of the bearing and on the outside of the bearing where it is held in the housing. Some wear is also possible on the inside of the motor housing, caused by a loose fit of the dowel pins or keys used to prevent the bearing from turning. There is also possible wear between the motor housing and the motor frame. It naturally follows that the distance of the spreading apart of gear and pinion is the sum of all the loose fits mentioned.

The bad condition brought about by too great spacing between gear and pinion is clearly illustrated in the accompanying five illustrations. They are from a series of photographs made by the R. D. Nuttall Company of a new railway gear and pinion set at different spacings. To bring out the injurious effect of improper spacing the Railway Improvement Company constructed a model, made up of a new gear and pinion mounted on a pedestal so designed that the space between the centers of the gear and the pinion could be set at various lengths by exact graduations of $\frac{1}{16}$ in. This model was shown at the Atlantic City convention. The gearing illustrated has a 13:74 ratio and a $4\frac{1}{4}$ pitch. The pitch line is shown by a white line marked on each tooth.

The first illustration shows the gear and pinion at the correct distance apart. In this position, as will be seen, the teeth engage at the pitch line. With this condition the white marks on the teeth of the gear and pinion in engagement make a practically continuous line.



The Injurious Effects of Too Great Spacing of Pinion and Gear Are Clearly Indicated. Pitch Lines Are Shown in White. The Five Spacings Shown Increase by 1/16-In. Intervals from the Correct Position to ¼ In. Wide

Digitized by Google

The next view shows the centers of the gear and pinion 1/16 in. farther apart, and in the third view the centers are another 1/16 in. apart, or at a distance 1/8 in. greater than in the first view. Already the teeth are shown to be beginning to engage at their outer ends only. This condition is still more marked, of course, in the fourth and fifth views, which shows the centers 3/16 in. and 1/4 in. farther apart respectively than in the first view. The engravings are about one-half actual size. In consequence, the spacing between teeth and gear centers are correspondingly reduced in the engravings over that in actual practice.

It is obvious from the view of the 3/16-in. wide centers that the teeth are engaging on only a very small portion of their wearing surfaces, and that if operations under these conditions are continued for any considerable length of time the natural result would be for the teeth to lose their original shape. It is also clear that all of this wear is coming at the ends of the teeth and that only one tooth on the gear and one on the pinion are in contact for any considerable part of the time, whereas in the view of the correct spacing two sets of teeth are in engagement for most of the time.

A condition like that in a 3/16-in. wide spacing will not continue long until the teeth will begin to lose their proper shape and it will be necessary to discard them. There will also be a great increase in noise, especially as the car speed changes during a run, as there is a great deal of backlash to take up when a change in the speed of the car makes the change from engaging on the front of the teeth to engaging on the back of the teeth, or when the direction of rotation of the motor is changed. There is danger also, under such conditions, that the teeth of gear or pinion or both will become broken because of the great impact between teeth combined with a small area of bearing surface.

Clearly, the correct way of gear operation is when the gear and pinion mesh as shown in the first illustration. This condition should be approximated as closely as possible by keeping the tolerance allowed for the fit of the bearing on its shaft as small as possible. This condition can be maintained only by measurement of the wear in the bearings and associated parts at more or less frequent intervals, depending upon their wearing qualities and the quality of lubrication supplied to them. A slight increase in the distance between centers may not seriously affect the proper shape of the gear teeth, but it is doubtful whether the allowance of 1/16 in. permitted under the rules of the American Electric Railway Engineering Association is not too great. The London Underground Railway is said to work to 1/32 in. clearance.

Clearances between shafts and bearings should not only be kept very small, but constant attention should be given to keeping bearings tight in their housings and housings tight in motor frames. Omission of this precaution, as already stated, permits spreading of gear and pinion centers.

When new bearings are installed, the caps should be pulled up tight and steel feelers applied between the cap and the brass to see that the bearings actually are tight. Still another way of determining whether they are tight is to apply the air brake, then turn the controller to the first notch for a moment. If the brasses move they are not tight.

Present-day practice seems to be not to give as much attention to the axle bearings as to the armature bearings, so conditions at the axle bearing fits are more likely to be neglected. Nevertheless, axle bearings are subject to greater wear than armature bearings because there are no springs between the axle bearings and the track and the pounding they get is harder. Moreover, water from the street is much more likely to get into the axle bearings than into the armature bearings. Still another point, and one of great importance, is that in the axle bearings the openings or windows for waste usually are larger in proportion to the surface of the bearings than they are in the armature bearings. Here are a number of very good reasons for very careful watching of axle bearings in motor inspection.

The destructive results of too great a spread and loose brasses are so insidious that it would be desirable on any property where the conditions are not positively known to have a check made right away. Even where it is thought the conditions are good, a check test may be worth while. As an example of how much wear sometimes comes, measurements will be quoted of wear observed on four axle bearings recently taken from a 40-hp. motor used in city service. The following amounts of wear were found:

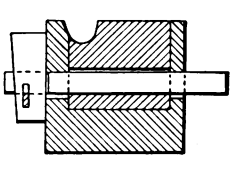
Flange Wear	Wear in Bore
One bearing, 1/2 in. wear	One bearing, 1/2 in. wear
One bearing, 1/4 in. wear	One bearing, 1/4 in. wear
One bearing, 1/8 in. wear	One bearing, 1/8 in. wear
One bearing, 1/16 in. wear	One bearing, 1/4 in. wear

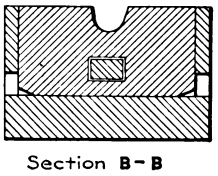
The figures given above are of wear only in the axle bearings. If to this wear is added that in the armature bearings and in the housings, the particular motor mentioned must have had considerable spread.

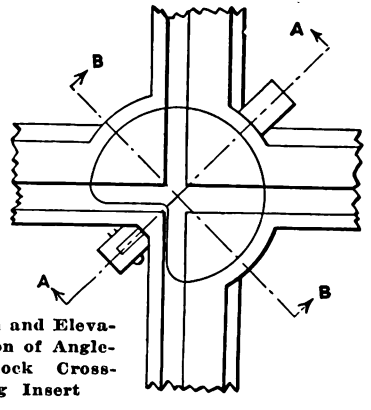
Crossing Insert Shaped to Hold Position

AN ANGLE-SHAPED hard center insert for crossing frogs has recently been designed by J. H. Asselin, engineering and construction department, Market Street Railway, San Francisco. A tapered key extending through the side walls of the casting and through the block itself holds it solidly in position. This key is held in place by a wedge through the end of the key.

The block itself resembles a cylinder, one-quarter of which has been removed. The angle thus formed







Plan and Elevation of Angle-Block Crossing Insert

fits into the inside angle of the intersection, where there is no wear. Due to this right angle, it is impossible for the block to shift. The alignment is thus kept true at all times and the block cannot rise or buckle.

The angle block has the thickness of approximately two-thirds of the depth of the casting. The block is cast-steel and specially heat-treated to resist shock. When worn down this block can either be built up by welding or the block itself can be removed. If desired, both the crossing and block can be made of manganese.

Safety Zone with Raised Platform Recently Installed in Terre Haute

Substantial Safety Zones Constructed in Terre Haute

Curved Concrete Guards Reinforced with Old Rails Afford Protection to Waiting Passengers—Cast-Iron Buttons Fastened to the Pavement Mark Limits of Zone

By D. H. Walker
Assistant Engineer Terre Haute, Indianapolis & Eastern Traction Company

During the past year the Terre Haute, Indianapolis & Eastern Traction Company constructed several cheap but effective safety zones on Wabash Avenue, the main street of Terre Haute, and part of the National Old Trails Highway. This national road carries a heavy stream of cross-country tourists all the year around. In addition, the majority of the large retail stores in the downtown district are on Wabash Avenue and the vehicular congestion made safety zones necessary to protect people boarding street cars.

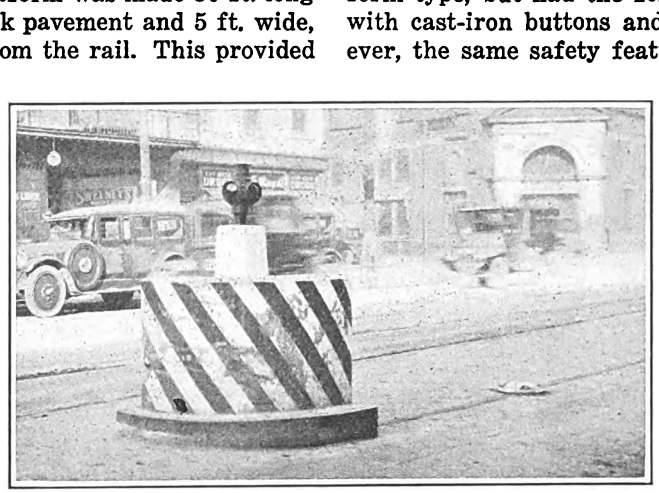
The first zone was installed as a raised platform at the corner of Wabash Avenue and Seventh Street, the busiest corner in town. As the street was 50 ft. wide between curbs there was approximately 18 ft. left from the rail to the curb. The platform was made 80 ft. long and 4 in. high above the brick pavement and 5 ft. wide, with its inside edge 18 in. from the rail. This provided enough length for unloading three Birney cars at once. A quarter circle concrete guard was placed at the end, and back of this guard was placed a concrete lamp base surmounted by an ordinary switch lamp with red lenses.

To prevent the guards at the ends of the zones being knocked over by a careless motorist, when the concrete was poured half a dozen old rails about 4 ft. long and extending down through the paving base were included for reinforcement. Guards were made 3 ft. high, 1 ft. thick, with a 3-ft. outside radius. In order to provide a hub guard the outside edge of the quarter circle was placed 6 in. inside the edge of the platform. The platform itself was poured directly on top of the brick paving, after taking out a zigzag row of bricks as a means of forming concrete lugs monolithic with the platform. A row of brick was removed at the inside edge of the platform toward the crown of the street to prevent seepage under the platform. To keep the concrete from chipping off an old three by three angle iron was used all the way around the edges and held by darts welded into the angle and extending diagonally down into the concrete.

It soon was found that the quarter circle guard prevented accidents that even the raised platform could not have stopped. Accompanying illustrations show a few of the dents put in the guards by careless or inebriated motorists. Several arrests of drunken drivers have resulted from these attacks upon the zones, but up to date no one waiting in the zones has been injured and the guards themselves have suffered nothing worse than the chipping off of a little concrete.

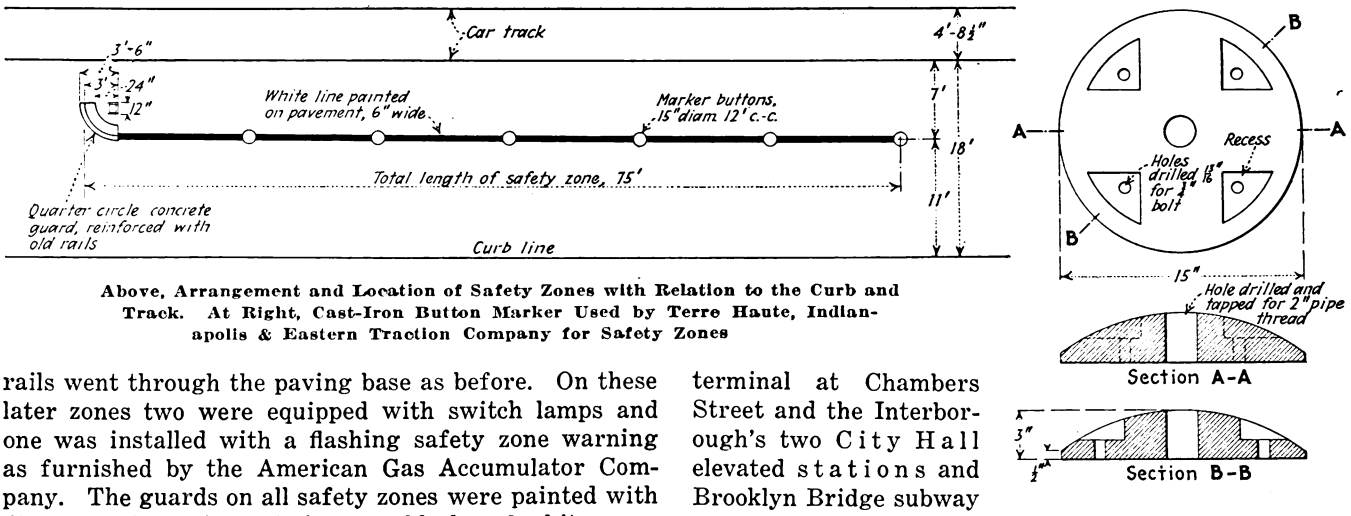
After a few weeks trial of this first zone it was decided to install three more. These were not of the platform type, but had the zone line marked on the street with cast-iron buttons and white painted lines. However, the same safety feature was provided by quarter circle concrete guards as used with the platform. These isolated guards also had the 6-in. hub guard with an angle iron forming the edge. This angle iron was extended the whole circumference and was welded at the corners to prevent loosening. Darts welded to the angle and extending into the concrete also helped hold this.

Bricks were removed under the whole guard and concrete poured to the paving base. Reinforcing



Reinforced Concrete Guard at End of Safety Zone—Cast-Iron Buttons and White Lines on Pavement Mark Limits

Digitized by Google



Above, Arrangement and Location of Safety Zones with Relation to the Curb and Track. At Right, Cast-Iron Button Marker Used by Terre Haute, Indianapolis & Eastern Traction Company for Safety Zones

rails went through the paving base as before. On these later zones two were equipped with switch lamps and one was installed with a flashing safety zone warning as furnished by the American Gas Accumulator Company. The guards on all safety zones were painted with diagonal 6-in. stripes of alternate black and white.

In the use of buttons to outline these zones it was necessary to design a special type and have a pattern and castings made to order. The Board of Works and the city engineer thought that posts connected by a chain would be necessary. They were willing to try first without the chains, however, if provision were made to install them in case it was deemed necessary later. The company felt that the chains were undesirable and accordingly used a button as shown by the accompanying sketch. This was fastened with four ¾-in. bolts on the corners in recessed notches. Holes were drilled in the paving for these bolts and they were set in cement grout. A hole through the center of the button was drilled and tapped for 2-in. pipe thread in order that posts could be placed in these holes later. While in use without posts the holes were filled by pipe plugs, a countersunk plug being used to minimize danger of tripping on the buttons. After a thorough trial it was found that the posts and chains were not necessary as the quarter circle guard furnished all the protection needed against motorists with inclinations to ramble through the zones.

New York City's Greatest Traffic Points

SUBWAY stations of the Interborough Rapid Transit Company and the New York Rapid Transit Corporation (B.-M. T.) at Times Square, Manhattan, remain the greatest traffic points upon their respective systems and constitute New York City's greatest rapid transit center. This is the conclusion drawn from the Transit Commission's annual compilation of figures of ticket sales at various stations upon the rapid transit lines made public recently.

During the fiscal year ended June 30, last, the Interborough collected 39,493,384 fares at Times Square, while the ticket collections at the B.-M. T. stations were 26,064,283, a total of 65,557,667 fares collected. as against 60,388,549 in 1924, a growth during the year of more than 5,000,000.

The figures show that Times Square as a rapid transit traffic center is further ahead of Brooklyn Bridge than last year. The center shifted two years ago. Last year Times Square increased to approximately 7,000,000 ahead of Brooklyn Bridge, and this year it is approximately 11,000,000 ahead. The total at Times Square includes the fare collections, as has been stated, at the Interborough and B.-M. T. stations, while at Brooklyn Bridge the total embraces fare collections for the Bridge station of the Brooklyn elevated lines, the B.-M. T. terminal at Chambers Street and the Interborough's two City Hall elevated stations and Brooklyn Bridge subway station. At the Brooklyn Bridge center there were 53,983,558 passengers in 1925, as against 53,885,798 in 1924, a growth for this center of only about 97,000.

Another great center of rapid transit traffic is at Union Square, Manhattan. There is one station of the Interborough at Union Square and two B.-M. T. stations, one of them on the Fourteenth Street-Eastern line, which was first placed in operation on June 30, 1924. The Interborough at Union Square had a traffic of 20,508,136, or an increase of approximately 900,000 over 1924. The B.-M. T. traffic was 19,690,245, or an increase of approximately 1,500,000. The total traffic for the center was 40,198,381, or a growth for the year of more than 2,350,000.

At Grand Central station, which is the station of second importance on the Interborough lines, 37,234,126 nickels were paid, as against 35,864,163 in 1924, a growth of 1,369,963, a rate of increase somewhat less than in the year previous. The Pennsylvania station, the third in importance in the Interborough system, with 32,073,801, had a growth of 1,922,771, or slightly less than the rate of increase in the previous year.

Figures for important Interborough stations follow:

	1925	1924
Times Square	39,493,384	37,594,661
Grand Central	37,234,126	35,864,163
Pennsylvania Station	32,073,801	30,151,030
Fourteenth Street (East Side line)	20,508,136	19,636,487
Atlantic Avenue (Brooklyn)	16,952,648	16,703,450
Brooklyn Bridge	15,714,454	15,673,611
Fulton Street (East Side line)	14,157,961	14,010,247
Borough Hall (Brooklyn)	13,414,219	13,640,702
Fourteenth Street (West Side line)	12,419,299	12,304,865
86th Street (East Side line)	11,406,290	11,267,689

On the Interborough subway system the local station of heaviest traffic, that is, a station served only by local trains, is that at 50th Street and Broadway, where there were collected in 1925 9,902,832 fares, or an increase of a little less than 300,000 fares for the year.

The most important traffic stations of the B.-M. T. subway and elevated lines are indicated as follows:

	1925	1924
Times Square	26,064,283	22,793,888
34th Street	21,853,851	19,163,092
Union Square	19,960,245	18,195,263
Coney Island terminals (Brooklyn)	16,825,685	14,932,523
Essex Street	15,815,237	14,200,520
Chambers Street (Municipal Building)	15,336,469	15,212,858
Cortlandt Street	13,891,455	12,626,451
Brooklyn Bridge ("L")	12,970,766	12,840,666
De Kalb Avenue (Brooklyn)	11,971,464	12,141,732
23d Street	10,807,254	10,064,998

It will be noted that Essex Street passed Chambers Street during the year and Cortlandt Street passed Brooklyn Bridge.

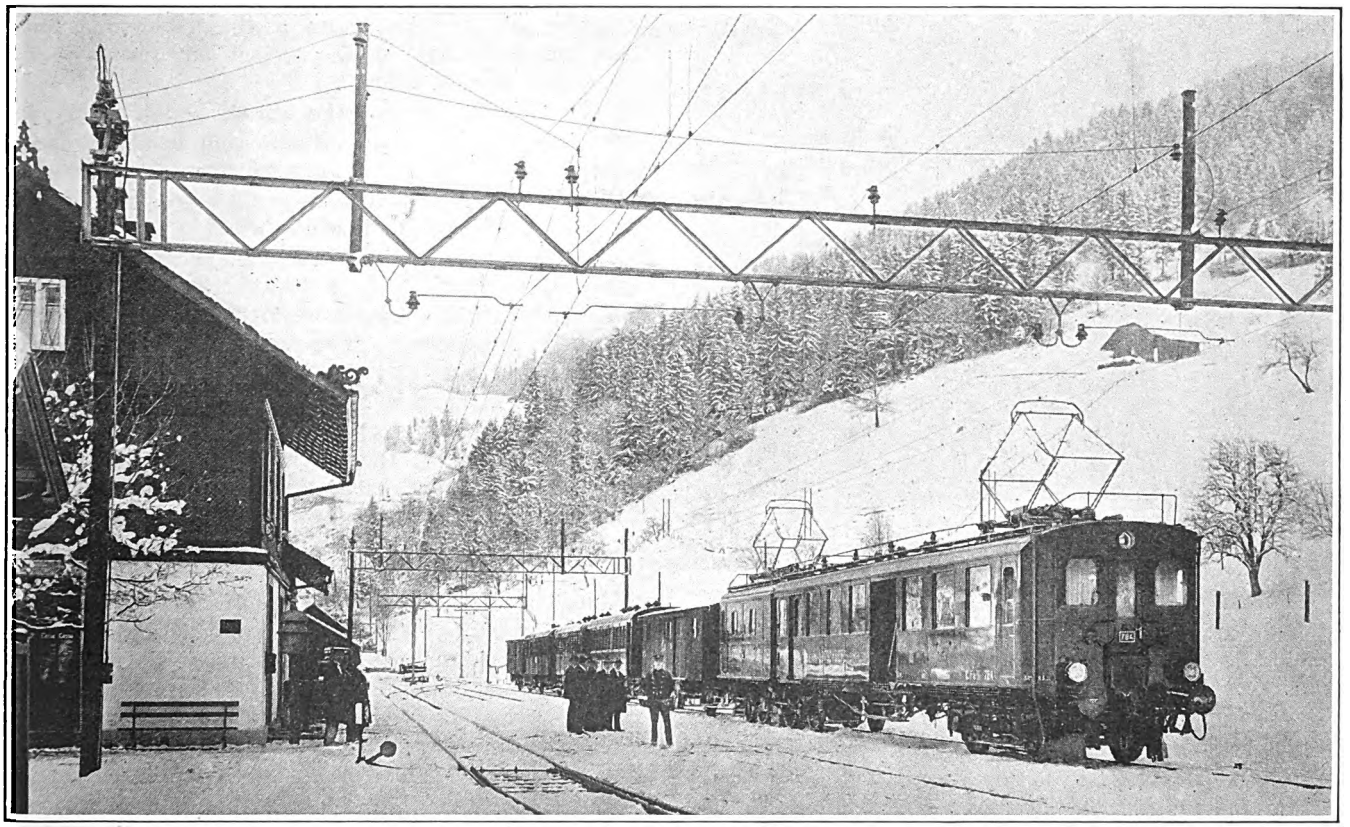
Combination Locomotive-Car Developed in Switzerland

Twelve-Wheel Vehicle Consists of a Six-Wheel Passenger Coach Permanently Coupled to a Six-Wheel Motive Power Unit—Unusual Safety Devices Are Provided



Combination Twelve-Wheel Locomotive-Car Used in Switzerland on Runs Where Traffic Does Not Justify Regular Train Operation

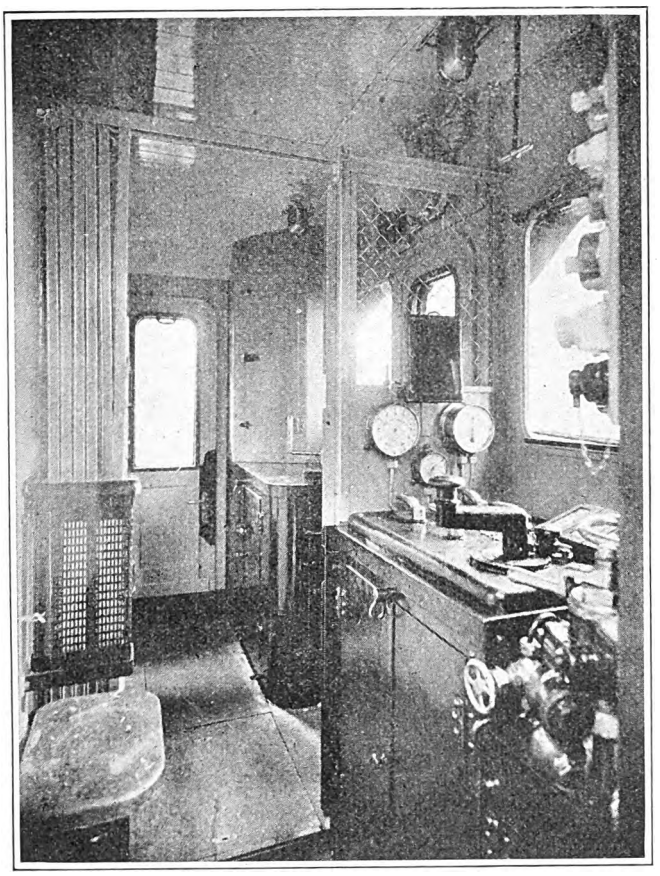
FOR service during slack periods when a long train is unnecessary, a combination locomotive and passenger coach is used by the Lötschberg Railway, which operates the section of the Swiss railways between Berne, Lötschberg and the Simplon. The new coaches are somewhat similar in design to those supplied by the Oerlikon Company in 1921 to the Burgdorf-Thun Railway. Electrical equipment is concentrated on a truck fitted with a leading axle and two driving axles, this truck being coupled to the main frame carrying the passenger and luggage compartments.

All the electrical equipment is in the locomotive portion. Current, single-phase 16⅔ period at 15,000 volts, is fed from the overhead collector device through isolating switches to the main current breaker, which is constructed for outdoor mounting. The circuit breaker is arranged for electro-pneumatic closing and for automatic electric release. A second pole of the circuit breaker is connected to the high-tension terminal of the transformer. The latter is of the oil-immersed, self-cooled type. In order to improve the cooling the transformer is inclosed in a second casing, into which air is drawn through the roof, passing over the transformer and escaping into the motor room.

The low-tension winding has eleven tappings which are connected to the motor as required for the various speeds, the highest voltage supplied to the motor being about 500. Connection between transformer tappings and motors is insured by means of twelve contactors that are controlled electro-pneumatically and are interlocked to prevent short circuits. They are arranged in the motor room. Passage from one notch to the next is insured without breaking the circuit in the usual way by means of a bridging coil.

Development of an hourly output of about 500 hp. at the wheel tires at a speed of 35 km. per hour (21.7 m.p.h.) was a requirement of the design. Another was that the motors should be as similar as possible to the spare motors kept on hand for the other electric engines of the company in order that they can be used in case of emergency. In view of this it was decided to adopt motors of the type supplied by the Oerlikon Company to the Bernese "Decree" railways that have been in successful use for a period of five years.

Digitized by Google



Motorman's Cab in Locomotive End of Combination Unit. Safety Devices Are Controlled by a Pedal and a Push Button

Each motor has ten poles, an actual one hour rating of 518 hp. at 21.7 m.p.h. and a continuous output of 425 hp. at 24.2 m.p.h. The highest speed is 40 m.p.h. The two driving axles are coupled together by means of a triangular system of rods and connected to the motor through a jackshaft. In this way it has been possible to use not only motors similar to those of the locomotives referred to but also the same gearing. Driving wheels are 4 ft. 4 in. in diameter, the gear ratio being 1 to 3.78. The controller is mounted on the motor frame, together with a fan set. The latter draws air from the motor room and drives it through the motor and out through the openings below. Multiple control and automatic acceleration are provided.

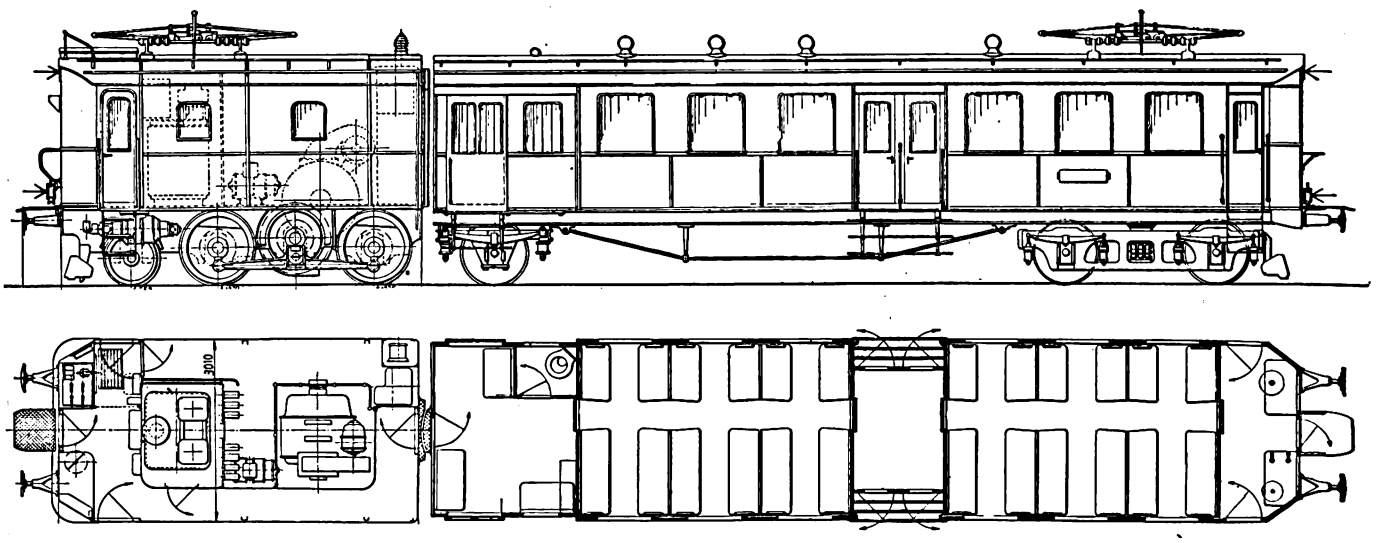
As they are intended for one-man operation, the cars have "dead man's" safety devices. Instead of having the safety device on the operating handle of the master controller, it is connected with a pedal which is depressed by the driver during the operation of the motor coach. When the pedal is released the motor circuit opens after a given interval, and the brake is brought into action by a relay. Within this interval, however, if the driver presses a push button mounted on the other side of the driver's cab, the switching off and braking is prevented. This arrangement was adopted to facilitate shunting operations, as the driver must under those circumstances be able to look out from one side of the cab or the other.

In order to permit of the vehicle being operated in either direction, the passenger coach is also provided with a driver's cab at the end away from the locomotive. Both the coach and the engine portion are provided with current-collecting apparatus.

Direct current at 36 volts for the control circuits and lighting is supplied by a 1-kw. motor-generator set and a battery of accumulators. Heating current for the different compartments of the coach is derived from the train heating bus lines. These are connected to a tapping of the transformer, giving 1,000 volts through an electro-pneumatically operated circuit breaker. The heating current for the driver's cab is obtained from the same supply system as the auxiliaries, such as the compressor set for the brake and the control gear. This supply system is connected to the 220-volt tapping of the transformer.

The coaches are each adapted to carry 60 passengers, although at times of heavy traffic five sitting and fifteen standing passengers can be accommodated in the luggage compartment. Over-all length of the engine proper is 21.6 ft. and of the complete vehicle 71 ft. 8 in. Total weight of the motor coach is 60.1 tons, of which the electrical equipment is responsible for 15.4 tons.

The vehicles were the joint production of three Swiss concerns, the Oerlikon Maschinenfabrik being responsible for the whole of the electrical equipment, the Swiss Locomotive & Machine Works, Winterthur, for the chassis and underwork, and the Swiss Industrial Company of Neuhausen for the body work.



Elevation and Floor Plan of Lötschberg Railway Locomotive-Coach. Seats for 60 Passengers Are Provided in the Main Compartment, with Fifteen Additional Seats in the Luggage Room

When Should Pinions and Gears Be Removed for Tooth Wear

By E. S. Sawtelle
Assistant General Manager Tool Steel Gear & Pinion Company, Cincinnati, Ohio

Gages Can Be Used Successfully on a Large Majority of Present-Day Gears and Pinions to Determine When Teeth Are Worn Out —A Few Abnormal Cases May Require Special Consideration

PRESENT practice of leaving to the judgment of inspectors the decision as to when a gear or pinion should be removed as having finished its useful life is unsatisfactory. Most superintendents of equipment and master mechanics would welcome some sort of a gage to decide when gears and pinions should be scrapped, but they seem to feel that the variety of tooth shapes and differences in gear ratios offer obstacles that prevent the use of a satisfactory gage. A study of the subject, however, shows that gages can be used successfully on the great majority of gears and pinions to determine when they should be removed. An occasional gear or pinion may wear abnormally, due to misalignment, bad bearings or some other condition. In such cases the tooth may be very badly worn at the top and thoroughly fit for rejection, though it may not show much wear at the gage point. Judgment must be used in connection with the gages to safeguard against a condition of this kind.

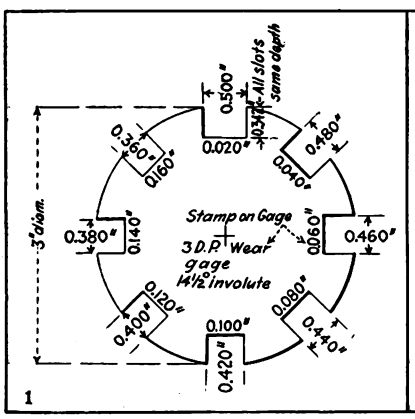
In order to illustrate the problems that are encountered in gaging gear teeth for wear, and also as a suggestion for types of gages that appear to be satisfactory for determining when gears or pinions should be scrapped, I have outlined in the accompanying diagrams several gages that should be of assistance to inspectors.

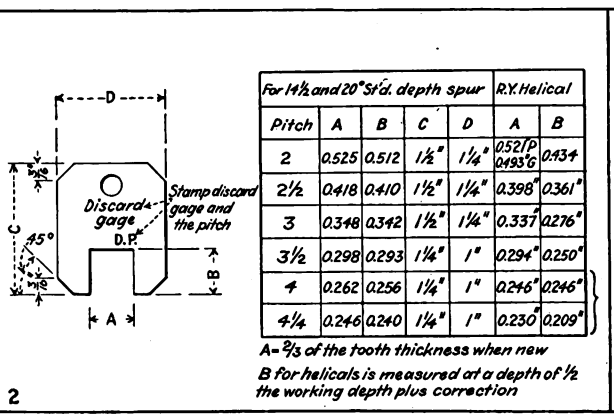
Where the standard Brown & Sharpe 14½-deg. gear or pinion is used wear at the pitch line can be determined by a simple snap gage which measures the wear from the top of the tooth to the pitch line. Fig. 1 shows such a gage, which can be read quickly and should be useful. This can be applied to any type of three-pitch pinion. The slots of this gage are all of the same depth and are equal to the corrected addendum for the pitch, but the width of each slot in the gage is varied so as to measure all the way from a new tooth to one worn out by progressive steps of 0.020 in. This gage should prove very handy for determining approximately how near worn out a pinion may be.

A discard gage is shown in Fig. 2, which can be used readily on a Brown & Sharpe 14½-deg. tooth for measuring a worn-out gear or pinion. The dimension *A* for the thickness of the tooth is usually taken as two-thirds of the original thickness at the pitch line of a new gear or pinion.

For a diametrical pitch of three this would be two-thirds of 0.523, or 0.348 in. The dimension *B* for the depth is the corrected addendum, which for a three-pitch pinion of about 14 to 17 teeth should be 0.345 in. This corrected addendum varies slightly with the number of teeth, but a gage for a depth of 0.345 in. can be used for any gear or pinion with a negligible error.

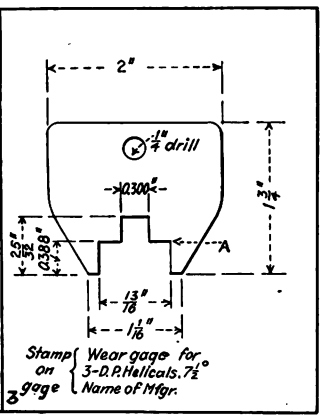
Several of the more modern tooth shapes depart from the Brown & Sharpe standard and have higher pressure angles. These include the long and short addendum tooth, the helical tooth and the wisdom tooth pinion. Originally these teeth are cut broader at the base and narrower at the top, with the result that frequently they may wear to a knife edge at the top before they are sufficiently worn at the center of the tooth to warrant discarding. Such a condition is shown in Fig. 4, to-





For 14½ and 20° Std. depth spur					R.Y. Helical	
Pitch	A	B	C	D	A	B
2	0.525	0.512	1½"	1¼"	0.521 P 0.493 G	0.434
2½	0.418	0.410	1½"	1¼"	0.398"	0.361"
3	0.348	0.342	1½"	1¼"	0.337"	0.276"
3½	0.298	0.293	1¼"	1"	0.294"	0.250"
4	0.262	0.256	1¼"	1"	0.246"	0.246"
4¼	0.246	0.240	1¼"	1"	0.230"	0.209"

A = ⅔ of the tooth thickness when new
B for helicals is measured at a depth of ½ the working depth plus correction



Note: all gages of 3/16" cold rolled steel, case hardened.

Note: For helical pinions 4 D.P. and 4¼ D.P. use gage C-144

Fig. 1—Wear Gage for Three-Diametrical Pitch Gearing. This Provides for Gaging Wear Every 0.020 In.

Fig. 2—Discard Gage for Brown & Sharpe 14½-Deg. Teeth to Measure Worn Condition

Fig. 3—Discard Gage for Gearing with Long and Short Addendum Teeth, Helical Teeth and the Wisdom Tooth Pinion

Digitized by Google

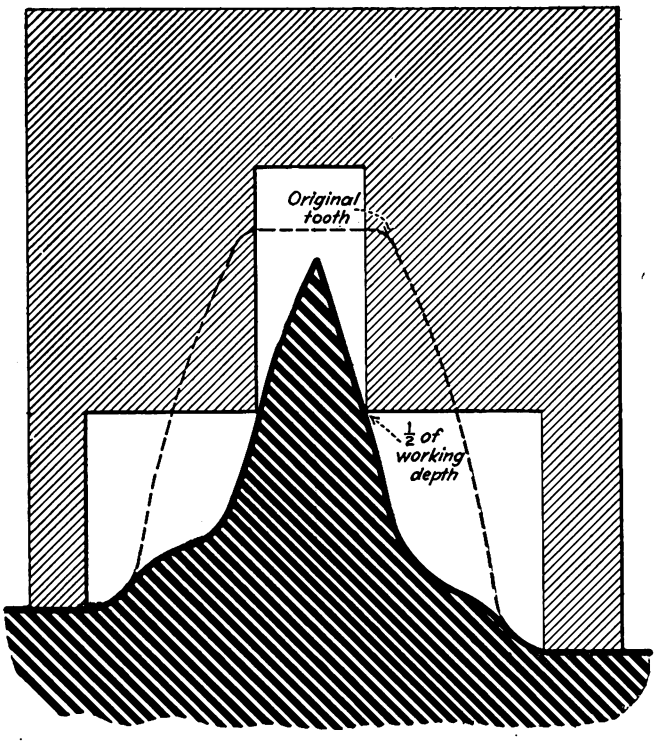


Fig. 4—Gearing with High-Pressure Angles Frequently Can Be Worn to a Knife Edge at the Top Before It Is Sufficiently Worn at the Center to Warrant Discarding

gether with an outline of the general type of gage that could be used to meet this condition. The gages shown in Figs. 1 and 2 cannot be used safely after the gear or pinion is worn to a knife edge. For such conditions a type of gage shown in Fig. 3 is recommended. This takes its height bearing from the root of the tooth. In this gage the offset at *A* is half way down the working depth of the tooth, and the thickness measured at this point is that at which the gear or pinion should be rejected. This is recommended to be two-thirds of its original thickness at point *A*. The vertical legs of the gage are of such length as to make the gage point *A* bear at the center of the working depth. The inside slot of the gage is such as to provide a clearance over the top of the tooth. This gage cannot be made universal, but a separate gage must be made for the gear and for each pinion with a different number of teeth. Likewise, an exact formula cannot be offered since there are variations used in the height and depth of the teeth for various types of gearing. The simplest method of getting dimensions for such a gear is to obtain exact data from gear manufacturers for the specific type of gearing used and make up a gage to suit individual ideas as to the degree of wear permissible before rejection.

During 1925 the number of accidents on the lines of the International Railway, Buffalo, N. Y., decreased 7.2 per cent. Serious accidents fell off even more, as shown by the fact that 10.28 per cent fewer persons were injured. During the *Courier* campaign against safety zone violators, I. R. C. employees turned in to the police 1,044 reports covering 1,235 violations of the ordinance establishing a 7-ft. safety zone around standing street cars. The campaign has greatly lowered the risk of accident to pedestrians and to passengers. A flashing signal was installed at Union Road on the Lancaster line and a new improved block signal system on the Buffalo-Niagara Falls High Speed line.

Noise Reduction Should Pay Well

WISCONSIN VALLEY ELECTRIC COMPANY
WAUSAU, WIS., Feb. 9, 1926.

To the Editor:

Several very inspiring articles have appeared in the ELECTRIC RAILWAY JOURNAL of late, and no doubt they have been read with a great deal of interest by many men in the industry who are constantly trying to improve service in their different localities.

The reply to "Master Mechanic" by the chairman of the noise reduction committee is very appropriate indeed, and I believe this committee deserves the support of the entire industry and should be encouraged rather than discouraged. There will, of course, always be with us the man who is ready to throw cold water on any proposition, but fortunately those men are in the minority, and the committee should know this.

It is very gratifying to read the letter by Clinton D. Smith, who certainly takes a very optimistic view about the future of our industry, and we must agree that he is right when he states that the car is our show window and it is through the pleasing appearance as well as comfortable, speedy and safe transportation that we will get our message across to the public, and that only in this way can we expect to get patrons enough to make our industry profitable. "Master Mechanic" wonders where the money to improve equipment is to come from. It is by the improvement of equipment and track that patronage is going to be increased, but occasionally we find some executive who thinks he must either curtail service or cut down the appropriation for maintenance of equipment as soon as the seasonal drop in patronage occurs.

Such men are losing track of the fact that we are at a dawn of a new era in transportation. The standard of living in our country, we are told, is constantly ascending to higher levels. If that is so it holds true equally well in transportation. We cannot expect that people are going to ride in dirty, dilapidated cars, many of which are equipped with hard slat seats. Instead we must be up to date and offer them an attractive ride, on full spring cushions, in cars which are clean and attractive, not necessarily luxurious. The bus properly co-ordinated with railway service should provide our service de luxe at proportionately higher rates than we are now getting for electric car service.

A word in regard to noise. Our old, heavy equipment was very noisy. It was also clumsy and was not economical to operate. We found that we could operate cars of lighter weight with quite a saving, but most of us went to extremes in lightness. Certainly the safety car has not proved less noisy than the old heavy equipment previously operated.

Within the last few years the car builders have brought out cars which they believe—and I think they are right—would strike a medium between the old heavy equipment and the too light safety car. This medium-weight double-truck car has met with favor among the operators as well as the riding public. It has a much more pleasing appearance, is more comfortable and speedier. Certainly the noise is considerably reduced and the cost of operation less.

Digitized by Google

The reduction of noise can be extended to the track structure as well as to the rolling stock. The more resilient the track structure the less noise will be noticed, and I believe that in all future trackwork, either new or reconstruction, serious consideration should be given to materials now on the market which have been proved to make the track resilient, and without movement enough to disturb pavement in the track area. On test track in different localities resilient construction has proved very popular.

The Wisconsin Utilities Association has a railway fellowship at the University of Wisconsin. The young man who is taking the course this year was given as his subject to study, "The reduction of noises in equipment." A committee of three operating men was appointed to confer with this young student and to guide him. He is free to call on any of the operators at any time for information which will help him in his work, and I have no doubt that when he makes his report next summer it will be of great benefit not only to us here in Wisconsin but to the entire industry.

I feel that the industry ought to get behind the committee on noise reduction and give it the support it so well deserves.

I have just read the address delivered by Mr. Budd at Indianapolis, and if all utility operators would look at the future as brightly as Mr. Budd does there would be no cause for worry, as every man would then be up and doing all the time.

NELS C. RASMUSSEN,
Superintendent of Railways and Chairman Railway Section Wisconsin Utilities Association.

Additional Information Concerning Number of Employees in Seattle

SEATTLE, WASH., Feb. 5, 1926.

To the Editor:

After reading the editorial in the Dec. 12, 1925, issue of ELECTRIC RAILWAY JOURNAL entitled "Cold Comfort for Municipal Ownership Advocates in Seattle Experience," I wish to call your attention to certain features of the situation not mentioned in that article. Acquisition of the street railway lines by the city occurred in April, 1919. Prior to this acquisition the total number of street railway employees was 1,876.

EMPLOYEES IN SERVICE OF SEATTLE MUNICIPAL STREET RAILWAY

	April 1, 1919*	April 1, 1920	Dec. 1 1925
Transportation:			
Dispatchers, schedule clerks, inspectors, starters, and station masters	39	44	30
Office	15	36	17
Trainmen	1,289	1,439	1,220
Shops and carhouses	325	461	287
Way and structures	169	234	285
Accounting	39	40	36
Accounting, stores department	†	26	16
	1,876	2,280	1,891

* Figures under April, 1919, include employees of the traction company and city employees engaged in operation of a municipal car line.

† The number of employees in the storeroom of the accounting department of the traction company not known at this time.

This figure includes those engaged in the operation of a municipal car line. Between April 1, 1919, and April 1, 1920, the number rose to 2,280. On March 22, 1920, a reorganization occurred which created a railway division of the public utility department. When this reorganization was completed and put into effect the services of 236 employees were disposed of. Due to further economies and reductions since that time, we had in our employ on Dec. 1, 1925, only 1,891. During the time that this reorganization has been in effect we established the basic eight-hour day. We allow the trainmen one day off in eight on their own time and have increased the number of car-hours on account of the installation of bus service in different sections. At this time 55 per cent of our operation is one-man. When the city took over the line from the traction company there was only a very small percentage of one-man operation. A tabulation of the number of employees at different dates is given in the opposite column.

There is considerable discrepancy between these figures and those which you quoted in your editorial from one of the Seattle newspapers. I thought you would be interested to know of this difference and to publish a correction.

D. W. HENDERSON,
General Superintendent.

Payroll Time Not Running Time

Feb. 15, 1926.

To the Editor:

In your issue of Jan. 30, page 195, there is a letter to the editor headed "Buses Faster than Electric Cars in New York." The writer bases his conclusions on a comparison of vehicle-miles and vehicle-hours, including layovers and delays. This is an error which is often accepted from statistical data and yet it is no true showing of the speed of a company's cars. Actual speed is determined by the average running time between terminals, excluding layover time and all other payroll time such as that allowed for reporting, turning in, meal relief, making out reports, etc. I do not know if the New York figures would show if it were possible to exclude these items from the New York Transit Commission reports showing car-hours, which generally mean payroll hours. I might mention in this connection that on certain properties the excess time is considerable, going to as much as 20 per cent over and above that spent in operating cars between terminals.

FAIR PLAY.

Credit Union Organized in Atlanta

GEORGIA already has one credit union, the Public Service Credit Union, which recently began operations under the auspices of the Georgia Railway & Power Company in Atlanta. A charter was secured by this union and organization was effected on Jan. 12, with an initial membership of 30, a stock subscription of 137 shares, at $5 a share, and excellent prospects for work among the 5,300 employees of the company.

The entrance fee has been placed at 25 cents and a member can start in it by taking out a single share. No member can hold more than 100 shares of stock, and no member can have more than $500 in stock or cash on deposit.

Two kinds of loans are made—a "character" loan and an "indorsed" loan. The character loan may run as high as $50 and is made, in the judgment of the credit committee, on the character of the applicant. This provides for emergency cases when an employee needs money quickly and cannot offer security for it. The indorsed loan may run to as high as $250, but must bear the indorsement of other members of the organization or some responsible person. These two types are expected to take care of the loan end.

A special feature will be the savings bank, which will lend out money at 6 per cent and pay 4 per cent for deposits, the difference of 2 per cent going to take care of the expenses of operation.

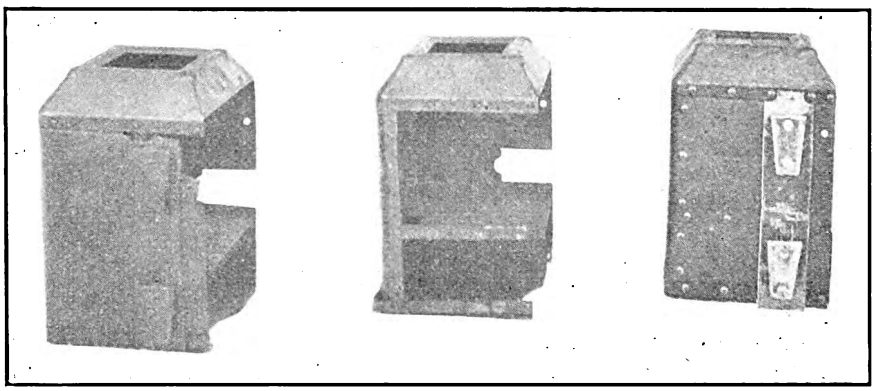
Equipment Maintenance Notes

Strengthening Fare Boxes During Repairs

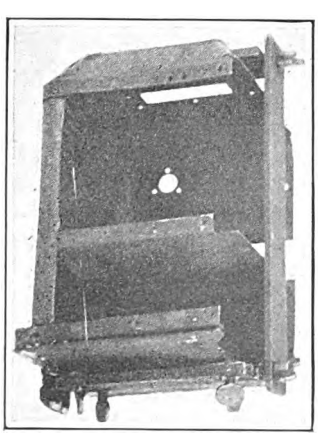
PASSENGERS alighting from electric cars frequently find the fare box a convenient place to hang onto for support until the car stops. As a result the supporting side of the fare box is frequently subjected to severe strains. The Eighth Avenue Railroad, New York City, has had a considerable number of breakages of the metal on the supporting side of Johnson fare boxes along the top edge. In repairing these, C. P. Westlake, supervisor of equipment, has arranged a strengthening plate of steel 5¾ in. x 4 in. x ⅛ in., which he installs and rivets inside to strengthen the point where failures occur. In order to provide a satisfactory and economical job several fixtures and jigs are used for the drilling and riveting operations in doing the work.

One of the accompanying illustrations shows the casing of three Johnson fare boxes; the one at the left in the illustration is a box before any repairs are made. This shows the breaking away of the metal at the top right hand corner. In repairing these boxes the first operation is to cut away the supporting side as shown in the center one of the fare boxes. The fare box at the right shows the finished job after repairs and reinforcement have been made. In order to hold the box in position after the side has been removed while work of drilling and riveting is being done a clamp is placed around the box. A second illustration shows this clamp in position. It has a number of thumbscrews for adjustment and tightening. Another illustration shows the fixtures used for doing the work. In this view the jig at the left is for drilling the new side plates which are installed.

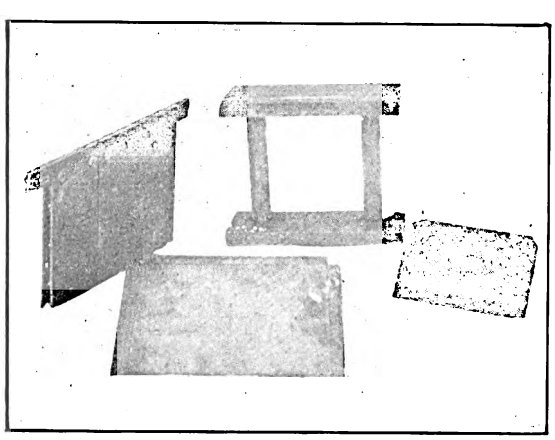


Fare Boxes Before and After Repairs Have Been Made
At left, casing with broken supporting side. In center, the supporting side has been cut away while making repairs. At right, completed casing after repairs have been made.

One of these plates is shown in the foreground of the illustration. The jig is made with two sides and the plate to be drilled is slipped between these and held firmly in position during the drilling operation. The reinforcing plate is shown at the extreme right in this illustration and a fixture for riveting in the background. This fixture is placed inside the box and, with the clamp shown in another illustration, makes firm support so that the riveting can be done satisfactorily. By this method of strengthening the supporting side of boxes during repairs the number of boxes which require work to be done for breaking away of the supporting side has been reduced considerably.



Clamp Used to Hold Fare Box in Position for Drilling and Riveting



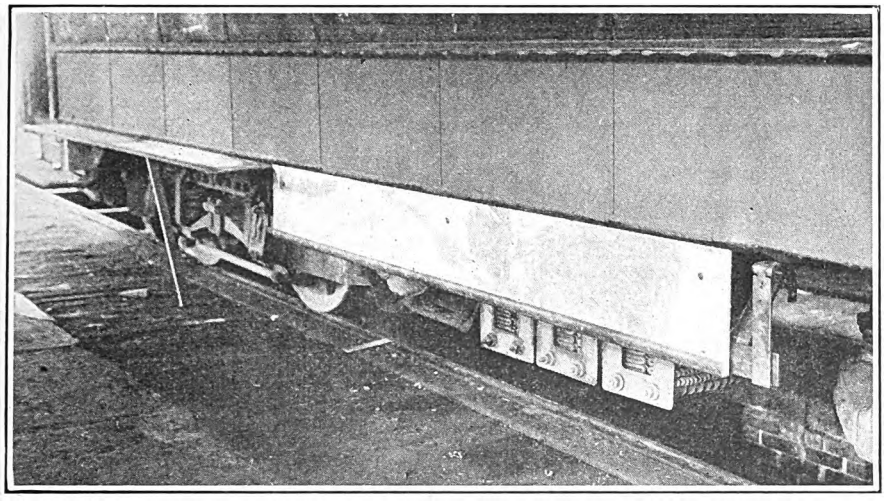
Jigs and Fixtures for Repairing Fare Boxes
At left, jig for drilling supporting side plates; in foreground, side plate before being drilled. At right, reinforcing plate; in background, fixture for riveting.

Hinged Apron Permits Easy Repairs to Cars

IMPROVED appearance of cars is one of the important factors in the campaign of modernization with which electric railway operators are bringing back the business that is logically theirs. The smart street car today is wearing an apron. The old-fashioned car set high over the trucks and displaying a confusing array of wheels, brake rods, motors, air compressors, etc., is quite out of harmony with the streamline designs and complete inclosures of the modern automobiles and buses which crowd the cars on every highway. Along with steps to make electric railway equipment more comfortable and less noisy, the elimination of this objectionable appearance of cars is being given careful consideration on a maintenance basis.

A simple method of accomplishing this purpose even on old cars is the apron in use by the Grand Rapids Railway, as illustrated herewith. William Goldner, master mechanic, reports that the original aprons were put on solid all the way around, which was not satisfactory due to the fact that it was almost impossible to get to the trucks for oiling, repair work, etc., without removing the apron, a defect which

Digitized by Google



Metal Moldings at Top and Bottom of Hinged Aprons Give Finished Appearance and Add Streamline Effect

he expects to remedy by putting the apron on hinges, as shown, which is the first apron built in that manner. This apron is ⅜-in. Plymetl, faced with steel on both sides. This provides great resistance to breakage or puncture with minimum weight. It is easily made and simple to maintain. Mr. Goldner says in the future he would prefer and specify ¼-in. Plymetl.

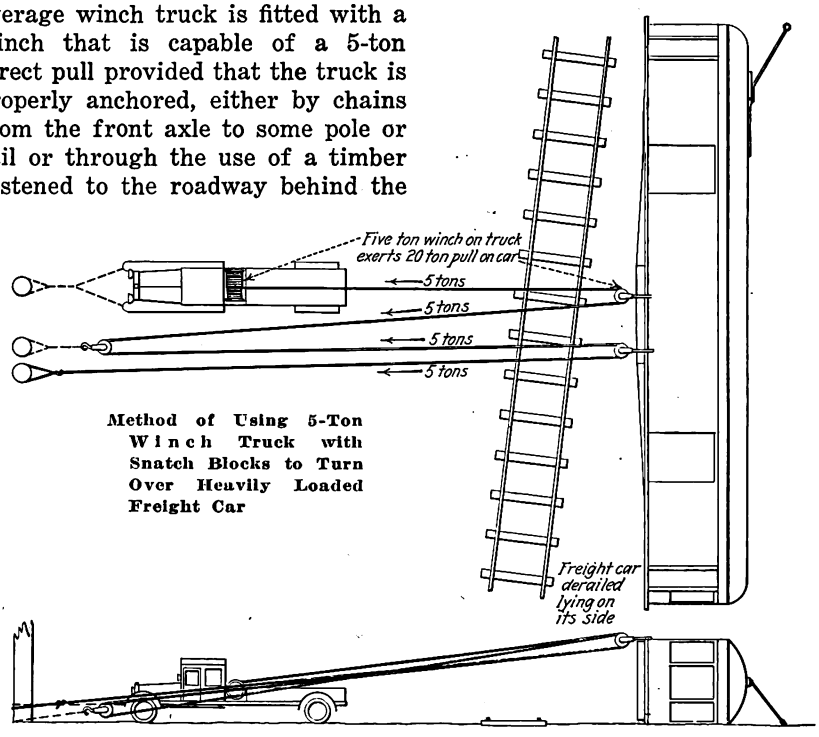
The apron shown is also the first one made with the metal molding running along the bottom. The top molding is screwed to the car proper so that when the apron is hanging down in place it has the appearance of having the molding all the way around, whereas the molding is fastened only to the bottom portion of the apron, while the top edge of the apron will be perfected by one metal face being broken over the edge.

Five-Ton Winch Truck Clears Freight Wreck

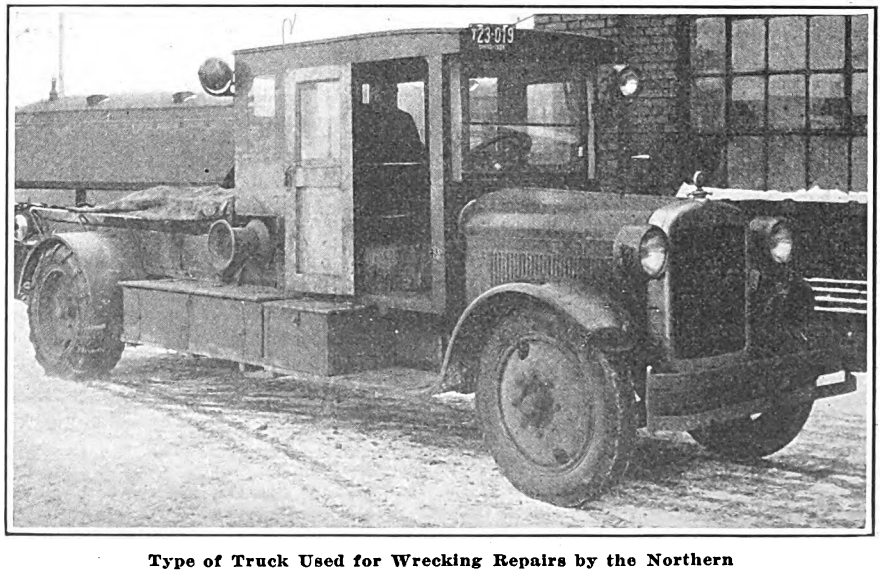
BY PIERRE V. C. SEE
Superintendent of Equipment Northern Ohio Traction & Light Company, Akron, Ohio

MOST city properties realize the possibilities of using trucks for street car wrecking. Their ability to get to the point of trouble in a minimum of time provides a speedy method for rerailing cars and clearing minor wrecks. It seems, however, that few properties realize the great possibilities offered to use the winch-type truck and a snatch-block combination for clearing up large interurban and freight car wrecks. The track and line departments of most electric railway properties are provided with winch trucks, which are available in case of emergency. Where the railway itself is not provided with such trucks it can usually secure the use of them from large auto towing concerns. The average winch truck is fitted with a winch that is capable of a 5-ton direct pull provided that the truck is properly anchored, either by chains from the front axle to some pole or rail or through the use of a timber fastened to the roadway behind the truck. A 5-ton direct pull will haul the car or truck back to the track and rerail it, and if the car is in a ditch or turned over the power furnished can be multiplied by attaching additional lines with snatch blocks. Each line adds an additional 5-ton pull.

The accompanying sketch shows how a 5-ton truck was used to turn over a 43-ft., 40-ton freight trailer which was laying flat on its side. In this particular case it was impossible to get a line under the car so as to provide a rolling hitch. Had this been possible the matter of turning the car over would have been simplified somewhat. As it was, the line was connected to the highest point on the bottom of the underframe. This was at the end of the bolster



Method of Using 5-Ton Winch Truck with Snatch Blocks to Turn Over Heavily Loaded Freight Car



Type of Truck Used for Wrecking Repairs by the Northern Ohio Traction & Light Company

Digitized by Google

and top of the needle beam. By using four lines as shown in the sketch, it was a very simple matter to turn this heavily-loaded freight car over to an upright position with one pull.

The winch truck that was used on this job is shown in another illustration. It has a six-cylinder chassis with 36x6 pneumatic tires, duals in the rear. A large cab is provided so that seven men can be seated very comfortably inside, while the open body is used for carrying jacks, blocks and other wrecking material. This particular truck is capable of making a speed of 40 m.p.h. and makes nearly as good time as can be made with a touring car in getting to a wreck promptly. In the particular case mentioned the wreck was more than 40 miles from the shop, so this speed was of decided advantage in clearing the tracks promptly.

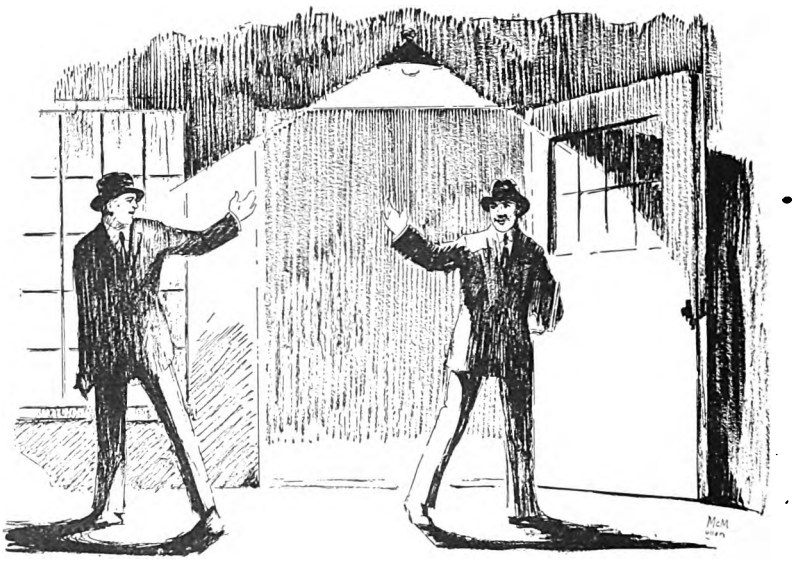
Bolted Anchor Plate Used to Hold Trolley Wire

UNTIL recently the Union Street Railway, New Bedford, Mass., experienced some difficulty with the type of anchor plate used to hold trolley wire. It had been the practice to solder the usual eyebolt clamp to the trolley wire and then attach the anchor wire to the clamp. It was found, however, that the heat from soldering had made a weak place in the trolley wire. It was also noted that the soldered surface of the clamp was so small that the trolley wire bent very easily when any extra pressure was brought to bear on the anchor wire. These defects frequently caused a breaking of the trolley wire.

To overcome these difficulties, Peter Dupuis, line foreman, designed a type of anchor plate that has proved very satisfactory. A piece of ⅛-in. machine steel plate, 8 in. long and 5 in. wide, was bent V-shaped. This plate was held together at the top by three 1½-in. x ⅜-in. machine bolts. Below these bolts is an 8-in. piece of ½-in. square machine steel, through which four 1½-in. x ⅝-in. setscrews are passed. The bottoms of these setscrews bear on an 8-in. piece of ⅝-in. square machine steel. When the anchor plate is in use this piece of steel rests on the trolley wire. By tightening the setscrews the ⅝-in. steel rod presses the trolley wire against the bottom of the V-shaped plate, while the ½-in. steel

Dick Encounters Difficulties

And Discusses Maintenance Cost Records



IT WAS far into the night when Dick Prescott, engineer of equipment of the Consolidated Railway & Light Company, and Steve White, carpenter foreman, decided to call it a day and go home. They had struggled long and wearily in the endeavor to arrive at a method of estimating the excessive maintenance cost on some of the antiquated equipment operated on their property.

"There are so many factors involved in this darn thing," said Dick, when they finally began to pack up thir papers, that it's almost a guess to try to get any comparision from the meager records that we've got available."

Dick picked up the pad on which they had been working. "It would be simple if the accounts were divided for different groups of cars," he remarked as he cast his eye down the row of items they had listed. "In addition to the costs," he continued, "I would also like to see pull-ins classified by car types. Gee! I'll bet that would tell a story that would soon show our practice up in a new light."

"I can remember one case," said Steve, "where we got to looking into the number of rewinds on one particular type of armature, and everybody was surprised to learn that the darn things were being rewound more than an average of once every year. No one knew how long that had been going on, until we happened to stumble onto it. If the accounts had been set up in the right way, the cost of maintenance on that type of motor would have stood out like a sore thumb."

"Well, all this is fine for the future, but we haven't got very far in estimating the costs for some of the equipment we now have in service."

"We can't get very far with that," replied Steve. "I've been digging up all the figures I can get hold of, but they don't give much. I do think, though, that I can get some estimates together now for the old 200 series cars that we're overhauling and the new 1200s."

"How are you going to get at it?" queried Dick.

"Well, I know about what we're spending on the bodies. I can get a fair estimate of the truck job from Bill Johnson, the truck shop foreman. Then, you see, Mike over at Center barn has all the 200s and some of the 1200s. I think he keeps some records of his own that may help us out. We've got power meters on both these groups of cars, and it won't be much of a trick to find out how much the power saving on the new cars amounts to. I also think Mike can check up his pull-ins and tell us how they compare on the old and the new cars. That's about as far as we can go."

"Even if that's all we can get together, I think it's worth talking over with the old man. He's working on the budget for next year and he could use that estimate for putting in a recommendation that we buy a group of new cars to replace the 200s and stop this heavy rebuilding program on them. Gee, I'll bet the money we're spending right there would more than pay the interest on new cars."

"Yes, but what about the capital?"

"You've got energy saving, faster schedules and reduced pull-ins to figure on. That's without allowing anything for the increased riding that would be bound to result if we took those old gunboats off the street. There's no question in my mind but that we've been blindly hanging on to some of this old stuff long past the time when it was profitable to do so. Of course, it's not up to us to say what's to be done, but it's a good thing to give the old man the dope. I'll bet if he takes that kind of a proposition into the staff meeting the transportation department and the new commercial department will be ready to hug him."

"Well, all right, Dick, I'm going to beat it for home before my wife comes after me. It's going to be kind of interesting to see what the old man has to say."

New Type Anchor Plate and Uses to Which It Is Adapted

No. 1. Side view of anchor plate used by Union Street Railway, New Bedford.

No. 2. A steel plate ⅛ in. thick, bent to V shape, is used to form the anchor plate.

Nos. 3 and 4. Typical uses of anchor wires across section insulators or at railroad crossings.

No. 5. Anchor plates used in New Bedford near section insulators, at drawbridges, etc., usually are arranged in a manner similar to that shown here.

rod presses against the three through bolts at the top of the plate. By this means the plate is securely held in place on the trolley wire. As will be noted, the trolley wire is not damaged by soldering and remains intact when the anchor plate is removed. This has proved advantageous when it is found necessary to change the location of the anchor plate.

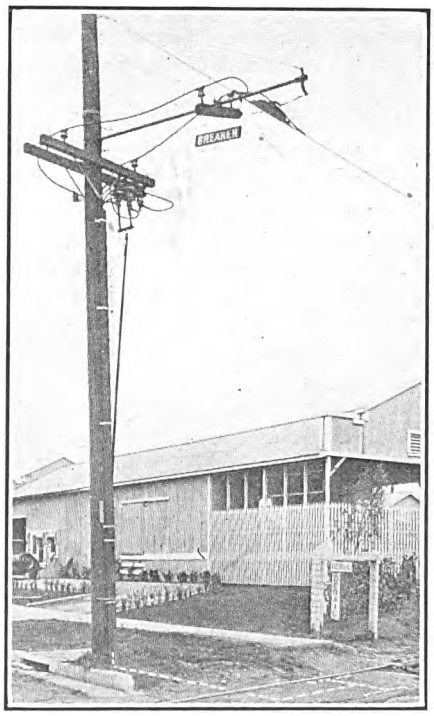
Various uses have been made of these anchor plates. They are used to hold an anchor wire where section breakers or splicing ears are located and wherever any strain on the trolley wire must be relieved. Trolley wires that go into trolley troughs or dead-end at drawbridges are an example of these uses. These anchor plates are also used in locations where there is a long stretch of unanchored trolley wire, to prevent strain on the span wires. Not only have these anchor plates proved inexpensive to make but they have given satisfactory results in the several hundred places where they have been in use.

Double Sectionalizing Switch for Oil Sidings

BY L. H. APPEL
Assistant Superintendent of Power Pacific Electric Railway, Los Angeles, Cal.

TO SAFEGUARD the loading and unloading of petroleum products the standard practice of the Pacific Electric Railway is to install a combined trolley and track sectionalizing switch on all spur tracks serving industries which handle oils and gasoline. This provision, together with that of installing insulated flange unions in pipe lines, has proved very effective in preventing electric sparks, which under certain conditions may cause serious troubles in the presence of fuel oil, distillates of gasoline, etc.

The double sectionalizing switch de-energizes both the trolley wire and the track at the siding, thereby removing any potential hazard that might exist if the trolley were left energized while tank cars were being handled. A double-pole, single-throw switch is used, which consists essentially of two copper blades fastened to insulators which are installed on cross-arms attached to the pole. One blade is used for controlling the trolley circuit and the other for the track circuit. A standard maple sectionalizing insulator is inserted in the trolley wire and white fiber insulated joints in the track.



Combined Trolley Wire and Track Sectionalizing Switch in Open Position

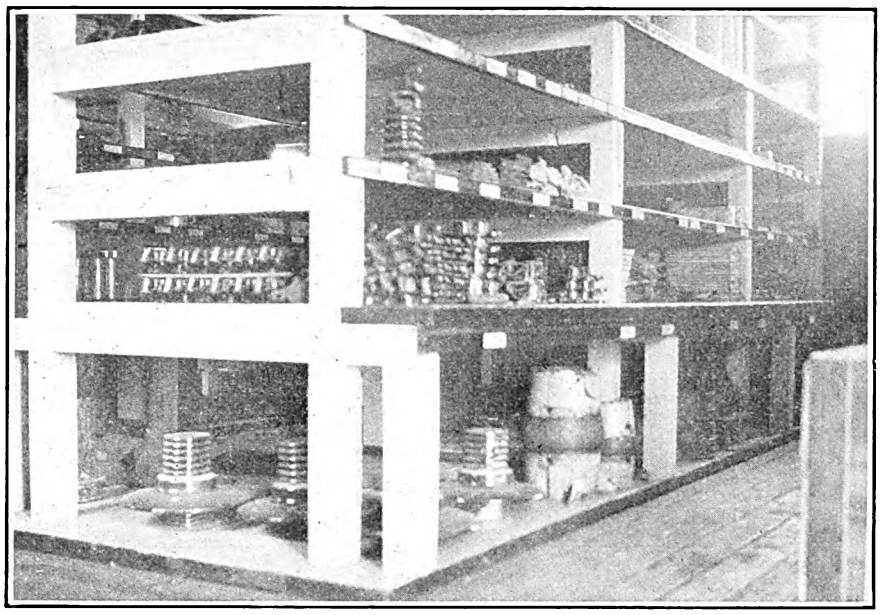
The trolley switch blade when closed permits the circuit to be completed or shunted around the circuit breaker and similarly the track switch blade permits the circuit to be shunted around the insulated joints, thereby allowing normal operation of the spur. Both blades of the switch are operated simultaneously by means of a long pole permanently fastened to the insulated blade head. This can be padlocked in either the open or closed position by train crews.

The switch is kept open normally so that the trolley and track are de-energized and is closed only when the spur is actually in use for electric operation. In addition to the use of this equipment for sidings serving plants where oils are handled, which include approximately 75 installations, a number of single insulating switches have been installed on sidings which serve industries operating clamshell shovels or other loading and unloading equipment which might come in contact with the trolley wire. The single switch installations provide for an insulator in the trolley wire only, as it is not necessary to insulate or de-energize the track.

Labeling Parts in Storeroom Shelves

DUE to the miscellaneous character of maintenance parts stored in the storeroom of the Southern Pacific Company at its Beaverton, Ore., shops, a flexible method for installing labels is required. An entirely satisfactory method has been devised through the use of a long metal slide 2 in. wide which runs the entire length of the storeroom shelves. These slides per-

Digitized by Google



Metal Slides for Inserting Labels Are Used in the Storeroom of the Southern Pacific at Beaverton, Ore.

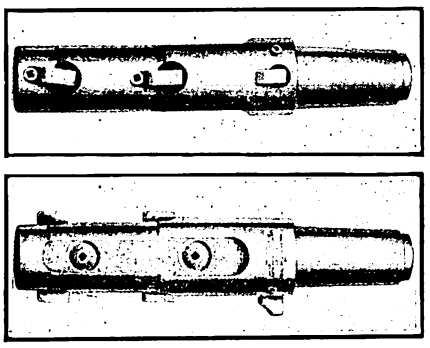
mit labels for the adjacent parts to be inserted where required, and after insertion they are protected with celluloid covers. This keeps them clean and gives a neat appearance.

Space required on the shelves for the storage of parts can be more economically used with this construction as the parts can be placed so as to make the best arrangement without regard to the location of labels.

New Equipment Available

Car Wheel Boring Tool with Wide Range Expansion

DESIGNED for the heavy-duty service of boring electric railway car wheels, a boring tool has recently been placed on the market by



Heavy-Duty Car Wheel Boring Tool

the Liberty Machine Works, St. Louis, Mo. The new boring tool has a triple arrangement of cutters, each set boring independently of the other. One set is for the rough-boring operation and a second for the finishing. The arrangement is such that the finishing cutters engage immediately after the roughing cutters clear the work. After the finishing cut is taken a third pair at the top of the tool chamfers the hub.

Each pair of cutters is uniformly expanded to the desired size by means of a cam arrangement controlled by a micrometer dial graduated in thousandths. This insures close adjustment to the desired size. One of the features of the tool is the hardened cutter support, the purpose of which is to insure a rigid holder for the cutters and to prolong the life of the tool by preventing disintegration on the surfaces where the tips come in contact with the tool body.

These hardened cutter supports permit setting the roughing cutters to the correct rake and angle. The cutter is set at this rake instead of grinding away part of the surface, as is the general custom. By inclining the roughing cutters, their life is materially increased, the tendency to heat is decreased and faster speeds are permitted.

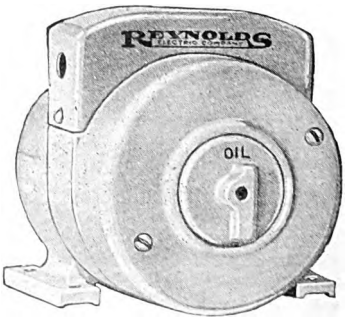
The new car wheel boring tool has a wide range of cutter expansion the purpose of which is to reduce cutter costs by using more of the high-speed steel on each set of cutters. The cutter locking device consists of a special screw lock which locks both cutters metal to metal. This arrangement insures uniformity of sizes and gives rigidity.

The tool is furnished in ten different sizes for boring steel, chilled or cast-iron car wheels. Sizes for the former range from 3¼ in. to 4¼ in. to 6¾ to 9½ in. and for the latter from 3 in. to 4¼ in. to 5¼ in. to 7¾ in.

Motor-Driven Flasher Unit for Warning Signals

RUGGED construction and small size are outstanding characteristics of a new unit flasher just brought out by the Reynolds Electric Company, Chicago, Ill. This flasher is for use with warning signals, crossing lights, blinkers, traffic guides, etc., as used by electric railways. The flasher mechanism is driven through a train of gears from a standard motor and all the mechanism is built into the special motor frame, so that the flasher is self-contained. The flasher is furnished with either one, two or three brushes, so as to handle a like number of circuits. The brushes ride the contactor drum without movement or vibration and special precautions have been taken which provide long life. The contactor drum operates on a quick make and break principle which is new in flasher construction and gives increased life and reduces failures.

The capacity of the unit is from 400 to 800 watts per circuit. The



New Self-Contained Unit Flasher

mechanism can be installed either inside or outdoors and its small size permits of mounting on a shelf against a wall if desired. The units are finished with two speeds, 60 r.p.m. and 7 r.p.m., so as to give respectively speed for flashing circuits on and off 60 times per minute or seven times per minute.

Association News & Discussions

Bus Maintenance and Lacquer Painting Discussed by C.E.R.A. Master Mechanics

Annual Meeting of Central Electric Railway Master Mechanics' Association at Akron, Ohio, Was Attended by Fifty Men from Central District—Topics of Interest to Interurbans Discussed

LIVE topics of particular interest to master mechanics brought out 50 men for the annual meeting of the Central Electric Railway Master Mechanics Association held at Akron, Ohio, on Feb. 11. The business session began at 9 o'clock and with an adjournment of one hour for lunch continued up to 2:30 p.m., after which an inspection trip was made through the shops of the Northern Ohio Traction & Light Company, where demonstrations were witnessed of equipment and methods used in maintaining buses and a demonstration of lacquer painting of electric cars.

Of the various committee reports, that on uniform charges to interchange of equipment brought out considerable discussion. F. J. Foote, chairman of the committee, presented the report, together with a revised list of prices for air-brake equipment. The report, including the revised prices, was adopted.

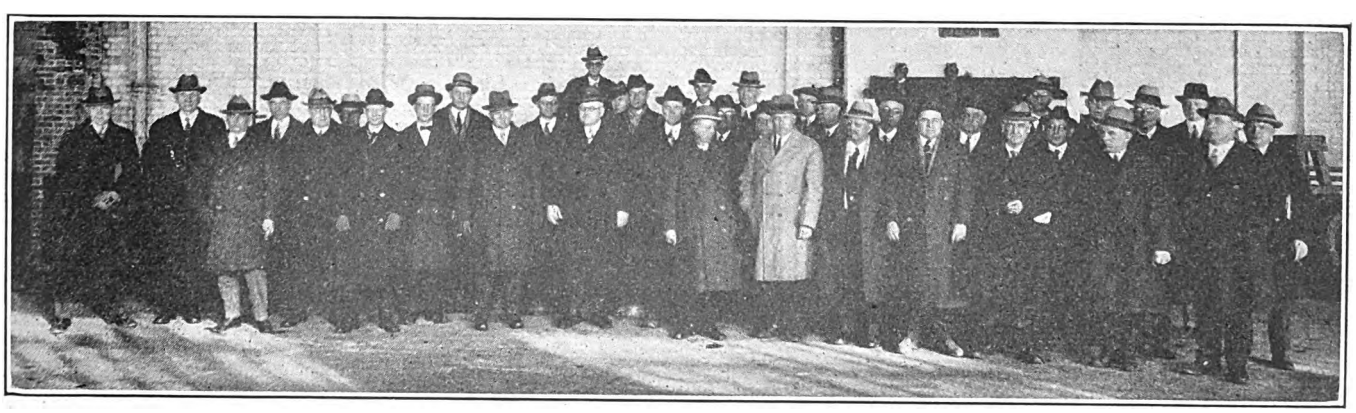
A committee was appointed to arbitrate disputes as to the responsibility for payment of parts replaced in interchange freight service. C. W. Squier, secretary of the equipment committee of the American Electric Railway Engineering Association, presented a request for consideration by the Master Mechanics' Association of two specifications now in the Engineering Manual. These specifications were E 100-12 for automatic couplers for interurban cars and radial draft rigging, including M.C.B. specifications for couplers, and E 101-12 specifications for the location of the end connections on interurban cars used in exchange service. No revisions to these specifications have been made since 1912, and as both refer to interurban equipment it was thought that the Central Electric Railway Association men were in best position to recommend changes in revision. The matter was referred to the standards committee of the association for study and report at the May meeting.

D. A. Scanlon, general superintendent of the railway department of the Northern Ohio Traction & Light Company, referred to a request which he had received from the Cleveland Railways to provide lights on freight trailers which operate through the streets of Cleveland. It appears that several accidents have occurred from automobiles running into cars which were without light. A committee was appointed to study the subject of providing a satisfactory method of illuminating the freight trailers so that such accidents will be prevented and so that a uniform method can be used by all roads of the district. This committee is to report at the May meeting of the association. Mr. Scanlon also brought up the subject of providing containers for way bills in interurban freight cars. After some discussion of this subject, it was referred back as being out of the field of activities of the Master Mechanics' Association. Discussion of the subject of loading cars beyond the stenciled weight brought out the fact that sometimes cars were loaded far beyond what they are supposed to carry. More attention will be given to this subject, as the tariff is supposed to be based on the stenciled weight with 10 per cent overload allowed.

Several changes were suggested in truck construction for the standard freight trailer which was adopted by the association. These changes were presented by a representative of the American Car & Foundry Company, and included some points which will reduce cost of construction and also provide increased life to trucks. The changes were approved and drawings will be changed to correspond.

The new officers of the association elected are: P. V. C. See, superintendent of equipment Northern Ohio Traction & Light Company, president; E. B. Gunn, master mechanic Western Ohio Railway, vice-president; together with an executive committee consisting of Fred Heckler, superintendent of motive power Lake Shore Electric Railway; F. J. Foote, superintendent of motive power and equipment Indiana, Columbus & Eastern Traction Company; J. W. Osborne, superintendent of equipment Terre Haute, Indianapolis & Eastern Traction Company, and A. W. Redderson, superintendent of motive power Indiana Service Corporation. A resolution commending the work of the retiring president, T. H. Nicholl, superintendent of motive power Union Traction Company of Indiana, was presented and adopted. He was also appointed as new chairman of the standards committee in place of C. M. Bange, resigned.

Two papers were presented, abstracts of which appear elsewhere in this issue. The first was a discussion of the lacquer system of painting, presented by J. S. Spratt of the Valentine Paint Company. In the discussion following presentation of this paper, questions by the master mechanics brought out information that the manufacturers do not recommend the applying of lacquer paint on top of old painting, as the old surfaces vary greatly and consequently varying results are obtained, many of which are unsatisfactory. Where paint is entirely removed the lacquer does not penetrate the wood, therefore some appropriate filler must



Master Mechanics of Central Electric Railway Association in Attendance at Akron Meeting

Digitized by Google

be used. Mr. Spratt said that the fourteen hours time given for finishing an average car requires a room temperature of at least 65 deg. No special spray gun is needed for the application of lacquer paint, and there are no special requirements by the fire underwriters over what is required for varnish removers. The powder that settles from the use of lacquer painting systems is not an explosive. Where spots are slow in drying this is evidence that the surface to which the lacquer paint is applied has not been thoroughly cleaned. After the lacquer paint has been applied cleaning with a dry cloth or with water is recommended. Car cleaning preparations can be used with success, provided they do not contain an excessive amount of alcohol. There are some lacquers that can be applied with a brush, but the spraying method is more satisfactory and more economical. The brush lacquers are improving rapidly and there are some over which varnish can be used, but the large majority cannot have varnish applied with success. There was considerable discussion as to economies that could be expected from the use of lacquer painting. The principal one of these results from the rapid drying of the lacquer paint so that cars are not out of service for extended periods. The general opinion of the master mechanics present was that there is no particular saving in time of application over that which would be obtained by spraying paint or enamel. Lettering can be done successfully with either lacquer paint, oil type paints, or enamel. P. V. C. See said that he had nine different kinds of lacquer paint in use. These were all applied over old paint surfaces. None has been in use a sufficient length of time to show definite results for comparisons.

A very complete paper on bus maintenance and gas engine operation was presented by E. Wooton, sueprintendent of equipment Chicago Motor Coach Company, an abstract of which is published elsewhere. Questions to Mr. Wooton brought out information that he renews oil every 2,500 miles and that he does not attempt to reclaim oil. The amount of extra equipment required for maintenance and overhauling is about 2 per cent for wrecks, overhauling, cripples, etc., and an additional 2 per cent for inspection. Probably a total of 5 per cent would be a good average figure to use. During the winter season in Chicago, radiator covers are used, but no alcohol is placed in the radiators. Skid chains are not used. The cost of maintenance by the Chicago Motor Coach Company during the past year was approximately 5½ cents per coach-mile. Mr. Wooton said that his company hoped to reduce this to 5 cents during the coming year. Depreciation of buses now used in Chicago is figured on a ten-year basis. Of course, this would vary considerably in different localities. The company has a very complete record system, so that it can tell when maintenance costs amount to more than the interest would be on the investment for a new coach. This accurately determines the point at which it is economical to scrap old equipment. Present equipment used in Chicago does not have starters, but Mr. Wooton said that larger equipment of six-cylinder engines would need starters. The scheduled speed is 10 m.p.h. in Chicago. This is figured by taking the mileage operated by the buses and dividing by the payroll time.

D. P. Cartwright of the North East Electric Company, Rochester, N. Y., presented two reels of motion pictures showing the electric starting, generating and ignition systems of buses.

The business sessions of the Master Mechanics' Association were held in the Terminal Building of the Northern Ohio Traction & Light Company, and this company also furnished a very attractive luncheon at the Portage Hotel, which was attended by the master mechanics and their friends. After the business session was completed, buses conveyed the party through the downtown garage of the company and out to the Kenmore Shops, where demonstrations were given regarding methods used in maintaining buses and also a very complete demonstration of the lacquer painting system. This latter demonstration was given by representatives of the Valentine Paint Company and included the application of all the various coats to an electric car. The car had been previously prepared with sections partly finished, so that the application could be demonstrated in a short time. This demonstration was with the application over old paint, and also included work necessary for patching. The next meeting of the association was arranged to be held in Decatur, Ill., some time in May.

Lacquer Painting Reduces Time Needed for Drying*

By J. S. Spratt
Valentine Paint Company

PAINTING by the nitrocellulose system involves three principal materials, primer, surfacer and enamel—each a nitrocellulose product, engineered to perform correctly its special function and capable of combining the completed system into a perfect whole.

Nitrocellulose primer is a true nitrocellulose material and forms the foundation of the nitrocellulose system. It is a nearly clear material carrying only sufficient finely ground red oxide of iron to enable the operator to see whether or not he has applied an even coat over the entire surface and it possesses adhesive qualities equal to the best varnish or oil type primers. It is furnished ready for application and is applied with a spray gun in a thin, even coat. It is suitable for use on metal of all kinds or wood surfaces. However, on new wood it is necessary first to apply a coat of oil type primer or wood filler such as standard paste wood fillers. This is necessary because lacquers do not penetrate wood, forming only a protective film on the surface, and to prevent moisture creeping into the wood through some break in the film which would cause the nitrocellulose material to peel it is necessary to use a penetrating material of this type.

Nitrocellulose gun glaze or surfacer is the material that might be termed "the keystone of the arch of the complete nitrocellulose system." It clings perfectly to the nitrocellulose primer and forms a perfect surface on which to apply the nitrocellulose enamel. It takes the place of the usual lead, half and half glaze, surfacer or rough stuff and sealer coats, thereby greatly simplifying the system as well as increasing its durability. Nitrocellulose gun glaze or surfacer possesses remarkable filling properties and goes on very smoothly. For use on cars it can be applied to give a sufficiently smooth surface without sanding. However, on buses, or where a perfect surface is demanded, it may be sanded readily to extremely smooth surface. Gun glaze or surfacer may be double or triple coated at one operation, applying more material where surface conditions call for a heavier coat, or it may be applied one coat at a time as desired. It air dries in a few hours at ordinary room temperature, ready for water sanding. Where the surface is not to be sanded, nitrocellulose enamel may be applied within an hour after the application of the last coat of gun glazer or surfacer.

The third and final material of the nitrocellulose system is nitrocellulose enamel. It is applied by the usual spray methods and it will be found that it sprays on very smooth and with quite a sheen. It can be supplied in any color. All nitrocellulose materials are supplied by the different manufacturers in heavy liquid form and should be thinned with solvent to the proper consistency before spraying. This is done for the purpose of avoiding settling, and for this reason the primer is supplied ready to apply as it contains only sufficient pigment for a guide coat.

There are as many kinds of lacquer furnished by various manufacturers as there were kinds of varnish and paint material furnished in the old days, and you will secure as widely varied results as you would from the range of varnish materials.

In the use of nitrocellulose materials I would recommend that you secure the materials for the complete system from one manufacturer, so that they are properly engineered, one material with another, as I believe that this is the only way in which you can secure uniform results.

Standard practice for a complete nitrocellulose system is one coat of primer, two or three coats of gun glaze or surfacer and two or three coats of nitrocellulose enamel. On street cars this entire system can be applied in one day. You can secure nitrocellulose materials which are elastic enough so that if you desire they may be var-

*Abstract of paper presented before the C.E.R.A. Master Mechanics Association, Akron, Ohio, Feb. 11, 1926.

Digitized by Google

nished over. These materials may also be polished to a very high luster if desired.

Without polishing a complete nitrocellulose system can be sprayed on a 45-ft. street car in approximately fourteen hours. If it is desired to sand the surfacer or gun glaze this increases the total time to an average of twenty hours.

Nitrocellulose materials are nonporous and therefore very easily cleaned, as dirt settling on them does not grind in as it does on varnish and oil enamels. The material becomes extremely hard and each time it is cleaned acquires more luster, so that for a period of time the car is getting brighter, while with the varnish type system it is steadily perishing.

Bus Maintenance an Important Part of the Chicago Operation*

By E. Wooton
Superintendent of Equipment Chicago Motor Coach Company

NO TWO bus properties can be operated exactly on the same principle, nor can the equipment be maintained in the same manner. I think, however, that the operation and maintenance methods practiced in Chicago can be used as a basis. We operate approximately 420 coaches, which are housed in four different garages, besides the central repair shops where all major repairs and painting are carried out. Garage superintendents are held responsible for the mechanical condition of the equipment in their respective divisions. They report direct to the superintendent of equipment, so that each division is on a competitive basis. Each division superintendent has a clerk who takes care of the clerical work, which consists principally of ready reference records of the equipment, gasoline and oil consumption and individual coach mileages. All reports are sent direct to the chief equipment clerk, who examines and files them in proper order, and at the end of the month makes up various kinds of comparative statements.

All coaches are held in for inspection on a 2,500-mile basis and a garage operating 100 coaches will run approximately 10,000 miles a day, which would represent four inspections per day. Two of these inspections would be held during the morning rush, the other 98 coaches would be scheduled for service. All inspections are completed and coaches scheduled for the afternoon rush.

During these inspections units are examined on a regular routine system, and should any of them be found defective or not considered capable of running until the next inspection the unit is removed and replaced with an overhauled one, the defective unit being returned to the central shops for repairs. The mechanics making the inspection have a complete report of the performance of the coach since its last inspection, therefore if any unit has been giving considerable trouble, this report helps the mechanic to form his conclusions. A complete record of all units is kept at the central repair shops, unit change slips being sent through for all units removed from coaches.

Each garage has an auxiliary stockroom which is supplied daily from the central stores. All parts are carried on a maximum and minimum basis, but not in large quantities. For small parts, the minimum number to be carried is placed in a small canvas bag, so that the storekeeper knows, if he has to take the parts from the bag, that he is down to the minimum and should order replacements immediately. For large parts, the minimum number of pieces is tagged.

The inspection system, like that of all other railway equipment, is very important. It enables us to make up an estimated personnel based on an estimated mileage supplied by the transportation department, which gives a predetermined payroll. It assures that every man employed has something definite to do. He is occupied at all times carrying out work which avoids trouble, rather than waiting for trouble to develop in order to remedy it.

We find in most cases where failures occur that on analyzing the cause it was due to some apparently unimportant part failing first. We know that there are certain parts which deteriorate or wear. We will take, for example, the case of a radiator hose. During inspection the man who is accustomed to doing this work can tell very easily whether this connection is capable of running another 2,500 miles. If he is in doubt he will take it off and replace it with a new one, which will probably cost between 40 and 50 cents. If the old one is allowed to run along and give out on the road it would probably mean a ruined engine, and there are many like examples which apply.

Another feature of inspection is that it insures that all parts, such as universals, wheel bearings, etc., are lubricated at regular and proper intervals, which is very important. Do not neglect inspection of a vehicle which happens to be running perfectly to relieve something else which might be tied up, as this will finally spell disaster.

When a coach is held for inspection its oil and gas averages are referred to, as these are a good indication of the mechanical condition of the vehicle. Each division keeps on file a daily record of the gas and oil consumption of every coach, also the miles per gallon. Fuel and lubrication costs are among the highest items and should be watched constantly, coaches with low averages being given special attention.

When considering garage construction, we figure to allow 350 sq.ft. per coach and to build one inspection pit for every 20 coaches. We are very much in favor, where possible, of using the indirect heating system, which has the advantage of supplying a certain amount of circulation, also supplying the heat underneath the engines, where it is most beneficial in extreme cold weather, and can also be used for ventilating in the summer.

The central repair shops in Chicago are entirely self-contained and are connected directly with the purchasing department and the general stores, which is a great convenience, where such arrangements can be carried out. In these shops we maintain all the units, such as engines, clutches, transmissions, rear axles, etc. Schedules are arranged to bring all coaches through the shop once a year, the major work being replacement of panels, painting, etc.. Very little mechanical work is done, since our inspection system at the garages takes care of this work. We feel this is very much more economical than the old system of dismantling the chassis completely once a year, since there are no two units which have the same length of life. By using our present system we obtain the maximum mileage out of each unit before it is repaired.

We employ approximately 100 men at the central shops, which is about one man for each four coaches owned. In figuring space for the central repair shops we feel that about 100 sq.ft. for each coach owned is sufficient.

Through the courtesy of the North East Company, I have been able to obtain the services of D. P. Cartwright, with two of the company's films which

*Abstract of paper presented before the C.E.R.A. Master Mechanics Association, Akron, Ohio, Feb. 11, 1926.

COMING MEETINGS
OF
Electric Railway and Allied Associations

Feb. 24-26—Electric Railway Association of Equipment Men, Southern Properties, Mobile, Ala.

Feb. 25—New England Street Railway Club, Copley Plaza Hotel, Boston, Mass.

March 5 — Metropolitan Section, A.E.R.A., 29 West 39th Street, New York, N. Y.

March 8-11—National Railway Appliance Association, annual exhibition, Coliseum and Annex, Chicago, Ill.

March 9-11 — Oklahoma Utilities Association, annual convention, Mayo Hotel, Tulsa, Okla.

March 12 — Pennsylvania Street Railway Association, annual meeting, William Penn Hotel, Pittsburgh, Pa.

March 17-18—Illinois Electric Railways Association, Illinois State Electric Association and Illinois Gas Association, annual joint convention, Springfield, Ill.

March 23-25—National Conference on Street and Highway Safety, Washington, D. C.

April 13-16—Southwestern Public Service Association, Galveston, Tex.

June 2-4—Canadian Electric Railway Association, annual convention, Quebec, Canada.

Oct. 4-8—American Electric Railway Association, annual convention, location not yet determined.

give some of the elementary principles of the functioning of the gasoline engine and its electrical equipment. These explain several important points.

We have three different classes of motor coach operation, city service, interurban service and long-distance service, each of which is in a class by itself. Since my experience has mostly been in city service, I would strongly recommend that the equipment be constructed with independent units, such as engine, transmission, rear axle, etc., and that these units be built in such a manner that they can be removed quite readily without any undue mechanical work. This is of vital importance in order to keep down the maintenance cost and keep the coaches in revenue service.

American Association News

Uniform Dimensions for Cars Proposed

CONSIDERATION of uniform dimensions for cars was given by the manufacturers' engineering committee in a three-day session at association headquarters, New York, Feb. 15-17. A joint meeting with the committee on unification of car design was held on Tuesday. Those present at the meeting were G. C. Hecker, chairman of the manufacturers' committee, together with J. A. Brooks, C. A. Burleson, and W. J. Clardy; H. H. Adams, chairman of the committee on unification of car design, with the following members: L. J. Davis, H. F. Flowers, C. Gordon, J. W. Hulme, G. L. Kippenberger, C. W. Squier and V. Willoughby. J. A. Brooks of the manufacturers' committee is also a member of this committee.

After a careful study of various car designs submitted by car manufacturers, together with a review of weight, seating capacity, fundamental dimensions and salient features of cars purchased during the last five years, the manufacturers' committee has prepared four drawings embodying dimensions and features which it considered suitable to the requirements of average size city or interurban properties throughout the country.

It was the consensus of opinion that car and electric manufacturers, by agreeing on the general sizes, weights and arrangement of the cars suggested, would be in position to offer to the industry cars of essentially uniform type suited to meet the requirements of the average city or interurban operating conditions. It was thought that such general uniformity would not limit the application of individual initiative in the further development of appearance and structural details that would place each manufacturer's stamp of individuality on his product. The urge of competition, it was felt, would bring about the improvement and development of cars considered necessary from the standpoint of competition with other forms of transportation. The fundamental problem was held to be the construction of cars that would attract patronage and reduce operating cost. Second only to this in importance, it was felt, is that greater uniformity in basic dimensions could be brought about and would result in reducing both the first cost and maintenance cost of equipment.

In discussing the advantages of a general agreement among car builders and electrical manufacturers as to the proper sizes and weights of cars for average city conditions, emphasis was laid on the fact that such general agreement was eliminating much of the present confusion regarding the type of car best suited for service in a given city, particularly on the smaller properties.

For city service, the committee proposed a light weight double truck car arranged for four motors. Drawings of cars for double end and single end operation have been prepared, that for single end operation differing from the other only in the platform arrangement at one end. The car for double end operation is similar to that shown in the 1922 report of the committee on unification of car design with bodies having 10, 11 and 12 windows. The committee recommends arch type roof construction, tapered flush platforms, with a single folding step. The first step is 15 in. and the second 14 in. high. The height from the bottom of the sill over the roof boards is 8 ft. 10½ in., the over-all width 8 ft. 4 in. post centers 29½ in., aisle width 27 in., seat length 35 in. and wheel diameters 26 in.

These cars, with four 25-hp. motors and double end platform type control, together with all safety features, should have a maximum weight not exceeding 32,000 lb. The maximum weight with 35 hp. motors and double end train control with all safety features should not exceed 37,000 lb. In considering weight, the committee felt that in most cases these maximum weights would be materially reduced in cars as constructed.

The truck centers for the ten-window car is to be 16 ft. 6½ in.; for the 11-window car, 19 ft., and for the 12-window car, 21 ft. 5½ in. The wheelbase will vary from 4 ft. 10 in. to 5 ft. 4 in.

Drawings for light weight interurban cars for double end and single end operation similar to that for city service were also considered. These cars will be made for lengths requiring 10, 11 and 12 windows. Provision is made for a smoking compartment, the size of which can be varied by moving the partition a full window length or more. A lavatory can also be incorporated, occupying one or two windows. Other details agreed upon were a plain arch roof, straight flush platforms, with first step 15 in. and second step 14 in., height from bottom sill over roof, 8 ft. 10½ in., over-all width 8 ft. 6 in., post centers 33 in., aisle width 24 in., seat length 35 in., wheel diameter 26 in., length of platform 5 ft. 4 in. The design submitted had sliding doors and stationary steps, but the cars can be equipped with the folding doors and steps without radical changes in the design. Cross seats are provided, with longitudinal seats at the end seating two passengers each.

The interurban cars with four 25 hp. motors and platform control for single unit operation should have a weight not to exceed 30,000 lb. The maximum weight with 35 hp. motors and double end train control should not exceed 37,000 lb.

The committee has also given careful consideration to other types of city cars. It found that the trend of car purchases as shown by the statistical numbers of ELECTRIC RAILWAY JOURNAL show that the single truck car is being bought in decreasing quantities, and that the double truck, one-man, two-man car has become increasingly popular. The committee found that as far as the single truck car is concerned, practically every car builder is prepared to build the standard Birney car or a modified Birney car and they consider that little would be gained by attempting recommendations for a new type of single truck car.

Cars with both center and end doors were discussed by the committee, which brought out the fact that such cars are used on relatively few properties and most of these are large ones. It was also found that in each instance this type of car was designed particularly to meet certain local conditions and that there was practically no uniformity in design adopted by the different properties using them. The decision of the committee was that no single design of center and end door cars could be produced which would meet the requirements of the different properties desiring to use such a car. It was therefore agreed that the committee would not attempt to submit a design for this type of car.

Metropolitan Section Reviews Steel Industry

A TALK on the steel industry, illustrated by six reels of motion pictures, was delivered by George A. Richardson, manager of the technical division Bethlehem Steel Corporation, before the Metropolitan Section of the American Electric Railway Association. The meeting was held on Jan. 5 in the Engineering Societies Building, New York City.

Before the main speaker of the evening. R. F. Carbutt, railway engineer H. L. Doherty & Company, gave a brief report of the Central Electric Railway Association meeting held on Jan. 27 and 28 in Indianapolis. John A. Dewhurst, associate editor of ELECTRIC RAILWAY JOURNAL, also gave a report of the New York Electric Railway Association meeting held at the same time in the Hotel Commodore, New York. A clear note of optimism and a better understanding of the basic problems that have developed was the underlying thought of both meetings.

Despite the severe weather experienced, the membership list has constantly increased from 1,122 reported at the last meeting to 1,168 reported at the meeting of Feb. 5.

Fare Question Up

Adjournment Follows Hearing Before Commission on Application for Higher Fare in Utica

Following the introduction of several exhibits setting forth the financial condition of the New York State Railways, Utica lines, and purporting to show the deficits sustained under a 7-cent fare, the railway rested its case on Feb. 17 in its petition to the Public Service Commission for permission to charge a 10-cent cash fare with provision for the sale of ten tickets for 75 cents. An adjournment was taken to March 10 to permit the city to examine the figures presented by the company and to prepare its case in opposition to an increased fare.

COMPANY READY TO CO-OPERATE

Clarence M. Williams, corporation counsel of Utica, announced to the commission that the city had retained Dr. Milo R. Maltbie to aid in the city's case. Mr. Williams asked permission of the company to have Dr. Maltbie examine the books to check the figures, but such consent was refused on the ground that it would delay the proceedings. The company through its counsel, Warnick J. Kernan, promised to supply the city with any information it desired, and Chairman W. A. Prendergast of the commission told Mr. Williams that the commission's accountants were now examining the company's books. Chairman Prendergast said that the full results of the commission's examination would be available to the city.

The valuation claimed for the Utica lines as of Oct. 1, 1925, by the company is fixed at $10,726,427. The company estimated that the proposed fare would yield an additional revenue per year of $96,403. This estimate was arrived at by using the number of revenue passengers carried in 1925, amounting to 16,000,229, and deducting 5 per cent for possible loss in patronage because of the increased fare. Of the 15,200,218 passengers remaining, it was estimated that 20 per cent would pay the 10-cent fare, giving a return of $304,004, and that 80 per cent would use the token fare, giving a return of $912,013. This would yield a revenue of $1,216,017.

EIGHT PER CENT NOT EARNED

The company, through exhibits prepared and sworn to by J. N. Joel, general auditor, claimed that in 1923, 1924 and 1925 it fell considerably short of earning an 8 per cent return on its investment. It alleges that it failed to earn a fair return even on the rate base fixed by the commission, which it contends was far too low, and claims that the earnings would return only about 2 per cent on the present fair value claimed by the company. It was claimed that the earnings fell $32,074 short of earning an 8 per cent return on the commission's rate base in 1923, $105,203 short in 1924 and $102,765 short in 1925.

Mr. Williams stated for the city that he would reserve any rights he might have to question jurisdiction of the commission to hear the increased fare petition. In 1922 a special term of the Supreme Court denied the city a writ of prohibition, but Mr. Williams said that he was not satisfied the decision of the special term was in accord with recent decisions of the courts on the question of jurisdiction of the commission where there are fare restrictions in the franchises of railway companies.

Baltimore Commission Approves Traffic Changes

A definite plan for the rerouting of cars of the United Railways & Electric Company, Baltimore, was adopted by the Baltimore Traffic Survey Commission at a meeting on Feb. 10. The plan approved by the commission is a combination of several lists of proposed changes. It was approved as the plan best suited for all concerned. The next step to be taken is the filing of a detailed report of the changes with the Maryland Public Service Commission. Public hearings will be held and the traffic body will be called upon to show why the changes should be made. It is said that the approval of the United Railways depends upon further action on the part of the commission. In this connection it is pointed out that if cars are ordered off one street and placed on another other traffic should be regulated to take care of the changes. The commission has still to report on vehicular and pedestrian traffic. A report covering these subjects is expected to be completed in March.

One of the most important features of the plan approved by the traffic commission is the removal of all cars from the downtown section of Lexington Street. The other features include the removal of all but one line from Charles Street, removal of one-man cars from the Halethorpe line and other reroutings.

The Baltimore Traffic Commission adopted the proposed changes after an exhaustive survey made by Kelker, De Leuw & Company, Chicago. The cost of the survey is being met by city, state and the United Railways. It was brought about as a result of suggestions that were made at the time the hearings were in progress that were held before the Public Service Commission to fix the valuation of the United's property. Mr. Miles is chairman of the commission.

Fare Plea in Binghamton

Seven-Cent Fare Continued Pending Settlement—Old Dispute On Over Franchise Restrictions

The temporary continuance of the 7-cent fare in Binghamton, N. Y., on the lines of the Binghamton Railway was recently authorized by the Public Service Commission pending a final decision as to the merits of the company's application. As a result a controversy of long standing is waging anew in which the city, the commission, the railway and the courts play prominent parts. On Jan. 30 the city filed a notice of appeal to the Court of Appeals from the decision of the Appellate Division.

The issue goes back to 1919, when the former receiver applied to the old Public Service Commission for an increase in fare from 5 to 6 cents. The city of Binghamton questioned the jurisdiction of the commission on the ground that there were restrictions in the franchises which limited the fare to 5 cents, but the commission overruled the city's objections. The city then applied to the Supreme Court of the State of New York for a writ of prohibition restraining the commission from granting a rate of fare in excess of 5 cents and restraining the receiver from charging a fare in excess of 5 cents. The writ was finally granted and entered on Dec. 17, 1919.

The receiver immediately took an appeal to the Appellate Division of the Supreme Court, but early in 1920, before the appeal could be argued, the Common Council of the city of Binghamton adopted an ordinance authorizing the receiver to collect a 6-cent fare for a period of two years. This ordinance contained a provision which precluded the receiver or the company from prosecuting its appeal while the ordinance was effective. Similar ordinances were subsequently granted covering the years 1923 and 1924.

In 1925 the Common Council of the city granted an ordinance consenting to a 7-cent fare for a period expiring Jan. 15, 1926. This ordinance contained no provision prohibiting the company from prosecuting the appeal from the order granting the writ of prohibition. The appeal came up for argument at the May, 1925, term of the Appellate Division, and a decision was rendered reversing the decision of the lower court and authorizing the prosecution of the original application to the Public Service Commission. The decision of the Appellate Division was based largely upon the ground that the restrictive provisions of the old franchises were intended to apply only to horse cars, and that when the horse car lines became electrified the 5-cent fare limitations contained in the old franchises became ineffective.

Upon the adoption by the Common

Digitized by Google

Council of the city of each of the ordinances mentioned consenting to a fare in excess of 5 cents for a stated period an order was procured from the Supreme Court holding the writ of prohibition in abeyance for the period covered by the ordinance. An application was then made to the commission for permission to charge the fare permitted by the ordinance for such period. On Jan. 15, 1926, the authorization expired which had been passed early in 1925 by the commission to charge a 7-cent fare under the ordinance.

In view of the decision of the Appellate Division holding that franchises did not limit the rate of fare which might be charged, the company filed with the commission in December, 1925, an application to continue the 7-cent fare beyond Jan. 15, 1926, without asking for any consent from the city. The commission on Jan. 15 granted its temporary order.

Ten Cents in East St. Louis

The East St. Louis Railway, acting under a federal injunction restraining the Illinois Commerce Commission from interfering, advanced the basic fare in East St. Louis, Ill., from 8 cents cash to 10 cents on single fares, effective Feb. 14. The new schedule means single cash fares of 10 cents or five tokens for 40 cents. The old scale was 8 cents for single cash fares or two tokens for 15 cents. The interstate fare between St. Louis, Mo., and East St. Louis and to points beyond East St. Louis will not be affected by the change in the East St. Louis city fares for the present.

The railway took the matter before the federal court after the Illinois Commerce Commission had twice suspended action on the company's petition for increased fares. The company contended that the failure of the state body to take some action on the petition for increased fares was in violation of the United States Constitution. The petition was passed on by Federal Judges Page, Lindley and Evans and the injunction was granted by them on Feb. 5 at Danville, Ill.

The application for increased fares in East St. Louis was first presented to the state commission almost a year ago and final testimony in the case was heard in October.

$5,000,000 Program Awaits Cleveland Council's Action

John J. Stanley, president of the Cleveland Railway, Cleveland, Ohio, says that as soon as the amendments which have been suggested to the Tayler franchise are adopted he immediately will call for the sale of a large block of new Cleveland Railway stock to finance the first portion of the improvements.

The changes are very simple. It is intended to provide a wider range of fare limits to meet contingencies created by unusually expensive operating periods, to increase the interest fund from $500,000 to $1,100,000, and to set up a sinking fund for capital retirement.

The first offer will be to stockholders as usual. But if this fails to provide all the capital needed the amendments make it possible to offer the stock on the open market with a two point discount to encourage salesmanship on the part of banks and bond houses.

First call for stock subscriptions in the improvement program may run as high as $3,000,000, if present shareholders of the company subscribe as much as 10 per cent of their present holdings, and this probably will cover all the work that can be accomplished in 1926.

Here are some of the items in the improvement program:

Four new carhouses, one of the first being a new plant to replace the antiquated Cedar Avenue carhouse.

Rail extensions on Pearl Road to the city limits.

Bus extensions in all outlying parts of the city and the suburbs.

Purchase of at least 100 new cars and as many additional buses.

Beginnings on various new short cuts and private rights of way to speed up service on many congested lines.

Development of multiple-unit train service on heavy main lines.

Experiments with buses and street cars in various rapid transit combinations for express and local service.

The amendments are substantially those proposed last June by the metropolitan transportation commission.

Bay Cities Agitated Over Fare Increases

Recent Increases in Rates Authorized by Commission Result in Hatching of Fantastic Bus-Ferry Scheme—Oakland Commissioner Suggests Survey of Entire East Bay Problem

SHARP attacks are being directed at the California Railroad Commission by clubs and civic organizations of the East Bay as the result of a series of recent decisions raising rates on the Key System Transit Company's lines and ferry and the Southern Pacific ferry and denying the application of a new ferry company which wished to operate between Berkeley and San Francisco.

Berkeley is taking a leading part in the fight, because that city is very much interested in getting the new ferry for autos and pedestrians. Despite the inadvisability of provoking a ferry rate war and with it lower fares, this seems actually to have been the desire of some of the protestants.

The Railroad Commission found, however, that there is no present need for the new ferry, because the public is already adequately served by two competing lines. The commission found further that the new ferry would not lower rates, because the rate schedule filed with the franchise application was higher than on those of the competing lines. This decision, coming on the heels of two denials of rate rehearings requested by Berkeley and Oakland, stirred a storm of protest.

A. O. Stewart, president of the Golden Gate Ferry Company, denied a certificate by the commission, has asked for a rehearing. In the meantime he has suggested to Mayor John L. Davie of Oakland that Oakland and the ferry company go into partnership in a bus-ferry combination, the city of Oakland to finance a bus service to the waterfront and his company to run a ferry service to San Francisco from Oakland. This plan is now being considered by various civic bodies and may be put on the ballot at the next election.

In the meantime the higher rates are in effect on the Key and Southern Pacific ferries and the Key traction system. The Key got its increases as "emergency measures," following a higher wage award to carmen by an arbitration commission. Then, after this raise had been granted, the Southern Pacific requested a separate hearing, at which it demanded higher rates to jibe with those on its rival, the Key system. New rates for the Southern Pacific were approved by the commission and went into effect on Jan. 25.

Officials of Oakland and other East Bay municipalities attended these rate hearings and presented their side of the case. Their contentions were overruled and the increases granted by the commissioners, after due deliberation. Then followed a series of rehearing petitions, all of which were denied.

The plan hatched at Oakland to vote on a municipal bus proposition at the next election has many backers, among them the Mayor and at least one city commissioner. Whether the suggestion would appeal to two-thirds of the votes is doubtful. Taxes are high in Oakland. They went up last fall. Sentiment favors their reduction. A million dollar bus bond issue, such as has been proposed, would undoubtedly raise taxes, and for this reason many would vote against it. The same thing applies to Berkeley and Alameda, which would probably be asked to aid the bond issue. Berkeley is conservative. A municipal bond issue for buses would be unlikely to receive even a majority in that city. Alameda is small and its vote would be unimportant, so far as the general result is concerned.

City Commissioner Frank Colbourn of Oakland has suggested that a survey be undertaken at once of the entire East Bay transportation problem.

Monorail Discussion Revived at Detroit

Discussion of the construction of an elevated monorail system at Detroit has been revived, and a new request of the Michigan Elevated Railway to construct an experimental system has been taken under advisement by the Detroit City Council. Representatives of the company, members of the Detroit Rapid Transit Commission and of the Department of Street Railways were present at a recent hearing at which the proponents of the elevated system stated that the company was prepared to finance the undertaking without assistance. It was also proposed to furnish an indemnity bond insuring the city against expenses and accidents.

Similar requests have been received by the City Council during the past several years and an adverse report was referred to which was made by the Rapid Transit Commission after it had studied the proposed system.

Seven Cents Sought in Elkhart

The Chicago, South Bend & Northern Indiana Railway applied to the Indiana Public Service Commission on Feb. 8 for authority to increase the cash fare on its Elkhart city lines from 5 to 7 cents and to sell tickets at the rate of four for 25 cents. The company sets forth that after the payment of its operating expenses, taxes and paving assessments for 1925 there was a deficit of $10,466 without making allowance for any return on money invested in the local system.

The company says, indicative of the necessity for the rate increase, that since the year 1916 the taxes on its property in Elkhart have increased 141 per cent; that since that year the cost of labor has increased approximately 100 per cent, and cost of material used in the maintenance and operation had increased approximately 85 per cent, that the cost of operating and furnishing that city service had increased approximately 100 per cent, and that in 1925 the railway suffered a decrease of $4,066 in its revenue from the street raliway lines compared with its average revenues for the period from 1921 to 1925 inclusive.

R. R. Smith, vice-president and general manager, said the company was forced to face the fact that it was impossible to continue longer the 5-cent fare in Elkhart. It was hoped the cost of operation would so recede that it could feel justified in continuing the 5-cent fare, but there seemed no likelihood of any recession in prices which would make that possible. He said the increase in the use of the automobile and the bus had seriously affected the earnings of the interurban line. The company published an advertisement explaining the situation.

Increase in Pay for Detroit Shopmen

A flat increase in wage of 5 cents an hour has been granted by the Street Railway Commission in Detroit to about 325 employees of the department's Highland Park shops. The men had asked an increase of 10 cents an hour, free transportation and a week's vacation annually with pay. The requests for free transportation and vacations were denied and the 5-cent increase was granted to the employees. The new scale included those who formerly received 80 cents an hour and those who received less than that rate but had been in the employ of the department two years or more.

A few weeks ago it was announced to the men that they would be permitted to work Saturday afternoons at the old rate of pay, but this arrangement was not satisfactory to them. They wanted an increased wage rate rather than a longer week with its increased amount. Only a few men took advantage of the opportunity at that time. The later recommendation of the general manager of the department that the men be allowed to work Saturday afternoons from Oct. 15 to April 15, if they wish, was adopted by the Street Railway Commission.

New Railway Line for Toronto's Suburbs

A joyous occasion was the opening some time ago of the Weston-Mount Dennis Street Railway under the supervision of the Toronto Transportation Commission, Toronto, Ont. Official ceremonies, followed by a parade, elaborate floats and congratulatory speechmaking, marked the happy day which brought the suburbs of York, Weston and Mount Dennis nearer the realization that some day they will be part of Toronto. The only lugubrious feature of the celebration was the carrying of the corpse of the old Toronto Suburban Railway, which formerly supplied service to these townships.

One hundred and fifty vehicles were in the parade. The line of march was through Mount Dennis to the northern limits of Weston, returning to the boundary line between Weston and York Township, where the official opening was held. A conspicuous part of the parade was on old horse-drawn car labeled "In Service Before 1891." Driving this was James Scott, who has served 33 years with the railway. After the old car came three of the modern red cars of the Toronto Transportation Commission carrying officials.

George S. Henry, Provincial Minister of Public Works, was the first speaker. He said that the occasion marked the passing of another milestone by the metropolitan suburbs of the city of Toronto. The fact that the Toronto Transportation Commission had undertaken to operate the transportation facilities showed the interest the city was taking in the suburbs. P. W. Ellis, chairman of the Toronto Transportation Commission, assured the people that the time would come when they would be part of Toronto. He said: "If a private concern were to take over the transportation it would lose money. But you are a good municipality and have fine borrowing powers. The agreement is fair to both sides."

Continuation Transfers in Irvington Not Needed

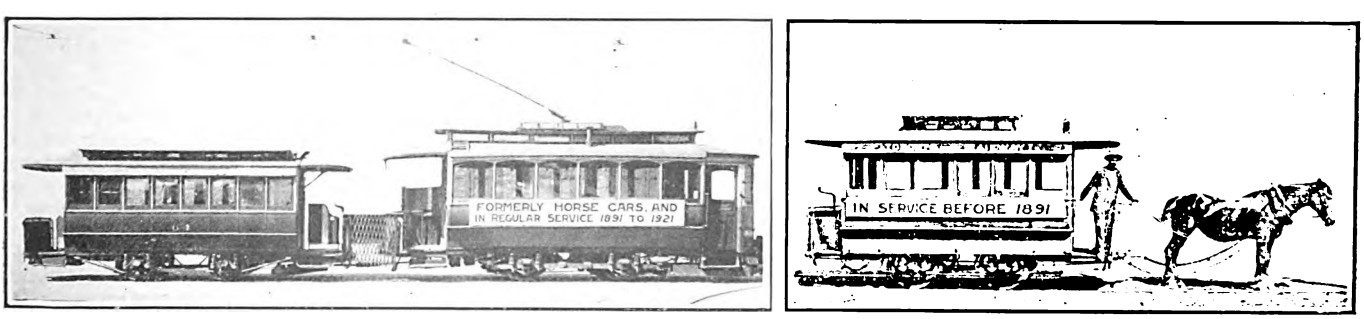
Issuance of continuation tickets by the Public Service Railway, Newark, N. J., from short route cars on Springfield Avenue to through cars has been held unnecessary by the New Jersey Board of Public Utility Commissioners. The town of Irvington sought to compel the company to grant continuation transfers without charge. It alleged that a person boarding a westbound car downtown after riding through two fare zones as far as Elmwood loop and desiring to reach a point west thereof would have to alight and pay an additional 5 cents to reach his destination.

The railway said that fare zones had been laid out in accordance with a plan intended to apply to the entire district and that to issue continuation slips would establish a precedent, cause undue hardship to one-man car operations and burden the company financially. It offered in evidence traffic checks to show that between 6 a.m. and midnight on a typical day 190 passengers arrived at the loop on 123 westbound car trips, but that only 24 transferred at this point to through cars.

$10,000,000 for Rolling Stock Suggested for Detroit

Within the next three or four years the Department of Street Railways at Detroit, Mich., should spend approximately $10,000,000 on new equipment and repairs to present equipment. H. U. Wallace, general manager, made this statement before members of the North End Progressive Business Men's Association on Feb. 16. This sum, Mr. Wallace said, could be paid from the earnings of the system without increasing the fare. At least 150 cars are obsolete and should be replaced soon. He said:

> These 150 cars outlived their usefulness long ago. They cannot be repaired and we are forced to keep them in service because we have no others to replace them. There are cars that should be scrapped or rebuilt, and others that should be repaired at once, about 750 in all.
>
> Even the Peter Witt cars are obsolete in some respects. They lack certain safety appliances which I consider essential, and the seats and floors should be changed. The seats are too hard and uncomfortable. We have found that leather upholstered seats have twice the durability of cane upholstered seats.
>
> As for the change in the manner of building floors, the new specifications for street cars call for battleship linoleum floors. These are easier to clean than the present wood slat floors, they add warmth to the cars, they have a better appearance, and they afford better footing for passengers in wet weather.
>
> It would not, however, be necessary to scrap these cars. They could be rebuilt and repaired.



An Exhibit that Appeared in the Line of March at Toronto

Wage Agreement in Cedar Rapids

Negotiations over the wage scale of railway operators employed by the Cedar Rapids & Marion City Railway, Cedar Rapids, Iowa, came to an end recently when the carmen agreed to renew a trial agreement of six months ending July 1, 1926. On that date they will get an increase of 2½ cents an hour, providing the company's revenues come up to the estimates made last summer in the city audit. If the increase is granted, it will be retroactive to Jan. 1, 1926. A similar agreement was made last July, but the company opened its books to show that business had not been as expected when higher fares were granted by the city and when the men were given one raise of 2½ cents last summer. The top scale is 52½ cents an hour for the carmen.

Pension Plan Under Consideration in Portland

At the annual banquet of the "Twenty-Year Club" of the Portland Electric Power Company, Portland, Ore., it was found that twelve of those present, including President Griffith, belong to the still more exclusive group known informally as the "30-year men." The combined years of service of the 278 members aggregate 6,661 years, and more than 50 new members have been added during the past year. The first woman to be admitted is Miss Annie I. Warnock, since 1906 assistant paymaster of the company. In two instances father and son are represented in the club, each having been with the company for 25 years.

Official announcement was made at the meeting by Franklin T. Griffith, president, that a general plan for an employees' pension system was under consideration by the company.

Philadelphia Will Not Appeal Fare Decision

City Solicitor Gaffney of Philadelphia, Pa., declared on Feb. 9 that no appeal would be taken by the city in the Philadelphia Rapid Transit Company fare case, in accordance with instructions received from Mayor Kendrick.

Mr. Gaffney said the city in its attack upon increased fares had for its objective the reduction of the company's operating expenses. He said that in a printed brief it had got together testimony in support of a drive principally against the amount of $8,560,400 set up each year since 1921 for maintenance and renewals, the 77 cents an hour wage payment and the federal income and other taxes.

The commission rejected the city's contention relative to the first two items and found in favor of the company. The reasoning of the commission in support of its findings, he said, had not shaken the conviction of the city in the soundness of its own contention. He referred to the case of the City of Scranton vs. the Public Service Commission, in which the city of Scranton appealed the decision of the commission. Mr. Gaffney quoted in part what Judge Porter said in this case: "We are of opinion, after mature consideration, that we are without authority to set aside a finding of fact by the Public Service Commission which is supported by substantial evidence where no constitutional question is involved." Mr. Gaffney said that that case had been followed and approved in a number of later cases.

The United Business Men's Association, which was a protestant in the fare case, has decided that it would not appeal the decision of the Public Service Commission in upholding the Philadelphia Rapid Transit Company's petition for maintenance of the 7½-cent fare.

Suburban Passenger Report at New York Due Soon

Governor Smith of New York has signed the Webb bill as Chapter 2 of the laws of 1926, extending to March 15, 1926, the time in which the commission created in 1925 to investigate and report upon the suburban passenger transportation problem of the city of New York must report to the Legislature.

Waukesha-Milwaukee Franchise Approved

The public utilities committee of the Common Council of Milwaukee, Wis., recently approved the application of the Milwaukee Electric Railway & Light Company for a franchise to operate the new Waukesha-Milwaukee high-speed electric line. A dispute was in progress for some time between the company and the City Council over the legality of this new high-speed line. After the company had secured a certificate of convenience and necessity from the commission, the city said that a franchise was necessary in view of the fact that the line would block numerous streets in the city. The company argued that the new line was in reality an extension of the present Clybourn Street line, and would be entitled to operate under the franchise granted in 1910. The company has not yet signified whether it will accept the grant.

Reorganized Company in Ohio Resumes Operations

The Nelsonville-Athens Electric Railway started operations on Feb. 8 between Nelsonville and Athens, Ohio. This is the new company which grew out of the reorganization following the abandonment of the Hocking-Sunday Creek Traction Company. This line had been in receiver's hands for months and was out of operation for weeks. It was sold late last year to E. B. Young, former general manager of the company, for $41,500. At that time the bondholders purchased the railway through Mr. Young, who said that he would resume operation of the system.

The company will operate a bus line as an auxiliary to the traction line. Buses will meet each interurban car and operate over a scheduled route in the city of Athens, Ohio, thereby giving hourly service over the principal streets of the city.

Service in Syracuse Explained

Education of the public to a realization of the company's imperative need of greater revenue by an increase in fares in Syracuse, N. Y., has been undertaken by the New York State Railways. The company has a petition before the Public Service Commission asking for a 10-cent cash fare rate and a rate of 7½ cents for ticket riders.

The advertising campaign which the company is promoting consists of a series of statements designed to arouse interest in the public utility.

One of the advertisements consisted of a condensed financial statement for the three years ended Sept. 30, 1923, 1924 and 1925. In 1923 the company had a shortage of $404,013. In 1924 it was $387,522, and for 1925 $388,543. One of the advertisements says in part: "A shortage of $1,180,079.42 in three years. How would you like to run a business that couldn't make a reasonable profit? In the face of these figures we believe that you will agree that your trolley company is giving far more than ordinary public service." In other statements the company has explained its business in detail, what the cost of public improvements meant, how much it cost to maintain service, how much of the fare goes for wages, and other pertinent questions.

Tired of Playing Tacoma Mayor's Game

The Puget Transportation Company, operating buses in Tacoma in competition with the lines of the Tacoma Railway & Power Company, at a recent meeting of its board of trustees, defied Mayor A. V. Fawcett to make good his reported threat to revoke the bus permits issued the company. The action is a step in the quarrel between the Mayor and the bus company, declared by company officials to be a political move on the Mayor's part. George Vandeveer, attorney for the company, charges the Mayor with a plan to purchase the Tacoma railway for the city and of using the company as a club to beat down the price of the street railway system. The trustees of the bus company state they will continue to operate the buses as long as it is possible, in the hope of salvaging something for the stockholders.

Utah Association Does Work of Mercy

The Traction and Power Mutual Aid Association, a body composed of employees of the Utah Light & Traction Company, the Utah Power & Light Company, Phoenix Utility Company and Western Colorado Power Company, held its annual meeting on Dec. 16, 1925, at Salt Lake City and elected officers for the ensuing year. The secretary's report showed that the association paid death claims of $6,000 during the year 1925, and for sickness, accidents and service refunds the sum of $4,656. A surplus of $14,303 was divided among the members in the usual form of a Christmas dividend of $15 each for twelve months membership and fractional time at the same ratio, 979 members participating in this.

Interurban Station Ordinance at Kansas City to Be Rescinded

At a meeting of the City Council of Kansas City, Mo., on Feb. 8 an ordinance was introduced into the lower house of that body with a view to repealing the franchise of the Central Interurban Station Company. The repeal ordinance was referred to the conference committee.

The original franchise, granted on Jan. 9, 1918, provided for a union interurban station at the northeast corner of Tenth and McGee Streets. The building was to have been a combined station and office building to cost $3,000,000.

Work on the proposed structure was to have been started by the station company within one year of the granting of the franchise. Two of the interurban companies which were to have participated in the plan met later with financial difficulties and the Kansas City Railways was placed in receivership. Officials of the terminal company secured two extensions of the time limit passed by the city fathers, but continued financial obstacles and the advent of many bus services, both in the city and between it and other cities in this vicinity, gradually caused the dream of the central interurban station to fade almost beyond recall.

In an interview several month ago, C. C. Peters, president of the company, admitted the improbability of the project's ultimate consummation, due to the much-altered general conditions in this section since the World War.

A part of the ground which was to have been the site of the station has been leased by the company during the last several months for a parking station, at an annual rental said to be little more than enough to pay the taxes and interest on the realty. No announcement has been made of plans for selling the property, in the event the franchise is repealed.

Rhode Island Railway Seeks Market for Surplus Power

In a bill filed with the Rhode Island Legislature authorization is asked for the incorporation of the United Electric Power Company at a nominal capitalization of $100,000. According to the petition, the new corporation would take over the power house and transmission lines of the United Electric Railways, Providence, and provide for the power requirements of electric railways, lighting, transmission and manufacturing purposes. The incorporators are Albert E. Potter, president of the United Electric Railways; Zenas W. Bliss, George H. Newhall, Harvey A. Baker, Ralph S. Richards, Edward B. Aldrich, J. Cuncliffe Bullock and Harold J. Gross, all directors of the United Electric Railways.

Bond Legislation Likely in New York

It seems likely that the Legislature will pass at the present session an amendment to the Constitution giving to New York City an exemption from its debt limit of $300,000,000 which may be raised by bonds for the building and equipment of subways. The original proposition was for an exemption of $275,000,000, but the legislative leaders are inclined to go a step further and give an additional $25,000,000 exemption. The measure will have to be repassed by the Legislature of 1927. It can then be submitted to the people and the money made available under its provisions for construction work in 1928.

Increase in Fare Sought in Albany

The United Traction Company, serving the cities of Albany, Troy, Watervliet, Rensselaer and Cohoes, N. Y., has filed application with the Public Service Commission to increase its fare from 7 to 10 cents, with the sale of thirteen tickets for $1. Hearing on the application will be announced at an early date.

Discussion of New Franchise in Richmond, Va., Renewed

Negotiations are being conducted between the City Council in Richmond, Va., and the Virginia Electric & Power Company for a blanket franchise covering all of the lines operated by that company. Some of the franchises which the company now has it considers perpetual. Others run to 1940. One expired on Jan. 1. It is the purpose of the company and the city to try to draft in conference a complete franchise satisfactory to both. One objection to some of the present franchises is that they specify the routes. Some also specify the headway. These conditions have prevented the company from improving the service as much as it otherwise might have been able to do. If the new franchise goes through, the company will probably reroute its cars down town and extend some of its rail and bus lines.

The law requires new franchises to be offered at public auction, but it does not require the city to accept the highest bid. The city is permitted to accept the bid it considers best for the city from every point of view.

News Notes

Will Rehear Fare Application.—The Pacific Electric Railway has been granted a rehearing by the Railroad Commission on its application for an increase in railway and motor coach fares in the city of Pasadena, Cal. The rehearing will be held before Commissioner Seavey in the court room of the commission at Los Angeles on March 16.

Pass System in Effect.—The Kingston, Portsmouth & Cataraqui Electric Railway, Kingston, Ont., started selling the first of the year a weekly pass for 75 cents.

One Day Off Bill Reappears.—Under the provisions of a bill introduced in the New York Senate by James L. Whitley, Republican, of Rochester, in which city the traction and bus company are operating under a service-at-cost-plus plan, the railroad law is amended to require operators of street surface railroads, trackless trolley or omnibus lines in cities or villages to give employees one day of rest in seven.

New Paper Appears.—The Jacksonville Traction Company, Jacksonville, Fla., started recently the publication of a pamphlet called the "Palm Leaf." It is to be issued every month for the benefit and entertainment of the employees. E. Q. Brown is editor.

Change in Name Desired.—At a recent special meeting held in Cleveland the directors of the Northern Ohio Traction & Light Company, Akron, Ohio, voted to change the name of the company to the Northern Ohio Power & Light Company. The action must be ratified by stockholders and a special meeting to act on the recommendation has been called for March 15.

Wages in Spokane Increased.—J. E. E. Royer, assistant general manager of the Spokane United Railways, Spokane, Wash., recently announced that an increase of pay for 218 railway men had been granted by the company to date from Feb. 1. The plan of the company to increase the pay of its street railway operating force came out in the hearing of the street car fare increase at Olympia, when officials of the company testified that $26,000 had been set aside for that purpose in the 1926 budget, or approximately $10 per month per man on an average. Mr. Royer said that the men were entitled to share in the fare increase; that the public had accepted the increase without protest and it was well that it should know that the men are to get a share of the slight addition to the fare. The fare settlement has been referred to in these pages.

Ten Cents in Belleville Allowed.—Efforts of City Attorney L. N. Perrin of Belleville, Ill., to prevent the East St. Louis & Suburban Railway from collecting a 10-cent fare on its cars in Belleville failed on Feb. 9 when United States Judge Lindsey in Chicago overruled a motion of the city for a modification of an injunction granted to the company several years ago. The injunction restrains the Illinois Commerce Commission from interfering with the rate charged by the company. The state commission was restrained on the grounds that the restrictions placed by the commission were confiscatory and in violation of the constitutional rights of the company. On Jan. 24 the fare in Belleville was advanced from 7 cents to 10 cents over the protest of the city officials. The city had sought to reopen the injunction case on the ground that the character of the company's business had changed since the granting of the injunction due to an extension of the Belleville city limits.

Refuses Request for Terminal.—The City Commission of Trenton, N. J., has refused the request of the Public Service Railway to establish a trolley terminal at Liberty and Adeline Streets to relieve traffic conditions at State and Warren Streets, more than a mile away. The refusal of the commission was based on the likelihood that traffic would become congested at the proposed new terminal.

Recent Bus Developments

Irresponsible Bus Operators in Massachusetts Must Go

Acting under the new law of 1925, which gives it jurisdiction over buses, the Massachusetts Department of Public Utilities has prepared a tentative draft of rules and regulations which will cover all the operations of the passenger-carrying buses in the state. This draft will be submitted to the interested parties for suggestions and criticisms and a public hearing on it will be given at the State House on Feb. 24. In brief, the commission takes control over the licensing of the buses, will require the filing and publishing of rates, will prescribe definite routes for all buses and will require a timetable, just as is done in the case of railroads and electric railways.

Every owner of a bus or buses to be operated in the public ways in Massachusetts, and doing an intrastate business either in whole or in part, will be required to obtain licenses and meet the bond and other requirements of each city and town in which they operate. A permit from the Division of Highways and a certificate of public convenience from the Department of Public Utilities will also be required.

The schedules to be filed must show the regular starting time, the time for passing certain points en route and the time of arrival at the terminal, and the rules say that no schedule shall be provided or maintained which will require unsafe and unreasonable speed. The rules will hold the buses to the schedules and to the defined routes, and if a bus fails to operate for a certain length of time it automatically loses the license.

The rules prescribe dimensions and weight of the buses, the strength of the cars, what the reserve equipment shall be, the degree of maintenance, and the condition of the equipment, types of tires, diagram of gear shifts and hours of service.

The regulations go into the subjects of conduct by the operators, application of the rules and penalties.

The rules will not be put into final form until after the public hearing. They are the first rules proposed for the control of the jitney or bus business in Massachusetts.

Bus Lines in New York City by July 1

Another step in the plan for New York City-wide bus operation was mounted on Feb. 17 when an amicable agreement was reached by the subcommittee of Mayor Walker's transit conference on the bus routes. Speaking for the sub-committee, which includes members of the State Transit Commission and the Board of Transportation, Joseph V. McKee, Aldermanic President, announced his belief that franchises for bus lines in all the boroughs would be awarded by the Board of Estimate within a few weeks so as to give the successful bidders sufficient time to acquire equipment to be placed in service on July 1, the date on which Mr. McKee believes city-wide bus operation can be effectively realized. This belief he announced at the close of a conference held in the City Hall, in which the Board of Transportation was represented by Commissioner Daniel L. Ryan and the Transit Commission by Commissioner LeRoy T. Harkness.

The routes, numbering 55 in four boroughs, will first be presented to the Mayor's transit conference and later to the Board of Estimate for official adoption. The President of the Board of Aldermen said that the routes adopted by the committee followed closely those recommended in the latest report by the Board of Transportation, of which John H. Delaney is chairman, together with the incorporation of certain of the modifying suggestions made by the Borough Presidents for routes in their respective boroughs. He intimated that while it might be found necessary to incorporate in the scheme some minor alteration, the principal features of the routes as suggested by the Board of Transportation had found favor with all in the "get-together" conferences.

With an agreement on routes assured, the question of franchises and general operating policies will be taken up. The problem, in Mr. McKee's opinion, lay in determining upon a policy of awarding borough-wide franchises for the most part or of awarding franchises for only partial borough operation to individual bidders.

Thirty-five-Mile Bus Line Proposed in New York

The Buffalo & Erie Coach Corporation a subsidiary of the Buffalo & Erie Railway, proposes to operate buses between Jamestown and Westfield, N. Y., over a route now served in part by a line of the Chautauqua Traction Company soon to be abandoned by permission of the State Public Service Commission. The proposed line would be 35 miles long. The bus company will apply for franchises at once to the Jamestown Council, it was announced, following a conference on Feb. 8 at Jamestown of citizens, representatives of the Broadhead traction interests and of the Buffalo & Erie Railway. The corporation agrees to carry no local passengers within Jamestown and between Jamestown and Asheville or intermediate points, this territory to be served by the Jamestown Street Railway, a Broadhead Corporation, when the Chautauqua Traction Company ceases operation.

Higher Fares Allowed. — Increased fare schedules have been ordered by the Indiana Public Service Commission for the bus line operated by the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., and a suspension of service was authorized on part of the line where losses have occurred. The new fares are based on a rate of 3 cents a mile.

Buses Suggested for Relief.—The use of buses to supplement the Municipal Railways of St. Petersburg, Fla., was recommended recently to the City Commission by R. E. Ludwig, director of public utilities. Mr. Ludwig advised the purchase of a fleet of buses to relieve street car congestion during the remaining months of the winter. Meanwhile the railway is being extended.

Competing Buses Removed. — Bus competition with the Weston-York Township-Toronto electric railway line operated by the Toronto Transportation Commission has been discontinued by official order as far as buses operating between Weston and Toronto are concerned. However, a bus line giving a service parallel to the railway from Toronto to a short distance outside the city limits continues in operation. The opening up of the Weston-York Township line has been referred to in these pages.

Buses Authorized in Fort Worth.— The City Council of Fort Worth, Tex., has adopted an ordinance by unanimous vote authorizing the Northern Texas Traction Company to operate buses in Fort Worth in connection with its railway system. No restrictions were imposed on the routing of the buses in view of the fact that their operation is an experiment.

Seeks New Bus Franchise. — The United Traction Company, Albany, N. Y., is seeking a franchise from the Albany Common Council to operate a bus line over New Scotland Avenue. An ordinance has been introduced in behalf of the company. The action of the Common Council must be confirmed by the Public Service Commission. The Albany Transit Company, an independent, is seeking a franchise to operate over the same avenue.

Supplementary Service Under Consideration.—The Birmingham Electric Company, Birmingham, Ala., is contemplating the operation of a number of modern passenger buses to supplement its railway service in several sections of the city. One of the proposed lines would run from East Lake to Huffman, replacing the Roebuck car line, while another would extend from Fairview to Bellview Heights. The matter is now being considered by the City Commission.

New Line in Burlington.—The Iowa Southern Utilities Company will start a temporary bus service in the spring following the authorization to establish a bus line in Burlington, Iowa, to supplant the present South Hill street car line. New buses, of the type now used on the Agency and Mount Pleasant-Bluff road lines are to be ordered, John H. Chase, resident manager, announced. It is said no further replacement of street car lines with buses is contemplated at this time. The company will remove its tracks and pay $12,000 in a series of installments to the city for relieving it of the responsibility of replacing the pavement.

Financial and Corporate

Milwaukee Does Well

$513,110 Increase in Net for 1925—Bus Earnings Represent Substantial Part of Transportation Revenue

Operating revenues of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., from transportation of passengers, freight and express for the year ended Dec. 31, 1925, were $10,615,589, an increase of 2.17 per cent over the year 1924.

Operating revenues of the electric and heating departments were $13,377,063, an increase of 9.92 per cent over 1924.

The percentages of operating revenues of the various utilities appropriated for maintenance and depreciation of physical property were as follows:

	Per Cent
Railway	23.07
Electric light and power	12.34
Heating	17.96

Net income available for the payment of dividends was $2,838,831.

Net capital expenditures for additions to and betterment of property during the year were $4,536,653, after deducting replacements and property withdrawn from service. The principal items have been summarized by the company as follows:

Railway utility	$1,373,212
Electric and heating utilities	1,143,357
Power and miscellaneous	2,020,083

Expenditures in the railway utility include principally the addition of new track at the end of the Vliet Street and First Avenue lines, betterment of approximately 13 miles of track in the city and suburbs of Milwaukee, including heavier type of construction to meet the heavier present-day traffic conditions.

The company acquired a private right-of-way from 35th Street and St. Paul Avenue in a general westerly direction through the Menomonee Valley and the town of Wauwatosa to connect with its present Watertown interurban line at a point just east of the Northwestern belt line crossover in the town of Greenfield. Grading work has been started and some trestle work erected. This improvement, when completed, will permit of a more direct route to the Land O'Lakes over the Waukesha-Oconomowoc-Watertown interurban line and will considerably shorten the schedule running time.

Nineteen new buses were acquired for passenger service on the Wisconsin Motor Bus Lines.

The company purchased a 99-year leasehold and option to purchase on property situated at the southeast corner of Sycamore and Second Streets, directly east and across the street from the Public Service Building. With this acquisition the company now controls a valuable site, which, at present, is being used as a central parking station in connection with the operation of its bus service.

During the year the company continued to obtain a substantial amount of its capital requirements from the sale of preferred stock offered to investors through its securities department.

At a special meeting held Dec. 21, 1925, the stockholders approved the recommendations of the directors that the authorized capital stock be increased from $40,000,000 to $80,000,000, to consist of $40,000,000 preferred capital stock and $40,000,000 common capital stock and that the par value of the common capital stock be changed from $100 a share to $20 a share.

Subject to the approval of the Railroad Commission the directors authorized the issue of $4,000,000 par value of additional 7 per cent preferred stock, of which $700,000 was issued to acquire the capital stock and notes of the Wells Power Company. Of the total amount of $11,000,000 of 7 per cent preferred stock now authorized, $6,896,900 had been issued and was outstanding as at Dec. 31, 1925, and $803,100 par value additional had been subscribed for on the installment plan. The company now has approximately 12,000 holders of its preferred stock, exclusive of subscribers to stock on the installment payment plan.

The only financing done by the company during the year 1925 consisted of the issuance of $1,696,700 par value of 7 per cent preferred stock placed for cash at par. The net additional 7 per cent preferred stock subscribed for under the installment payment plan during the year was $504,800; $150,000 of 5 per cent serial notes matured on July 1, 1925, and were paid; $225,000 of refunding and first mortgage bonds were retired during the year through sinking funds; $6,500,000 of consolidated first mortgage 5 per cent bonds matured on Feb. 1, 1926, and were paid, the cash required therefor having been obtained by the issue and local sale of preferred stock, the purchase of $3,750,000 par value of additional common stock by the North American Edison Company and by cash advanced by the latter company.

At a special meeting held on March 23, 1925, the stockholders voted to accept the "service-at-cost and municipal contract" ordinance passed by the Common Council of the city of Milwaukee on March 2, 1925, and accepted by action of the board of directors of the company on March 9, 1925. This ordinance was approved by the Railroad Commission on March 24, 1925. At the special election held April 7, 1925, the ordinance was defeated by referendum vote of the electorate of the city of Milwaukee and finally rejected.

It is explained that in the transportation revenues of the company there is included a very substantial amount derived from bus operation.

William W. Coleman, Milwaukee, has been elected a director and member of the executive and finance committee to fill the vacancies in these offices created by the death of John I. Beggs, former president of the company.

STATISTICS OF RAILWAY OPERATION AT MILWAUKEE

	1925	1924
Miles of track owned	419.28	418.72
Miles of track leased	1.90	1.56
Miles of revenue track operated	391.49	391.08
Revenue passengers carried	150,591,216	150,857,684
Transfer passengers carried	53,635,554	52,306,065
Per cent transfer to revenue passengers	35.61	34.67
Receipts per revenue passenger	$0.0677	$0.0664
Number of passenger cars owned	861	870
Number of passenger motor buses owned	124	107
Kilowatt station demand (railway and light)	166,200	146,900

INCOME ACCOUNT OF THE MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY

	1925		1924	
Operating revenues		$23,992,653		$22,559,912
Operating Expenses:				
Ordinary operating expenses	$14,415,619		$14,169,176	
Depreciation (reserve credit)	1,847,077		1,627,102	
Taxes	2,160,755		1,757,306	
Total operating expenses		18,423,452		17,553,585
Net operating revenues		$5,569,200		$5,006,327
Non-operating revenues		357,675		252,884

Interest Charges:				
Interest on funded and unfunded debt	$2,574,457		$2,454,117	
Interest on depreciation reserve balances	471,814		438,978	
Interest on other reserve balances	41,772		40,393	
Total interest charges		$3,088,043		$2,933,489
Net income		$2,838,831		$2,325,721

Gross Off, but Net Larger, in Indianapolis

Gross earnings of the Indianapolis Street Railway, Indianapolis, Ind., in 1925, the first full calendar year in which a 7-cent basic fare prevailed, were $51,806 less than in 1924. This was made plain in a report for the twelve months filed on Feb. 13 with the Indiana Public Service Commission. The gross last year was $5,536,369. The shrinkage is attributed to increased bus competition and a substantial decline in the total number of passengers carried owing to unfavorable industrial conditions experienced for a part of the year.

Despite the lower gross revenue, however, the report shows a net revenue of $487,741 for the year. In 1924 the net revenue was $484,965. Operating expenses were lower last year than in

Total deduction	$446,566	$430,000
Surplus	$41,175	$54,965

1924. Two quarterly dividends during the year were deferred. A condensed statement for the two years is presented in the accompanying table.

Rehabilitation of Detroit United Makes Progress

No financial statement has been issued by the receivers of the Detroit United Railway, Detroit, Mich., for the year 1925. It is probable that some report will be made to the creditors, but the stockholders do not now figure to any extent since their failure to finance the reorganization. Reports have been made for various committees, including those representing the bondholders, but no complete financial report has been issued. Progress in rehabilitating the system is reported by the Security Trust Company, Detroit, receiver. Economies in operation are being effected, but no prophecies are made about the outcome. Rumors of reorganization plans are heard, but nothing definite has materialized.

Another St. Louis Reorganization Move

Rolla Wells, receiver of the United Railways, St. Louis, Mo., on Feb. 13 applied to the United States District Court for permission to enter into a contract with the reorganization committee for the railway whereby $4,200,000 of receiver's certificates will be paid in full in cash and $4,100,000 of underlying bonds will be exchanged for general 4 per cent bonds.

The plan is to have the receiver pay $2,300,000 in cash and the reorganization committee $1,900,000 to take up the receiver's certificates. The underlying bonds would be surrendered by the present holders in exchange for 4 per cent bonds. The reorganization committee would receive $6,000,000 in general 4s for its cash and the underlying bonds to be taken up. There are now outstanding $30,300,000 of the general 4s.

The question of issuing the $6,000,000 of additional general 4s held up the reorganization of the company. There was a serious question about exchanging the underlying bonds for general 4s, but Sam Mitchell, counsel for the bondholders of the St. Louis Transit Company, recently told the court that this objection had been removed. The application of Mr. Wells substantiates Mr. Mitchell's statement. It also indicates that the railway properties will shortly be foreclosed under the $9,790,000 transit bond issue.

The receiver regards it as for the best interest of the company that an early reorganization be brought about and adds that a plan for a friendly foreclosure under the transit company 5 per cent mortgage has been arranged by financial interests of the company.

Outstanding underying bonds due since Oct. 1, 1923, include $1,474,000 of Lindell Railway, $1,640,000 of Cass Avenue & Fairgrounds and $986,000 of Merchants Terminal Railroad.

Disposition of Ohio Interurban Undecided

Sale of the electric light and power properties of the Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio, to the Cleveland Electric Illuminating Company, noted in the ELECTRIC RAILWAY JOURNAL for Jan. 23, page 174, naturally provoked questions about the probable disposition of the railway. It is understood now that this is a matter still to be decided. It will probably not work itself out until later. The electric light and power service was the more profitable of the two operations of the company. Since this end of the business has been sold it will remain for future developments to determine whether or not the railway service is to be continued. The railway operates 38 miles of track.

Commission Authorizes 13 Miles Abandoned in Chautauqua

The Public Service Commission on Feb. 5 authorized the Chautauqua Traction Company to abandon that part of its route between Ashville and Mayville, Chautauqua County, a distance of 13.4 miles. Two short sections of track of this company are to be retained, one section, from Lakewood to Ashville, being transferred to the Jamestown Street Railway and the other, in the village of Westfield, being transferred to the Jamestown, Westfield & Northwestern Railroad. The opinion of Commissioner Pooley, who heard the case, points out that the road has sustained substantial losses in every year since 1909, and it has not earned operating expenses in any year since 1918.

He said further that in the last abandonment proceeding it was claimed that the interests controlling both the Chautauqua Traction Company and the Jamestown, Westfield & Northwestern Railroad were diverting business from the traction company to the railroad, and while this claim was not made in this proceeding, the commission was in receipt of communications to that effect, with the intimation also that these companies were not receiving all revenues to which they were entitled by reason of the issuing of passes for free transportation to various persons. The commission has considered the facts and the evidence taken shows that the railroad has not been, and is not, earning its fixed charges; the deficit for the past two years being approximately $50,000 a year. As to free transportation it was shown that at the time the properties came under the control of the representatives of the estates of Messrs. A. N. and S. B. Broadhead, 120 passes were outstanding. This number has since been reduced to 40, and passes have been strictly confined to those who may receive them under the statute.

Syndicate May Purchase West Milton Line

A syndicate composed of residents and shippers living along its route is being organized to purchase the Dayton, Covington & Piqua Traction Company, West Milton, Ohio. The line was offered at a receiver's sale recently and no bids were made. The lowest bid possible for the line, which is 30 miles long, was fixed at $150,000. The syndicate, it was said, contemplates making arrangements with the special master in the receivership, and a new minimum rate may be set. Sale of the line must be approved by Federal Judge Smith Hickenlooper of the Southern district of Ohio before the sale can be consumated.

The commission authorized abandonment of the line a few months ago. In its petition for abandonment the company declared it had been operating at a loss due to automobiles and buses cutting down the patronage.

Receivers Sought for Rockford Properties

Suit for the appointment of a receiver for the Rockford & Interurban Railway and the Rockford City Traction Company, Rockford, Ill., because of non-payment of interest on bonds, has been filed by trustees on demand of the bondholders. The Union Railway, Gas & Electric Company is named a party to the bill. The petitioner is the Continental & Commercial Trust & Savings Bank, Chicago, trustees. The petition is returnable to the April term of court.

The two lines are subject to liens secured by bonds to the amount of $1,650,000. The first issue was in 1902 of $800,000 for construction of the railway and a further issue of $1,459,000 was made for equipment. From earnings, $574,000 bonds were purchased and set aside from time to time as a sinking fund. The entire issue was payable on Oct. 1, 1922, but an extension was arranged until Oct. 1, 1930, all holders, except those whose bonds totaled $32,000, accepting.

At that time, to prevent foreclosure proceedings and the loss of $400,000 of notes held against the company for equipment, the Union Railway, Gas & Electric pledged certain securities. These included notes for $83,675 and an open account for $374,857. Under the agreement for the extension, provision was made for annulment in case the company, as a party to it, did not pay the interest on the bonds. Payments were made until April, 1925, but in October of that year payment was again passed.

The Continental & Commercial Trust & Savings Bank, which is bringing action, has resigned as trustee for holders of the bonds against the interurban lines. The company, however, is still trustee for a $1,650,000 bond issue. In the name of the holders of these

Digitized by Google

bonds it is instituting the action. The bonds, originally issued to cover local properties and the Belvidere interurban line, also are a lien against the Rockford & Freeport and Rockford, Beloit & Janesville lines to the amount of $1,250,000, but no action is instituted in this case.

$99,929 Surplus at Pittsburgh

For the year recently closed the Pittsburgh Railways, Pittsburgh, Pa., reports a surplus of $99,929. Car riders last year paid an average of 5.77 cents for each ride, according to the railway. This compares with 6.62 cents as average fare for 1924. Weekly, Sunday and holiday passes were largely responsible for this reduction, and in the closing months of 1925 the average fare received was almost 29 per cent less than that for the same period the preceding year.

$1,700,000 in P. R. T. Certificates

Equipment trust certificates of the Philadelphia Rapid Transit Company, Philadelphia, Pa., to the amount of $1,700,000, bearing interest at 5 per cent and priced to yield about 4.75 to 5.35 per cent, are being offered by Dillon, Read & Company, New York. These certificates, known as equipment trust, series J, are issued under the Philadelphia plan and will mature in equal annual installments from Feb. 15, 1927, to Feb. 15, 1936. The purpose of the issue is to pay in part for new equipment to be constructed at a total of not less than $2,283,750. The equipment includes 50 standard double-truck vestibule street railway passenger cars, 75 double-deck motor coaches and 60 single-deck motor coaches. The par value of the certificates will represent less than 75 per cent of the cash cost of the equipment. Some facts about this equipment were given in the ELECTRIC RAILWAY JOURNAL, issues of Feb. 6 and Feb. 13.

Long Island Lines to Be Sold

The New York & Long Island Traction Company, New York, N. Y., will be sold at public auction at the County Court House at Mineola, L. I., on Feb. 25, following a ruling of the Supreme Court of Nassau County in pursuance of a judgment of foreclosure and sale brought by the Union Trust Company as trustee plaintiff. The property will be sold in five parcels, including franchises, rolling stock, real estate and certain trackage rights and personal property. The sale will also include the Long Island Electric Railway, which company is also controlled by the Long Island Consolidated Electric Companies. George Le Boutillier, vice-president of the Long Island Railroad, recently announced that the notice of the sale of these companies meant that operation of cars on both lines would be discontinued. The New York & Long Island Traction Compnay operated 41 miles of line, connecting Mineola, Garden City, Freeport and other important points on Long Island and the Long Island Electric operated 25 miles of line connecting Brooklyn and Far Rockaway.

Suit to Hold Up Seattle-Rainier Sale

Fight by Rainier Valley residents to block a referendum vote on the purchase by the city of the Seattle & Rainier Valley Railway was delayed in the Superior Court, when Judge Malcolm Douglas granted the motion of Arthur Schramm, assistant corporation counsel, for a continuance of the hearing on the show cause order issued against City Comptroller Harry W. Carroll. Judge Douglas did not set a definite time for the hearing.

Even if the court action had not been brought, the referendum could not go before the voters at the March 9 election owing to the legal requirement that its validity must be certified 45 days before a regular election. When the referendum is submitted to popular vote, if such proves to be the case, it must be at a special election.

Rainier Valley residents obtained a temporary restraining order preventing the City Comptroller from certifying the petitions to the City Council and restraining the making of a report on the petitions to the Council. The opponents of the referendum proposed assert that the petitions are illegal, that only the petitions which were filed on Dec. 26 and which contained only approximately 4,000 signatures are legal.

Quarterly Earning Statements in Philadelphia. — The income account statement of the Philadelphia Rapid Transit Company, Philadelphia, Pa., heretofore prepared and printed monthly for the information of stockholders, will hereafter be issued quarterly to coincide with the dividend period on P.R.T. common stock. The next income account statement will accordingly be issued during April for the first three months of 1926.

Deficit in 1925.—For the year ended Dec. 31, 1925, the gross income of the Portland Railroad, leased by the Cumberland County Power & Light Company, of Portland, Me., was $1,451,902, against $1,582,264 in 1924. The operating expenses and taxes for 1925 were $1,178,574, against $1,294,781 the year previous. The net income was $25,730 in 1925, against $39,885 in 1924. After the consideration of dividends, which for both years amounted to $99,950, operation in 1925 resulted in a deficit of $74,220, against a deficit of $60,065 in 1924.

Judgment of $110,535 Against Urbana Line.—Settlement of the affairs of the Kankakee & Urbana Traction Company, Urbana, Ill., is progressing rapidly. Judge Smith recently approved the report of the master, without objection, entering judgment for $110,535 against the road and directing its immediate and absolute sale. The date, however, has not yet been set. T. B. Webber, vice-president and secretary of the line, was recently appointed receiver. The property includes trackage and right-of-way from Urbana to Paxton, four cars and a station at Rantoul.

Loan Authorized.—The Indiana Public Service Commission recently approved a petition of the Hammond, Whiting & East Chicago Railway, Hammond, Ind., to negotiate a $20,000 loan and to issue three notes of $24,766 each. The notes will be taken by the Chicago City & Connecting Railways collateral trust. They represent a refunding of the unpaid balance of money advanced to the issuing company in 1918 by the United States Housing Corporation to extend lines and to buy new equipment for increased service to factories engaged in war work.

Business of Railway Concluded.—A decree approving the findings of the receiver in the case of the Alamance Railway and ordering distribution of funds was received recently to be filed in the office of the clerk of the Western North Carolina District Court at Greensboro, N. C. The decree is concerned with the winding up of the affairs of the company and distribution of funds to the bondholders, for whom the American Trust Company, Richmond, Va., is acting. The Alamance Railway formerly operated a street railway system in Burlington and Alamance and between these two towns. Cars have not been run for several years.

Net Income in Worcester, $349,735.—The net income of the Worcester Consolidated Street Railway, Worcester, Mass., for the year ended Dec. 31, 1925, was $349,735, or $7.77 a share, compared with $362,504, or $8.05 a share, in the preceding year. As of Dec. 31, 1925, current assets were $1,208,420 and current liabilities $569,129, leaving net working capital of $639,291. For the quarter ended Dec. 31, 1925, net income was $223,895 after charges, equivalent to $4.97 a share on the 45,000 shares of capital stock outstanding, compared with $53,144, or $1.18 a share, in the corresponding quarter in 1924.

May Discontinue Electric Line.—Contending the service is being operated at a loss of $5,000 a month, the Missouri Pacific Railroad contemplates the discontinuance of the Coal Belt Electric Railway, Marion, Ill. It is reported attorneys for the railroad are preparing briefs to present their case before the Illinois Commerce Commission to discontinue the service. The Coal Belt Electric Railway, operated by the Missouri Pacific, a steam road, is 14 miles long, extending through Marion, Herrin, Carterville and Energy.

Easements Should Be Included in Valuation.—An opinion has been given the Maryland Public Service Commission by Thomas H Robinson, Attorney-General of Maryland, holding that easements should be included in the commission's valuation of the property of the United Railways & Electric Company, Baltimore. Following shortly after the ruling the United made an announcement that no matter what valuation was placed on the property there would be no increase in fares. The present fare is 7½ cents. During the hearings Clarence W. Miles, people's counsel, said that if easements were included it was probable that he would take the case into the courts. Before the commission took any action it sought the opinion of the Attorney-General. Mr. Miles will make a close study of the ruling before he decides what action to take. The United placed a valuation of almost $18,000,000 on easements during the hearing.

John H. Hanna President Capital Traction

Chief Operation Official of Washington Property Made Executive Head of the Company

John H. Hanna, vice-president in charge of operations of the Capital Traction Company, Washington, D. C., for the last ten years, has been elected president to fill the vacancy created by the resignation of George E. Hamilton. His advancement will become effective on March 11, the date of Mr. Hamilton's resignation.

It has, indeed, been a strong combination of talent, this association of Mr. Hamilton and Mr. Hanna on the Washington property. George E. Hamilton knows finance and the law as

J. H. Hanna

few other men do. Equally as much can be said of Mr. Hanna about his familiarity with engineering and his knowledge of transportation. Under the new arrangement of personnel the responsibilities of the two men are readjusted, but the association remains, for, as explained elsewhere in this issue, Mr. Hamilton continues as chairman of the executive committee.

George E. Hamilton makes no pretensions to being a street railway man as that term is generally applied. Neither does Jack Hanna, for that matter. No man, however, can escape the estimate put upon him by his contemporaries. In the case of Jack Hanna that estimate places him well up at the top, if not actually at the top. For 32 years now he has served the one company, a company that reflects, more than do many others, the ideas and ideals of a single officer, now made its head. If ever a property were well kept up, it is the Capital Traction. Remember, too, that it is an underground conduit road. As for the cars, they are the last word in both appurtenances and appearances. Jack Hanna was one of the first men in the industry fully to appreciate the pulling power of paint with the public. He is more than an operator—he is a pioneer. As one instance of this there is the use under his direction of the bus in de luxe service to Chevy Chase, treated in the ELECTRIC RAILWAY JOURNAL for Feb. 13.

It has not all been operation with which Mr. Hanna has had to deal in Washington. Legislators down there may be remiss about other things, but they never lose sight of the fact that Washington is the nation's capital. Civic spirit knows no limit. This is commendable, but it is also distressing at times. Commissions have a say in everything, for there is no elected government. It is in just such situations that Jack Hanna is a diplomat among diplomats. His public relations are of the very best. He is well known and well liked, two things that appear always to go together but do not always do so. With the boys of the district Jack Hanna is aces high, as they say. He is a member of the executive committee of the Washington Council of the Boy Scouts. As a matter of fact, there is not much that is planned for this organization in which Mr. Hanna does not take a hand.

Relation of this particular activity of the man may appear to be far removed from railway operation. It is. But every man is a composite. Few live by bread alone. Jack Hanna likes to fish and he likes to play golf. One of these predilections testifies to the ability of the man to amuse himself when thrown upon his own resources—a great test in this age—and the second testifies to the ability of the man to amuse himself when thrown on somebody else's resources.

Mr. Hanna has long been active in affairs of the American Electric Railway Association. He was president of the Engineering Association 1913-1914, and in addition to being a member of the executive committee in 1925 he had a prominent part in tre work of many other committees. Included among these were the 1925 committee of the mid-year meeting and dinner arrangements, of which he was chairman, the committee on national relations and the committee on subjects and meetings. He was the association's national councilor to the United States Chamber of Commerce. This year he is a member of the executive committee and chairman of its membership committee and chairman of the sub-committee of the national relations committee on depreciation.

After leaving college Mr. Hanna engaged in steam railroad engineering work and then entered the service of the Washington & Georgetown Railroad, predecessor of the present traction company. The following year he was appointed assistant superintendent and four years later became superintendent and assistant engineer of the company. In 1909 he was appointed chief engineer in charge of all construction and maintenance. Then in 1916 he became vice-president.

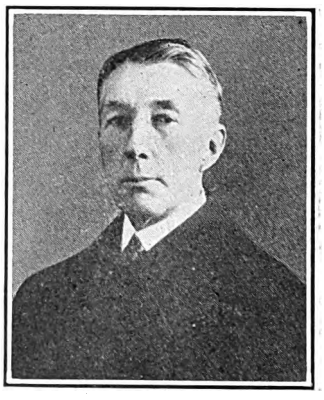
Mr. Hanna was born in Henderson, Ky., in 1871. He acquired his early education in the high and private schools of his home town, and was graduated from Princeton in 1892 with the degree of civil engineer.

C. C. Castle in New Post

Executive Well Known in Equipment Field Joins New American Car & Foundry Motors

C. C. Castle will become actively associated with the American Car & Foundry Motors Corporation on April 1. At that time he will sever the business affiliation with B. A. Hegeman, Jr., which has extended over a long period. For years one of the most outstanding figures in the railway field, Mr. Castle will carry to his new association an enormous amount of prestige and of good will. The name Charlie Castle is a byword on the lips of both old timers and newcomers alike in the industry.

He has been associated with Mr.



C. C. Castle

Hegeman ever since May, 1910, and the milestone of each passing year has testified mutely to the progressive activity of that well-known partnership. As first vice-president of the National Railway Appliance Company, vice-president of the Hegeman-Castle Corporation, vice-president of the Anglo-American Varnish Company and one time vice-president of the Genesco Corporation, Rochester, N. Y., the force of Mr. Castle's personality has long made itself felt. Lately, the press of duties has made it impossible for him to continue as vice-president of the Genesco Corporation and he accordingly resigned from that office and became the secretary of the corporation.

Mr. Castle has for years taken an active interest in the affairs of the electric railway industry. While the American Electric Railway Manufacturers Association was still in existence, he served as president of that organization. He is a manufacturing member of the executive committee of the Railway Supply Manufacturers Association, a member of the finance committee of the New York Railroad Club and a member of the New England Street Railway Club. He belongs to the Railway Club of New York and is a member

Digitized by Google

of the admissions committee of the Lotos Club of New York.

Prior to his association with Mr. Hegeman, Charlie Castle was vice-president of the Hildreth Varnish Company. In fact, these have been the two principal business affiliations of his long and active career. He was born in Syracuse, N. Y., on a date known only to himself. He early exhibited a penchant for railway affairs. At the age of sixteen he entered the employ of the Merchants Dispatch Transportation Company, Syracuse, N. Y. After a brief period spent in this work, he became attached to the Sherwin-Williams Company and remained with that company for approximately three years. Then came an offer of an opening with the Hildreth Varnish Company and the growth of his extraordinarily wide acquaintanceship throughout the railway field.

R. J. Ritchie Advanced by Fitkin Interests

Ralph J. Ritchie, operating vice-president of the Jersey Central Power & Light Company, southern division, has been transferred to the New York office as operating manager of Fitkin Utilities under the management of the General Engineering & Management Corporation.

Mr. Ritchie's new assignment is a promotion for meritorious service. To him was assigned the difficult task of consolidating the various properties which now comprise the Jersey Central southern group. He had been a year and a half in the territory.

As operating manager Mr. Ritchie will have reporting to him the supervisors of the group divisions of Fitkin utilities.

George E. Hamilton Resigns at Washington

George E. Hamilton has resigned as president of the Capital Traction Company, Washington, D. C., effective March 11, which will be the eighteenth anniversary of his election to that office. His resignation was presented at a meeting of the board of directors on Feb. 11. It was accepted with the understanding that he would continue to serve the company as general counsel and as chairman of the executive committee. Mr. Hamilton gave as his reason for resigning his desire to devote more time to professional employment and personal matters.

When Mr. Hamilton took over the presidency of the Capital Traction Company in 1908 he succeeded the late George P. Dunlop. Mr. Hamilton continued, however, as senior member of the low firm of Hamilton, Colbert, Yerkes & Hamilton. Prior to his assuming the presidency of the company he was a director and legal representative in Washington City of the Baltimore & Ohio Railroad and lecturer on wills and legal ethics in the Georgetown Law School, of which he was formerly dean.

In his official resignation he said the eighteen years of his official life had been "eventful ones in the history of our company—years filled with difficulties overcome, dangers avoided and with fair accomplishment in a safe and useful direction."

W. H. Kennedy Auditor for Chicago Surface Lines

W. H. Kennedy has been appointed auditor of the Chicago Surface Lines, succeeding J. J. Duck, resigned. R. E. Eddy has been promoted from the position of auditor of receipts, which he has held for the past six years, to the position of assistant auditor.

Mr. Kennedy went to the Chicago property from the Western United Corporation at Aurora. Previous to that he was for five years assistant treasurer of the Savannah Electric & Power Company, Savannah, Ga. He has been connected with Stone & Webster properties for 25 years, serving, in addition to those mentioned, with the Lowell Electric Light Corporation, Lowell, Mass.; Edison Electric Illuminating Company, Brockton, Mass.; Electric Light & Power Company, North Abington, Mass.; Cape Breton Electric Company, Sydney, N. S.; Keokuk Electric Company, Keokuk, Iowa, and the Houghton County properties, Houghton, Mich.

W. H. Kennedy

Previous to his Chicago connections Mr. Eddy served with so-called Hodenpyl-Hardy companies, including the Springfield Consolidated Railway and the Springfield Gas Company, Springfield, Ill., of which he was assistant secretary; Kalamazoo Gas Company, Michigan Light Company and Consumers' Power Company at Kalamazoo, Mich.

R. E. Eddy

The positions of general auditor, auditor of receipts and auditor of disbursements, the latter held by I. C. Shellenberger, have been discontinued by the Surface Lines.

It is understood that Mr. Duck's status with the Chicago City Railway remains unchanged.

"Pop" Shepherd's Record

Versatile Employee of New Jersey Road in Service Thirty-five Years

Look to your laurels, men in electric railway work who pride yourselves on your records of continuous service in the industry! William H. Shepherd, Jersey City, doesn't actually challenge you, but his record is attracting much attention in New Jersey. Thirty-five years in the railway business with Public Service Railway and predecessor companies—that's the record of Mr. Shepherd. He started Jan. 9, 1891, as a conductor in Jersey City on the Erie Street horse car line of the Jersey City & Bergen Railway, and he is now assistant to the general superintendent of Public Service Railway.

Working as a conductor on various lines of the Jersey City & Bergen Railway and later the Consolidated Traction Company until 1894, Mr. Shepherd was then appointed an inspector. Subsequently, he was starter at various carhouses in Jersey City for the Consolidated Traction and the North Jersey Railway. When the Public Service Railway started in 1903 Mr. Shepherd took a position in the employment office in Hoboken, later was a clerk in the Hudson Division office and in 1904 was transferred to the time-table department. The headquarters of the company were moved to Newark that year and Mr. Shepherd went along to take a position in the passenger agent's department, soliciting special car business. The following year he was transferred back to the time-table department, also in Newark, and remained there until 1923, when he was appointed to his present position. Mr. Shepherd started in the time-table department as a clerk and rose to the position of assistant superintendent of the department.

Popularly known among the trolleymen as "Pop," Mr. Shepherd organized the Public Service Railway Athletic Association and was active in promoting track and field sports, baseball leagues and pool tournaments. The first annual outdoor meet of the association was held in 1912 at Hilton oval, near Newark, and an indoor track meet was held in the Fourth Regiment Armory, Jersey City, the same year. His own ability as an athlete qualified him for this work. In those days he wore the silks of the Scottish-American A. C. Later he joined the Wayne A. C. and gradually changed from distance runner to sprinter, hurdler and jumper. His best mark for the 100-yard dash was 10.1; for the standing broad jump, 10 ft. 3 in., and the standing high jump, 4 ft. 11 in., the latter two marks being made indoors.

As an indication of the popularity of Mr. Shepherd with the rank and file in Public Service Railway, it is recalled

Digitized by Google

that in 1915, when a New York newspaper conducted a contest to determine the most popular railway man in the Metropolitan district, Mr. Shepherd not only won first prize—a trip to the San Francisco Exposition, with all expenses paid—but, through the loyal support of the trolley men of the Public Service he polled 3,000,000 votes, beating his nearest competitor by almost 1,000,000.

Mr. Shepherd is a member of the veterans' organization of the Fourth New Jersey Infantry. He was a captain in the Fourth Infantry on the border during the Mexican trouble in 1916, and among his treasures is a watch fob given him by the enlisted men of his command, a further proof of the high esteem in which he is generally held.

W. L. Briar Made Shop Supervisor at Kansas City

W. L. Briar has been appointed shop supervisor of the Kansas City Railways, Kansas City, Mo., reporting direct to R. S. Neal, assistant superintendent of equipment. All shop foremen now report to Mr. Briar. To correlate the shop and division mechanical work, all division foremen report to Mr. Briar on all mechanical repairs and replacements. Reports, records, etc., are handled through the office of the assistant superintendent of equipment, with materials handled through the office of supervisor of materials.

Dean W. Flowers, formerly general superintendent for the St. Paul Gas Light Company, has joined the engineering staff of the American Light & Traction Company in San Antonio, Tex. That company at one time controlled the St. Paul Gas Light Company and now owns the San Antonio Public Service Company and other utility organizations.

H. G. Milson has been appointed director of personnel of the Toronto Transportation Commission, Toronto, Canada, replacing Dr. S. G. Mills, who has returned to private practice. W. H. C. Seeley, who served for some time as assistant to Dr. Mills, has been appointed assistant director of personnel.

Henri Camp, general secretary of the Union Internationale de Tramways, de Chemins de fer d'Intérêt Local et de Transports Publics Automobiles, has resigned to engage in business. The executive committee of the association, which is made up of electric railways and bus lines in western Europe, has appointed in his place André de Backer, engineer. Mr. de Backer's appointment dates from Jan. 1, 1926.

Paul Kayser, widely known in newspaper and business circles in Wisconsin, has joined the staff of the Milwaukee Electric Railway & Light Company to take charge of publicity work.

J. M. Markham, general agent of the Northwestern Mutual Life Insurance Company, has been elected president of the City Railway, Dayton, Ohio, succeeding Valentine Winters, who served as president since 1921 and has also been a member of the board for years. Mr. Markham accepted the nomination of the board only under condition that the position be an honorary one and that it carry no compensation. Heretofore the office of president carried a salary of $15,000 a year.

F. P. Snyder General Manager of Oakwood Street Railway

Fred P. Snyder has been appointed general manager of the Oakwood Street Railway, one of the five railway companies entering the city limits of Dayton, Ohio. In announcing his appointment directors of the company said that his experience made him the logical man for the position. Mr. Synder was appointed superintendent of transportation and equipment of the Oakwood Street Railway a few years ago, after several years in charge of the shops. For many years prior to his association with the railway he was associated with the Barney & Smith Car Company, Dayton. He brought to his railway position a thorough knowledge of car building, maintenance of rolling stock and technical data on electric transportation.

F. P. Snyder

Ed Crawford was recently elected secretary-treasurer of the Shreveport Railways, Shreveport, La. Mr. Crawford is the son of the late Captain Crawford, who was vice-president of the company and one of the pioneers in the Southern transportation field. Captain Crawford was succeeded by Ed Jacobs.

Obituary

Donald McColl

Donald McColl, formerly general manager of the Shanghai Electric Tramways, Shanghai, China, died recently at Seaford, England. For a number of years he was connected with the Glasgow Corporation Tramways, but he left that position to go to Lisbon to become traffic superintendent and chief accountant of the tramways there. Later he returned to England and assumed the position of general assistant to his old Glasgow chief, the late John Young, who at that time was general manager of the London Underground Railways. Mr. McColl took part in the electrification and reorganization of the Metropolitan District Railway, and in the starting and development of three new tube railways in London. In 1908 he was appointed to the Shanghai tramways, owned by a British company. Under his management the tramways there were developed and transformed into a profitable undertaking. Mr. McColl was the author of a standard work on tramway bookkeeping and accounts.

Thomas E. Leahey, superintendent of the line department of the Public Service Railway, Newark, N. J., is dead. He was 59 years of age. Mr. Leahey entered the street railway field in 1889, when he became a lineman for the Newark Passenger Railway, one of the predecessors of the Public Service. When the several street railways merged to form the present traction company Mr. Leahey remained as an employee of the new corporation.

Anthony B. Calvin, well known as an attorney, at Youngstown, Ohio, died from heart disease on Feb. 7. For many years Judge Calvin was counsel for the Youngstown & Suburban Railway. He was born in Mahoning County on March 13, 1877, grew up on his father's farm and was educated in the district schools of the county. He was graduated from Northeastern Ohio Normal College at Canfield in 1897 and in 1900 from the law school of Ohio State University. Following this, he was admitted to the bar and had practiced his profession in Youngstown since that time.

David T. Goff, general roadmaster of the Southern Ohio Public Service Company, Columbus, Ohio, died recently at his home in Newark, Ohio. He had been associated with electric railways from the time of the first interurban lines in Ohio. He helped in the construction of the city lines in Newark and Zanesville and interurban lines connecting Columbus, Newark and Zanesville. With the exception of seven years during which he served as a motorman with the Ohio Electric Railway, he has been in the construction and maintenance of way department of the Ohio Electric Railway and its successor the Columbus, Newark & Zanesville Electric Railway and later the Southern Ohio Public Service Company. He was 64 years old.

Carter Miller, advertising manager of the Timken Roller Bearing Company, Canton, Ohio, is dead. Mr. Miller went with the Timken Company six years ago and was promoted rapidly to various positions both in the field with the Timken Roller Bearing Service & Sales Company and at the home office with the Timken Roller Bearing Company. Later he was placed in charge of the advertising department. Mr. Miller was born in Bay City, Mich. He attended the elementary schools in that city and was graduated from Kenyon College at Gambier, Ohio, in 1919. In the business world he was recognized as a keen analyst of advertising and business problems. His advice and counsel were frequently sought in a consulting capacity in matters connected with advertising and in solving publicity problems.

Oil Men Have Their Say

A Material Stiffening of Prices Is Anticipated—More Uniform Production for the Future

Characterizing as mere propaganda for big advances in prices the statements that the petroleum reserves of the country are in immediate danger of being exhausted, an official of one of the larger oil producing companies declared that such an eventuality need not be looked for now or in the near future. What the industry needs more than anything else at the present time, in his opinion, is a movement toward permanent stabilization of prices and production. The disastrous slumps in oil and gasoline prices and the periods of inordinate profits are alike unjustified.

This applies with telling force in the case of the railways. Whether oils are purchased on a basis of the gallon or on the basis of mileage, it is undesirable to be subjected to heavy fluctuations from one year to the next. The stabilized basis for prices will be arrived at only when all of the larger companies in the field have seen the light and have called off their respective entrants from the "industrial dog fight."

Prices, under this new order of things, will not be low. However, the quality of oils sold will average considerably higher and the various grades will be more uniformly standardized. It is often the case, at present, that an operator using a certain grade of oil will find enormous variations from one delivery to the next. This does not make for economical operation and for proper maintenance procedure. The distributing oil companies cannot be entirely blamed for such a condition at the present time, since the oils are obtained from such widely divergent spots and are produced under varying conditions.

This condition was mentioned by one official as an argument for a monopolistic control of the industry. Only under such an arrangement, he feels, can the shoestring operator be excluded, along with his production of oils of doubtful quality. Whether or not the companies which exercised this control would be content to allow prices to remain at a reasonable level is open to conjecture. However, in a free country, there is nothing to prevent the entrance of outside capital into drilling ventures, in case the leaders become unduly obstreperous in handling the situation.

Two are not one as yet, since one company is predicting an immediate stiffening of prices on both oils and gasoline, while another cannot see any prospect of such a move in the near future. The weight of opinion seems to favor the former view, however, although no one apparently anticipates a major advance within the next few months.

Oil companies are looking with considerable interest upon the ever-increasing adoption of co-ordinated bus and trolley service by the railways. Since the oils used in buses are of a much higher quality than the grades required for street car operation and, further, since buses require vastly larger quantities of oil than do their adopted cousins, the cars, it is quite natural that this new business should look very tempting to the producing companies. While the exigencies of bus lubrication are very complex, as compared with the trolleys, and require much careful study so that they may be properly handled, great strides have been and are being made in this direction.

S. M. Curwen Heads J. G. Brill Company—Other Officers

At an organization meeting of the board of directors of the J. G. Brill Company, Philadelphia, Pa., held on Feb. 11, the following officers were elected: President, Samuel M. Curwen; vice-president, James W. Rawle; treasurer, Edward P. Rawle; secretary, Edmund L. Oerter.

H. W. Wolff, vice-president of the American Car & Foundry Company, was elected a director to fill the unexpired term of Stephen J. Simon, resigned. The selection of Mr. Wolff gives the American Car & Foundry Company five of the nine members of the J. G. Brill Company board. This is in line with the recent formation of the Brill Corporation, a merger on the J. G. Brill Company and American Car & Foundry Company's motor subsidiaries. The Brill Corporation is controlled by American Car & Foundry.

The present personnel of the J. G. Brill Company board is as follows: Samuel M. Curwen, E. P. Rawle, Francis A. Lewis, W. Clarke Mason, W. H. Woodin, W. M. Hager, C. S. Sale, W. C. Dickerman, H. W. Wolff.

Electric Locomotives Now Completely Built in Japan

Japan is making rapid strides in the development of her home industries. As an illustration of this comes the announcement that the Kawasaki Shipbuilding Yard is now manufacturing electric locomotives for use on Japanese railroads. These machines are claimed by the makers to be purely Japanese in all materials, no parts having been imported for use in their erection.

In August last the yard received an order for four 25-ton electric locomotives from the Nippon Denryoku K. K. Two of these were delivered in December and the remaining two are now under process of construction. In addition orders are on hand for twelve units ranging from 41 tons to 73 tons. These will be delivered to various railways in the country, the largest order, for five 55-ton locomotives, going to the Fuji-Minobu Railway.

ELECTRIC RAILWAY MATERIAL PRICES—Feb. 16, 1926

Metals—New York

Copper, electrolytic, cents per lb.	14.275
Lead, cents per lb.	9.125
Nickel, cents per lb.	35 00
Zinc, cents per lb.	7 875
Tin, Straits, cents per lb.	64.25
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	56 00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$5.00
Somerset mine run, Boston	2 30
Pittsburgh mine run, Pittsburgh	2.05
Franklin, Ill., screenings, Chicago	1.575
Central, Ill., screenings, Chicago	1.125
Kansas screenings, Kansas City	2.30

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.95
Tie plates (flat type), cents per lb.	2.25
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.25
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.35

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (28 gage), cents per lb.	3.25
Sheet iron, galvanized (28 gage), cents per lb.	4.50
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	12-18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13-17.50
Colored	10-14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.*	11.70
White lead in oil (100 lb. keg), cents per lb.	15.50
Turpentine (bbl. lots), per gal.	$0.97
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4-6

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	16.00
Rubber-covered wire, No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, cents per lb.	17.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$147
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.10
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.875
Light copper, cents per lb.	10 00
Heavy brass, cents per lb.	7.375
Zinc, old scrap, cents per lb.	4 75
Lead, cents per lb. (heavy)	7 625
Steel car axles, Chicago, net ton	$17.75
Cast iron car wheels, Chicago, gross ton	17 25
Rails (short), Chicago, gross ton	17 75
Rails, (relaying), Chicago, gross ton	25.50
Machine turnings, Chicago, gross ton	9.00

*The method of selling linseed oil on a gallon basis has been changed and all sellers now quote on a pound basis.

Data on New Equipment for South Bend

Specifications on a considerable number of cars and electric locomotives ordered some time ago by the Chicago, South Shore & South Bend Railroad, Chicago, Ill., have just become available. This road, now an Insull property, has embarked upon an extensive campaign of modernization and the new rolling stock, which is detailed here, constitutes an important move in this program.

Regular passenger equipment ordered consists of ten combination baggage and passenger motor cars seating 44; six cars with inclosed smoking compartments, seating 48, and nine passenger cars without special modifications, seating 56. These cars are being built by Pullman Company. They were ordered on Aug. 1, 1925, for delivery on June 1 of this year. The specifications follow:

Seating capacity	56
Weights:	
Car body	62,500 lb.
Trucks	32,000 lb.
Equipment	25,500 lb.
Total	120,000 lb.
Bolster centers, length	38 ft. 0 in.
Length over all	60 ft. 0 in.
Truck wheelbase	7 ft. 0 in.
Width over all	9 ft. 9½ in.
Height, rail to trolley base	14 ft. 4⅜ in.
Body	Steel
Interior trim	Mahogany
Headlining	Steel
Roof	Arch
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Standard Steel, heat treated
Car signal system	Faraday single stroke bell
Car trimmings	Adams & Westlake
Side bearings	Stucki
Compressors	D-3-F
Control	Westinghouse
Couplers	Tomlinson
Curtain fixtures	Railway Curtain Supply
Curtain material	Pantasote
Destination signs	Electric Service Supplies
Gears and pinions	Nuttall
Hand brakes	Peacock
Heater equipment	Peter Smith and Railway Utility
Headlights	Electric Service Supplies
Journal boxes	Symington
Lightning arresters	Westinghouse
Motors	Four Westinghouse No. 567-C-7, inside hung
Paint	Chicago Varnish
Sanders	Ohio Brass
Sash fixtures	O. M. Edwards
Seats	Hale-Kilburn
Seating material	Chase Frieze Plush, grade C
Slack adjuster	Westinghouse
Springs	Baldwin Locomotive Works
Step treads	Stanwood self-clearing
Trolley base	Westinghouse
Trolley shoes	Miller
Trucks	Baldwin
Ventilators	Railway Utility
Wheels	Steel, 36 in. A. R. A.
Special devices	One Westinghouse pantograph per car

Special rolling stock ordered includes two parlor-observation trailers with seating capacities of 21 and two dining car trailers seating 24 passengers. These units were ordered in December from the Pullman Company and are to be delivered in July. The specifications follow:

Length over all	64 ft. 0 in.
Truck wheelbase	11 ft. 0 in.
Width over all	9 ft. 9½ in.
Body	Steel
Headlining	Steel
Roof	Arch
Air brakes	Westinghouse
Axles	Heat-treated
Car signal system	Faraday
Car trimmings	Bronze
Side bearings	Stucki
Control	Westinghouse
Couplers	Tomlinson MCB
Curtain fixtures	Railway Curtain Supply
Curtain material	Pantasote, silk lined
Hand brakes	Peacock
Heater equipment	Peter Smith and Railway Utility
Headlights	Electric Service Supplies
Journal bearings	Plain
Journal boxes	Symington
Paint	Chicago Varnish
Sash fixtures	O. M. Edwards
Seats	Pullman chairs
Seating material	Leather
Slack adjuster	Westinghouse
Step treads	Stanwood
Trucks	Commonwealth Steel Co., six-wheel
Ventilators	Railway Utility
Wheels	36-in. A.R.A.

Four locomotives are also being constructed for this road. Baldwin Locomotive Works is the builder and delivery is expected to be made on June 1. They were ordered Sept. 21, 1925. Specifications for these units are given here:

Weights:	
Body and trucks	102,379 lb.
Equipment	57,621 lb.
Total	160,000 lb.
Bolster centers, length	18 ft. 4 in.
Length over all	39 ft. 4 in.
Truck wheelbase	8 ft. 8 in.
Width over all	10 ft. 7 in.
Height, rail to trolley base	12 ft. 1½ in.
Body	Steel
Air brakes	Westinghouse
Axles	Standard Steel
Compressors	Two Westinghouse D3-F
Control	Westinghouse
Couplers	Tomlinson M.C.B.
Gears and pinions	Nuttall, grade B-P
Hand brakes	Peacock
Heater equipment	Railway Utility
Headlights	Electric Service Supplies
Journal boxes	Symington
Lightning arresters	Westinghouse
Motors, type and number	4 Westinghouse No. 3553
Motors	Inside hung
Sanders	Ohio Brass, Form 1
Springs	Baldwin
Trolley base	Westinghouse
Trolley wheels or shoes	Miller and Pantograph
Trucks	Baldwin
Wheels (type and size)	42-in. tired
Special devices, etc.	Sirocco blowers, fan for motor ventilation

New Merger in Rubber Field

Financial interests of the Hewitt Rubber Company, Buffalo, N. Y., and the Gutta Percha & Rubber Manufacturing Company, New York and Brooklyn, have recently been merged. At a reorganization meeting held in Buffalo, N. Y., F. E. Miller was elected president of the Gutta Percha & Rubber Manufacturing Company, John H. Kelly and Amadee Spadone were elected vice-presidents and W. J. Magee became secretary and treasurer. The reorganization is the first step in the removal of the company's plant, office and other facilities to Buffalo. The company will continue the manufacture of corded fabric tires and mechanical rubber goods. It is expected that the personnel of the two merged companies will remain unchanged.

Turbine Drive for Boiler Feed Pump

Numerous advantages in favor of the use of turbine-driven boiler feed pumps are shown in the report of the Toledo, Bowling Green & Southern Traction Company, Findlay, Ohio. A year ago the company replaced two steam pumps with one General Electric 60-hp., style D-51, two-stage turbine-driven centrifugal pump. The total annual saving has been $663, a return of 28.9 per cent on the investment. The pumps are now held as standby.

Although the new unit has 50 per cent greater capacity than the two previous pumps, it occupies only one-fourth the floor space. Its water rate is approximately 20 per cent less than the water rates of the Duplex pumps. The turbine has required no repairs, whereas the pumps averaged $235 a year for repairs and renewal of parts. Only one-fifth as much time is now required for attendance, and the oil consumption has been cut from one gallon a day to one-half gallon a month. The turbine operates with a minimum of noise and vibration.

Temporary Relief for Shortage of Equipment in Detroit

Detroit Department of Street Railways has been authorized by the City Council to rent from the Peoples Motor Coach Company, a subsidiary of the Detroit United Railway, ten single-deck 25-passenger motor coaches on a basis of 8 cents per coach-mile.

H. U. Wallace, general manager of the D.S.R., is quoted as recommending the rental of the coaches until such time as the department is in position to add to its own equipment. The department is having difficulty to give proper service on existing coach lines due to lack of sufficient equipment. A large number of the street cars still in operation by the D.S.R. that were taken over from the Detroit United Railway are reported to be in very poor condition, and this condition enhances the need for new equipment including both street cars and motor coaches.

Mack Sales to Traction Companies

Among recent sales of Mack buses to electric railways by the International Motor Company are the following:

Beaver Valley Motor Coach Company, New Brighton, Pa., one 25-passenger city type, for operation between Leetsdale, Ambridge and Beaver Falls. Zone fare system, 5-mile route, 10 cents per zone.

Savannah Electric & Power Company, Savannah, Ga., one 29-passenger city type, trolley substitution in Savannah. Fare, 7 cents.

Twin City Motor Bus Company, St. Paul, Minn., seven 230-in. chassis, Eckland bodies, for operation between Minneapolis and St. Paul, a 12-mile route at a 25-cent fare.

Los Angeles Railway, Los Angeles, Cal., three 230-in. chassis, for operation at a 5-cent fare over a 3.06 mile route on Alvarado Street.

Yakima Valley Transportation Company, Yakima, Wash., a subsidiary of the Union Pacific Railroad, one 29-passenger city type, for operation on the Summit View line in place of trolley cars over a 3-mile route at a 10-cent fare.

Utah Light & Traction Company, Salt Lake City, Utah, one 29-passenger city type to operate as a feeder to trolley line over a 6-mile route between Sugar House and Mill Creek for a 10-cent fare.

Boston Elevated Railway, Boston, Mass., three 29-passenger city type, for operation on Boston and vicinity routes.

Rochester Railways Co-ordinated Bus Line, Rochester, N. Y., part of New York Railway System, one 25-passenger city type bus.

Cincinnati Gets 54 Buses

Cincinnati Street Railway is purchasing 29 Mack buses, equipped with Bender bodies; eighteen Six-Wheel chassis, with Kuhlman bodies, and seven Schacht chassis, the bodies for which have not been determined. Permits were issued on Feb. 18 for operation on all bus lines except route H.

Samuel M. Curwen Sees Enlarged Market for Transportation Vehicles

President of New Brill Corporation Outlines the Advantages of Recent Merger—Expresses Confidence and Optimism Relative to the Electric Railway Situation—Sees Dawn of New Era of Usefulness and Prosperity

AN INTERVIEW

By Charles Gordon

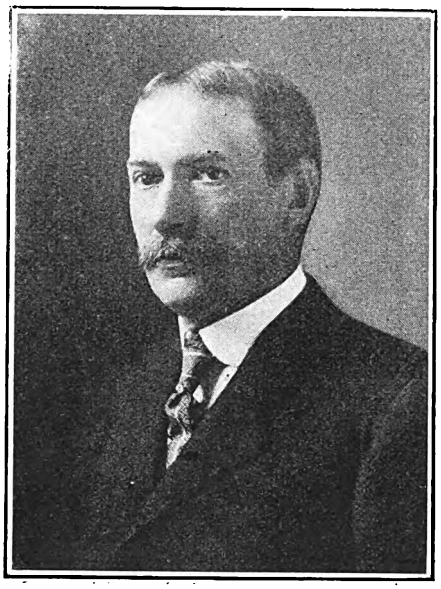
IT IS significant that the recent combination of Brill and American Car & Foundry resources comes at a time when the electric railway industry is just entering a new era; when concrete evidence is available of the opportunity for intensive development of facilities, and when interest in improved electric railway equipment is growing rapidly. The new Brill Corporation, which Samuel M. Curwen now heads as president, links enormous financial and manufacturing facilities for the construction of all forms of common carrier transportation—steam, electric and automotive vehicles for both highway and rail operation.

What are the advantages of this combination to the purchasers of electric railway cars and equipment?

How will it affect the design, manufacturing and sales organizations of the several companies controlled by the new Brill Corporation?

Are any changes contemplated in the character of work at the various Brill plants now building electric railway cars?

Does this consolidation indicate a belief that the electric railway field has arrived at a point where its recovery and expansion may be hastened by mustering to its service greatly expanded design, manufacturing and merchandising facilities?



Samuel Curwen

Outlines Plans of Company

Back of every great development is a strong personality. History itself is only a record of the lives of the men who made it. So, also, in following the development and expansion of great industrial enterprises, back of the physical framework and shell of the structure there is found a dominating personality which supplied the imagination, courage, will power and driving force to rear it and give it life. There the man is found.

The industry is naturally interested at this time in getting the viewpoint of Sam Curwen, as he is best known among his many close friends. Although busily engaged in clearing up the details connected with the present changes, he consented to outline the present plans of the companies now brought together and in addition expressed a view of the electric railway situation which in itself radiates confidence and optimism for the future.

To the purchasers of electric railway equipment, the advantages of the recent merger, while indirect only, are nevertheless of outstanding importance at this particular time, according to Mr. Curwen. The new Brill Corporation, control of whose common stock rests with the American Car & Foundry Company, is primarily a holding company, organized to take over the various subsidiary plants that are thus drawn together for greater co-ordination of effort. In this combination are included two groups of properties. One group consists of the J. G. Brill Company, with its subsidiaries — the G. C. Kuhlman Car Company, in Cleveland, the American Car Company, in St. Louis, the Wason Manufacturing Company, in Springfield, Mass., and the Cie J. G. Brill in France. The second group consists of the new American Car & Foundry Motors Company, made up of the Hall-Scott Motors Corporation and the Fageol Motor Car Company of Ohio. By drawing together these large facilities for the production of both rail and highway transportation equipment, he pointed out, additional impetus will be given to the development of both forms of vehicles.

RAPIDLY growing confidence in the electric railway situation and interest in the improvement of electric railway equipment give added significance to the recent merger of Brill and American Car & Foundry resources. This is the first of a series of interviews with car builders and other prominent manufacturers regarding the outlook for the industry.

Mr. Curwen shed further light on the plans for the immediate future. These do not contemplate any material changes in the functions of the various plants. While the future may dictate the combination of the present automotive rail car and bus body products of the Philadelphia and Cleveland plants of the Brill Company with the other automotive activity of the American Car & Foundry Motors Company, no changes of this character are contemplated for the present. He indicated that the products of the Philadelphia plant, the Fageol Company of Ohio and the Kuhlman plant in Cleveland will continue to be offered to the trade.

The J. G. Brill Company, Mr. Curwen explained, will continue its long-established policy of building electric cars and their trucks for both domestic and export shipment. Through many years these products have become known and have built up a reputation throughout the world. The process of development and improvement will be continued. The extent to which this has been carried on in the past, he pointed out, is attested by the many patents granted the company covering devices developed by its engineers for improving the performance of cars and increasing the comfort afforded passengers. The seaboard location of the Philadelphia plant and the facilities for shipment of electric railway and self-propelled cars adapt it admirably for export business.

So far as present plans contemplate, the four present Brill plants are considered to be so situated in their respective territories as to avoid unnecessary heavy freight charges in the shipment of their products to electric railways in various parts of the country. It seems logical that this territorial arrangement will continue to be advantageous.

Mr. Curwen expressed the utmost confidence in the future of the electric railway industry. He declared that there is no intention of subordinating electric railway car development and

Digitized by Google

production to bus or self-propelled cars. Through the combination of interests represented, it is the intention to develop and cultivate intensively every form of public transportation on steam railroads, electric railways and highways.

Buses to Play Important Part

Since the manufacture of buses looms as an important part of the new company's activities we passed to that subject. Mr. Curwen held that the extent to which the bus may in the future be applied as part of the transportation system of the country is as yet a matter for conjecture. He pointed out that the bus has been definitely proved to have an important part to play in feeder service and through districts where a de luxe service at higher fares than mass transportation agencies is desired. In new territories, where the character of future development is uncertain, the flexibility of the bus offers an opportunity of extending transportation service at minimum initial expense until such time as the volume of riding justifies the investment in rail and overhead line. Its more economical operation, and its apparent superiority of facilities for quick loading and unloading of passengers, makes the use of the street car imperative where the volume of riding approaches mass transportation conditions.

This answer was made to a question regarding the extent to which Mr. Curwen expected to see the bus play an active part in the future local transportation scheme of the country. But he went further. He pointed to increased parking congestion difficulties in large cities as a reason for a growing field for application of de luxe bus service at substantially higher fares than electric cars, and predicted that there would be a large increase in demand for such transportation agencies to replace the use of private automobiles for travel in the congested portions of large cities. There was little doubt in Mr. Curwen's mind of the future usefulness of the bus.

Has Intimate Knowledge of Car Development

Here the discussion centered more definitely on the electric railway car and the future of the industry itself. Mr. Curwen's knowledge of cars, trucks and equipment comes from detailed contact with their design, construction and operation. Prior to 1891, when he became a general salesman for the Brill Company under John A. Brill, he had worked his way through the drafting department to the position of chief draftsman. From the position of salesman he became assistant general manager and in 1903 was made general manager. In 1908, upon the death of John A. Brill, he became first vice-president, and in 1912 succeeded James Rawle to the presidency.

Not even after he was carrying heavy executive responsibilities did Mr. Curwen relinquish close contact with the improvement of the company's products. Careful study of the operating problems of the industry enabled him to foresee its requirements and resulted in the development of many of the valuable patents owned by the company.

With this background of experience to draw from, I sought his opinion on the status of car design and on the outlook for the electric railway industry.

"The car exhibits at the Atlantic City convention last fall to my mind showed that the electric car can be made as attractive as the automotive vehicle," he said. "It is necessary, however, in refining the electric car to bear in mind that its service is to the masses, and that while a part of the public would be willing to pay the higher rate of fare necessary to maintain such refinements, it is questionable whether passengers generally are not more interested in reaching their destinations with the quickest dispatch. While comfort is important, it is subordinated to the other functions of the electric car in handling large crowds quickly."

"What, in your opinion, is the outlook for electric railway car purchases during 1926?" I asked.

"From present indications the outlook is very promising and the large number of inquiries for new cars shows a tendency on the part of electric railways to recognize the advantages of up-to-date equipment. With the knowledge that it will be profitable to replace many of the obsolete cars now in service and with convenient financing facilities available, it is probable that electric railways will retire this year many of the cars which they know are costing them much more to operate in comparison with new equipment than the interest requirements on the investment in new cars."

How the operating managements in the industry can co-operate in bringing about improved design of cars and in lowering manufacturing costs seemed an important angle of the subject. In Mr. Curwen's opinion, precedent and purchasing methods have much to do with this question. He pointed out that it has been traditional in the industry to specialize in types of rolling stock to suit individual ideas of design. This, he explained, is not economical. Car builders are willing to build whatever the customer wants, provided the latter is prepared to pay the additional cost of special design and construction. He indicated that manufacturing costs would be lowered by more uniformity in design.

Interurbans Have Important Place

Our discussion closed on the subject of the outlook for the interurban lines of the country. Mr. Curwen was optimistic in his view of their future usefulness, except of course in those instances where conditions did not warrant the construction of lines in the first place. He pointed to the examples of roads in which the application of light-weight and modern equipment by greatly decreasing the cost of operation has resulted in vast improvement of situations formerly held to be hopeless. He is convinced that the spread of this process to other properties will be followed by a period of renewed prosperity and usefulness for many interurban lines. He held that the ease of maintaining schedules and the comparatively high degree of safety of the interurban make it a transportation agency which, with proper facilities, has a valuable function and service to perform.

Rolling Stock

Cleveland Railway, Cleveland, Ohio, has before the Council for action a program of improvement totaling $5,000,000 which calls, among other things, for the purchase of 100 new cars and a similar number of buses.

British Columbia Electric Railway, Vancouver, B. C., intends to order some new equipment. One authority states that the equipment will probably consist of four two-car trains and eight single cars.

Hydro Electric Railways, Toronto, Canada, is awaiting delivery of twelve cars for Windsor offered to the radial department of the Provincial Hydro Commission under $10,000 each. The cars have been inspected and pronounced suitable for use in Windsor. Five new cars have also been ordered by the company and will be delivered in three or four weeks.

Municipal Railway, San Francisco, Cal., plans to purchase fifteen or twenty cars, at a cost of $255,000 and $340,000 respectively.

Union Traction Company of Indiana, Anderson, Ind., through Arthur W. Brady, receiver, has prepared a petition asking authority to purchase sixteen buses. The approximate cost will be $135,000. The purchase will include eleven of the large type passenger buses that have been in use on the Hoosier Stage line. The five others are to be buses for use on city lines in Muncie and Anderson, Ind. The transaction has been sanctioned by the Indiana Public Service Commission and all that now remains to complete the deal is the sanction of the Circuit Court at Anderson.

New York Railways Corporation is contemplating the purchase of 25 additional buses for experimental purposes in the co-ordination of bus and trolley service. These buses will be single-deck units of the same general type as the sample bus which was designed by the company last summer and described in detail in ELECTRIC RAILWAY JOURNAL of Sept. 5. No franchise has been received for the regular operation of buses as yet, but the application has been filed for some time.

Track and Line

Binghamton Railway, Binghamton, N. Y., will construct an extension along Floral Avenue in Johnson City from Askley Avenue to Riverside Drive. The evidence showed that the village authorities, the residents of Floral Avenue and the company have agreed on the paving of the street and the extension of the trolley line under its franchises. The Public Service Commission has approved the extension.

Philadelphia Rapid Transit Company, Philadelphia, Pa., has submitted plans for laying a double track on Erie Avenue from Second Street to Torresdale Avenue and on Torresdale Avenue to Frankford Avenue. The track extension will provide a cross-city route for the accommodation of the public in the northeast section.

Speeding Up Railway Operation Helps Local Merchants

ELIMINATION of automobile parking in congested districts will aid retail business rather than injure it. That is an old story to the experienced transportation men of the electric railway industry, but the local merchants usually refuse to believe it. Without taking the trouble to analyze the situation carefully, the average storekeeper jumps to the conclusion that his trade will suffer if customers are not allowed to park their automobiles in front of his door. That the users of public transportation vehicles outnumber the users of private vehicles in the ratio of three or four to one is overlooked.

In Pittsburgh, however, the experiment of prohibiting all parking on certain downtown streets was made in the early part of last year and the results have demonstrated that the apprehension of the merchants was groundless. Checks made by the research department of the Pittsburgh Railways show that there has been a substantial reduction in the running time of street cars since the new parking restrictions have been in effect. Detailed figures are published elsewhere in this issue. It is even more interesting to note that the downtown retail trade has prospered more than that in the outlying sections since the change was made. Industrial depression which prevailed during 1925 resulted in a slight decrease in trade throughout the Pittsburgh district. In the downtown section, however, the effect was less noticeable than in the district as a whole, the volume of business being only 0.8 per cent lower than in 1924, whereas for the entire area the decrease was nearly 3 per cent.

The conclusion seems fairly obvious that the downtown merchants prospered by the enactment of traffic regulations that made it easier for the majority of people to reach their stores. This result is probably no different from that which has followed the establishment of similar regulations in other cities, but Pittsburgh is particularly fortunate in being able to establish the fact by such convincing figures.

New Cars Are Desirable Because They Will Earn More

REPLACEMENT of 28,000 electric railway cars has seemed to some persons such a radical proposal that in certain quarters it has been questioned. "We cannot throw away more than a third of the rolling stock of the industry," say these managers. "How can we finance the purchase of new cars for the purpose when money is not to be had for much-needed extensions?"

Such an attitude naturally does not take into account the real purpose of the plan for using new cars instead of old. No one contends for a moment that these cars can or should be replaced all at once. It will tax to capacity all the car building plants in the country for several years to carry through such a program, to say nothing of the new cars which are needed for extensions of service.

The real point is that new cars are urged because they will earn their keep. Cars twenty years or more old were built prior to the development of modern equipment and devices, and before steel was used to any considerable extent in framing. Nearly all such cars are heavy for their carrying capacity. Platforms, doors, aisles and step heights were not designed to get riders in and out quickly or efficiently. Provisions for fare collection are inadequate. The trucks and motors are relatively inefficient. Then, too, with twenty years or more to their credit they are not able to give the quality of service they once could, nor to operate at the same cost for maintenance.

It can be shown easily that new cars are an economy. Mr. Storrs has done that in several addresses. Mr. Budd in his Indianapolis paper before the Central Electric Railway Association not only gave a few examples of what new cars have done, but he listed a dozen roads that have increased their revenue, both gross and net, in the past five years. A factor of no inconsiderable importance in each case was the substitution of new cars for old. What does the cost of new cars matter if the net revenue can be increased materially due to their use?

Merger of Electric Railway and Bus Manufacturers Should Speed Co-ordination

TRANSPORTATION men should view with favorable interest the recent consolidation of the American Car & Foundry, Brill and Fageol interests. Here large builders of steam railroad and electric railway cars have added to their interests a going bus manufacturing business of considerable size and importance. The new company now stands in the unusual position of being prepared to sell transportation vehicles of practically every type now seriously considered. The principal men in the new company have wide experience in their respective fields. By combining their knowledge and financial resources as they have, the way is opened for constructive thinking of the kind that should prove helpful to the industry at this time.

Never before in the history of the transportation industry has there been more need for care in the selection of the type of vehicle to be used, particularly in local systems. While engineers may estimate the results to be anticipated with this or that method, it remains for the builder to produce the vehicle which will carry out the proposal. It has been seen repeatedly that such elements as vehicle weights and operating speeds spell the difference between success and failure. The manufacturers' engineering committee, recently formed

Digitized by Google

under the auspices of the American Electric Railway Association by car builders and equipment men, can do much in pointing out these things. But the result must necessarily lie with the company that actually builds the equipment.

Consideration of the bus in connection with many of the problems of local transportation makes it essential that its use be given careful study and fair and unbiased treatment. For the first time a manufacturer is in the position to build either cars or buses as desired. This gives it the opportunity to study in a practical and unbiased way the advantages and the limitations of each method of transportation under different operating conditions. This it can do if it will reveal its findings without fear or prejudice. By grasping its opportunities it is in an enviable position to aid the movement for co-ordination and modernization of transportation methods. Through the wide and diversified experience of its personnel, it can give a greater measure of constructive help than was possible when the companies were divided and operated individually.

Skillful Public Relations Work Made Part of a Rehabilitation Program

METHODS by which transportation revenue has been increased 65 per cent in three years on the Chicago, Aurora & Elgin Railroad are told of elsewhere in this issue in the first of several articles describing the rehabilitation of the property. Many factors have contributed to the development. The territory is a highly competitive field in which four steam railroads operate suburban service in addition to that provided by the electric line. It has been necessary, therefore, to use every available means of building up the traffic.

Of greatest importance in the success which has attended the efforts of the company has been the really high-class service rendered by the Aurora-Elgin line. Many new and modern cars have been bought. Track has been thoroughly rehabilitated, using stone ballast in place of gravel. Old stations have been spruced up and attractive new stations built. Power facilities have been improved. Signals and additional crossing protection devices have been installed.

Besides the great improvement which has been made in the physical plant, skillful work has been done in fostering good public relations. Among the interesting steps taken in this direction might be mentioned the issue of special low-rate homeseekers' tickets. These have been used to encourage residents of Chicago to go out into the Aurora-Elgin territory to examine its possibilities as sites for future homes. Many people whose first knowledge of this electric railway was acquired in this manner have now become regular patrons.

Commutation tickets have furnished another means of cultivating public relations. Whenever a new name appears on the list of buyers of monthly tickets, the management sends a special message of greeting expressing the hope that the new ticket buyer will find the service satisfactory and requesting his co-operation in finding ways to improve it. In case an old name disappears from the list of commutation ticket buyers a representative of the management calls to find out why the former user has dropped out. In this way many minor shortcomings of the service have been discovered, and by the exercise of tact and diplomacy former customers have been won back to the railway. The possibility of copying these particular methods does not exist on every railway, but alertness to take advantage of the opportunities that do exist, however, will usually do much to improve public relations and build up traffic.

Boston Figures Deserve Careful Study

LIGHTLY to pass over the record of the Boston Elevated Railway for 1925 as disclosed by the digest of the annual report in the issue of the JOURNAL for Feb. 13 would be a mistake for others engaged in the work of the industry. That report as presented by the public trustees to the state reflects not only the record of the road itself, but it contains in its statisics many unit figures that are of immeasurable value for comparative purposes. Of the value of these to him each reader must judge for himself. Aside from all this, however, there are certain points which should perhaps be emphasized.

Of particular interest is the attitude of the company on the matter of buses. The management is ready to furnish bus service wherever it appears desirable to do so. It might at first be thought that this was only a generality, but that is not so when the record of increase from 63,937 bus passengers in 1922 to 2,472,456 passengers in 1925 is considered. The chartered bus is also becoming a factor at Boston. Of interest, too, is the plan made for parking automobiles outside of congested centers and inducing their users to journey into the city on the car lines. Particularly proud are the trustees of the record that shows that only 12.7 per cent of the passenger cars now in service on their lines are more than twenty years old compared with the fact that of the 82,340 cars in the United States in similar service 34 per cent are of greater age. The accident record also reflected the intensive work that is being done to decrease the hazard to the passenger.

One of the saving features at Boston is that a broad discretion is vested in the trustees to change the rates of fare when necessary, but their acts are subject at all times to the principle of service at cost. True, $2,327,816 is due to the cities under the provisions of the public control act that if in any year the established rates of fare do not meet the cost of service and the reserve fund of $1,000,000 is used up, then any loss above that amount will be paid over by the state to the trustees. Any such amount paid by the state is assessed upon the cities and towns in which the lines are operated in proportion to the number of persons in such cities and towns using the service at the time the payments are made by the state. If, in later years, receipts exceed the cost of service, any amount in the reserve fund in excess of the $1,000,000 with which it was started is paid over by the state to be repaid to the cities and towns until any assessments have been repaid. Thereafter, any such excess remains in the reserve fund until needed to meet the cost of service. Fares are then to be reduced as described above.

These are terms that have been stated many times before. Sight should not be lost of them in any study which is made of the mass of data contained in the report of the trustees as presented to the Legislature.

Digitized by Google

Under the conditions that prevail at Boston it was no ordinary performance on the part of the management that resulted in the showing of $502,195 in 1925 as the balance of receipts above the cost of service compared with a deficit of $636,696 for 1924. In fact, the more one studies all the circumstances the more is the truth borne home that the residents of Boston are the real subjects for congratulation.

Staggered Hours Again Proposed to Relieve New York Transit Situation

RELIEF from the almost intolerable conditions on the rapid transit lines of New York is proposed by the Health Commissioner and the head of the Transit Commission through the adoption of the staggering of working hours. The plan was proposed in Washington and in New York during the war, and was actually put in practice for a short period in each city. Its use was abandoned, largely because the workers had not accustomed themselves to the adjustments necessary in their daily routine. In Washington it is said that the difficulty of obtaining negro maids who would prepare breakfast at several different periods had much to do with the disfavor into which the plan fell.

Outside of the transportation industry, it is not generally realized that peak-load conditions have become much worse during the past few years. Evidence to this effect is readily available, however. Study of the load curves of a number of the large electric generating stations illustrates in a striking way the change that has taken place. Between 1920 and 1925 there has been a marked improvement in the load factors of stations which supply no railway power, while in the case of generating stations serving the electric railways the load factor has become worse during this period.

Undoubtedly the present situation is a serious one. Congestion in the streets, overcrowding of transportation vehicles, excessive investment cost for equipment needed only in rush hours and uneconomic use of power station facilities all indicate the imperative need for some form of relief. Staggered working hours will afford a measure of such relief if the public is willing to accept this solution of the problem.

Reduction in Hours of Labor Has Increased Rush-Hour Congestion

ACCENTUATION of the sharpness of the rush-hour peak demands on the urban transportation systems is due in a considerable part to reduction in the hours of labor. The time for starting work has been set later, so that the executives, clerks and laborers begin and end their business day more nearly at the same time. This has meant that to carry the people on the transportation systems additional equipment has had to be put in service as far as possible. Beyond that, overcrowding has been the only way out.

Shifting of the hours of work slightly will make it possible for the transportation companies to give better service than under present conditions. If the spread of working hours is over only a limited period, the plan will tend to increase rather than to decrease the cost of rush-hour service, as the maximum loads per vehicle will be reduced. Real relief can be obtained if the hours can be spread sufficiently so that the cars and trains can make more than a single round trip during the rush hour, which is all the most of them can make under present conditions. In case enough spread in the peak can be obtained so that two or more trips can be made it will mean that much better service can be provided at a cost no greater than the present. It will mean that construction of rapid transit lines, now sadly behind due to the policies of ex-Mayor Hylan, will be given a chance to catch up with the growth in population.

The same plan can be used to advantage in any city where there are sharp rush-hour peaks. As a means of getting more transportation it has such merit that, barring the construction of new lines, it warrants serious consideration.

Detroit Will Pay for Its Cars Out of Earnings

INTEREST in the suggestion of H. U. Wallace, general manager of the municipal railway at Detroit, Mich., to acquire 300 more new cars and 150 new buses goes beyond the proposal itself. True, that suggestion reflects the growth of the demand for transportation, but it is his remarks about the inadvisability of keeping old cars in service that show the modern trend in selling transportation. The information available does not indicate the age of the equipment which Mr. Wallace would replace. It would be interesting to know that. Of greater significance is the fact that the department at Detroit has been assured it will be able to secure new cars and buses, on terms that will permit it to pay for all of the cars out of earnings or out of the savings that the department will be able to make in the cost of operating the new, light, modern rolling stock as compared with the present heavy and obsolete units.

Mr. Wallace is not given to making rash statements or to holding out promises that are not likely to be fulfilled. His task at Detroit is a difficult one. He knows that. If other evidence of his ability correctly to diagnose the needs of Detroit were needed it is furnished in the paper presented by him before the Highway Engineering Congress at Ann Arbor on Feb. 17, a digest of which is published elsewhere in this issue. That shows his grasp of the general situation. More recently, however, he went on record with respect to the need for up-to-date rolling stock before the North End Business Men's Association. He knows what the public wants. As the disposition of the Board of Street Railway Commissioners is favorable to his proposal the riders of Detroit will probably get what they want. Not only that, they will apparently get it on terms and conditions that should appeal to the railways elsewhere confronted with similar problems of providing adequate rolling stock, some of which have heretofore been loath to believe that the plan which he has in mind was workable.

The Detroit proposal is, of course, not new. Its sponsors would not claim credit for that. But the credit is theirs of putting the matter before the public in its present light and of being prepared to subject the matter to the acid test of daily experience. The equipment trust obligation, in which the cost of new equipment is amortized over the years out of earnings, is an old device, but resort to it has been all too infrequent in the electric railway field.

Depreciation as an Operating Expense

FIRST ARTICLE

Definition of the Problem—Service Life Is Difficult to Determine, and on This the Whole Structure Rests—Illustrations Given to Show Several Viewpoints—Creation of a Depreciation Reserve Is Vitally Important

By W. H. Maltbie
Late General Counsel United Railways & Electric Company of Baltimore

SOME months ago, as the result of a conversation with one of the editors of this paper, the author undertook to prepare a series of articles on the subject of depreciation. This series was looked forward to with great interest, as Mr. Maltbie was an outstanding authority on the subjects of valuation and depreciation. After his death, the manuscript was located and forwarded to this paper through the kindness of J. H. Hanna, chairman of the A.E.R.A. committee on national relations sub-committee on depreciation, of which Mr. Maltbie was a member.

These articles were written from the viewpoint of the present investigation by the Interstate Commerce Commission of the whole subject of depreciation of electric railway property. This investigation was undertaken with a view to establishing definite rules and regulations covering the allowance of charges for depreciation as an operating expense on all roads subject to its jurisdiction. Since there is a possibility that any regulations of this sort established by the I. C. C. may be accepted as a precedent by various state commissions it is important that all street railway executives should be familiar with the present situation.

These three articles, dealing respectively with causes of depreciation, methods of setting up funds to provide for depreciation and practical methods of building up a retirement reserve, constitute a valuable contribution to the literature on the subject. They were probably the last creative work of the author.—EDITOR.

THE interstate commerce act, as amended Feb. 28, 1920, contains in Sec. 20, paragraph 5, a direction to the Interstate Commerce Commission to determine for all carriers subject to the act the classes of property for which depreciation charges might properly be included under operating expenses and the percentages of depreciation that should be charged with respect to each such class of property with power to the commission to classify carriers for this purpose and thereafter, if necessary, to modify these items. The act further provides that carriers subject to the act shall not charge to operating expenses depreciation on any classes of property except those included by the commission or charge for any class of property a percentage of depreciation other than that prescribed by the commission.

There is some dispute as to the real intent of this section of the law. Some hold that Congress was fearful lest certain railroads should use their previous freedom as to the setting up of depreciation reserves as a means of absorbing income which would otherwise be subject to recapture, and passed the section in question solely with a view of preventing overcharges for depreciation. Under this interpretation of the act the charging of depreciation upon any particular class of property is optional with the company, but if charged it can be only upon those classes of property which the commission has selected, and at the rate which the commission has fixed.

Others hold that it is the intent of the act that the Interstate Commerce Commission should set up classes of depreciable property and fix percentages for each class, and that thereafter carriers subject to the act shall set up depreciation at the fixed percentages upon all property classed as depreciable.

In carrying out the provisions of the act the Interstate Commerce Commission has created a depreciation section in its Bureau of Accounts and instructed this section to make a study of depreciation for each class of carrier subject to the act and prepare a report to the commission which will be made the subject of subsequent testimony, brief and argument.

Reports upon carriers by water, telephone companies and steam railroads have already been prepared and filed by the depreciation section, and the study of electric railway property is now in progress. No decision has been handed down by the Interstate Commerce Commission in any of these cases.

While the depreciation section, of course, is not compelled to follow in its electric railway report the precedents established in its other reports, the reports already published indicate the general point of view of the section.

The American Electric Railway Association has undertaken to give the Interstate Commerce Commission the fullest possible co-operation, and with that end in view has created a sub-committee of the committee on national relations to handle the problem, with J. H. Hanna of the Capital Traction Company, Washington, D. C., as chairman, and on the recommendation of this sub-committee employed the writer as its attorney to study the collected information, prepare the case for the association and submit it to the Interstate Commerce Commission.

DEPRECIATION A TWOFOLD PROBLEM

The problem is so complex and the information already furnished to the commission and the association indicates such a wide divergence of views, and in some cases such a complete misunderstanding of the situation, that it seems wise to accept the invitation of the JOURNAL and attempt to clarify matters by a discussion of the problem now under consideration.

Depreciation is in reality two distinct problems. The

Digitized by Google

difference between them will perhaps be more clearly understood by considering the executive who has bought a new car and confining our attention for the moment to the single car. It is a reasonably safe bet that at some future date that car will be retired and replaced by a new one. When that time comes the company should have at hand a sum equal to the cost of the retired car, accumulated during the life of the car. A determination of the annual contribution to this retirement fund is therefore nothing more than the simple operation of dividing the cost of the car by the number of years of its service life.

But what is its service life? It may go out at any time through an accident; it may wear out at some future date, which may be almost indefinitely deferred by proper maintenance or hastened by lack of proper care; a change in the art may make it so uneconomical a unit to operate as to force its retirement; it may no longer meet with the approval of public taste; or it may become inadequate on account of its speed or loading limitations and be retired for that reason. No matter how skilled and experienced the executive, his answer to the question is a guess, based upon a consideration of those causes which tend to shorten and those causes which tend to lengthen the useful life of the car in question.

The executive, if he is wise and his revenues will stand the strain, having made his guess as to the service life of his one car, will deliberately shorten it in order to protect himself in case its ultimate retirement comes earlier than he anticipates. Even then, if he is dealing with a single car, he is liable to lose a large part of his investment, since it is impossible to accumulate a reserve with sufficient speed to protect the owner against all possibilities of accidental destruction.

Depreciation Must Be Treated as an Operating Charge

The annual payment into this reserve will be treated as an operating charge, and the problem which the executive has now solved is the problem of depreciation as an operating expense.

Now let us assume that ten years have elapsed and that the executive desires to know the value of the car, which has not yet been retired. His problem is: "How much is the car worth to me; how much will I take for it and purchase a new car?" And the answer to the question is to be found in a comparison of the expected life of the car as it stands with the expected life of a new car replacing it. The original life expectancy was a guess based upon an estimate of the length of life till retirement through accident, the length of life till retirement through obsolescence, the length of life till retirement through wear, and the length of life till retirement through inadequacy. Ten years have elapsed, but withdrawal through accident is no nearer than it was ten years before. If the art has been changing, retirement through obsolescence may be at the very door; if the art has not been changing, it is probable that the life until obsolescence retirement estimated today will be as long as the life estimated ten years before.

The danger from removal through inadequacy may be as indefinite as it was ten years before, may be much greater, or may even be more remote. The amount of remaining wearing life depends on the present condition of the car. It would seem evident, therefore, that the question of the present value of the car cannot be answered merely by a computation based upon the executive's original guess as to service life and the elapsed period of ten years.

A Second Illustration

The distinction will perhaps be clearer if we use more definite quantities in our illustration. Let us assume that the car in question was a double-truck, four-motor equipment with a seating capacity of 40, and that the company operated an interurban line connecting a number of smaller communities with a larger center, but had no urban division. The executive, on the basis of his own experience and such information as he can collect elsewhere, decides that in the long run, so far as mere wear is concerned, cars may, with proper care and maintenance, be kept in active operation for a period of 50 years. Therefore his protection demands an annual appropriation of 2 per cent. He is one of those who believe that the gradual progress of the art will continue and that passenger cars in general will become obsolete after 20 years. Protection from this demands an annual appropriation of 5 per cent. Finally, believing that his central city is about to develop as a manufacturing center to which the smaller communities which he serves will become suburban areas, he reaches the conclusion that within ten years this car will become inadequate and must be replaced either by cars of larger capacity or by multiple-unit trains. He therefore, for this reason, assigns a ten-year life and sets up a reserve of 10 per cent annually.

Since the reserve for inadequacy will provide the entire cost of the car before either obsolescence or use demand its removal, the latter elements are entirely ignored, and the depreciation reserve of 10 per cent set up on account of inadequacy is the sole reserve set up, and the service life is estimated, therefore, at its minimum figure of ten years.

Now that the ten years have elapsed, however, the car would have, if original conditions had continued and the original estimates been correct, no value except scrap or resale. As a matter of fact, however, the executive's expectations as to the development of his central city as a manufacturing area have not been realized. Instead, it has developed as a jobbing and educational center. His 40-seat unit passenger car is as adequate today as when it was first installed, and there is practically no probability that it will ever become inadequate. Moreover, the executive has acquired in the ten-year period an urban division, and therefore if the inadequacy should by any chance occur, he is prepared to shift this car to meet the constantly increasing demand for urban service. It is, therefore, so far as inadequacy is concerned, just exactly as valuable as it was at the beginning of the ten-year period.

So far as obsolescence is concerned he finds that the manufacturer is still building the same car and selling it, and that he himself, if he desired to increase his service with new cars, would probably buy identical equipment with that which he already operates. He still believes that in the long run cars will go out through obsolescence in an average of 20 years, but there is certainly no difference, so far as obsolescence is concerned, between this car and the new cars which are being turned out by the factory, and therefore, if he assumes that this car has lost half of its value because ten years of the assumed 20-year life have elapsed, he is driven to the ridiculous conclusion that

Digitized by Google

new cars coming from the factory are worth only half what they cost.

So far as wear is concerned, while he anticipated 50 years of usefulness, the car may actually have done better or worse than he anticipated, and the only thing to do is to examine it and determine whether or not it has probably more or less than 40 years of life remaining.

Suppose that on examination he finds that it is wearing about as he expected. He has then a car which will presumably wear for 40 years; is probably good, so far as obsolescence is concerned, for 20 years, and is in no danger of inadequacy. Its probable service life, at the end of the ten years originally estimated, is therefore 20 years, and the car for which a reserve of the full difference between cost and resale value has been accumulated bids fair to render the same service, and therefore to be as valuable, as a new car.

In other words, present-day value is not to be measured by elapsed life, or by the deduction of the existing reserve from the present value. In the words of one of our federal courts, depreciation reserves "represent what observation and experience suggested as likely to happen, . . . with some margin over . . . The law requires deduction only for actual depreciation, just as actual as the present value, and the extent of that depreciation must be ascertained by the same kind of evidence; in the last analysis opinion based on contemporary investigation." U. S. District Court, Southern District, New York, New York Telephone Co. vs. Prendergast. Rate Research Vol. 25, No. 11, page 165.

The pending case before the Interstate Commerce Commission is related entirely to the first of these two depreciation question, namely, how much shall street railway companies set up year by year as a reserve with which to care for the retirement of property?

The answer to this general question involves the answer to several subordinate questions which we will now consider.

What Property Needs a Reserve?

First—For what property shall a reserve be created?

The obvious answer to the question is to create a reserve for all property which must eventually be retired and to make the reserve equal to the difference between the original cost and the value of the property when retired. In other words, there will be no reserve created for land; very nearly 100 per cent reserve for cars which it is expected will be retired through obsolescence or wear, since scrap value is small, and a smaller reserve for a car which it is anticipated will be retired at an early date through inadequacy, since the resale value of such a car may be considerable.

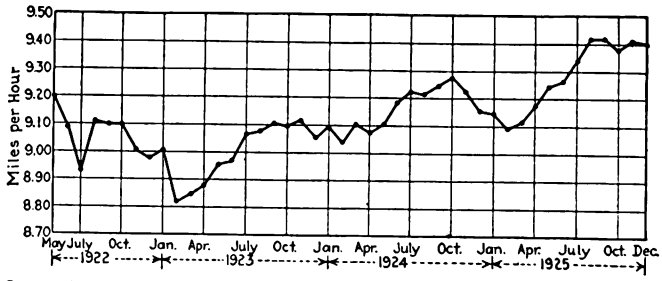
The answer to the question is not, however, so simple as it seems. Consider the trackage of a large steam railroad system. It is obviously impossible to set up a depreciation reserve for each rail or each tie. Rails and ties wear out, however, and are, as they wear, replaced from year to year. But, as a matter of fact, current repairs and current maintenance leave the system, generally speaking, with the same or a greater value at the end of each calendar year than it had at the beginning. It is true that the appropriation might be made to the depreciation reserve year by year, and the amount expended for rails and ties entered as charges against this reserve, but on a large diversified system the annual charges would approximately equal the annual appropriation, and the only practical result of the application of the depreciation theory to this trackage is a complication of the accounting requirements of the company. Considerations such as these have led the Interstate Commerce Commission, in its dealings both with the steam and with the electric lines, to make it optional with the carrier as to whether a depreciation account shall be set up for trackage; have led the depreciation section of the Interstate Commerce Commission, in its recommendations with regard to steam roads, to suggest that no depreciation reserve be set up for rails, ties and track construction, and have led the Treasury Department, through the Income Tax Division, to refuse to make any allowance for depreciation on track structure.

While this ruling is entirely satisfactory to the larger electric railway systems, which, because of their age and large total mileage, do approximately the same amount of track reconstruction work each year, it is not satisfactory to the smaller companies, and particularly to the smaller companies of recent origin. These smaller companies may run for several years without any important reconstruction program, and then be compelled to reconstruct a large percentage of their entire trackage, or, as in a case recently presented to the Income Tax Division, a new road may find itself at the end of its first life cycle compelled to face practically a 100 per cent track reconstruction program.

It is obvious that a heavy burden of this sort cannot be absorbed by operating expenses of a single year, and good business dictates that a company which foresees an expense of this sort shall accumulate out of earnings an adequate reserve.

Operating Speed Increased at Detroit

DURING the year 1925 the Department of Street Railways, City of Detroit, increased the operating speed of its cars from 9.10 m.p.h. in February to a maximum of 9.42 m.p.h. in August and September. During the fall months there was a slight retrogression. The increase in average speed is attributed by H. U. Wallace, general manager, to the electrification of switches, which were formerly manually operated; widening of certain streets and the work of the Mayor's traffic committee, which has brought about many improvements in traffic regulations. Moreover, 90 cars which formerly used storage air were equipped with compressors. Birney cars, which were formerly operated on some of the principal streets of the city, have been removed and are now used in outlying districts. It is felt by the management that a continuation of the present program will make possible a general average speed of about 10 m.p.h. The operating speed of the Department of Street Railways is shown in an accompanying chart by months from May, 1922, to November, 1925.



Operating Speed by Months of the Department of Street Railways, City of Detroit

Pleasing appearance of passenger stations has helped to build up traffic on the Chicago, Aurora & Elgin Railroad. This shows a Chicago limited train at Wheaton

From Receivership to Prosperity in Three Years

FIRST ARTICLE

Development of Territory, Reconstruction of Track and Operation of New Cars on the Chicago, Aurora & Elgin Railroad Have Increased Transportation Revenue 65 per Cent in Three Years—Fares Are Higher on Electric Line than on Competing Steam Roads

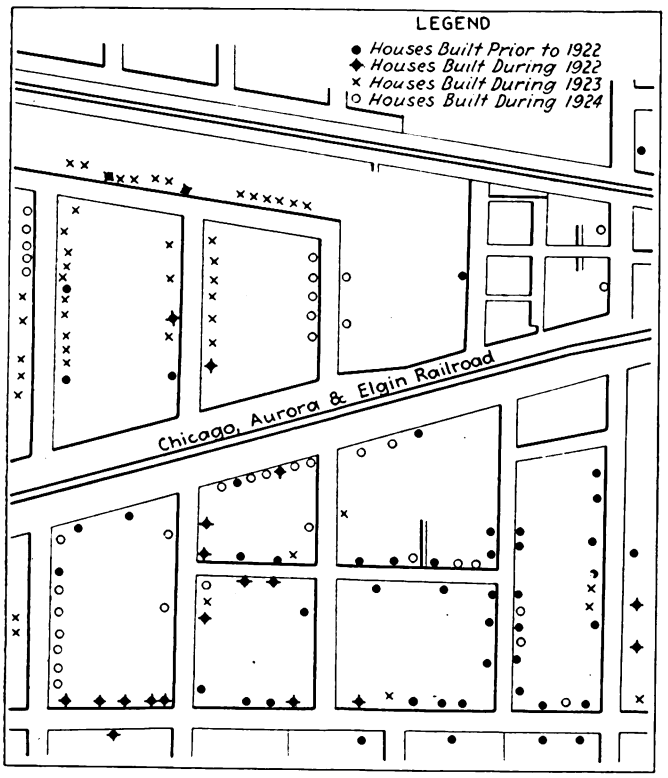
FROM out the wreck of the receivership of the Aurora, Elgin & Chicago Railroad a new company was born in the summer of 1922 and has forged ahead rapidly since that time. The plan of reorganization was formulated by Dr. Thomas Conway, Jr., who became president of the new company, known as the Chicago, Aurora & Elgin Railroad. While considerable work had been done during the receivership to improve the physical condition of the property, it was far from being up to the standard desired by the new management. An extensive program of rehabilitation was undertaken immediately, including the reballasting of the line from Wheaton to Chicago, a distance of 25 miles; purchase of new passenger and freight equipment, construction of additional substations and improvements to passenger stations along all its lines. The resulting substantial increase in traffic has fully justified the expenditure of $1,500,000 for these improvements. The story of the development of traffic is told in this issue. Details of the track reconstruction, new rolling stock, improvements in power facilities and the development of a profitable freight business will be told in future articles in this paper.

At the time the Conway management assumed control, the property was dependent mainly upon the through business between Chicago and the five terminal cities located in the Fox River Valley, Aurora, Elgin, Batavia, Geneva and St. Charles. No sustained attention had been given to the development of the intermediate territory. The Aurora-Elgin property, as it is called, is faced with competition as keen as any to be found in the United States. The territory through which it runs is served also by the suburban lines of the Chicago & Northwestern, the Chicago, Burlington & Quincy, the Illinois Central and the Chicago, Milwaukee & St. Paul railroads, which render suburban service of the first quality, both as regards comfort and frequency. The traveling public has a free choice of using either steam or electric service, depending upon which seems most attractive. The new management decided that a rehabilitated and modernized electric railway had certain advantages, which if properly exploited would enable it to command a fair share of the competitive business. The plans, however, did not contemplate building up the Aurora-Elgin property solely by taking traffic away from the steam railroads. The objective of the new management was primarily the upbuilding of the territory served, thus creating more traffic and simultaneously increasing the prosperity of the railway and the various communities.

As soon as the work of physical rehabilitation of the property has been sufficiently advanced to constitute a

Digitized by Google

self-evident demonstration of the good faith of the new management and of its ability to carry out its promises, Dr. Conway called together all the real estate dealers and municipal officials of the several communities served by the railway, to acquaint them at first hand with the plans of the new company and enlist their support in a co-operative effort to build up the territory adjacent to the company's lines. He pointed out that in the decade



Section of Permanent Record Map Showing Houses Built Each Year Since Reorganization of the Railway

which ended in 1920 the population of the city of Chicago had increased 23.6 per cent, while the population of the suburban belt, known as Metropolitan Chicago, increased 76 per cent. The Chicago, Aurora & Elgin Railroad territory did not receive its share of the growth which occurred, because none of these suburban communities on the line showed an increase in population of as much as 76 per cent. Opportunity existed, he said, not only to attract a proportionate share of the future growth of the suburban belt but also to catch up and secure a part of the growth which should have occurred from 1910 to 1920.

Close and cordial relations were established between the management and the real estate interests and municipal officials. For the purpose of assisting in the suburban development, the Chicago, Aurora & Elgin Railroad put into effect a system of homeseekers' tickets, sold in lots of 100 to real estate agents, at rates approximately equal to the 25-ride ticket rate applicable to the same point, which averages between 1.4 cents and 1.5 cents per mile, depending upon the distance from Chicago. In a short time all of the real estate dealers in the territory were purchasing these tickets and distributing them to prospective home buyers to enable them to make inspection of the property which the dealers had to sell.

The railway believed that this ticket would not only assist in attracting people to the territory but it would also introduce them to the Aurora-Elgin service, which, if it proved acceptable, would win the new settler as a regular patron. It soon became apparent from a study of the development of the territory and the traffic of the property that the use of homeseekers' tickets constituted an almost exact index of the rate at which lots and homes were being sold. The accompanying chart shows graphically the collection (not sale) of these tickets by months from July, 1922, to the end of 1925.

From the beginning the company has given the closest attention to the rate of development of its territory, by periodically making a comprehensive and detailed survey of the situation. In July, 1922, a few days after the new management assumed control, instructions were given to the engineering department to make a detailed survey of the entire suburban territory to furnish a basis for future comparisons. The results of a house-to-house field canvass were plotted upon permanent maps, thus furnishing a permanent record of all buildings then constructed within a distance of 1 to 1½ miles on either side of the company's lines, the distance depending upon the degree to which the road might expect to attract traffic in competition with other transportation agencies. A similar field canvass was made in December, 1922. Observers were furnished with photostat copies of the original map showing the results of the July canvass, with instructions to indicate thereon all new houses. Similar checks, the results of which were compiled in like fashion, were made in December, 1923; in December, 1924, and in June and December, 1925. A portion of a typical office map showing all houses constructed in a section of the town of Villa Park from 1922 to 1924 is shown in another column.

Records of this kind have proved useful in estimating growth in traffic, in planning schedules and future cap-

COMPARATIVE INCOME STATEMENT FOR TWELVE-MONTH PERIOD ENDED JUNE 30, 1922, AND FOR CALENDAR YEARS 1922, 1923, 1924 AND 1925, CHICAGO, AURORA & ELGIN RAILROAD

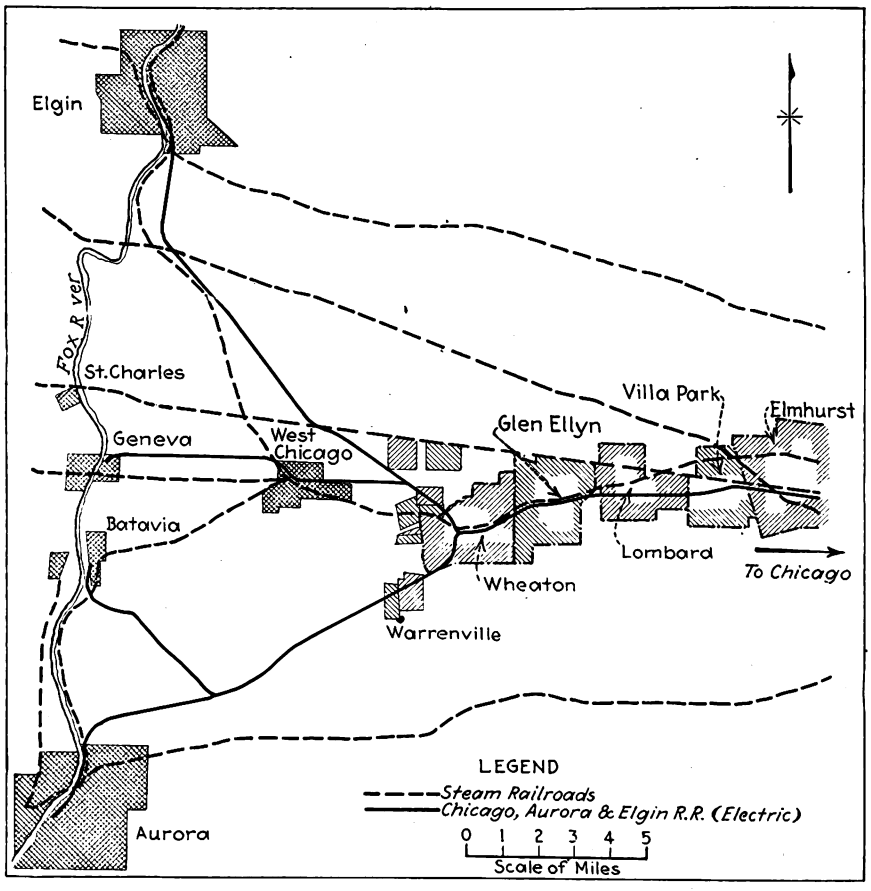
ital requirements, particularly as regards the need for additional substation capacity, rolling stock, shop facilities, etc., in outlining the annual program for crossing protection, in determining what new station facilities are required, in keeping track of the progress of real estate development and in determining whether the company was receiving its proportionate share of the growth of the business in each community.

The tabulation on page 360 shows the tremendous progress which has been made during the last four years in the development of the suburban community between Wheaton and Chicago on the main line of the Chicago, Aurora & Elgin. The per cent increase in the number of houses in each suburban town for each year over the number of houses in existence at the end of the preceding year is given.

Perusal of this tabulation shows that the increase in the number of houses in the various suburban communities from July 1, 1922, to Dec. 31, 1925, has ranged from 53 per cent to 379 per cent. Through the territory as a whole, the average increase in the number of houses within the area tributary to the lines of the Chicago, Aurora & Elgin Railroad over the 3½-year period has been 136 per cent.

In consequence of the close cooperation established between the real estate developers and the management, it has been possible regularly to secure from many of the former the names and addresses of home buyers about to settle in the territory. These prospective customers have been promptly added to the mailing list of the Aurora-Elgin and effective publicity literature has been sent to them. The advantages of the electric service and ticket rates prevailing have been called to the attention of the new residents at or shortly after the time they move into the community.



Suburban Territory Served by the Aurora-Elgin Lines. Shaded Areas of Communities Between Wheaton and Chicago Are Developments of Past 3½ Years

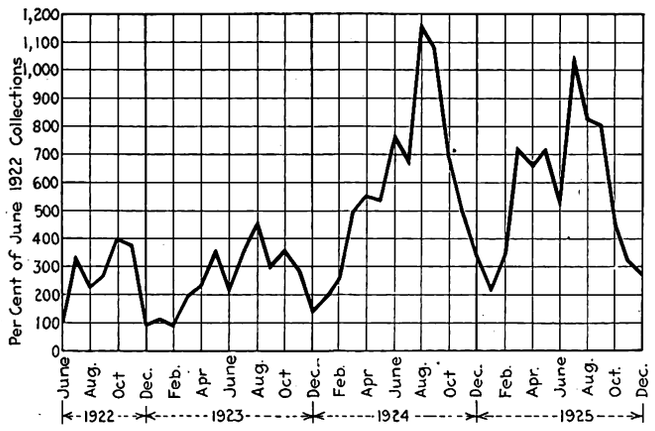
All ticket agents are required to report monthly the names of persons who for the first time have appeared on their records as purchasers of commutation tickets. A personal letter is written by J. H. McClure, general manager, to each new commuter, welcoming him as a patron of the company, expressing the hope that he will find the service satisfactory and that if he has any complaints or suggestions to make he will do the company the favor of giving it the benefit of his opinion. This letter also calls attention to the ten and 25-ride tickets sold by the company and their uses and advantages to the other members of the family. It has been found that these letters give a personal touch to the relationship between the management and the new commuters, as evidenced by hundreds of letters written by the recipients of such communications and many valuable suggestions that have been made by them.

Ticket agents of the company are also required to report each month the names of all commuters who purchased tickets in the preceding month, but who do not appear in the records as having purchased monthly tickets for the period in question. A representative of the transportation department is immediately assigned personally to interview these individuals and to report results of this interview to the general manager. Many discourtesies or lapses in service have been brought to the attention of the general manager. In a large majority of these cases, personal interviews resulted in ironing out the irritations of passengers and in winning back the business temporarily lost. The knowledge that every passenger who discontinued the use of the line would be interviewed by a representative of the management and a written report made thereon has had a salutary effect in promoting uniform courtesy and thoughtfulness on the part of the trainmen.

Unlike many electric railways whose fares are lower than those of competing steam carriers, the rates on the Chicago, Aurora & Elgin Railroad between Chicago and most of the suburban towns were substantially higher than those which prevailed upon the lines of its competitors before the increase made by the latter in December, 1925. The ten-ride ticket rates prevailing between Maywood and Wheaton on the one hand and Chicago on the other have ranged from 15 per cent to 35 per cent higher than those on the steam lines. The 25-ride ticket rate has been from 28 per cent to 35 per cent higher than similar rates on the steam lines.

It was believed by the management that if a superior standard of service could be established business would be attracted to the electric railway at higher rates than those charged by its competitors. Moreover, it has been well known for years that the steam railroads operating out of Chicago were running suburban service at a loss. The present management of the Aurora-Elgin decided

Digitized by Google



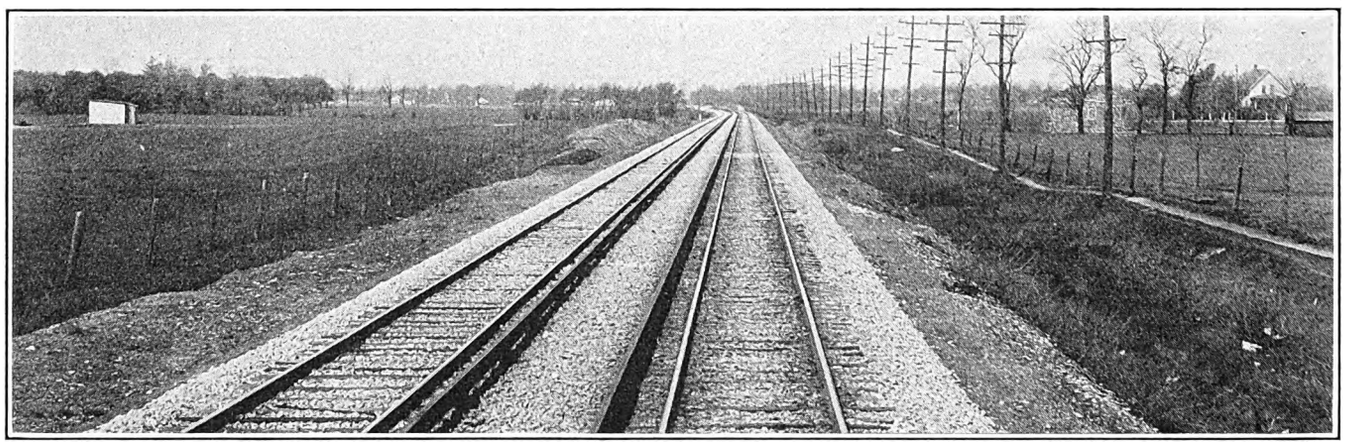
Collection of Homeseekers' Tickets Has Been Found to Be an Accurate Index of the Development of the Suburban Territory Served by the Railway

that traffic to be worth while must pay reasonable rates, and it therefore determined not to inaugurate any new fares at the ruinous figures prevailing upon the steam lines. Faith in the ability of good service to attract patronage has been justified by the fact that railway operating revenues have increased more than 65 per cent in three years, while railway operating expenses, including maintenance, rentals and general taxes, increased only 49½ per cent. Net earnings from railway operations have increased more than 154 per cent in 3½ years. Percentages of total traffic handled by the Aurora-Elgin from various towns, passenger revenue by month and a summary of revenues and expenses by year are shown in accompanying tables.

The company has recently marketed successfully a $5,000,000 bond issue, involving the purchase in the open market of more than 90 per cent of an underlying bond issue secured by a closed non-callable mortgage. The old bonds were deposited under a new first and refunding mortgage. The new $5,000,000 25-year, 6 per cent bond issue provides funds for the retirement of the 7 per cent, series A, refunding and improvement bonds issued at the time of the reorganization, and also for an issue of $750,000 in two-year, 6½ per cent notes sold in December, 1924. It provides also a substantial amount of new capital for additions and betterments to be made in the near future. Provision is made for future necessary junior financing through the creation of a prior preferred stock issue and the issuance at this time of $500,000 of such stock.

Municipalities through which this road operates have been growing so rapidly that frequent schedule changes have been necessary in order that adequate service should be furnished. A new schedule has recently been completed which calls for 221 passenger trains per day, divided into three different classes, limited, express and local. This is a slight increase over the previous winter schedule and provides a headway varying from ten minutes to 30 minutes during the entire day for municipalities within a distance of 26 miles of the Loop district of Chicago. Such service enables patrons living in Wheaton, a distance of 25 miles from the Loop district of Chicago, to reach their destinations within the same time or in even less time than they would be able to were they living in certain parts of the city of Chicago.

Running time between Wheaton and Chicago is 45 minutes on limited trains and one hour on local trains. The intervening municipalities are reached in proportionally less time. During the morning and evening rush hours this schedule provides for limited trains every twenty minutes, or less, between Chicago and the western terminals of Aurora, Elgin, Geneva, St. Charles and Batavia, and an hourly limited service to each western terminal the balance of the day. Elgin is more than 41 miles from the Chicago terminal and the total running time of the fastest trains from Chicago to Elgin is 65 minutes. Twenty-six minutes is consumed in going out over the elevated structure to the end of



Well-Maintained Rock-Ballasted Track Permits High-Speed Operation

INCREASE IN HOUSES, IN TOWNS AND VILLAGES CONTIGUOUS TO THE CHICAGO, AURORA & ELGIN RAILROAD, WHEATON TO MAYWOOD

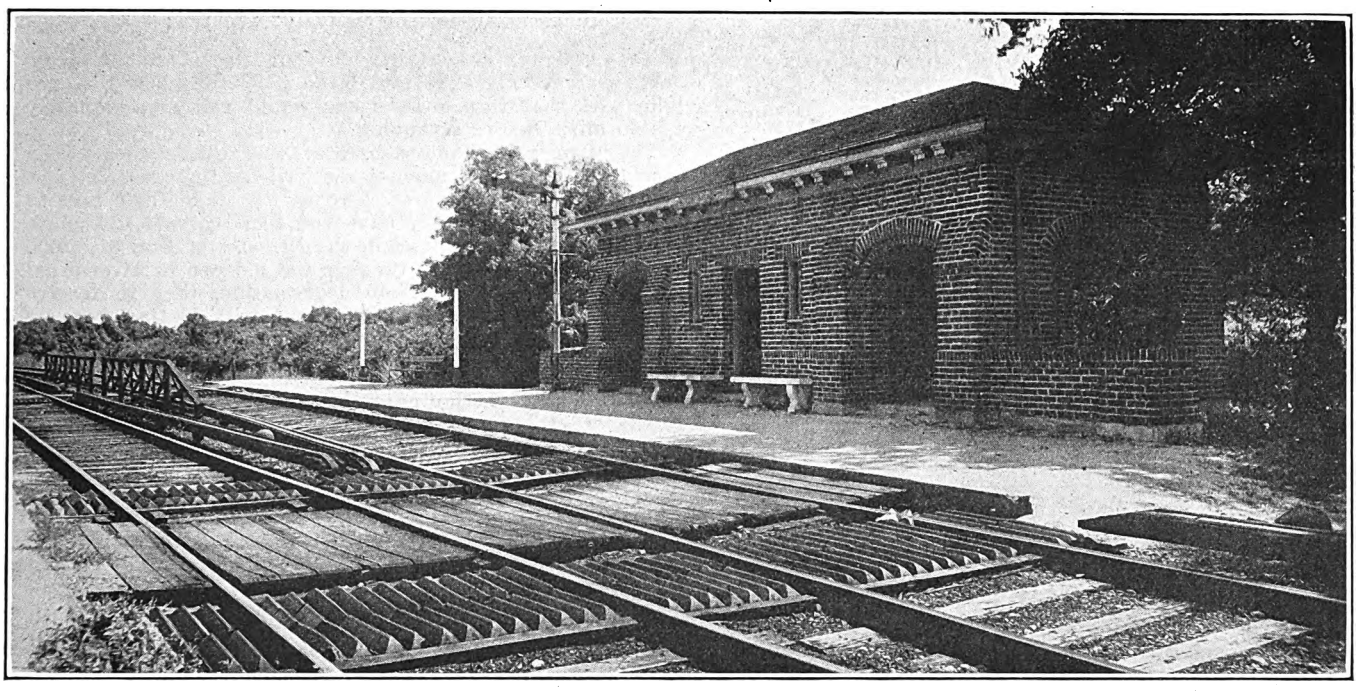
1922 over 1921	14.5	24.5	24.9	43.5	19.8	22.2
1923 over 1922	9.1	18.4	22.1	52.3	19.3	20.0
1924 over 1923	7.3	19.2	27.2	52.8	23.2	22.4
1925 over 1924	14.4	32.2	32.8	43.7	41.3	31.3
Cumulative 1925 over 1921	53	133	157	379	148	136

Boarding or Alighting at	Percentage of Total Traffic Handled by the Aurora-Elgin 1922	1925
Elgin	59.8	69.2
Geneva	25.9	40.1
Wheaton	39.9	61.0
Glen Ellyn	48.2	57.3
Lombard	55.2	68.6
Elmhurst	16.3	32.8

Digitized by Google



Attractive Brick Station at Chicago Golf Club on the Aurora Branch

joint operation at Forest Park, a distance of 9 miles. The remaining 32 miles is run in 39 minutes, including stops to take on and discharge passengers at Lombard, Wheaton and Glen Ellyn.

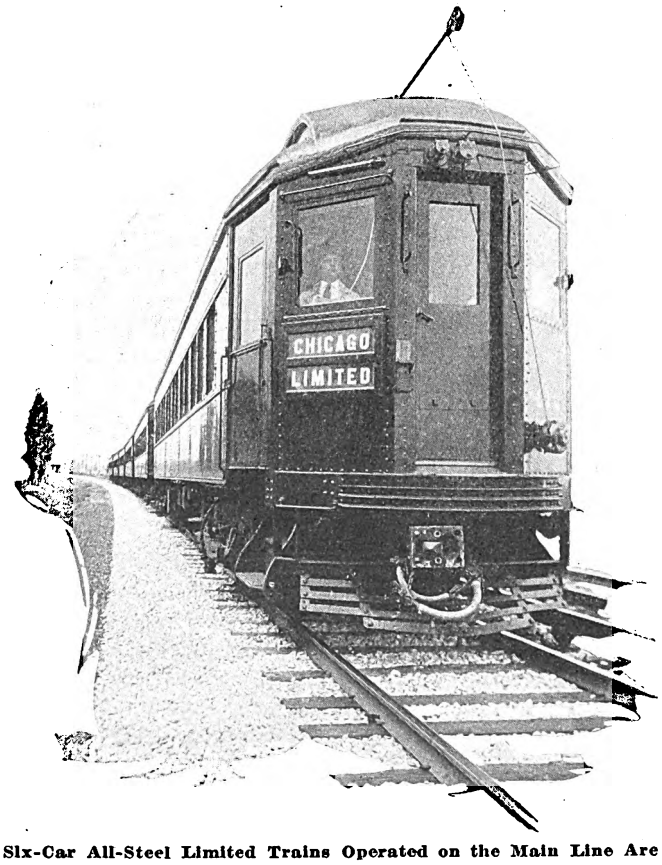
In spite of these most difficult operating standards an analysis shows that of the total number of trains operated under the present schedule, approximately 100 per cent depart from their terminals on time, and that 95 per cent of them arrive at their destinations on time or less than three minutes late.

Below is a list showing the number of trains operating between Chicago and the larger municipalities along the road:

Stations Between	Miles from Chicago	Number of Trains
Maywood and Chicago	11	95
Bellwood	13	90
Berkley	14	90
Elmhurst	16	91
Villa Park	18	86
Lombard	20	141
Glen Ellyn	23	143
Wheaton	26	144
Geneva	37	34
St. Charles	40	34
Batavia	40	50
Aurora	40	52
Elgin	42	49

Wheaton, Glen Ellyn and Lombard enjoy service which provides 71 trains daily to the Chicago Loop and 73 trains outbound daily from the Loop, this service being operated from 5:45 to 1:30 a.m. Thirty-eight of the 73 trains are fast expresses. In the rush hours these communities enjoy a service approximating a 7½-minute headway. At the east end of the Aurora-Elgin line, where there is a convergence of the fast high-speed limited trains from the Fox River terminal cities, the Wheaton expresses and the Elmhurst short service there now is a train on the average of every 3½ minutes in the direction of heaviest travel, these trains ranging in length from two to six cars each.

Trains operating into and out of the Wells Street Terminal, Chicago, are made up of two to six cars each. In cases where more than six cars are operated, the trains are run in sections, due to the present platform limitations in Chicago. During the summer months, in addition to the regular scheduled trains, excursions ranging from 60 to 120 cars each are operated between Chicago and the park owned and operated by the company in the Fox River Valley.



Six-Car All-Steel Limited Trains Operated on the Main Line Are Run in Three-Car Sections on Aurora and Elgin Branches

The company has capitalized its natural advantages in popularizing its service. In its advertising literature it has continuously featured "No Smoke, No Dust, No Cinders" and has constantly called to the attention of the people in the communities served the remarkable accessibility of its Chicago terminal as compared with those of the steam railroads and the ability of passengers to change under cover and without walking up or down stairs from Aurora-Elgin trains to elevated trains, taking them to any department store or most business establishments or places of amusements in the Loop district of Chicago without setting foot in the street.

November	130,709.52	140,849.78	151,900.52	164,335.84
December	138,223.80	146,716.09	152,008.65	168,641.72
Totals	$881,145.57	$1,745,012.08	$1,828,075.45	$1,951,575.85

Great emphasis has been placed upon the cleanliness of the cars, keeping the seats in first class repair and condition, spotless toilets and other like features demanded by a discriminating public.

STATIONS HAVE BEEN MODERNIZED

The management has carried out a program of thorough rehabilitation and modernization of its terminal stations in Aurora, Batavia, Geneva, St. Charles and Elgin and has painted and put into first class condition all other passenger stations. Lately a new brick station has been built at Seventeenth Avenue, Maywood, and the company is now constructing an artistic passenger station at Glen Ellyn.

These are the more important principles evolved and applied by the management in building up the passenger traffic of the property. The faith shown in the ability of an electric railway to hold its own in competition with steam railroads of the highest class when the most modern type of facilities are provided and modern methods of operation and improvements in service are employed has been strikingly justified.

Railway Turns Tables on Auto Dealers

SOME time ago the Mobile Light & Railroad Company published an advertisement in the local papers calling attention to the expense of using private automobiles for business and the economy of street car riding. An article by R. S. Kellogg, secretary of the News Print Service Bureau, published in the *Nation's Business* was quoted showing automobile operating costs, as follows:

	Car 1	Car 2	Car 3
Cost of car	$792.90	$1,379.74	$2,238.22
Mileage	14,000	13,494	33,100
Years used	2.5	3.16	3.71
Depreciation per mile, cents	3.0	4.9	5.0
Repairs, upkeep, etc., per mile	2.6	4.7	2.0
Tires per mile	2.0	2.4	1.9
Insurance, licenses, etc., per mile	1.5	2.4	1.6
Gasoline	1.5	1.9	1.0
Garage	.4	1.7	1.0
Total, cents	11.0	18.0	12.5

Ford dealers in Mobile came back at the railway with an advertisement stating that a Ford can be operated for 3.92 cents per mile. This figure was arrived at by the following calculation:

Fire and theft insurance	$12.00
Liability and property damage insurance	29.40
License	12.00
Taxes	12.00
Tires	84.00
Gasoline	201.60
Oil	39.60
Mechanical and oiling	72.00
Battery	13.80
Depreciation	125.40
Total operating cost	$601.80
Miles run	15,120
Cost per mile, cents	3.92

Not to be outdone, the railway retorted:

We challenge the statement that the depreciation on said car was only $125 for 15,120 miles, or $0.0082 + per mile. At that rate a Ford car would run approximately 62,445 miles before scrapping.

The depreciation on a car is the difference between original cost and the amount received for the car after use.

We advise all owners of Ford cars to take their cars to a Ford agent, after they have run their cars 15,120 miles, and show the agent his ad in the *Register* of Oct. 31, 1925, and demand a new car, turning the old car in at original cost of $516.35 less $125.40 depreciation, they to receive $390.95 for the old car. The agent will do this, because he advertises the depreciation is only $125.40 on a Ford for 15,120 miles.

The result of the controversy was that the automobile dealers were overrun with people demanding an exchange at the figure mentioned in the advertisement. This they were not prepared to do and consequently were compelled to acknowledge their mistake in publishing the figures.

Parking Restrictions Speed Up Cars and Aid Retail Trade

CHECKS made by the research department of the Pittsburgh Railways show that there has been a substantial reduction in the running time of street cars since the new parking restrictions have been in effect in the downtown district. Detailed information concerning these regulations was published in ELECTRIC RAILWAY JOURNAL for May 30, 1925, page 847. Time saved by cars routed over various loops is shown in the accompanying table.

TIME SAVED BY CARS ROUTED OVER VARIOUS LOOPS

Loop Number	Number of Cars During Maximum Hour	Average Decrease in Time, Minutes
1	26	1:01
2	84	2:47
3	81	3:51
4	27	5:21
5	57	2:55
6	23	:25
7	20	:56
8	52	:35
9	159	3:17

It is significant also that retail trade in the downtown district has prospered more than that in the outlying sections since the change was made. Comparisons are given below of the buying power of the Pittsburgh district, as represented by bank payrolls in 1924 and 1925; retail sales for the entire district and downtown sales, as represented by seven large department stores.

Three Months Ended	Buying Power, Per Cent	Retail Trade: Entire District, Per Cent	Retail Trade: Downtown, Per Cent
March 31	—9.01	—1.87	—2.53
June 30	—1.77	—5.90	—2.37
Sept. 30	—3.67	—6.20	—2.77
Dec. 31	—8.13	+1.50	+3.47
Year	—5.72	—2.80	—0.80

Industrial depression resulted in a slight decrease in buying power and trade, but the decrease in the downtown section, 0.8 per cent, was much less than that of the district as a whole, which was 2.8 per cent. The fear expressed by some downtown merchants that their business would be injured by the stringent parking regulations appears to have been without foundation.

Earnings of the Pittsburgh Railways decreased 1.67 per cent as compared with a decrease of 5.72 per cent in buying power for the district.

Impressions of European Tramways

Conditions and Practices in Several Continental Cities Indicate that in Some Essential Things, Such as Courtesy, the Europeans Excel—Short Four-Wheeled Cars Are Standard Nearly Everywhere, but Operation Is Almost Noiseless—Few Abandonments of Tramway Lines Noted, but the Bus Is a Factor in Extensions

By James A. Emery
Vice-President Ford, Bacon & Davis, Inc., New York

The Royal Exchange, London, a Heavy Traffic Point. Tramways Do Not Operate in This Part of the Business District

Mr. Emery's observations were made on a somewhat hasty pleasure trip through England, Belgium, Holland, western and southern Germany, Austria, Italy, Switzerland and France. No attempt was made to study the urban transportation situation, so that only such matters are covered as naturally attract the notice of one interested in the business.
—EDITOR

CITY transportation systems abroad appear to be in much better shape than other lines of industry. On the Continent, particularly, tramway cars are noticeably crowded; that is, carrying many standing passengers, even during off hours. The general condition of the physical property is good. Cars are clean and well painted, and track, with a few exceptions, is excellent. The large traffic volume can probably be ascribed to the movement of population from country to city that has taken place since the war in spite of unemployment. The physical condition is undoubtedly due to good habits of maintenance, high standards of design and cheap labor.

It is hardly likely, notwithstanding good appearances, that the tramway lines are generally prosperous, as fares are very low measured by our standards, for rides of average length. In a large proportion of European cities the tramways are owned and operated by the municipalities, so that the necessity of paying all expenses and a satisfactory return on the investment is not so urgent as with private companies.

The zone system of fares is very common, and as the platforms are open the conductor is a busy man. He wears a little satchel or wallet for his tickets and change and gives every passenger a punched ticket or receipt, which, however, is not collected when the passenger leaves the car. In Vienna, and probably in some other cities, a monthly pass is sold for about $3.25 (U. S. equivalent).

It is probably in part due to the zone fare system that the use of one-man cars has not been attempted to any great extent.

In England the traffic is noticeably lighter than on the Continent, but municipal systems, particularly in London, seem to be operating more service than the volume of traffic warrants. This may be due to the unemployment situation. The London tramways are

Digitized by Google

said to be hardly earning their working (operating) expenses.

Tramways are not permitted in the inner or principal business sections of London and Paris.

To an American the prevalence of narrow gage track is interesting. Perhaps two out of every three systems are narrow gage, 3 ft. in Great Britain and 1 m. (39.38 in.) on the Continent. Narrow grooved rail is universally used in paved streets. The substructure is integral or identical with the paving base, and the rails are held by steel ties or cast-iron chairs imbedded in the concrete base and spaced about 5 ft. apart. Heavy flat tie rods are used and no joint welding was observed, although it is understood that welding has been practiced to some extent. As the wheel loads are light this construction preserves its line and surface for a long time, and if it goes bad, repairs are made at once so that there is very little rough track or paving in evidence.

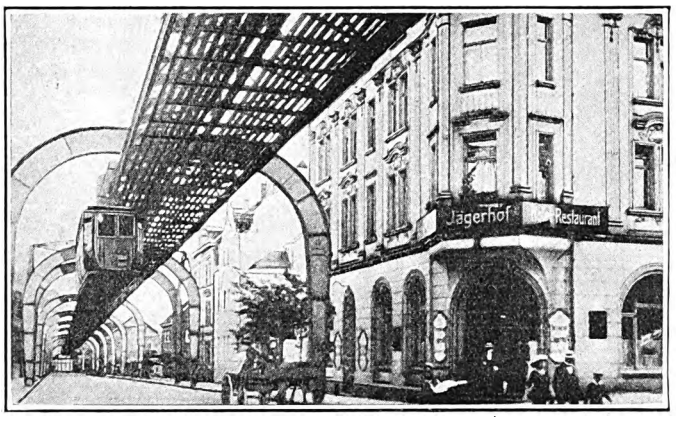
Overhead wires are kept in first-class shape. Nothing is used but steel or iron for poles and structural or built-up poles are common. Concrete protection for poles around the base is often seen. Sliding contacts are used almost altogether on the Continent instead of trolley wheels. In the zones immediately surrounding the inner sections of London and Paris there is much slot construction, and in Paris the slot is formed along the inner side of one of the running rails.

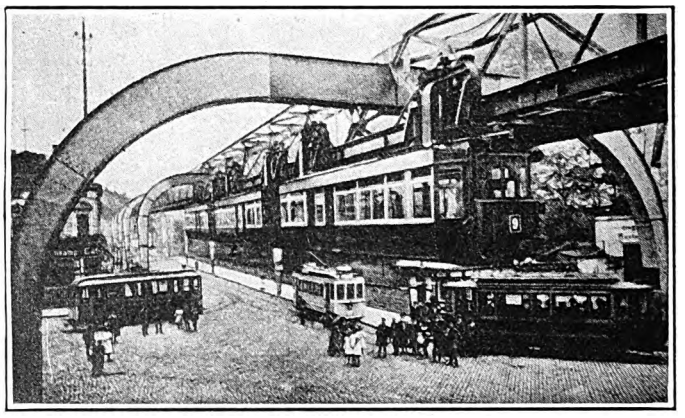
Short four-wheeled cars are standard nearly everywhere on the Continent, with a notable exception in Paris, and in the larger cities they are operated in trains all day long with one motor car and from one to three trailers. Some of the trailers are very light with very small wheels and low floors. In Great Britain double-deck cars are used on all the larger systems. The stairs lead up from the rear platform and the upper deck is inclosed. On the Continent they have a fancy for delicate colors. Such colors would be fantastic in our cities, but in the clean, picturesque European streets they are rather pleasing and not at all out of place. Of course it is necessary to keep such paint clean, and the paint and varnish must be well looked after. The finish often looks like a furniture job.

Compared with American operation, the cars are almost noiseless. While much of the credit for this is due the track, yet it speaks for close fits and frequent tightening of all truck parts and for close attention to gears and pinions.

There are no inclosed platforms on city cars. This, together with operation in very narrow streets, would seem to look bad for the accident account, but it is probably not as important with them as it would be with us. In some streets the rail cannot be more than 3 ft. from the building line. Street traffic even in London is nothing like as great a problem as it is with us, because automobiles have not come into such general use. In Rome, for example, a city of 900,000 population, there are very few traffic policemen. Pedestrians seem to be more wary than here, for automobiles and taxicabs go tearing through the narrow streets tooting their horns most urgently, but nothing happens.

Next to their standards of maintenance the most important particular in which European tramways excel ours is in route signs. All routes are numbered. The numbers show in big figures on the signs and are so well advertised that every one is familiar with them. In addition, the destination and generally the principal streets operated on are named on the outside signs. Inside, the complete route and rates of fare are conspicuously displayed. In the subways each car carries several large cards showing the line diagrammatically with every station and transfer point. In the subway stations the signs are so complete that it is not necessary for the stranger to ask a single question. Folders and small scale maps are widely distributed describing the routes in detail and giving directions for reaching all points of interest. The routes are so well advertised that the public, particularly hotel people and policemen, are surprisingly familiar with them. In London and Paris stopping points are indicated by neat, distinctive signs.





Suspended Railway Running from Vohwinkle to Barmen in the Rhine District of Germany

On the Continent buses are not used to any extent, except in the largest cities. This is probably due to municipal operation of so many tramways and to lack of funds. In England bus lines are fairly common in the principal cities, but do not seem to be permitted to poach on the tramways to the extent that they have done in London.

Of much interest to an electric railway man is the extensive program of electrification of steam railway lines that is in progress. A large portion of the suburban service around London and Paris has been electrified, and in Switzerland and the mountain districts of Italy where coal is dear and water power plentiful much work is going on.

Tramway men acknowledge that future extensions of service will have to be provided for by buses as the cost of tramway construction is prohibitive as compared with bus installation.

Digitized by Google

There has been very little abandonment of tramway lines and no cases of bus substitution came to notice.

The suspended railway (Schwebebahn) running from Vohwinkle through Elberfeld to Barmen in the lower Rhine country is a novel and interesting system of transit. The cars are suspended by gooseneck hangers from a single rail, there being two hangers per car, each attached with motor to a two-wheel truck. The rails are carried by latticed trusses running longitudinally and hung on cross-frames shaped like an inverted U or V. The line is about 6 miles long and the greater part of it is located over the Wupper River, a small stream from 100 to 120 ft. wide. The river bed is very crooked so that the railway alignment is a succession of curves. This, together with the frequent stations, results in a rather low average rate of speed. There is an intensive industrial development all along the line, so that two-car trains were well filled on five-minute headway during off-peak hours.

This suspended railway has been in operation for over 25 years, so that its practicability is well proved. It is much less costly to build than an elevated railway of standard type and makes comparatively little obstruction. It has favorable operating features in point of comfort, quietness and minimum stair climbing. In view of the apparent success of this system, from a technical standpoint, and its several advantages, it seems singular that it has not been used or seriously considered in many cities where rapid transit is needed but where the traffic is not heavy enough to support a subway or elevated line of standard type.

While definite conclusions can hardly be drawn from "horseback" observations, it seems fairly clear that European tramways are far ahead of American in car signs, advertising, maintenance standards and courtesy of operatives. They have made a quicker "comeback" since the war than other industries so far as volume is concerned, but in spite of this they are not earning cost of service, so that a part of their support must be coming out of general local taxes. Future extensions will be taken care of by buses. Municipal operation is apparently efficient under European conditions in so far as quality of service is concerned.

Wages on European Electric Railways

WAGES paid to motormen and conductors on the tramways in Europe are far less than those prevalent in this country. Statistics giving information up to date on European wages were presented in a report at a meeting held in Brussels in July, 1925, of the personnel connected with European tramway companies. This report gives for all the principal European countries the average hours per week or per day of the employees in the transportation and maintenance service, with wages paid, accident and sick benefits awarded, and other similar information.

In Great Britain a motorman is paid somewhat more than a conductor and averages, according to the size of the city, from $12.84 to $15.24 a week. These wages are based on a standard week of from 48 to 52 hours. The conductors get about a dollar less per week. These statistics are taken from the reports of 142 tramway systems, of which 90 are municipally owned and 52 under private operation. The tramways in Great Britain employ more than 50,000 persons, of whom 12,620 are employed in London.

In Holland there are nine tramway systems, of which five are municipal, and the transportation employees in Holland earn from 30 to 40 kronen a week, or from $12 to $16. They work from eight to eleven hours per day.

In Italy the wages are considerably lower. For transportation employees they average 780 lire, or about $28 per month, and the men work from 8½ to twelve hours a day. Italy has 44 city tramway systems, with about 30,000 employees.

In Sweden the wages of the men seem to be as high as anywhere in Europe. That country has eleven tramway enterprises, of which eight are municipal, and 2,402 men are employed. Forty-eight hours a week is the standard period of work and the wages average from $54.67 a month in the small towns to $72.36 in Stockholm. After about twelve years of service a man in the small town can work up to a monthly wage of $67.80, while the motorman in Stockholm can expect $89.80 a month after twelve years of service.

There is only one railway system in Alsace-Lorraine, that in Strassburg. The men make from $21.18 to $24.75 per month. Married men get $2.50 more a month, as well as 75 cents a month extra for each child under fifteen years. Overtime is paid at the rate of 14 cents an hour before midnight and 24 cents an hour after 12 p.m.

Accident Record Good in St. Louis

ACCIDENTS for the year 1925 on the lines of the United Railways, St. Louis, numbered 19,171, which is the lowest figure of the last four years. Of this total 10,775, or 56.2 per cent, were collisions with other vehicles. This, the largest class of accidents, has grown steadily from 323 in 1907 to a maximum of 12,609 in 1923. Starting organized safety work in 1924, the company was able to check the increase and accomplish substantial decreases in 1924 and 1925. This has been done despite the fact that the number of motor vehicles in St. Louis has increased from 80,556 in 1923 to approximately 150,000 at the present time. Except for the item of collisions with motor vehicles, the accident record of the railway for 1925 is the lowest in the nineteen years, beginning with 1907, for which records are available. All other accidents total 8,396, as compared with a maximum of 22,167 in 1909.

Accidents for the past year are classified as follows:

Type of Accidents	Number
Collisions with wagons	444
Collisions with persons	531
Collisions with animals	41
Car collisions	270
Car derailments	130
Boarding and alighting	2,046
Falls in car	951
Disturbances	534
Car equipment failures	42
Miscellaneous	1,966
Transportation employees injured	115
Power plant and line employees injured	216
Maintenance of way injuries	419
Shop injuries	307
Electrolysis	31
Struck by car doors	353

Fatal accidents in which the United Railways was involved numbered 31. The low record of fatalities occurred in 1920 with 25, and the high record in 1910 with 70. Car-miles numbered 2,465 and passengers carried 23,831 per transportation accident in 1925. Per passenger injury, the car-miles averaged 11,542 and the number of passengers carried 111,595.

Association News & Discussions

Diesel-Electric Locomotives Discussed in Joint New York Meeting

SOMEWHAT conflicting views were presented at the meeting held in New York on Feb. 18 when the Metropolitan Sections of the four great engineering societies—civil, electrical, mechanical and mining and metallurgical—met to discuss the Diesel engine and its effect on heavy traction. This is not strange because the Diesel locomotive is a newcomer in the railroad field.

C. A. Stein, general manager Central Railroad of New Jersey, was the first speaker. Progress of the steam locomotive was depicted in stating that the present locomotives are 34 times as heavy and 52 times as efficient as the first 8-ton, 2,000-lb. tractive effort locomotives used in the United States in 1829, almost 100 years ago. For the first 70 years the railroads expanded and grew in size, but made few changes in the design of the steam engine used for propelling the locomotive. Since 1900, however, many improvements have been made, until now almost too many things are placed on the locomotive. Mr. Stein inferred that the steam locomotive has almost reached the limit of its development.

The speaker mentioned several objections to electrification, the first and principal one being its high cost. He feels also that there is a danger in the third rail and the high voltage overhead trolley. Sleet and ice have proved a real interference to third rail operation and also, to some extent, to overhead trolley. Troubles at the power house and on the transmission lines cripple electric operation of the entire zone rather than of one unit only. While the thermal efficiency of the electric engine is greater than that of the steam locomotive, he believes that it is not as efficient as the Diesel engine. The Diesel engine undoubtedly will find an important place in steam road operation, particularly in terminals, whether electrified or not, until one standard system of railway electrification can be determined upon.

The Central Railroad of New Jersey is operating one Diesel locomotive in its Bronx terminal. It is self-contained, requiring no heavy investment to provide for peak conditions. One unit is just as efficient as it would be if Diesel locomotives were used throughout. In other words, a changeover from steam to Diesel engine can be made gradually, as conditions warrant.

High grade mechanics are not necessary in Diesel engine maintenance, according to the speaker. In common with electrification, the steam road is freed of water tanks, cooling stations, water scoops, ash-handling equipment and other similar necessities to steam locomotives. This one Diesel locomotive operating in the Bronx yards has a fuel cost of only one-fifth that of the steam locomotive it replaced, because on account of smoke reduction the steam locomotive had been burning anthracite at $8 a ton. Mr. Stein feels that the Diesel-electric or oil-electric locomotive is going to find a very definite place in steam road operation and will be a considerable competitor to electrification.

Hart Cooke, of the McIntosh-Seymour Corporation, stated the case for the Diesel locomotive. Mr. Cooke's paper is abstracted elsewhere in this issue.

Electrification Favored by Mr. Storer

N. W. Storer, general engineer Westinghouse Electric & Manufacturing Company, delivered an outstanding paper in favor of electrification. Mr. Storer's paper will be found elsewhere in this issue.

Edward B. Katté, chief engineer electric traction New York Central Railroad, read into the records a few remarks, reproduced elsewhere, and showed several tractive effort curves of the freight and the passenger Diesel locomotives designed for the New York Central, in comparison with steam locomotives. These are the first Diesel locomotives used in this country for road service.

W. B. Potter, chief engineer railway department, General Electric Company, in a brief discussion, said that the electrical engineer must think of electrification in the terms of transportation. The speaker has long been interested in both electrification and internal combustion engines, and while he believes that the Diesel locomotive will find an important place in steam road operation, because of its high thermal efficiency, he sees no fear for heavy electrification of trunk lines because of this unit. Mr. Potter looks forward to the future of steam road operation as being capable of absorbing all of these forms of locomotion in their proper place.

Sidney Withington, electrical engineer New York, New Haven & Hartford Railroad, rose to the defense of the electrical operation of his road between New York and New Haven, saying that its reliability had been greater than under steam locomotive conditions, despite the dependability upon a power station and transmission line. Also, he is not alarmed as to the personal injury possibilities mentioned by one of the other speakers, saying that it is only a matter of education to warn people of the dangers of the third rail and the high-tension trolley. During the shopmen's strike a few years ago it was a very significant fact that the electric locomotives were better maintained by the unskilled labor available than were the steam locomotives, an important point in favor of electric locomotive operation.

Mr. Withington said that the system of electrical operation should be standardized, particularly in the East, where the steam roads of one company come in contact with others so frequently that it would be an annoyance and an expense if many of these other roads were electrified by different systems.

Even in the congested districts in New York the sum of all rated power of the New Haven electric locomotives is four times the capacity of the power house, indicating clearly the effect of the diversity factor. Diesel locomotives would be more expensive, not only because of the greater expense of the Diesel engine per horsepower, but because it would be necessary to supply so much more generating capacity than would be possible under full electrification operated from central power stations. Likewise, the future oil supply may seriously affect the economic status of the Diesel engine in the future, in the opinion of Mr. Withington.

W. S. Murray said that the final answer was an economic one, and that the annual charge composed of the two factors, one of operating and the other of fixed charges, must determine the usefulness of any type of locomotion. He has little fear for electrification as a whole, but sees an opportunity to use the Diesel engine in yards, branch lines, and perhaps on road work on long light lines that do not require heavy trains and are not encumbered by heavy grades.

Several others discussed various points that were raised by the speakers. The entire meeting showed a great interest in the subject and a desire for some type of engine to replace the steam locomotive under conditions that are not favorable to its operation and maintenance.

The Diesel Locomotive Must Prove Itself*

By E. B. Katté
Chief Engineer Electric Traction
New York Central Railroad

SUCH a locomotive as the Diesel should promote the extension of heavy electric traction in that it may be considered a competitor of the electric locomotive in certain fields, and as such, should tend to reduce the cost of electric locomotives.

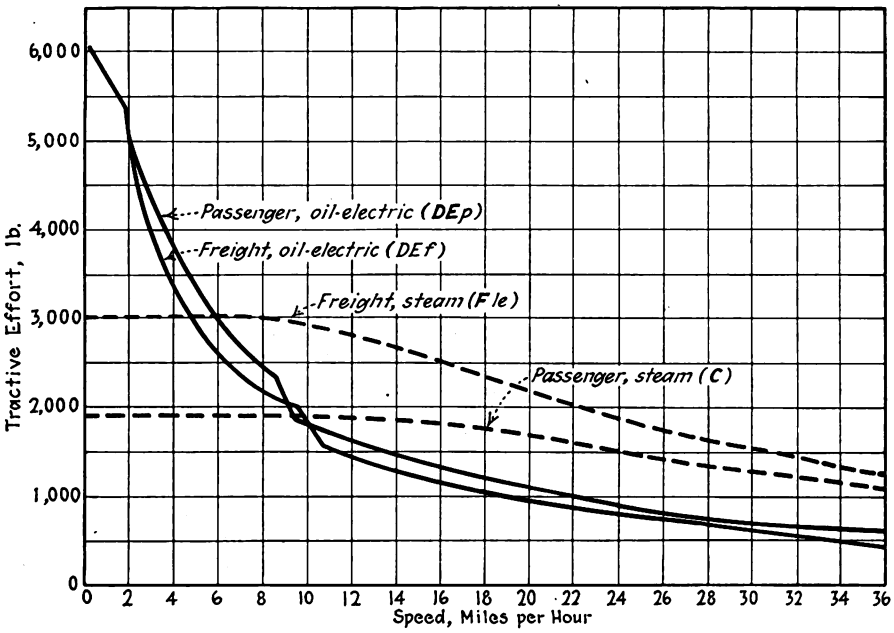
The most promising field for the Diesel locomotive is in switching service in non-electrified yards, or between yards operated under different systems of electrification; also on railroads

*Abstract of discussion before a joint meeting of A.S.C.E., A.S.M.E., A.I.E.E., and A.I.M.&M.E., New York City, Feb. 19, 1926.

Digitized by Google

with relatively infrequent service, or on branch lines where the traffic is not heavy enough to provide an operating saving sufficiently large to cover the increased fixed charges incident to electrification. To compete successfully in either of these fields the Diesel locomotive must operate practically noiselessly and smokelessly; the economy in operation must at least equal that of the electric locomotive and the first cost must be less than the combined cost of the electric locomotive and the working conductors.

During the preliminary exposition of the advantages of the Diesel locomotive, railroad engineers have accepted without argument the first three requirements, knowing that the contract trials will demonstrate their truth or fallacy. With regard to the ultimate cost of the unit there is still grave question. The prices thus far quoted are excessive, considering the small capacities offered. It is only in the hope that prices will be very materially reduced when Diesel locomotives are built on a mass production basis that railroad engineers have been able to recommend the trial orders thus far awarded.



Comparison of Tractive Effort, New York Central Steam and Oil-Electric Locomotives

Like all other railroad problems this is one of economics. There is no question but there is a field for the Diesel locomotive adjacent to and bordering those fields now occupied by the steam locomotive and the electric locomotive, but its economic advantage over both must be firmly established before the railroads can invest very heavily in this new type.

Thus far the principal development of Diesel locomotives in this country has been for switching, in relatively small sizes. Such a locomotive was tested by the New York Central Railroad during the summer of 1924. These tests were very encouraging but clearly indicated that a locomotive of greater capacity was desirable.

Since that time the engineers of the New York Central have diligently endeavored to interest manufacturers in the production of an oil-electric locomotive weighing about 100 tons and capable of developing about 1,000 hp. As a result of their activity two orders have been placed for Diesel-electric road locomotives. The one for passenger service will contain an 800-hp. McIntosh-Seymour engine. The weight of this locomotive is about 148 tons. It is intended for light passenger service on the main line of the Putnam division. The freight road locomotive will weight about 128 tons, and the power will be furnished by a 750-hp. Ingersoll-Rand engine.

Tractive effort and speed characteristics of these locomotives, and of the steam locomotives which they are intended to supplant, have been plotted to the same scale and are shown on the curve reproduced elsewhere. Both the passenger and the freight locomotives will be equipped with four General Electric motors, each having a continuous rating of 266 hp. The locomotives will be arranged for multiple-unit operation, two or more being coupled together for hauling heavier trains.

The speed of the passenger locomotive hauling average trains on the Putnam division will be between 15 and 50 m.p.h., depending upon the weight of the train. The maximum safe running speed of this locomotive light will be 60 m.p.h. The freight locomotive is designed to haul the average weight trains on the Putnam division between 8 and 35 m.p.h., with a maximum safe speed of 45 m.p.h.

Effect of Diesel-Electric on Railroad Electrification*

BY HARTE COOKE
McIntosh-Seymour Corporation

PROBABLY the best way to get an idea of the effect of Diesel-electric locomotives on the electrification of steam railways is to look into the characteristics of the different types of motive power and take up the requirements of some of the special kinds of railway service, so that we may see what the special conditions are and what motive power would be best suited for the service.

The tractive effort curve has a maximum value which is limited by the weight on the driving wheels. This total weight on the driving wheels is limited by the axle loads permissible for any given track structure and also the number of driving wheels which can be used. A steam locomotive will maintain this maximum tractive effort practically constant up to about 10 m.p.h. Then the tractive effort falls off approximately inversely as the speed, approaching a hyperbola which is limited by the horsepower which can be developed by the cylinders and the boiler capacity of the locomotive. With this form of tractive effort curve the locomotive can pull at considerable speed any load which it can start. Full horsepower capacity is only developed at relatively high speeds.

As a matter of reference we will refer to the weight, first cost, fuel cost and time the engine is in service of the steam locomotive as 100.

The Diesel-electric locomotive has the important peculiarity of being able to develop its full horsepower at any speed, and this with the even torque of the electric motor gives very high tractive effort at starting. The weight of the locomotive is such that practically all of this can be utilized.

The tractive effort of a Diesel-electric locomotive varies in general inversely as the speed, the curve being approximately a hyperbola equivalent to the net horsepower that the locomotive is able to deliver. This gives the locomotive ability to start very easily any load it can draw at a reasonable speed and this large tractive effort at starting also gives high accelerations. In regard to weight, the Diesel-electric locomotive will weigh about 50 per cent more per horsepower than the steam locomotive; say we will represent this by 150. The cost per horsepower will be in the neighborhood of three to four times as much as the steam locomotive, which we will represent as 300 to 400.

In regard to maximum output, this type of locomotive can be arranged for multiple-unit control, so any amount of output desired can be provided.

With this type of locomotive the fuel and water necessary for a great many miles can be carried on the locomotive so that no tender is required. With the same relative leeway as used for the steam locomotive, and allowing for the absence of standby losses for the Diesel locomotive, we find that the fuel cost will be represented by 30.

Because of the freedom from operating delays and those caused by servicing and maintenance, the time in active service of a Diesel locomotive would be represented by 200, about twice what is usual with a steam locomotive.

On the same basis the electric locomotive would have a weight per horsepower equivalent to 75 as compared to steam, a cost of 300 to 600, depending upon the power station requirements; a fuel cost of 37 and a time in actual service equivalent to 225.

*Abstract of discussion before a joint meeting of A.S.C.E., A. S.M.E., A.I.E.E. and A. I. M. & M. E., New York City, Feb. 19, 1926.

Digitized by Google

From a detailed analysis of the various fields in which the Diesel locomotive might be used we conclude that for very light traffic the freight and through passenger traffic can best be handled by the steam locomotive and the local passenger traffic by gas rail cars to keep the capital expenditure to a minimum, as the traffic is not heavy enough to allow the savings accruing from the more economical operation of Diesel-electric locomotives or full electrification to balance the increased capital cost.

As traffic increases, changed conditions should be carefully analyzed to see when the steam locomotive should be supplemented by Diesel-electric, the Diesel-electric making the best showing when it can operate the most miles per day.

The capital cost for full electrification is variable and becomes less as the traffic density increases. It is a rugged arrangement and can give much service at a low fuel cost if used in heavy traffic. Under these conditions the capital costs are reduced to an amount which the fuel saving justifies.

The Diesel-electric has an important difference from full electrification in that the investment can be made gradually and the benefits obtained at once and in proportion to the extent to which it is used.

All of the above shows that the three kinds of motive power are supplementary:

For light traffic, steam.

For heavier traffic, Diesel-electric.

For very dense traffic, full electrification.

Some Features of the Diesel-Electric Locomotive*

By N. W. Storer
General Engineer Westinghouse Electric & Manufacturing Company

RAILWAY people the world over show a tremendous and widespread interest in the Diesel-electric locomotive. This is simply indicative of the need for a locomotive which, while having all the advantages of steam as an independent motive power unit, avoids many of its disadvantages. The Diesel electric avoids much of the smoke, dirt and noise, the frequent trips to the roundhouse for attention to fires and boilers, and for fuel and water. It has four times the thermal efficiency of the steam locomotive and adds to that all the flexibility and easy control of the electric.

The steam locomotive is one of the greatest machines in the world but the interest aroused by the Diesel electric shows how anxious the railways are to get something better, how thoroughly everyone has come to believe that it is only a question of time when it will be superseded. Whether the Diesel engine is to displace it is another matter.

After the engine itself the great problem is the transmission of the energy developed to the driving wheels. Direct mechanical connection is more or less satisfactory for very small outputs, the hydraulic with a little larger capacity; and a combination of the two is being exploited in Europe. Practically everyone in this country who is working on a locomotive to be operated with the Diesel engine is using the electric system of transmission, indicating that there are serious limitations to the mechanical and hydraulic systems and that the great superiority of the electric is generally accepted. On the face of the matter, it would seem that a direct connection between the engine and the drivers would be the simplest and most efficient, but since the Diesel engine is not self-starting and does not operate satisfactorily at very low speeds, a direct connection is impracticable and any mechanical or hydraulic means, while possibly satisfactory and reasonably efficient when new, will continually develop troubles and will lose its efficiency with age. The electric transmission system, while admittedly being more or less expensive and heavy, is extremely simple to operate, absolutely flexible in its speed-torque characteristics and maintains the same efficiency throughout its life.

*Abstract of discussion before a joint meeting of A.S.C.E., A.S.M.E., A.I.E.E. and A.I.M.&M.E., New York City, Feb. 19, 1926.

Similarity of Diesel Electric to Motor-Generator Type

The Diesel-electric locomotive is very similar in its characteristics, performance and equipment to the motor-generator type of alternating-current locomotive which takes power from a single-phase trolley and utilizes a synchronous motor to drive a direct-current generator which furnishes current for the driving motors. The Diesel electric substitutes the engine with its auxiliaries for the synchronous motor, transformer and all other parts of the equipment pertaining to them. The equipment, from and including the direct-current generator to the motors, is or may be practically the same. Speed regulation is by voltage control of the generator in both cases. The motors for both are low-voltage, direct-current series machines, with all of their rugged characteristics. The main difference between the Diesel electric and the motor-generator type is that the output of the former is limited to a very definite value which may be carried for long periods, while the synchronous motor, which the same continuous rating, has a great power house back of it and may carry very heavy overloads for short periods. The Diesel electric in this respect has almost the same limitation as the steam locomotive. Its horsepower capacity is limited. It can exert the same maximum tractive effort as the all-electric because of the motor drive, but only at very low speeds.

On a Diesel-electric locomotive, the generator and motors must be considered as a unit in calculating the output of the locomotive. The most important features of the electrical equipment are:

1. The ability to utilize the full capacity of the engine at whatever train speed it is needed or desired.
2. A high efficiency so as to transmit the maximum amount of energy from the engine to the wheels.
3. Simplicity of control.
4. Light weight.

What are the characteristics of the electrical equipment that will best utilize the engine capacity? Voltage control of the generator has already been mentioned as giving the maximum flexibility for control of speed and tractive effort. This, however, is operative only up to the normal voltage of the generator and over most of the range while overloading the motors and generator. Over-voltages are sometimes secured by forcing the generator field. Where the voltage is limited, as is necessarily the case with a generator designed for a definite voltage, further speed control may be secured by weakening the fields of the motors, and there is no reason why a very considerable range of speed cannot be covered in this way. Difficulties from commutation of the motor at weak fields and high speed might be serious with motors taking current from a trolley with all its fluctuations and surges in voltage, but it is much less serious where the power plant goes with the motors. It must be remembered that neither generator nor motor is overloaded while operating with weak fields on the motors.

The efficiency of the electrical equipment is of the utmost importance, not simply on account of the fuel consumption, but because the higher the efficiency the greater will be the energy of the locomotive available at the wheels. Every effort should be made to make it as high as possible. The electrical equipment, when properly designed, will have an excellent all-day efficiency.

With all of the complications of the Diesel engine and its auxiliaries to contend with, it is all the more necessary to have a simple electrical control system. There are a number of ways to secure this feature. The one most commonly used provides an automatic control of the generator voltage which limits the output of the generator to the capacity of the engine so that the engine is in no danger of being stalled. This is usually combined with engine speed control. It is very desirable with the Diesel engine to keep the speed as low as possible for the output that is required, as low speed means lower maintenance, and especially lower consumption of lubricating oil, which is usually one of the most expensive items of operation. It is fortunate that this idea of variable engine speed combines very readily with a good control system for the electrical units of the power plant.

The auxiliaries on a Diesel-electric locomotive are like the auxiliaries on other kinds of locomotives—very important and very annoying. The Diesel engine requires pumps for water circulation and for lubrication. It requires air filters and radiators with a thorough ventilating system for cooling the engine. There must be ample

Digitized by Google

capacity of air compressors for the brakes and control. These are preferably driven electrically, either from the main generator or from an auxiliary supply system. Means must be provided for starting the engine. This is a matter of the greatest importance, since if the engine cannot be started, it is useless. It is usually started by compressed air, a pressure of from 200 to 500 lb. being necessary. In some cases the engine is started by current from a storage battery using the generator as a motor. Of course, a comparatively small amount of control equipment for the electrical apparatus will be necessary, but the sum total of the auxiliary equipment amounts to quite a large proportion. Last, but not least, is a good supply of fuel, oil and water.

Weights of Diesel Locomotives Are High

Diesel locomotives that have been built thus far range in weight per horsepower from 207 lb., which was in practically the first locomotive built, to 400 lb. The largest one built in this country to date, the 1,000-hp. Diesel electric built by the Baldwin Locomotive Works, with electrical equipment manufactured by the Westinghouse Electric & Manufacturing Company, weighs 275 lb. per horsepower. It is probable that it will be some time before locomotives weighing less than 200 lb. per horsepower can be built regularly with Diesel electric equipments.

Therefore, when I give 200 lb. per horsepower as the low limit for the Diesel-electric locomotive, I give a figure which has never yet been attained and which will require all of the ingenuity and refinements available to secure. For the present, it is much safer to figure on a weight of 250 to 300 lb.

The Field of the Diesel-Electric

Is the Diesel-electric locomotive going to displace all of the steam locomotives and eliminate the electric from further consideration? It is quite unnecessary for anyone in the steam or electric locomotive business to be alarmed at this time. Samuel M. Vauclain has said that much time will elapse and many millions of dollars be expended to develop the Diesel-electric locomotive to a point where it will figure to any great extent in transportation service. While Mr. Vauclain is probably right so far as trunk-line service is concerned, it undoubtedly will have a definite field in transportation circles. The first and probably the most important field will be on branch lines of railroads in service such as the Canadian National Railways is handling with its Diesel-electric cars. Switching is a most desirable place for the Diesel electric. The ordinary steam switchers used around buildings are a great nuisance on account of the noise, smoke and dirt which they disseminate. They are also expensive to maintain. The Diesel-electric eliminates a great part of the nuisance, is able to stay on the job for many hours at a time and probably will require little maintenance when it is taken to the roundhouse. These features, together with the flexibility of the electric transmission and the fuel economy, make it a most desirable successor to the steam locomotive. It is preferable in some situations in large cities to the electric switcher, since it eliminates the necessity for the overhead wires or third rail which are extremely difficult to apply in and around buildings and represent a high investment from which little return is possible.

The Diesel-electric will probably find a certain field in main-line service, especially for low-speed freight haulage, where the weight per horsepower is no particular disadvantage. It will be particularly useful in this respect on branch lines where the traffic is comparatively light. Further than this, no one can speak with any degree of certainty at this time, but in general it is not probable that it will be used to any extent for other than low-speed traffic for some years to come.

There is one point concerning it which cannot be too often emphasized; its use does not eliminate the fundamental limitation of the steam locomotive, namely, that its power is limited to the amount that can be generated on the locomotive itself, while the electric always has all the power it can utilize.

Electrification

Electrification will go forward in terminals and on the railways having heavy traffic where the investment in overhead lines and substations does not represent a considerable part of the cost of electrification. The Diesel-electric and the straight electric locomotive will move side by side in improving the transportation of the railways of the world. The steam locomotive will still roll along for many years, as it has advantages which are hard to overcome. It must be understood, however, that the steam locomotive is not the simple machine it once was. The improvements which have so greatly increased its capacity and efficiency have made it a very complicated machine and one which is most difficult to maintain. These are the reasons which will ultimately compel the retirement of a large part of them in favor either of the all-electric, the Diesel-electric or some other independent type of locomotive.

COMING MEETINGS
OF
Electric Railway and Allied Associations

March 5 — Metropolitan Section, A.E.R.A., 29 West 39th Street, New York, N. Y.

March 8-11—National Railway Appliance Association, annual exhibition, Coliseum and Annex, Chicago, Ill.

March 9-11 — Oklahoma Utilities Association, annual convention, Mayo Hotel, Tulsa, Okla.

March 12 — Pennsylvania Street Railway Association, annual meeting, William Penn Hotel, Pittsburgh, Pa.

March 17-18—Central Electric Traffic Association, Portage Hotel, Akron, Ohio.

March 17-18—Illinois Electric Railways Association, Illinois State Electric Association and Illinois Gas Association, annual joint convention, Springfield, Ill.

March 23-25—National Conference on Street and Highway Safety, Washington, D. C.

April 13-16—Southwestern Public Service Association, Galveston, Tex.

June 2-4—Canadian Electric Railway Association, annual convention, Quebec, Canada.

June 28-July 2 — Central Electric Railway Association, summer meeting, S. S. South American, Buffalo, N. Y., to Chicago, Ill.

Oct. 4-8—American Electric Railway Association, annual convention, location not yet determined.

Track Saturation Problem in Detroit*

By Col. H. U. Wallace
General Manager Department of Street Railways, City of Detroit

DETROIT has much in common with other large cities in its transportation problems, but it also has many problems which are peculiar to itself and are perhaps unique in the urban traction field. The intensive industrial life of the city not only lengthens the peak periods but increases the customary two periods to three distinct periods, with some three or four semi-peak hours in the intervals.

The city extends along the north bank of the Detroit River for a distance of approximately 12 miles and is solidly built up from the river in a generally northwesterly direction to a depth of about 9 miles. It is nearly rectangular in shape. The business center is on the city's southerly edge, approximately in the center of its river frontage, extending about ¾ mile along the riverfront and about the same distance inland.

One line of railroads enters the city in the southwesterly corner and extends diagonally across it from the business center. A second line of railroads extends from the westerly limits of the city, running southeasterly in a diagonal line to the business center. In addition to these, a belt line extends around the city approximately 6 miles from the center. Naturally the manufacturing district follows very closely along these railroads, which brings this district in an approximate semi-circle 3 miles from the business section, while some of the larger plants lie in a circle from 5 to 6 miles from the center of the city.

Our traffic surveys indicate that the majority of our people live on the side of the city opposite to which they work; that is, people engaged in plants on the westerly side of the city live on the easterly side, and vice versa, thus making it necessary for them to travel across the city to get to their work.

Many of the industrial plants work either two or three eight-hour shifts

*Abstract of a paper presented at twelfth annual conference on highway engineering, Ann Arbor, Mich., Feb. 17.

Digitized by Google

per day, employing thousands of men. There are probably very few railway systems in the world outside of Detroit that have a peak hour between 11 p.m. and 1 a.m. This peak is followed by the usual morning peak period from 6 to 9 to the business and industrial centers, and another in the afternoon from 3 to 6 o'clock. Since the starting time of these eight-hour shifts in our various industrial plants is not standardized, we find several periods which may well be termed semi-peaks. This lack of standardization, however, is helpful to the department, since if the hours were standardized we would require a tremendous increase in our rolling equipment to handle the armies of men who would pour into the streets.

While the transportation given by the department is fundamentally electric car service, a co-ordinated coach service is being developed rapidly. The growth and expansion of the city has made it imperative that we go into the coach business to serve newly populated areas on the outer edges of the city where the density of population is sufficient to warrant organized transportation but does not warrant the heavy investment incident to the construction of rail lines.

Coach lines run generally as extensions to the car lines in territory not directly served by the street car. Others are laid out as belt lines through newly developed territory intersecting existing car lines, thus giving a similar service through the transfer to that maintained where the car lines exist. This co-ordinated service works out to the benefit of the city, since the patrons originating their ride on a coach line can transfer, without additional cost, to a car line, and then, upon payment of 1 cent, can obtain a transfer to other existing car lines in the city.

The great expansion of the city demands some form of rapid transit. This may be rendered in two ways: First, of course, by a system of subways or elevated lines, or by a co-ordinated express and local street car and coach service. We are studying at the present time plans for such a co-ordinated service. These plans, which are still very much in the laboratory stage, would provide an express service by running street cars with stops approximately 1 mile apart. This service would be supplemented with a local coach service, or the reverse might be carried out with the coach in the capacity of an express.

One of the advantages of having the local service given by coaches is the ability of the coach to load and unload at the curb, thus avoiding a delay in the general flow of traffic, at the same time protecting passengers from the necessity of crossing through the traffic line to the center of the street to board the cars. The matter of protecting passengers either leaving or intending to board the cars is a serious problem because of the many unusually wide thoroughfares in Detroit. We have several streets of 100-ft. width and our main east and west artery, Jefferson Avenue, is 120 ft. wide. It will be seen from this that the distance from the curb to the car tracks is equal to the width of the average street.

Since, from necessity, the street car stops should be at intersecting street car lines, which means that usually these stops would be where the main traffic on the highway would also stop, there would be an advantage in having the street cars make only such stops, and if a substantial saving in time is made by these express cars, it is not inconceivable that local passengers would transfer from local coaches to the express street cars at these stops in order to get to the center of the city more rapidly.

Such a co-ordinated local coach and express car service would naturally be given only in the more densely populated areas. In other words, the coach routes would terminate approximately 4 miles from the center of the city, at which point the street cars would take up the local schedule to the end of the line. Studies of this co-ordinated service which have been made by this department indicate that on the longer lines reaching into the outlying sections a saving of ten minutes can be made in the run from the center of the city to the terminus of the line.

Since the city is paying for the railway system and its operating costs from the fares received and from no other source, one of the questions which must be answered is whether a line of coaches as outlined above would serve as a feeder to the car lines or act as a competitor, thus cutting down income and defeating the plan of purchase and operation. The studies made so far, however, indicate that the business is sufficient to warrant both classes of service, particularly since the service would be so attractive that competing privately owned jitney and bus companies will be forced out of business. It appears that this may be the solution for the present problem of tract saturation.

Oklahoma Utilities Speakers Announced

PROMINENT men in the different branches of the public utilities field have been selected to speak before the eighth annual convention of the Oklahoma Utilities Association to be held in the Mayo Hotel, Tulsa, Okla., March 9-11. Among those listed on the program are R. B. Campbell, president Midwest Electric Railway Association; Thomas F. Kennedy, member of executive committee H. L. Doherty & Company, New York City; J. E. Davidson, president National Electric Light Association; F. B. MacKinnon, president United States Independent Telephone Association; E. P. Dillon, general manager Research Corporation, New York City; Gen. Charles Keller, Byllesby Engineering & Management Corporation, Chicago; J. W. Gleed, general attorney Southwestern Bell Telephone Company, St. Louis; A. W. Leonard, president Natural Gas Association of America, Tulsa, Okla., and R. H. Sniffin, manager power department, Westinghouse company.

In addition to the general sessions, there will be division meetings for the electric railway, public relations, electric, gas and telephone sections. Ample opportunity for discussion will be afforded on the program.

Central Traffic Meeting

ON MARCH 17 and 18 the Central Electric Traffic Association will hold its next regular meeting at the Portage Hotel, Akron, Ohio.

The morning session on March 17 will be in the nature of a round-table discussion. The afternoon session will be given over to the transaction of committee work. It is the desire of the association, however, that so far as possible all committee work may be completed before the meeting in order to give more time to the transaction of business at the meeting. The session of March 18 will be devoted to reports of committees and such other business as may properly be presented.

American Association News

Mr. Trigg Proposed for Director of Chamber of Commerce

IN A LETTER addressed to member railway companies of the American Electric Railway Association, Executive Secretary J. W. Welsh calls attention to the coming election for directors of the United States Chamber of Commerce, which will be held at the annual meeting in Washington on May 11 to 13. He states that the industry's support has been asked for the election of Ernest T. Trigg, president and general manager of John Lucas Company, Philadelphia, Pa., who is a candidate for re-election from the second district. It is suggested that members communicate with their local Chambers of Commerce and also with any other organization members of the United States Chamber of Commerce in an endeavor to enlist their support in the above election.

Mr. Trigg has been connected with his firm since 1908. He has been general manager since 1912 and was elected president in 1922. He has been on many important boards and commissions of a public character, and was twice president of the Philadelphia Chamber of Commerce. Mr. Trigg is a director of the Philadelphia Rapid Transit Company and the Philadelphia Belt Line Railroad.

Metropolitan Section of the A.E.R.A. Meets March 5

FURNISHING transportation will be the subject of the next meeting of the Metropolitan Section of the American Electric Railway Association. W. B. Wheeler, assistant superintendent of transportation Third Avenue Railway, will present a paper on this subject. It will be discussed by M. J. O'Connor, superintendent of transportation New York Railways, S. S. Hamilton, assistant superintendent of transportation Brooklyn City Railroad, and D. K. O'Rourke, trainmaster Interborough Rapid Transit Company. Entertainment will be supplied by a well-known saxophone quartet from Connecticut.

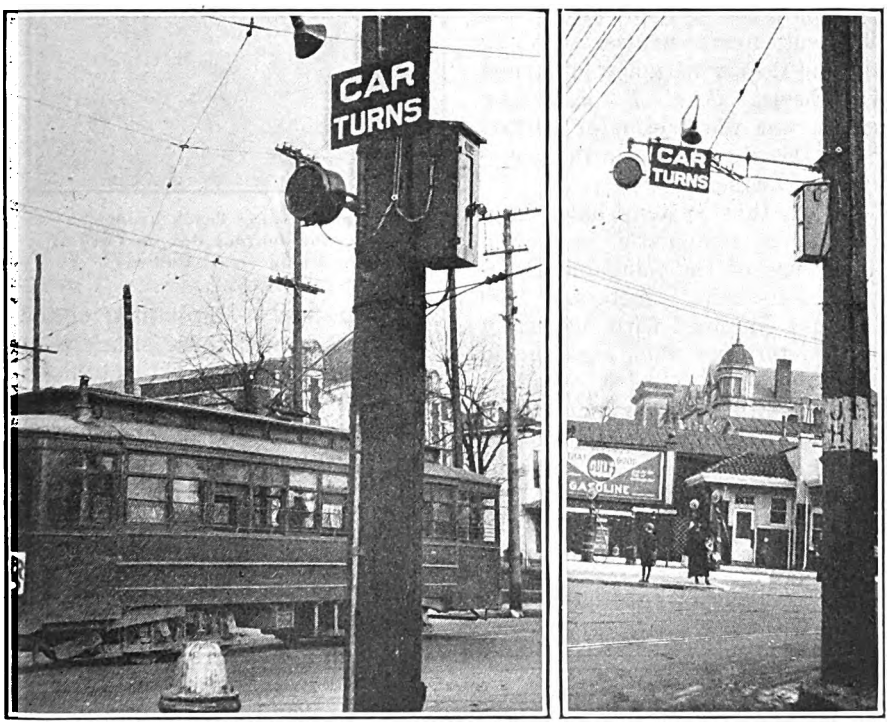
Maintenance of Equipment

Right-Turn Signals at Louisville

IN ORDER to avert collisions caused by automobilists while attempting to pass to the right of a car when that car is turning into a street to the right, the Louisville Railway, Louisville, Ky., has installed right-turn signals. Similar signals have been installed at other points where cars are likely to back on the main line and create a condition where vehicles should not approach too closely. The equipments were furnished by the Nachod and United States Signal Company and include a red projector, a floodlighted sign, a clearing contactor in the trolley wire and a relay in a box mounted on a pole.



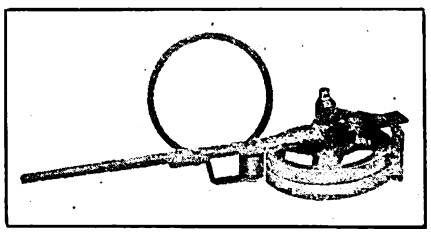
Signals in Connection with Floodlighted Signs Warn Motorists When Cars Are to Take a Turn. At Left, Pole Mounting for Sign. At Right, Pipe Bracket Mounting

When used in connection with a Cheatham switch, the same operation of the car under the Cheatham contactor that throws the switch-point for the diverging route shunts out a relay in a normally closed circuit. This causes its armature to drop to a back contact, closing a circuit to illuminate the red projector and to floodlight a sign reading "Car Turns." The projector is equipped with a 50-watt lamp in a 9-in. parabolic glass reflector with red cover glass and makes a brilliant effect even in daylight. The floodlight reflector has a 50-watt lamp also in series with the projector. This display of signals not only gives an arrestive warning, but explains the reason for it.

After the car has made the turn, it passes under a normally open contactor of the short type, which picks up the "stick" relay again, and thus removes the indication. The railway has installed six of these in various parts of the city. One is used to give warning that a car is about to back over a piece of double track while wye-ing; in this case the sign reads "Car Backs." It is controlled by two independent contactors. Another is placed where the car line swings across the street to make a terminal loop. One illustration shows the outfit mounted on 1½-in. pipe bracket, extending from the pole with sign and projector at the outer end of the bracket. The other shows a sign and projector mounted against the pole.

Fixture for Edgewise Bending of Rings

FINISHING rings for flush type headlights are made of ¾-in. flat stock ⅛ in. thick in the shops of the Eighth Avenue Railroad, New York, N. Y. The rings are formed by bending the stock edgewise in a special fixture, which is shown in the accompanying illustration. The fixture has a central portion, around which the bending takes place. A slot in this central ring keeps the stock in place and prevents it from turning up. A clamp to hold the end of the stock is pivoted from the central part of the ring, and the forming arm has rollers, with a groove to hold the edge of the flat strip. These roll the ring into position. This forming arm is also pivoted from the central part of the ring.



Fixture Used to Form Headlight Finishing Rings from Flat Stock. A Finished Ring Is Shown in the Background

To form a ring, the stock is heated so that it will bend readily, and the end is then placed in position and held firmly by the clamp of the fixture. By rotating the arm, the rollers force the flat stock into the groove of the central ring of the fixture and so bend it into circular shape. After the rings are formed, the ends are scarfed and welded by a blow from a hammer.

Changeable Sign for Front and Rear Entrance

DURING rush hours cars of the United Electric Railways, Providence, R. I., are operated with two men, but at other times many one-man cars are in operation. Passengers may board cars at the rear end with two-man operation, but must, of course, enter at the front of

Digitized by Google

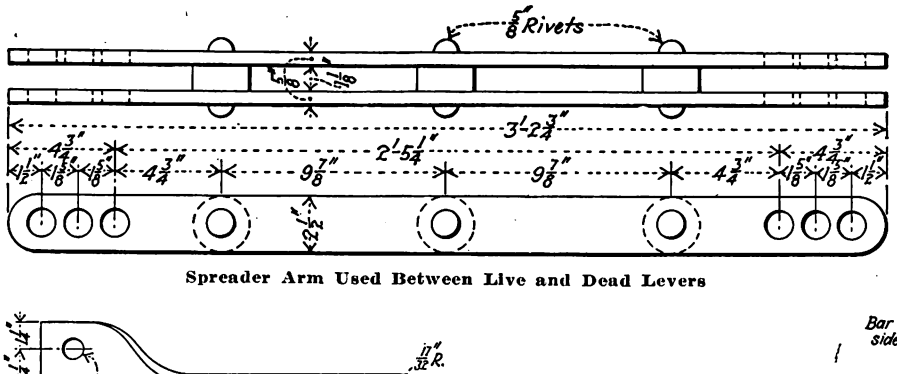
one-man cars. It was thought desirable, therefore, to install a sign to tell passengers at which end to board the car. Immediately below the destination sign in the front vestibule window a translucent sign has been installed. One end reads "Enter Front" and the other side reads "Enter Rear." A movable metal slide can be so placed that either end of the sign is concealed. Thus it can be made to read simply "Enter Front" for one-man operation or "Enter Front or Enter Rear" for pay-leave, two-man operation or "Enter Rear" for pay-enter, two-man operation. The sign itself consists of a piece of cloth spread on a metal frame attached to the window posts. The light of the car body is sufficient to make the sign readable from the street at night.

Maintenance Practices of Union Street Railway, New Bedford

Dead Lever Guide Aids Brake Adjustment

IN ORDER to insure proper braking at all times, the Union Street Railway, New Bedford, Mass., uses a somewhat novel brake-adjusting device. A piece of ½-in. steel 36 in. long and 3 in. wide is bent U-shaped and bolted to the truck bolster. Through this U-shaped piece of steel two or three rows of ⅝-in. holes are drilled. There are usually eight or ten holes in a row and they are so aligned that they provide a 7/16-in. distance between holes, thus permitting a 7/16-in. take-up of the brakes. The dead lever arm is passed through the center of this U-shaped dead lever guide and is held in position by means of a steel pin that is passed through a pair of these drilled holes. Adjustment for brake shoe and wheel wear can readily be made. The spreader arm which extends between the live and dead lever arms is provided with three bolt holes to take care of the adjustment made necessary when equipping the car with new or turned down wheels. G. H. Bonner, shop foreman, was the originator of this device. Details are shown in accompanying drawings.

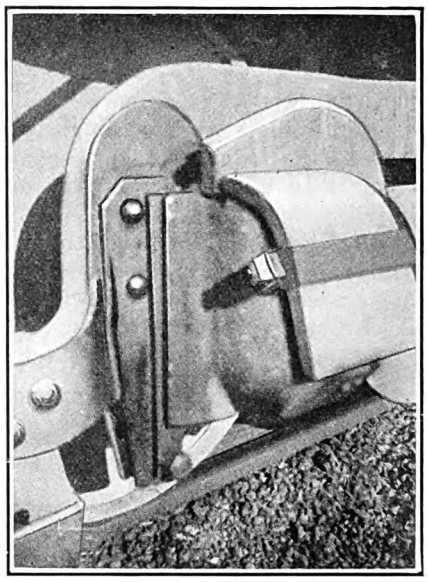
Cars of this system have been placed on a systematic inspection basis by use of the Sangamo Economy power-saving meters. The meters are equipped with inspection dials to determine when cars should be inspected or overhauled. When a car has operated approximately 750 miles it is given a brake inspection. This has been found frequent enough to keep a car which is provided with this brake-adjusting device in proper braking condition at all times.



Spreader Arm Used Between Live and Dead Levers

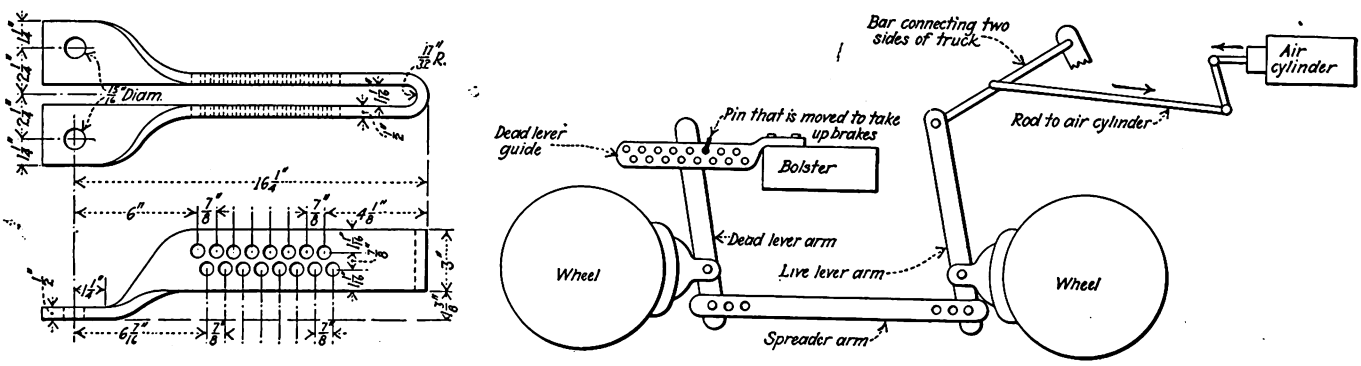
Journal Box Shims Save Wear

AS A means of holding the journal box housings in their proper place the Union Street Railway, New Bedford, Mass., makes a practice of placing steel shims between the journal box housing and the truck frame.



Shims Bolted to the Truck Frame Save Wear on the Journal Box on Cars of the Union Street Railway

A through bolt at the bottom of the truck frame holds these shims in a vertical position, while side motion is prevented by the presence of the journal box housing on one side and the bolt heads of the truck frame on the other side. As these shims are of softer metal than the journal box housings they absorb whatever wear there is and thus leave the truck frames and journal box housings in their original condition. Ordinarily shims ¼ in. thick are used, but in exceptional instances a ⅜-in. shim is installed. The surfaces of these shims are kept lubricated by applying old crank case automobile oil. Use of these shims has almost eliminated the breaking of truck and journal box parts and has resulted in holding the frame, journal, axle bear-



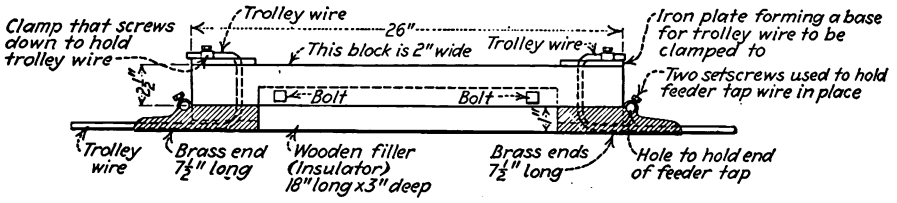
At Left—Detail of Dead Lever Guide. At Right—Brake-Adjusting Device Used on Cars of the Union Street Railway, New Bedford

Digitized by Google

ing and wheel in proper alignment. This has necessarily aided in eliminating worn journal box bearings, worn axle heads and grooved truck and journal box housings.

Long Section Insulator Used by Union Street Railway

A 26-IN. wood section insulator designed by Peter Dupuis, line foreman, is used by the Union Street Railway, New Bedford, Mass. It has an oak filler 18 in. long, which makes a positive breaking of the current. This filler is driven into a slot in the breaker and is held firmly in position by two through bolts. The brass approaches are



Section Insulator Designed to Prevent Damage to Ends of Trolley Wire

7½ in. long and are ordinary except for the special device for holding the ends of the feeder wires. These are not soldered, but are held in a socket provided with two setscrews. This method insures proper contact and at the same time the feeder wires can be easily removed. The ends of the trolley wire are passed through a gradual curve on the ends of the breaker and firmly held on the top of the breaker by means of an iron plate equipped with an iron clamp provided with two bolts. This method avoids damaging the ends of the trolley wire. Another advantage of this type of breaker is that the ends of the trolley wire are of sufficient length so that they are held in such a position that a maximum of strength is obtained.

Special Work Made by Thermit Welding

SEVERAL simple pieces of special work have been made in the Rochester shops of the New York State Railways by using their new thermit welding outfit. In this work, measurements of the old frogs which are to be replaced are taken in the ground by the railway engineering department. A sketch is made up from these measurements, and the work is done in the blacksmith shop under the direction of Louis Kubiak. The accompanying illustration shows two frogs being constructed. These are made in one piece to avoid joints. The guard rail is cut to the proper length and is then bent to the radius desired. The rails are fitted together and a slight space is left between the rails of the central points where the welding is done. After the work is set up, measurements are checked against the drawings before the pieces are finally bolted down to timbers for the welding operation.

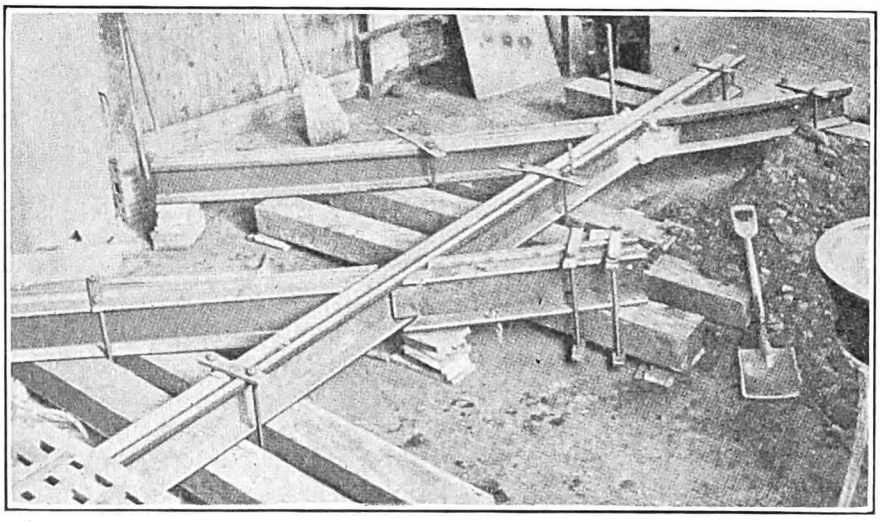
A mold constructed in standard manner is placed around the point where the thermit metal is to be deposited, and a crucible is set over the junction of the rails. The thermit welding is done in the usual manner. The illustration shows the metal as freshly deposited at one of the frog points of the double frog being made. The sand about the mold has been removed. After the metal is cooled properly, it is ground to a smooth surface at the top and the proper groove is ground to permit the passage of wheel flanges.

The cost of constructing special work as indicated is much less than what would be required to buy the pieces from manufacturers, but of course these frogs will not last as long, as they contain no solid manganese points to take the excessive wear at the centers.

Discarded Headlights for Indirect Park Lighting

SOME 18 miles north of Toronto, along the main highway and the route of the Toronto & York division of the Hydro-Electric Railways, lies a fine pleasure resort comprising a lake of more than 50 acres and another 165 acres of adjacent beach and woodland. When this park was in the hands of the original Toronto & York Radial Railway it was operated directly by the railway at a substantial loss. Under the Hydro-Electric Commission, however, the grounds have been turned over to a professional amusement concern, with the result that the railways are in a fair way to be relieved not only of the former operating expense, but of interest on the investment as well. This desirable end will be aided by a housing development scheme whereby cottage builders will be able to secure lots at a distance of only 300 ft. from the lake, their homes being made accessible by a 30-ft. roadway to be built at the rear of the cottages and going round the lake.

One of the features that has helped to popularize the park is a novel and economical scheme of indirect illumination. At the lake end nearest the highway is a power house and plenty of shrubbery. Concealed in this shrubbery is a battery of discarded arc headlights. These headlights produce illumination similar to that of a monster searchlight of an excursion steamer and of course attract the favorable attention of the thousands of travelers on the main highway near by. As the power used is entirely off-peak, the principal cost is for replenishing carbons.



Two Special Work Frogs Set Up for Welding in the Rochester Shops of the New York State Railways

The News of the Industry

Wage Change in San Francisco

The Market Street Railway employees of San Francisco, Cal., have received a voluntary wage increase of 2 cents an hour, effective Feb. 28, while the San Francisco supervisors have just denied more pay to the employees of the Municipal Railway. Under the new scale Market Street Railway employees will receive 56 cents an hour. Commensurate increases were given in all other departments, including shops, substations and track repair men. Samuel Kahn, executive vice-president of the road, said that the raise was entirely voluntary on the part of the management and would cost the company about $200,000 annually. About 2,500 men are affected. This action followed shortly after similar action by the California Street Cable Company. It is in line with the policy of restoring wages to the pre-war maximum.

The decision of the supervisors denying Municipal Railway employees an increase in wages from the present scale of 67½ cents to 75 cents an hour was attended by a series of bitter attacks by representatives of the men. The combined finance and public utilities committees of the San Francisco Board of Supervisors said, in effect, that it wanted to give the raise but it could not find the money for the purpose. The spokesmen for the employees said the money should be found even if a 6-cent fare were necessary.

It was agreed by the committees that there was at hand a sum amounting to $343,000 which might be used to pay the wage increase demanded, but they also pointed out that this would last for only two years and that afterward there would be an annual deficit. Expert accountants retained by the employees declared that the figures quoted by the supervisors were obtained through erroneous bookkeeping methods and that there was money enough to meet the increase. They urged rectification of the accounting system. In the end it was agreed that there must be some changes in the financing before any pay increase could be recommended.

Committee to Study Atlanta's Needs

Mayor Sims of Atlanta, Ga., following a councilmanic resolution, has named a new committee to consider the "relief petition" of the Georgia Railway & Power Company. The petition of the company was filed early in December and suggested seven different remedies of relief. One of these, the elimination of jitney buses from the streets, has already been granted, and another, that of eliminating certain unnecessary street car stops, has been recommended by the Council and is now before the Public Service Commission for action. The other suggested remedies are: Elimination, to the extent necessary, of the gross receipts tax and street paving assessments; 10 cents for cash fares, with a special rate for riders who use tickets, and a 2-cent charge for transfers.

Railway and Bus Company Unite in Bid

New York City Companies Would Abandon 25 Miles of Track and Run 50 Miles of Bus Routes at Five-Cent and Ten-Cent Fares with Transfers on Latter

AN EXCLUSIVE franchise to operate an extensive bus system in Manhattan on which 5 cents would be charged on crosstown lines and 10 cents on longitudinal lines was sought in a joint petition presented on Feb. 24 to the Secretary of the Board of Estimate of New York City by the Fifth Avenue Bus Company and the New York Railways. The two companies announced an amalgamation for the purpose of bus operation and offered in return for the franchise to eliminate 25 miles of street car tracks, remove 200 cars and to give up perpetual franchises owned by the railways.

A summary of the main points of the new petition, follows:

(a) Marks first move toward the installation of a comprehensive motor coach service through co-operation of effort and co-ordination of facilities of existing surface car companies.

(b) Discontinuance of the use of 25 miles of street car tracks.

(c) Surrender of perpetual franchises to operate street cars on those tracks.

(d) Removal of over 200 street cars from the congested city streets.

(e) Operation of ten crosstown motor coach lines—23.96 miles of route—for a 5-cent fare.

(f) Operation of three longitudinal motor coach lines—24.58 miles of route—at a 10-cent fare.

(g) A universal transfer system, under which by means of transfer and retransfer for a single fare of 10 cents a person may ride from any point on the system to any other point thereon.

(h) A modern motor coach system covering about 50 miles of routes in Manhattan.

(i) Service to be started at once on certain lines and full service to be in operation in 90 days on the remainder of the system.

(j) Provision made for recapture by the city after five years for the purpose of municipal ownership and operation.

(k) Efficiency of service guaranteed by a staff of men experienced in omnibus operation and familiar with local transportation conditions in Manhattan.

Through John A. Ritchie of the Fifth Avenue Coach Company as spokesman, it was disclosed that controlling interests of that corporation and of the New York Railways had effected the amalgamation through the formation of a company just incorporated as the New York City Omnibus Corporation, of which Mr. Ritchie is president and J. M. McCarthy secretary.

The consolidated company withdrew the previous applications made by the Fifth Avenue Coach Company and the New York Railways and submitted its new joint plan, which calls for a virtual monopoly of bus operation in Manhatton with extensions into the Bronx.

The corporation also makes provision for recapture in the interest of municipal operation by the city after five years of private operation, if the city should so elect.

A statement by the sponsors for the new application concerning their proposal follows:

Under this plan presented by the New York City Omnibus Corporation, headed by John A. Ritchie, the new system can be put into immediate operation, first, because the new corporation has available the unique facilities of the Fifth Avenue Coach Company, including buses, equipment, personnel and organization, to put such a system into immediate operation, and, second, because all danger of litigation between the interests involved would be at once eliminated, and the city would, moreover, without expenditure, regain control of many of the streets, its use of which is now restricted by existing perpetual franchise grants.

Traffic all through the Borough of Manhattan would be vastly speeded up; congestion due to unnecessary duplication of routes would be eliminated, and the transit facilities of the borough would be placed in a more plastic state, whereby the city would mold them more nearly to meet the needs of the changing conditions.

The new company proposes that as soon as practical other street car lines of the New York Railways shall be motorized and the street-car tracks taken out. The ultimate object of the new company is to extend this plan to all street-car operation in Manhattan when and as soon as possible and practicable.

Sixth, Seventh and Columbus Avenue, three of the traffic arteries, would be immediately freed of street-car tracks under the plan, and Eighth Street and 116th Street for the most part would be immediately similarly cleared of inflexible street railway lines.

The crosstown routes, ten in number, would be operated at a 5-cent fare. The longitudinal lines would be operated at a 10-cent fare. Free transfers would be issued from the 10-cent lines to the 5-cent lines and to the other 10-cent lines, and a 5-cent transfer would be sold on the 5-cent lines for use on the 10-cent lines. The transfer privilege would allow a person by use of a transfer and retransfer to ride from any point on the system to any other point on the system for a single fare of

Digitized by Google

10 cents. This is the most comprehensive transfer arrangement which has been submitted with the proposals for bus operation in the Borough of Manhattan.

The proposal provides for the recapture by the city for municipal operation after five years at a valuation to be agreed upon by arbitration.

The routes proposed not only include substantially all of those laid out by the City Board of Transportation, but also additional routes provided for by the surrender of part of the perpetual franchise routes of the New York Railways—that is, Sixth, Seventh and Columbus Avenues and other thoroughfares. Service on some of these routes can be started immediately and the entire system can be completed and placed in operation within ninety days.

Approximately 200 surface cars would be eliminated by the plan and the passenger-carrying capacity of the borough's surface lines would be increased vastly by the installation of 210 double-deck and 202 single-deck motor coaches on the superseded electric lines and the additional new lines contemplated, which buses would be of the finest and most modern type and practically noiseless.

Consideration was given in the plan of the system to the elimination of inconveniences of unnecessary transferring by making provisions for the through routing of vehicles between extreme points in the borough at a maximum cost of 10 cents to the passenger.

The most of the afternoon of Feb. 24 was devoted to conferences with representatives of three of the principal competing bidders for bus franchises in Manhattan and to a general study of the terms and conditions offered in their respective petitions. The three applicants were the Service Bus Corporation, the Fifth Avenue Coach Company and the People's Electrobus Corporation.

It is said that the Fifth Avenue Coach Company also plans to combine a new bid with that of the Third Avenue Railroad subsidiary in the Bronx and may file a joint supplemental petition for the Bronx. The Third Avenue bus subsidiary is known as the Surface Transportation Company. The Third Avenue Railway now enjoys the greater part of all the road surface transportation in the Bronx.

Mayor Walker said on Feb. 25 that no action on the application of the New York City Omnibus Corporation could be taken until after consideration of the other applications for bus franchises and after the statutory hearings on the petitions yet unheard. The Board of Estimate fixed March 11 to hear the omnibus corporation.

Jersey Paving Bill Laid Over

After a fight in the Legislature, Senator Frank D. Abell of Morristown was compelled on Feb. 23 to lay over his bill to relieve street railway companies from paving obligations. On three roll calls he was able to get only ten of the eleven votes necessary for the passage. Although several Senators joined in the debate against the measure, Simpson of Hudson County and Roberts of Burlington County were the only ones to vote in the negative, the others remaining silent as their names were called.

Senator Abell said that the obligations originally assumed by the traction companies had become obsolete, and he charged that it was unfair to continue to compel them to help keep up the roads used by competing jitneys and motor buses. He declared that the Morris County Traction Company was in bankruptcy and that unless relief were granted trolley service would be lost to the working people. He argued that eight states have relieved trolley companies of such obligations.

Senator Simpson led the attack on the bill. He said that the utility companies, in order to obtain their valuable franchises, had agreed to certain things that they were now finding expensive and that if they were allowed to escape the burden it would have to be borne by the municipalities. He said in the next six years it would cost Jersey City $2,500,000 and Hoboken would have to pay several hundred thousand dollars on paving that had been neglected by the Public Service Railway.

New Deal Suggested for Worcester

Special Committee Named by Mayor to Investigate City's Street Railway Needs Favors Transportation Monopoly as Best Policy, with One Company Operating Trolleys and Buses

THE entire passenger traffic of the city of Worcester, Mass., should be handled by the Worcester Consolidated Street Railway, whether by trolley cars or buses used in conjunction with the trolley cars. Changes should be made in the regulation of the routing of buses so used, so that every emergency of traffic might be met with the least inconvenience. These are the principal recommendations submitted to Mayor O'Hara by the special commission appointed to investigate.

Among the most vital needs are given the speeding up of the trolley service in the city, provide new and up-to-date cars equipped with proper safety devices, that will permit the company to meet the new conditions that have come with the fast-moving automobile competition. At present the average speed of trolleys is a trifle more than 8 m.p.h.

An interesting feature of the report is the finding, based upon an actual count of passengers carried at the busy hours in Worcester, that buses cannot take the place of trolleys, but only aid in the carrying of traffic because the streets could not accommodate sufficient buses to handle the problem.

The report was drafted by Prof. Albert S. Richey of Worcester Polytechnic Institute and was adopted by the full committee, which included Frank H. Willard, City Solicitor William C. Mellish, William J. Flickinger for the New Haven Railroad, Clark V. Wood, president of the Worcester Consolidated Street Railway.

The report came as a result of the study made by the special commission of Worcester trolley needs, prompted by the appeal of the officials of the New York, New Haven & Hartford Railroad for co-operation from the city of Worcester in the effort of the railroad company to have legislation enacted at the State House that would permit the railroad to take back control of the trolley lines of the state, and on which the railroad officials in return promised to expend large sums of money in rehabilitation. Worcester was slated to have $1,000,000 of the proposed amount to be so expended in improving the service, and more if needed.

Professor Richey says the competition of the privately owned automobile has very seriously reduced the patronage of the railway in Worcester, as it has in every other comparable city of the country. It is believed, however, that with the proper rehabilitation of the railway, including the substitution of a considerable number of comfortable, convenient, attractive, and thoroughly modern cars, and especially if some improvement can be made in operating speed, a great deal of this lost patronage can be regained.

Among other things the report as presented says:

One of the most vital factors entering into proper street railway transportation is speed, and there should be a proper co-operation by the city officials toward its attainment. There is no question but that the larger part of the traveling public is served by the street cars, or that the street car is by far the most economical user of street space. Both of these facts are demonstrated by counts made within the past two weeks and referred to later, herein. Any steps taken to expedite the movement of street cars are for the general good of the entire city.

The company owns about 168 closed cars, most of which are less than 20 years old, and which are suitable for present service, with the exception of 25 cars which have been remodeled from open cars, have high platform, two steps and narrow doors, and which for those reasons unduly slow up service and consequently should be retired. This leaves about 145 closed cars which I agree with Mr. Wood are suitable for present operation, and deducting this number from the requirement of 220, Mr. Wood arrives at his number of 77 new cars to be purchased. He speaks of the proposed new cars as "lightweight one-man two-man cars," which agrees with the Day & Zimmermann statement as to a suitable type of car for this property, and with which I also agree, except that in the light of recent experience elsewhere, I believe practically the entire operation can be with one man, especially if the cars are designed to facilitate the movement of passengers and the collection of fares, including such devices as the treadle-operated rear exit door.

Equipment Should Be Overhauled

The purchase of new cars should be accompanied by a complete overhauling and repainting of all of the existing equipment which is retained in the service, and the future policy should and of course will include that of good housekeeping to the extent that cars are kept well painted, clean, safe and comfortable in operation, and manned by operators who at all times consider themselves as enthusiastic salesmen of a proper transportation service as much as the servants of the public as though in its direct employ.

The additional bus service suggested by Mr. Wood in substitution for railway service on the Worcester & Webster and Webster & Dudley lines and the Blackstone Valley division, south of Millbury, are matters which are most important to the city of Worcester. Such lines as these can be served best by bus, and in my opinion such substitution should be made.

Within the city of Worcester, it is doubtful if there is any section which at present is not served properly either by street cars or buses, but the street railway should be ready to provide one service or the other as soon as the need for it is demonstrated, and it is shown that a reasonable patronage is ready for the service.

With traffic which requires as does Park Avenue operation the use of street cars as frequently as 22 in a period of 1½ hours, there can be no question but that such operation is much more economical than would be that of buses, even if there were street room for the latter.

Relative to the reconstruction of various tracks in the city comprising about 34,000 feet of track in twelve locations, there is no question but that a proper rehabilitation of the railway would include such reconstruction. The railway should co-operate with the city in connection with all track reconstruction, to the end that where such reconstruction is necessary and the street is to be rebuilt, the work be done simultaneously, and at such time as

Digitized by Google

the city is ready to proceed with its work. In connection with track reconstruction and betterment, automatic electric switches should be installed at all points where track switches require movement in the operation of one-man cars.

In order to determine the relative use of the street by automobile and street car, I arranged for counts to be taken on South Main Street at Wellington Street, on Jan. 26, 1926. All outbound traffic was listed during the period between 4 and 6:30 p.m., and during that period the following outbound traffic was noted:

Six hundred and ninety-four private automobiles, with 1,144 passengers.

One hundred and thirty automobile trucks, with 196 passengers.

Twenty-two taxicabs, with 41 passengers.

Eight hundred and forty-six total automobiles, with 1,381 passengers.

Seventy-one street cars, with 3,127 passengers.

Professor Richey says it is probable that this count represents a fair cross-section of all cars and riding persons leaving the downtown section in all directions. He directs attention to the fact that although less than 8 per cent of the vehicles were street cars, they handled 70 per cent of the persons; also that the average number of passengers per automobile was 1.63, while the average number of passengers per street car was 44. He says that when it is considered that the street car occupies no more street space than two automobiles, the remarkable efficiency of street cars as a transportation agency as compared with the automobile is manifest, together with the fact that it is handling many more than double the number of passengers traveling by all other agencies. True, the above observations were taken wholly within the rush hour, but Prof. Richey says it must be remembered that this is the time during which the traffic problem is most serious.

School Regulations in Chicago Expedite Railway Travel

A step in curbing the exuberant youth in car loading at the high schools of Chicago, Ill., has been taken as a result of the ingenuity of the leaders of one school who devised and caused the adoption of regulations to get the students on their way home in orderly fashion. The regulations have been published as a model and are the product of Tilden Technical High School students. The school is one of a number at which several thousand students clamor for street car service, mostly at the same time. The regulations follow:

On each corner will be about four cadets with one senior cadet in charge. As soon as a car is available, one cadet will call the destination of the car, as, for instance, "Halsted and 79th." When the car is loaded a director will give signal for car to start. If there is a car superintendent present, he will give signal for the car to start.

Follow These Instructions

1. Line up in a single file parallel to the street car.
2. Do not get on the car while it is in motion.
3. Do not stand on the rear platform of the car unless it is impossible to enter the car.

Purpose of Regulations

Develop a well-regulated system of boarding street car and passing between periods which will:

1. Safeguard the lives of the students.
2. Save time.
3. Prevent congestion.
4. Give Tilden a good name.

Slogans

"Have fare ready"

"Line up" "Speed up"

"Move Along"

Goal

"To make the best better"

Willing to Surrender Massillon City Franchise

Heavy losses sustained in the operation of its city lines in Massillon have led the Northern Ohio Traction & Light Company to ask the Council of that city for permission to discontinue its city service. Such application has no bearing on the interurban service between Massillon and Uhrichsville on the south or Canton, Akron, Cleveland on the north.

The company does not desire to be placed in the attitude of attempting to evade its contract, and for that reason has hesitated to suggest an abandonment of the system to the City Council and citizens of Massillon. It develops, however, that a bus company has been organized with capital sufficient completely to motorize the city. In view of this, the company has expressed a desire to abandon its so-called city lines, leaving the interurban line through the city.

The company has felt for some time that the people of Massillon wanted a bus transportation system for the city, but it does not now desire to extend its bus operations to that extent, nor has it in the past desired to do so. The company which has proposed to put in a bus system is experienced in bus operation.

On its part, the Northern Ohio Traction & Light Company has offered to aid the city and applicant company to establish a permanent bus system. The company believes that in cities the size of Massillon a bus system can be operated which will be of greater benefit than the present rail system, and meet more adequately the needs of the public than does the railway. The company's present contract has only a few years to run. The lines have been operated year by year at considerable loss.

The proposal of the bus company, headed by Frank Booth, fixes a rate of fare at 8 cents cash, two tickets for 15 cents. It is intended to operate upon the principal streets of Massillon, and particularly to serve the steel mill district.

The application of the bus company and the one for abandonment will come before the Council on March 1.

$11,000,000 Milwaukee Budget

Approximately $11,000,000 will be spent by the Milwaukee Electric Railway & Light Company, Milwaukee. Wis., and its associated companies under the 1926 budget adopted at the annual meeting on Feb. 17. The program provides for these disbursements:

Milwaukee Electric Railway & Light Company, $6,100,000; Wisconsin Electric Power Company, which owns the Lakeside power plant, $2,300,000; Wisconsin Gas & Electric Company operating in Racine, Kenosha, Waukesha and other communities in southeastern Wisconsin, $1,600,000; Wisconsin Traction Light Heat & Power Company, operating in Appleton, $800,000; Badger Public Service Company, operating in Elkhart Lake and other Sheboygan County communities; Peninsular Power Company, operating in the northern peninsula of Michigan, and the Milwaukee Northern Railway, $200,000 among them.

The greatest single expenditure will be $2,300,000 for equipment to increase the output of the Lakeside pulverized fuel plant. Approximately $2,000,000 will be expended on the electric railways, exceeding by $600,000 the expenditure during 1925. About $1,000,000 will be required to complete the Waukesha interurban cut-off. Reconstruction of track in Milwaukee will require approximately $885,000.

New Problem in Jacksonville

In view of an adverse opinion from Austin Miller, city attorney, of Jacksonville, Fla., no referendum on the proposal that the city acquire by purchase and operate the Jacksonville Traction Company will be called by the City Commission, according to Frank H. Owen, chairman. The popular vote, which was requested by the City Council, was scheduled for April.

According to the opinion by Mr. Miller, it would be illegal for the city to spend public funds to determine "whether or not the city should do something it is not authorized to do by its charter." If any individual or group wants to press for a referendum, according to the opinion, it will be necessary to go to the Legislature for an act empowering the city to engage in street railway ownership.

So the Public of Baltimore May Know

The United Railways & Electric Company, Baltimore, Md., is conducting an advertising campaign through the Baltimore newspapers which gives the public intimate details of the street car system and how it is operated. Several of these advertisements have appeared.

The United takes the view that this advertising, if steadily and consistently presented, will greatly benefit the city, the patrons and the company.

The following benefits are listed:

A better understanding of the street car company's problems.

More street car riders and increased revenue for the company.

Better street car service.

A quickening of the city's progress, which is bound to be dependent upon the quality of its transportation facilities.

The company says:

Big improvements in street car service are expensive—more expensive now than ever. And yet rapid transit must grow and improve if the city is to grow and improve. In order to increase its capacity for improvement the company must increase its revenues. The sole source of a railway's revenue is its riders. Its income consists entirely of individual car fares. It cannot have more income until more Baltimore people ride the street cars. With increased riding and increased income there must come major improvements in service.

For years and years street car companies have been almost inarticulate. Other institutions, public and private, with problems to be solved and work to do have taken the public into their confidence and have asked their help and understanding. Street car men have worked in silence. Being in closer contact with the exacting and critical public than any other public utility they have leaned in the direction of taciturnity under fire. Work hard, take your medicine, keep quiet. That was the creed of the old time street car man.

It was a praiseworthy and creditable creed and it still is. But today "keep quiet" is a principle easily carried to extremes. The United intends to continue to live up to it. But it will amend the principle to this extent—it will not require the Baltimore public any longer to guess at the truth about its affairs or to accept misstatements in place of the truth.

These are the reasons for the United's advertising.

Franchise Memorandum on File at Louisville

A tentative memorandum regarding abolition of the present franchise and fare ordinance, under which the Louisville Railway, Louisville, Ky., now operates, and replacement of it with a new one, with a higher cash fare and slightly lower than present ticket fare, has been placed in the hands of Mayor A. A. Will. It is expected the memorandum will be made the basis on which something tangible may be worked out.

Experience seems to have proved that the present modified service-at-cost ordinance under which the company operates could well be modified in its provisions to the benefit of the city and the company.

News Notes

Metal Tokens in Use.—The Beech Grove Traction Corporation, connecting Indianapolis, Ind., and Beech Grove, has discontinued the sale of its five two-zone tickets for 50 cents and is now using metal tokens and Johnson fare boxes. The majority of patrons, it is said, prefer the metal tokens.

Seeks Increase in Fares.—The Union Traction Company, Coffeyville, Kan., has petitioned the Public Service Commission for an increase in its fares in the cities of Parsons, Cherryville, Independence and Coffeyville. The company requests a boost in local fares to 8 cents or two tickets for 15 cents, with a book fare of 25 rides for $1.65. The present rate is 6 cents with a 5-cent book fare. The case was set for hearing at Topeka March 1.

Books Extended to Fourteen Days.—The Public Service Commission has approved an amended local passenger tariff of the Geneva, Seneca Falls & Auburn Railroad, Inc., Seneca Falls, N. Y., changing the limit on 20 trip commutation ticket books from ten to fourteen consecutive working days. This amendment was effective Feb. 15 under special permission of the commission.

Metal Tokens Again in Louisville.—The Louisville Railway, Louisville, Ky., which has been issuing paper tokens since Feb. 1, has gone back to the metal tokens, following complaints of patrons. The tokens are the same as those previously used by the company. There is no saving for the consumers in buying tokens. They are sold at the rate of seven for 35 cents.

Higher Fares Discussed at Hearing.—The railway division of the Illinois Power Company, Springfield, Ill., is making less than 3½ per cent of its investment and last year fell $96,719 short of earning the 7 per cent return allowed by the State Commerce Commission, according to reports of accountants and engineers presented at a recent hearing. The increased fare proposed would retain the 10-cent cash fare, with tokens increased from four for 25 cents to seven for 50 cents and family fare books from $2 to $2.50 for strips of 40 tickets.

Foreign News

Bermuda to Have Electric Railway

Permission has been granted for the construction of a tramcar line in Bermuda, and it is planned to start work on it in the next few months. The ban has not yet been lifted on automobiles and motorcycles, so the single motor truck to carry freight remains the only representative of the automotive family.

"Antiquity, even in transportation facilities, is part of the stock in trade of Bermuda," says a bulletin from the Washington, D. C., headquarters of the National Geographic Society. "To the visitor this is one of the chief sources of its charm. There are no industries other than agriculture and catering to the tourist trade. The steamboat whistle and the clatter of horses' hoofs on the smooth hard roads are the only foreign noises that disturb the Sabbatical quiet of the island."

Plans Approved for Lisbon Subway

Concessions for the construction of a metropolitan subway in Lisbon, Portugal, has been granted by the Municipal Council of that city to a Spanish group. This concession comprises eight lines radiating from the Rocio Square over a total area of about 16½ miles. The hilly nature of the city will necessitate deep construction, but stations will be near to the surface and elevators need not be installed.

Vignole rails, 59½ ft. long with fish plates and weighing 90 lb. per yard, will be used, with a gage of 4.72 ft.

It is planned to build this subway in eight sections, each costing approximately $2,250,000. The Spanish engineers are now seeking an initial loan of foreign capital in the amount of $200,000 to defray the expenses of the first section built. It is proposed to finance the successive sections by capital flotations and local loans in Spain and Portugal.

National Electric Scheme for Great Britain

The general electricity supply plan which the British government is contemplating has some interest in the realm of electric traction, because if it is carried out many small power stations will be closed and energy taken from great economical stations.

The three main features of the new government scheme are large generating stations, a national board and distributing stations. The generating stations are to number about 60. The electricity produced by them is to be purchased by the board and sold to the distributing stations. Interconnecting power lines will be established by the board between the generating and distributing stations. Many small power stations will disappear. To allow interconnection between generating stations, it is proposed that a standard frequency of 50 cycles per second should be set up for the whole country. Cheap and abundant supply for all purposes is the goal, but it is recognized that a good many years must elapse before much benefit can accrue.

Many municipalities which have power stations and the steam railway companies which contemplate electrification will probably oppose the plan. If the plan is successful, many of the smaller tramway undertakings in the country should benefit from having a power supply from the national mains at a cheaper rate than they can produce for themselves.

Underground Railways for Manchester.—Proposals for the construction of underground electric tube railways in Manchester, England, are again being revived. The plan is for a circle railway with a central station, from which radiating lines would be constructed to the outside areas. The estimated cost is from £250,000 to £300,000 per mile.

Liverpool to Purchase Tramway System.—Purchase of the Waterloo & Great Crosby tramway undertaking has been decided upon by the Liverpool, England, City Council. This railway has been operated by the Liverpool Overhead Railway, but its lease on the lines will soon expire.

Electrification Planned in Czechoslovakia.—Contracts were placed recently for the first electrifying project of the Czechoslovakian State Railways. This comprises the electrification of the Prague railway stations and the connecting lines. A considerable part of this contract work has been placed with the Skoda Works, whose special department for electric railways has developed into the largest and most modern undertaking of its kind in Czechoslovakia.

Electric Train Test in Sweden.—Successful trial runs with electric goods trains took place recently on the Moholm-Falkoping section of the line between Stockholm and Gothenburg, Sweden, the electrification of which will soon be completed. Four trains were dispatched simultaneously in each direction, the longest consisting of 50 trucks. A fully loaded train maintained a speed of 37½ m.p.h., even on the steep grades on the line.

Trackless Trolley in Darlington.—Inauguration of the trackless trolley system in place of the tramways in Darlington, England, is now taking place. This is a complete substitution. The financial position of the municipal tramways would not permit the extensive renewals required. This tramway system was opened in 1904 and has never been financially successful. The type of trolley bus adopted is a single-deck, 31-passenger vehicle with a central door. The interior is divided into two compartments, one being used as a smoker.

Recent Bus Developments

Plan at Buffalo Collapses—Railway Renews Offer

Plans of Ernest M. Howe, Detroit, and the American National Omnibus Corporation, New York, to establish 5-cent bus service in Buffalo over thirteen routes covering 71.5 miles of streets have collapsed following the failure of the company to complete its financing arrangements as ordered by the Public Service Commission. The company lacked $300,000 of the necessary $1,500,000 paid-in capital on the last day allowed by the state utilities board to complete its financing and appear before the commission for a hearing on its application for a permit.

With the announcement that the Howe plan had collapsed, Bernard J. Yungbluth, president of the International Railway, Buffalo, and its subsidiary company, the International Bus Corporation, said the traction interests plan to carry out the first steps of the co-ordinated bus-trolley plans filed with the Buffalo City Council last summer. These plans were held up by the municipal authorities when Mr. Howe entered the field with his 5-cent bus proposal, for which he later secured a franchise from the city.

The application of the International Railway and the International Bus Corporation on file with the city covers five of a dozen steps in a general plan for co-ordinated bus-trolley service. These are:

Establishment of a Best-North Street bus line and abandonment of the Best Street car line; establishment of a Richmond Avenue bus line and abandonment of the Hoyt Street car line; extension of the Bailey Avenue bus line from Kensington Avenue city line to East Seneca Street and over McKinley Parkway after the parkway is completed and abandonment of the Bailey Avenue car line; extension of the Delaware Avenue bus line from the Terrace to Shelton Square at Main Street; rerouting Delavan Avenue bus line, a cross-town service, over Potomac Avenue from Chapin Parkway, which will allow abandonment of part of the Forest Avenue car line from Delavan Avenue to Niagara Street.

There will be little opposition to the establishment of new bus routes and the extension of existing bus lines, but it is understood the City Council is opposed to the abandonment of car lines which have been long established, on the basis of the plan outlined in the Yungbluth proposals.

Allentown Bus Service Planned

In furtherance of a statement made some time ago by the Lehigh Valley Transit Company, Allentown, Pa., of its intention to adapt the bus to the transportation problem, comes the announcement from H. F. Dicke that a bus line operating on Turner Street, between Nineteenth and Seventh Streets, would be established as soon as the Public Service Commission granted the permit. The plans as they now stand call for a fifteen-minute service for two periods of three hours each in the morning and evening and a 30-minute headway during the rest of the day. Two buses will be used to maintain the former schedule and one during the so-called off-peak hours. A 10-cent fare will be charged. This will include transfer privileges to any of the company's lines. In opening the new line the company had in mind the accommodation of customers living far from present car lines.

In December of last year the company applied for a certificate to operate buses for "group and party service."

Railway Pays State Biggest Bus Bill

A check for $50,009, the largest bus license ever paid in the State of Minnesota and one of the largest ever paid in the United States, was delivered on Jan. 27 by the Twin City Motor Bus Company, Minneapolis and St. Paul, to Mike Holm, Secretary of State of Minnesota. This company is a subsidiary of the Twin City Rapid Transit.

The check is in payment of the 1926 license for 94 buses and four service cars operated by the bus company on its intercity lines as well as several suburban lines. This is a tax of 10 per cent on the list price, with a depreciation allowance of 10 per cent a year with a minimum tax of $350 for each bus operated.

The average fee is approximately $500 a bus. In addition to this state tax the company pays federal taxes of $20 a bus for the year May 1, 1925, to April 30, 1926. This is an additional tax of more than $8,000, or an aggregate tax of approximately $58,000.

Abandonment and Bus Petitions Before Utah Commission

The Utah Light & Traction Company, Salt Lake City, Utah recently applied to the Public Utilities Commission for permission to abandon its Davis County line, serving the towns of Centerville and Bountiful and intermediate territory. The application was in the form of a petition in intervention before the commission at the hearing of the application of the Bamberger Electric Railroad, which is seeking a permit to operate an automobile passenger and express line between Salt Lake and Ogden. It is requested that if the order of abandonment is permitted to the railway the bus line application of the interurban should be allowed provided the bus service will not pick up passengers in Salt Lake for discharge within the corporate limits of the city. If, however, the commission should refuse the petition in intervention, it is asked that the petition of the Bamberger company be denied.

Holyoke Railway Wins Point

The Holyoke Street Railway and the Interstate Bus Corporation, both of which have aired their differences in the county criminal and civil courts, have had their case settled by a triple bench of the federal court. Massachusetts bus control statutes were found to be constitutional, and the Interstate Bus Corporation is to be restrained from operating buses through Massachusetts cities without a license to do so. An injunction has been issued.

The Interstate Bus Corporation operates lines in all of the New England states except Maine. Its principal field of operation is in Boston and Providence. It recently brought proceedings into the federal court against the Holyoke Street Railway alleging collusion in interfering with the bus business in Holyoke, Mass. The suit was a counter one against the railway, which sought an injunction to prevent the bus company from operating.

The litigations began with a suit by the Holyoke company to prevent the operation of buses between Greenfield and Springfield, Mass. The suit was removed to Boston and warrants for the arrest of the bus company's chauffeur's followed. The bus company filed a complaint in an equity suit and obtained an order to show cause why an injunction to restrain the criminal prosecutions should not be granted. This order was given only after a long-drawn-out hearing.

Judges George W. Anderson, John A. Peters and Elisha H. Brewster ruled:

> These two cases have, by agreement, been heard together on agreed facts. They are, in effect, cross suits, and involve a single issue—the constitutionality of the Massachusetts statutes regulating the operation of buses in Masssachusetts highways. These statutes are stated, construed and sustained by the full court of Massachusetts in Barrows vs. Farnum's stage line, and need not here be restated.

Interstate Bus Service Curtailed in New Jersey

Acting on the complaint of the Public Service Railway, Newark, N. J., the Board of Public Utility Commissioners has ordered the Pierce Coach Corporation to discontinue the transportation of passengers between points within the state in connection with the operation of a bus line between Morristown and Orange and New York. In the absence of municipal permits authorizing local service, the carrying of passengers whose journeys begin and end in New Jersey was held to be illegal.

Gasoline Tax Increased in Kentucky

The Kentucky Legislature on Feb. 20 passed a bill in which the gasoline tax is increased from 3 to 5 cents a gallon. It was approved with a wide majority in both the House and the Senate. The measure was recommended by the Governor. The law is to become effective at once and continue until July 1, 1928, provided no succeeding Legislature may change the time limitation. Other bills are before the state to increase license taxes on buses and taxicabs, on the basis of a seat charge, greater than that now in effect.

Digitized by Google

Cross-town Line in Fond du Lac.—The City Council of Fond du Lac, Wis., has accepted the proposition of the Wisconsin Power & Light Company to operate a cross-town bus line in that city. This bus system would work in harmony with the company's railway with interchangeable transfers. The application of the company was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 13, page 299.

New Line to Run.—The Lordship Railway, Bridgeport, Conn., has been authorized by the Public Utilities Commission to operate a new bus line between Avon Park, Stratford, and Bridgeport, connecting with its present bus route from Lordship to Bridgeport. Two buses are now operated on a one-hour headway.

Line to Be Replaced with Bus.—The Southern Public Utilities Company, Anderson, S. C., plans to replace its line to North Anderson with bus service. The line to North Anderson has been in service since the development of the northern suburb began several years ago. It was not stated whether the line had been operated at a loss or not, but it was said that the bus would prove more beneficial to the residents of that suburb.

More Buses at Asheville.—Any day now seven new passenger buses costing $11,000 each and seating 29 people will be put in operation in Asheville by the Asheville Light & Power Company. Some of the equipment will be put on the run between Asheville and West Asheville. The purchase brings the total number of buses owned and operated by the company up to nine. Decision to utilize buses rather than cars was reached after a conference with city officials in regard to the traffic situation.

Bus License Sought Again in Westfield.—The Springfield Street Railway is still seeking a bus license to operate in Westfield, Mass. The City Council has not yielded despite numerous meetings and long arguments. At least two members of that body are holding out for assurance that the railway will maintain one crosstown trolley line. The railway says such a line does not pay and will not promise to continue operating any line at a loss. To further the interest of the city of Westfield the Springfield company has signified its intention to replace all highways to the satisfaction of the highway department, if licenses are granted to operate buses.

Fare Increased from Eight to Ten Cents.—The Public Utilities Commission of the District of Columbia has authorized the Washington Railway & Electric Company to increase the fare on its Burleith bus line from 8 cents cash, six tokens for 40 cents and 2 cents for transfers between intersecting car and bus lines to 10 cents cash with tickets sold at the rate of six tickets for 50 cents provided that a free transfer, good on any intersecting car or bus line of the company, be issued in payment of 10 cents cash fare or on payment of one ticket fare and 2 cents. Transfers to the Burleith bus line will be issued by connecting car and bus lines for 2 cents only upon the payment of an 8-cent cash fare.

Financial and Corporate

$1,043,401 Net Income for Chicago Rapid Transit

Company Operating Elevated Lines Reports Progress During 1925—Expenses $199,600 Less than 1924

Gross revenues of the Chicago Rapid Transit Company, Chicago, Ill., for the year ended Dec. 31, 1925, representing combined operating and non-operating revenue, were $19,281,887, an increase of $505,954 over the previous year. Total expenses, including taxes and $241,906 for retirement reserve, were $14,967,509, or $199,600 less than the year before.

Net earnings were $4,314,378, an increase of $705,554. Interest, rentals and amortization of discount totaled $3,270,977, leaving net income of $1,043,401, an increase of $242,025 over the year 1924.

Dividends on the company's outstanding 7.8 per cent prior preferred stock were declared and paid to the extent of $308,529, leaving $734,871 as unappropriated surplus earnings for the year, no interest having been declared or paid on the company's adjustment debenture bonds. To this surplus should be added other net credits to profit and loss of $38,169 and the surplus of $958,672 from the previous year, making a total surplus at the end of the year 1925 of $1,731,713.

INCOME STATEMENT OF CHICAGO RAPID TRANSIT COMPANY FOR THE YEAR ENDED DEC. 31, 1925

Passenger revenue		$17,786,474
Other transportation revenue		1,245,338
Gross operating revenue		$19,031,812
Operating Expenses:		
Maintenance of way and structures	$1,778,749	
Maintenance of car equipment	1,444,216	
Power	1,979,684	
Conducting transportation	7,006,823	
General and miscellaneous	1,135,721	
Total operating expenses		*$13,345,194
Net operating revenue		$5,686,618
Taxes, city compensation, etc		1,622,314
Operating income		$4,064,303
Non-operating income		250,074
Gross income		$4,314,378
Deductions:		
Rentals	$881,282	
Interest on mortgage debt and equipment obligations	2,277,380	
Other interest	†55,498	
Amortization of discount	56,816	
Total		$3,270,977
Net income for the year 1925		$1,043,401

SURPLUS ACCOUNT

Balance, surplus Dec. 31, 1924		$958,672
Net income for the year ended Dec. 31, 1925 (as above)	$1,043,401	
Less dividends paid on prior preferred stock	308,529	
Surplus earnings for the year unappropriated		$734,871
		$1,693,544
Miscellaneous debits and credits (net)		38,169
Surplus, Dec. 31, 1925		$1,731,713
*Total operating expenses include credited to retirement reserve.		$241,906.92

†No interest declared or paid on adjustment debenture bonds.

The rapid transit lines carried 216,045,575 revenue passengers in 1925, an increase of 3,144,551 compared with 1924.

One hundred new steel motor cars, ordered Dec. 19, 1924, were placed in service, the last of these being delivered on Nov. 23, 1925. These cars provide the maximum of comfort and safety and cost $2,268,840. The company now has 1,906 cars in service, including 1,862 passenger cars, of which 456 are all-steel construction. For the last ten years the company has been purchasing steel equipment in anticipation of a subway being built.

In September, 1924, the company requested the city for permits to extend all station platforms so as to allow eight-car train operation, which would substantially improve the service. Permits were obtained from time to time, but it was not until the city passed an enabling ordinance on July 22, 1925, that authority to extend all platforms was secured. The work was started the day following the passage of this ordinance and has been carried on continuously ever since. The work of extending the platforms on the Loop, Ravenswood-Kenwood, Howard-Jackson Park, Lake Street and Garfield Park lines has been practically completed. On the Douglas Park, Logan Square and Humboldt Park lines extensions will be completed soon.

While the number of passengers carried on the elevated lines in 1925 showed an increase, the ill effects of the handicap of inadequate loop terminal facilities became increasingly apparent. The company put into effect the only remedy available to it in the extending of loop platforms to accommodate eight-car trains. This has proved of considerable benefit in the rush-hour periods, but far from meets the situation.

On Sept. 27, 1924, the company publicly announced its policy of extending and enlarging its service by formally requesting the City Council of Chicago for consent to construct about 40 miles of specified elevated extensions, estimated to cost approximately $31,500,000. If such consent is obtained it is the company's intention to commence the work of constructing the extensions without delay and to complete the same as soon as practicable.

In addition the company, in order to obtain much-needed additional capacity for handling passengers in the central business district, has proposed to the City Council that if the city would build and grant the company the use of a rapid transit subway running from 22d Street north through the Loop district to North Avenue and connecting at both ends with the elevated lines, the company stood ready to enter into an agreement to pay to the city for the use of such subway a fair compensation

Digitized by Google

either by way of fixed rental or a division of earnings. It is estimated the use of such a subway would enable the company, during the rush periods, to carry about twice the number of passengers it is now capable of carrying in such periods in and through the Loop.

On Nov. 16, 1925, work had progressed to the point where a considerable number of eight-car trains could be added to the service. The cost of this improvement, inclusive of platform extensions, changes in structure and car equipment and new equipment as previously stated, is $3,322,063.

On March 28, 1925, rapid transit service was extended to Dempster Street, Niles Center, the Chicago Rapid Transit Company having leased trackage rights over the new Skokie Valley line of the Chicago, North Shore & Milwaukee Railroad. This new line extends westward from the Howard Street station of the Evanston division and north to Dempster Street, Niles Center, a distance of 5 miles. It is believed that the territory tributary to this line will be rapidly built up and that it will soon become a valuable addition to the company's system.

A trackage lease was negotiated with the Chicago, Aurora & Elgin Railroad under which rapid transit service will soon be extended over that railroad to additional western suburbs of the city, including Maywood, Bellwood and the new community of Westchester.

For the purpose of defraying the cost of the new cars and platform extensions above mentioned and other corporate purposes the company during the year sold $2,212,000, par value, of first and refunding mortgage 6½ per cent gold bonds (series due 1944).

During the year the company paid off or acquired its underlying bonds and equipment obligations aggregating $1,117,000. This includes $231,000 first mortgage bonds of the Northwestern Elevated Railroad acquired for the sinking fund.

Attitude of Government on Non-Voting Stock

The government doubts if there is any way in which it can legaly meet the situation visualized by Professor Ripley in his campaign against non-voting stocks. Sec. 240 of the revenue bill, having to do with the consolidated returns of affiliated corporations, was before the Senate. The test of affiliation was a certain percentage of the voting stock. The Senate, by amendment, struck out the word "voting." High legal opinion is that this amendment resulted from the Ripley agitation and that "it will increase the tax difficulties of public utilities." Another view is that it sets up as a precedent the theory that the total stock is the test of affiliation, wherefore, in anti-trust suits, a similar test should lie, in which case unity of control through ownership of management, or "B" stocks would not be subject to attack if the "A" stocks were widely held. The argument seems a little far fetched, but it is worth noting.

Increase in Illinois Power & Light Preferred Stock

A special meeting of stockholders of the Illinois Power & Light Corporation was held on Feb. 23 for the purpose of submitting to the vote of the stockholders the question of increasing the authorized capital stock of the corporation by increasing the authorized par amount of the 7 per cent cumulative preferred stock from $30,000,000 to $40,000,000.

The sale of 7 per cent cumulative preferred stock of the corporation has been successfully continued during the past year to customers residing in the various communities in which the company's properties are located and through other channels, with the result that the present authorized amount of 300,000 shares of the par value of $100 each has now been nearly all sold and issued. The increased amount can only be issued upon approval by the Illinois Commerce Commission and upon condition that net earnings are not less than twice the annual dividend requirement on shares now outstanding and to be issued, and that the assets of the company after deducting liabilities shall not be less than $125 for each share, including the consideration to be paid for the new stock.

On Feb. 23 Blyth, Witter & Company, New York, offered $2,000,000 of the 7 per cent preferred issue of the company for subscription at $100 a share and accrued dividend. The balance for bond discount, depreciation and dividends in 1925 was $5,403,301 compared with $4,621,000 in 1924.

East Avenue Bus Operation at Rochester Unprofitable

The report of James F. Hamilton, president, for the year 1925 on the operations of the East Avenue Bus Company, a subsidiary of the New York State Railways, Rochester (N. Y.) lines, shows a deficit of $4,495.

The net operating expenses exceeded the revenues by $12,361, which, with taxes imposed, brought the net operating deficit to $13,226. Offsetting this loss in part was the sum of $10,290, which represents the non-operating income or the difference between the results of the operation of the Browncroft line, a part of the company's system, and the return of the 8 per cent guaranteed under the company's five-year contract with the Browncroft Realty Corporation.

The East Avenue Bus Company operates the East Avenue line, purchased in 1924 from an independent company. This route connects the heart of Rochester's business section with the suburban village of Pittsford, 10 miles to the east. It traverses East Avenue throughout, a street which for a mile is the center of the fashionable shopping district and thereafter the most exclusive residential street in Rochester.

The Browncroft line was established about a year ago, linking the business section with the exclusive subdivision of Browncroft, a 6-mile route. This line is patronized chiefly by well-to-do business men and their families and by late theater crowds, for whom special service is provided. At first a 25-cent

SUMMARY OF OPERATIONS OF THE EAST AVENUE BUS COMPANY, ROCHESTER

Operating revenues	$44,666
Operating expenses	57,028
Net operating deficit	*$12,361*
Taxes assignable to bus operation	864
Operating deficit	*$13,226*
Non-operating income	*10,290
Gross income	*$2,936*
Deductions from gross income	1,558
Net deficit	*$4,495*

*This item represents the difference between the results of operation of the Browncroft Bus Line and the return of 8 per cent guaranteed under the five-year contract with the Browncroft Realty Corporation.

Figures in italics denote deficit.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 144 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Digitized by Google

fare was charged with no stops. After a few months the company cut the fare to 15 cents and stopped buses on signal.

The equipment is carried in the assets at $73,091.

Deficits in Portsmouth Must Be Wiped Out

The Portsmouth Public Service Company, Portsmouth, Ohio, suffered a deficit of $62,346 in 1925. This, added to the other deficits of the past three years, makes a total of $137,374 reported to City Auditor Ralmadge Edwards. James F. Loftus, general manager, in a letter accompanying the financial statement, declared that unless there was some "material change" in the number of car riders the outlook for the railway, as a money-making investment, was "far from encouraging." With a view to reducing the loss, the company is considering a number of changes, among them one-man car operation. This new system will likely go into effect on March 1. The company operates 37 miles of line and charges 7 cents for fare. No change in this rate is contemplated during the present year.

Receiver Liquidates First Mortgage Issue.—The entire issue of $50,000 Flushing & College Point Electric Railway first mortgage 5 per cent bonds due June, 1925, have been liquidated by the receiver of the New York & Queens County Railway, New York, N. Y. An order of the New York State Supreme Court authorized the receiver to pay not more than $850 for each $1,000 bond with all unpaid coupons attached. Fisk & Roberts, New York, negotiated the settlement with the bondholders, some of whom were represented by a protective committee.

$159,176 Decrease in Net at Detroit

Extraordinary Expenditures for Repairs and Advance in Wages Cut Down Municipal Railway Earnings

During the year ended Dec. 31, 1925, the balance of net income of the Department of Street Railways at Detroit, Mich., was $566,793, while for the year ended Dec. 31, 1924, it was $725,969, a decrease of $159,176. The balance of net income for the first six months of 1925 was $306,623, while for the last six months it was $260,169, but in the latter period $257,787 more was expended for repairs to tracks and cars than was expended in the first six months of 1925. Of this amount $102,207, is classed as extraordinary; another important matter was the increase in wage granted to the platform men, which amounts to about $150,000 increase over what was paid in the first six months for like service performed. Had no more been expended on repairs in the last six months than in the first six months, the balance of net income would have been $517,956.

The facts are taken from the financial statement of the Department of Street Railways of the city of Detroit, covering December, 1925, and the year ended Dec. 31, 1925, issued by W. M. Hauser, auditor. The system that has now been finally adopted by Mr. Hauser is to give the general balance sheet at the close of business on the last day of the month, and an income and statistical statement for the month compared with the corresponding month of the preceding year.

The balance of net income for December, 1925, is $78,876, after the payment of sinking fund charges. The balance of net income for the month of December, 1924, was $74,823, so that the past month shows an increase over that for December, 1924, of $4,052, or 5.4 per cent.

During the year ended Dec. 31, 1925, 481,236,694 passengers were carried by the rail lines and 10,951,951 by the coach lines, a total of 492,188,645 passengers, compared with a total of 458,540,992 for the year ended Dec. 31, 1924, divided 457,562,210 rail lines and 978,782 coach lines, so that the Department of Street Railways carried 33,647,653, or 6.8 per cent, more passengers in the year 1925 than in the year 1924.

Mr. Hauser points out that accrued depreciation has been provided in the accounts in the amount of $3,179,111, equal to about 3 per cent a year on the value of the depreciable property. This amount represents a transfer from surplus to a separate account and is invested in property.

In considering the subject of depreciation it should be remembered that this account admits of several definitions and usages, depending upon the purpose of its use and the attitude of mind of the user. In point of fact depreciation implies a decline in value; that is, diminution of productive or net earning capacity, it is cited. Obsolescence or inadequacy are not results of age or upkeen, for the reason that a street car or any other physical unit of the property, regardless of its age or maintenance condition, may become obsolete or inadequate, or both, at any time when in the best of judgment of the owners it is unsuitable for the service required.

With reference to the operating reserves for injuries and damages, the amount has been adjusted to $774,267; $700,000 has been credited back to surplus. Price, Waterhouse & Company, in their report rendered on Nov. 9, 1925, on the accounts of the Department of Street Railways stated that "from the information so obtained the reserve as at June 30, 1925, is more than 100 per

INCOME AND STATISTICAL STATEMENT OF THE DEPARTMENT OF STREET RAILWAYS AT DETROIT

Digitized by Google

cent in excess of the indicated requirement at that date."

In view of this it has been found proper, the auditor states, to effect an adjustment in this account. Claims paid and charged to the reserve account during the period from Sept. 1, 1921, to June 30, 1925, amounted to $582,001, while claims paid since July 1, 1925, to Dec. 31, 1925, amounted to $194,411, of which $134,881 was for accidents prior to June 30, 1925, and $59,529 for accidents subsequent to July 1, 1925.

While up to June 30, 1925, it was not the practice of the Department of Street Railways to set aside funds for the specific purpose of liquidating claims for injuries and damages, the basis of accounting has now been changed in this respect and appropriations of cash are now being made for the purpose of liquidating liabilities of this nature. At Dec. 31, 1925, $106,758 had been set aside in cash, so that of the $774,267 shown as reserved $106,758 is actually set up in cash.

The balance of net income at Detroit for January, 1926, is $56,698 after the payment of sinking fund charges. The balance of net income for January, 1925, was $52,551, so that the past month shows an increase of $4,147, or 7.9 per cent over January, 1925.

During January, 1926, 43,162,941 passengers were carried by the rail lines and 1,692,191 by the coach lines, a total of 44,855,132, compared with 40,145,926 in January, 1925, divided 39,889,805 rail lines and 256,121 coach lines. In other words, 4,709,206, or 11.7 per cent, more passengers were carried in January, 1926, than in January, 1925.

The five years of operation at Detroit since Feb. 1, 1921, is summed up by Mr. Hauser, auditor of the department, as follows:

In five years $45,327,701 was provided for capital cost. Of this amount $41,080,000 was provided by vote of the electorate now represented by $37,131,000 debt, $3,949,000 having been paid off from earnings. The sum of $4,007,971 was provided out of earnings, of which $3,691,113 represents accrued depreciation, the accrual being invested in property. The amount of $316,868 shown as profit and loss balance and $239,729 received from the sale of property go to help make up the total amount of $45,827,701, which is represented in the capital costs as follows:

Of the amount of $45,560,410, $44,293,545 represents road and equipment, $114,600 working funds and $1,152,264 material and supplies. In other words, the system fully equipped to do business has cost $45,560,410. This amount is in excess of the provisions made for it by $232,708. It represents the amount that the current and working liabilities are in excess of the current and working assets.

All sinking fund and operating reserves and interest requirements are funded 100 per cent, and specific cash and securities are now carried in funds to protect the sinking fund and operating reserves and interest requirements up to and including Jan. 31, 1926. In the case of the reserve for injuries and damages, the diversion of these funds by the former management for construction purposes has been replaced and made good.

The close of five years finds the department with the following:

Sinking fund, consisting of cash and securities for debt purposes	$5,392,290
Special deposits, consisting of cash for interest purposes	409,720
Insurance and other funds, consisting of cash for:	
(a) Injuries and damage purposes	798,845
(b) Repairs and renewal purposes	30,000
Total	$6,630,855

Outlook for Iowa Interurban Improved

The protective committee representing the holders of the first mortgage bonds of the Waterloo, Cedar Falls & Northern Railway, Cedar Falls, Iowa, has submitted to the bondholders a three years condensed comparative statement of operations of the company, as follows:

	1925	1924	1923
Gross earnings	$827,353	$860,308	$896,104
Operating expenses	750,899	792,602	828,385
Taxes	48,166	38,612	38,659
Net income applicable to first mortgage bonds	$28,288	$29,093	$29,060

The amount necessary to pay the annual interest on the outstanding $5,773,000 first mortgage 5 per cent bonds is $288,650.

The committee says that while on the surface the net income in 1925 was less than that of 1924, it is significant that the last quarter of 1925 showed a gross increase of $23,835 over the similar period of 1924, which encourages the hope that business conditions in Iowa—long depressed—have at last turned the corner. Earnings in January, 1926, exceeded those of December, the best month of 1925.

Long continued unfavorable business conditions in the territory served by the company, combined with aggressive bus competition, the general use of the automobile, and a falling off in coal and grain freights, are advanced as reasons for the decrease in gross earnings, while the high cost of operation and necessary outlays for maintenance, together with the necessity for meeting accumulated taxes and equipment obligations, have reduced the net income to about one-tenth of the amount required to pay the first mortgage bond interest. These considerations explain why the committee has thus far been unable to submit to the bondholders a plan of reorganization.

Up to date there have been deposited with the protective committee $5,188,000 out of a total of $5,773,000 outstanding first mortgage bonds and $2,170,000 out of a total of $2,333,000 outstanding common stock.

Receiver Appointed at Rockford

Adam Gschwindt, general manager of the Rockford Electric Company, was appointed receiver for the Rockford City Traction and Rockford & Interurban Railway, Rockford, Ill., under action instituted recently by trustee for bondholders of the two systems. Mr. Gschwindt has announced that his general policy will be to abandon profitless interurban lines and gradually to separate them from city lines, but there will be no immediate change in operating policy of the city lines. It was generally understood that the receiver had reference to the Rockford, Beloit & Janesville and Rockford & Freeport interurbans as lines to be abandoned. The receivership followed default of the interest payment on $1,650,000 of bonds, but bondholders are reported to have assured Mr. Gschwindt that they stand ready to back such improvements as he may determine. The Rockford Electric Company is one of the largest creditors of the traction systems. There was no opposition to the court's selection of the receiver.

New Directors in Alliance.—New directors of the Stark Electric Railroad, Alliance, Ohio, were chosen recently as follows : N. F. Glidden, Howard Morris of New York, James Bertran, W. S. Chittenden, L. W. Popp, E. W. Sweezy, O. K. Ayers and Charles Sebring.

Electric Plant Acquired.—Announcement has been made of the purchase of the Marengo Public Service Company, an electric company of Marengo, Ill., by the Illinois Northern Utilities Company, Freeport, Ill. R. T. Fry, Marengo, has been in charge of the local plant. The purchaser will take possession on March 1.

Companies Consolidated. — Seven companies which have been operated as subsidiaries of the Wisconsin Public Service Corporation have been consolidated with the main system and will conduct all business as the Wisconsin Public Service Corporation. Included in the group are the Green Bay Park Railway, serving Bay Beach Park and the River View Motor Bus Company, supplying interurban service between De Pere & Green Bay and city service in Manitowoc.

Receiver Sought.—Suit asking that the Indianapolis, New Castle & Eastern Traction Company, Anderson, Ind., be placed under control of a receiver and that Arthur W. Brady, present receiver of the Union Traction Company of Indiana, be named receiver, has been filed in the Circuit Court at Muncie, Ind., by the Fidelity Trust Company, trustee, holder of bonds aggregating $1,500,000 issued in June, 1912. The action was ordered transferred to Anderson, Ind. The Indianapolis, New Castle & Eastern Traction Company is operated under lease by the Union Traction Company.

Authorized Issues Under 1924 Amount. — During the twelve months ended Dec. 31, 1925, the California Railroad Commission authorized the issue of $132,036,749 of stocks, bonds, notes and other evidences of indebtedness. The total issue was below the amount for the last few years, $237,875,848 having been authorized in 1924 and $196,802,936 in 1923. Electric railway issues totaled $3,610,461 in 1925 compared with $13,067,496 in 1924.

City's Share Lower.—Ralph E. Carley, manager of the western division of the Illinois Power & Light Corporation, supplying Quincy, Ill., with traction service, recently submitted a report of the finances of the company's operation in that city, under terms of the ordinance which requires payment of 2 per cent of the gross earnings annually. The 1925 payment to the city was $5,226 from $261,343, the company's gross, which included $252,350 from street car lines and $8,993 from buses. Comparisons show a gradual and continued decline in earnings since 1920, when the city's share was $6,443; 1921, $5,682; 1922, $5,456; 1923, $5,470, and 1924, $5,238.

J. R. Ong at Cincinnati

Former Railway Consultant Placed in Charge of New Department of Street Railway

Creation of a new department, to be known as transportation engineering, in charge of Joe R. Ong, has been announced by Walter A. Draper, president of the Cincinnati Street Railway, Cincinnati, Ohio. For several years Mr. Ong has resided at Piqua, Ohio, where he has engaged as a consulting electric railway transportation engineer. In his new capacity he will have charge of all traffic surveys, the making of schedules and will devote considerable time to studies in economies of operation. He also will have charge of general statistical data of an operating nature.

J. R. Ong

Mr. Ong has made a number of exhaustive traffic surveys in different parts of the country which have brought him into prominence as a consulting engineer. Notable among these was his work in Los Angeles, Cal.; Winnipeg, Canada, and Atlanta, Ga. He goes to the Cincinnati Street Railway with a record of accomplishments in all undertakings in which he has been identified. He has already assumed his new duties and is co-operating with J. B. Stewart, Jr., general manager, in working out a plan to secure the contemplated results of the new department.

From 1911 to 1912 Mr. Ong was superintendent of substations and assistant electrical engineer for the Fort Dodge, Des Moines & Southern Railroad, with headquarters at Boone, Iowa. The following year he assumed the duties of electric railway engineer, serving jointly the Railroad Commission of Wisconsin and the Tax Commission of that state on appraisals of public utility properties and in traffic and service studies on street railway properties in Milwaukee and other cities of the state.

In 1918 he became electric railway transportation engineer for the Board of Control of the Kansas City Railways and from 1919 to 1920 held a similar position with the Winnipeg Electric Railway, Canada. The following year he became electric railway transportation engineer for the Georgia Railway & Power Company, Atlanta, Ga., and held that post until 1923, when he became a consulting engineer with, headquarters at Piqua. In that capacity he made an exhaustive survey for the management of the Los Angeles Railway and studies in economies of operation for a number of other electric railways throughout the country.

Before going to college Mr. Ong served with the Indianapolis & Cincinnati Traction Company and the Chicago, Lake Shore & South Bend Railway. His first work after leaving college was done for the Westinghouse Electric & Manufacturing Company at its main plant in East Pittsburgh. Later he was transferred to the company's Philadelphia sales office.

Mr. Ong was born at Columbus, Ind. He was graduated from Purdue University in 1909 as an electrical engineer.

E. M. Hervey in Consulting Work

E. M. Hervey, connected with the Wisconsin Power & Light Company as manager of its Sheboygan electric and railway properties for the last three years, has resigned to enter business for himself as a consulting engineer in the power transmission field. In that work he has specialized for the past twenty years. Prior to his promotion as manager Mr. Hervey was the company's electrical engineer at Sheboygan.

Personnel Changes in Dayton

The annual meeting of the stockholders of the City Railway, Dayton, Ohio, was held on Feb. 11. As the company personnel is now constituted the officers are: J. M. Markham, president, whose election was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 20; H. S. Mead, vice-president; W. S. W. Edgar, secretary, and T. A. Ferneding, treasurer. The directors are: W. S. W. Edgar, T. A. Ferneding, J. M. Huffman, W. H. Kuhlman, J. M. Markham, H. S. Mead and V. Winters.

Thomas E. Howell remains as general manager and Edward H. Hartman continues as superintendent of transportation.

L. P. Fessenden Manager at Sheboygan

L. P. Fessenden, chief engineer and superintendent of the Sheboygan central station since 1912, has been selected to succeed E. M. Hervey as manager of the Sheboygan electric and railway properties of the Wisconsin Power & Light Company. Mr. Fessenden's responsibilities at the same time will be widened to include the district managership of all the company's properties in Sheboygan and Plymouth.

F. A. Richards Vice-President and Sales Manager American Car

Ford A. Richards, sales manager of the American Car Company since 1918, has been honored by the directors by also being elected to the vice-presidency. As sales manager Mr. Richards has enjoyed a wide acquaintanceship, particularly throughout the territory west of the Mississippi River, covered by his company for the Brill organization.

His affiliation with the electric railway industry dates back to 1898, when he entered the employ of the Peckham Manufacturing Company, then builder of electric railway trucks. During the intervening 28 years he has been engaged in various capacities, including that of assistant to the vice-president and foreign sales manager of the Peckham company and later as a member of a partnership under the name of the J. A. Hanna Company, formed to promote the sale of both cars and trucks.

Mr. Richards joined the Brill organization in 1909 as Pacific Coast sales manager with headquarters in San Francisco. He continued in this capacity until 1918, when he was transferred to St. Louis as sales manager of the American Car Company, which had become a Brill subsidiary in 1904.

F. A. Richards

As vice-president and sales manager Mr. Richards will continue, just as he has in the past, to devote his attention to the problems of the industry in that part of the country where he is so well known.

A native of Ohio, Mr. Richards was educated at the Uniontown High School, from which he was graduated in 1893, and at Mount Union College, Alliance. It may well be said that he has devoted his entire business life to the electric railway and affiliated manufacturing industries. His success is attested by his recent promotion.

Ernest Hatton has resigned as general manager and engineer of Newcastle-on-Tyne Corporation Tramways, owing to ill health. The municipality received the news with great regret. Mr. Hatton has held the post since 1905. During that period he has been responsible for carrying out important developments of the system. Before he went to Newcastle he occupied a similar position at Salford and was in

Digitized by Google

charge of the work of electrifying the horse tramways there. Under his charge the Newcastle tramways have shown highly satisfactory financial results.

C. R. Harte A.E.R.E.A. Head

Impressive Career of Connecticut Company Engineer Dates Back to 1893 —Active in Association Work

Charles Rufus Harte, who has succeeded Roy C. Cram as president of the American Electric Railway Engineering Association, has been connected with the New York, New Haven & Hartford Railroad and the Connecticut Company continuously since 1893 except for a short period during 1901-04. All his life Mr. Harte has been active on the firing line. He has gone from one big construction job to another until one marvels at the capacity of the man to carry on uninterruptedly for so many years. He was really drafted into electric railway work as a result of the New York, New Haven & Hartford taking over the trolley lines in Massachusetts and Connecticut, and he had foisted upon him engineering and other problems which he himself readily admits he could not have solved had it not been for the co-operation of the officers of the company, notably Messrs. Storrs and Punderford, and his immediate associates.

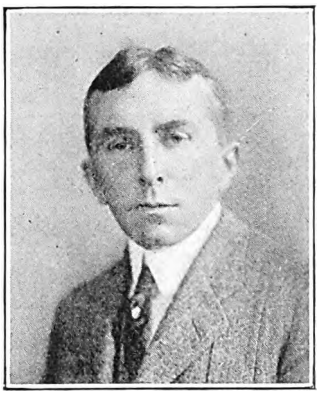
It would, indeed, be interesting to recount each of the man's achievements, but it is impossible to do more than to indicate them by giving the facts with respect to the various positions he has held. As the bare biographical data are disclosed the background will unfold itself not only to the engineer but to the non-technician. The degree of appreciation of the work of the man will vary between the two sets of readers, but each of them will finish with a keener realization of the abilities of the new president than he had before.

Mr. Harte was graduated from Columbia University School of Mines with the degree of civil engineer in 1893. He at once entered the construction department of the New York, New Haven & Hartford Railroad, being employed from 1893 to 1901 in positions of steadily increasing responsibility on the four-tracking and elimination of grade crossings between New Haven and the Housatonic River; on the elevation of the Providence Division and the new four-track connection, including the Back Bay station from Dartmouth Street to the South Station, Boston, and on the double-tracking of the Naugatuck Division from Derby to Naugatuck.

In 1901 he accepted a position with Stone & Webster. For them he put under construction the 33-mile urban and interurban electric railway at Sydney, N. S., extending into the adjacent mining settlements and to Glace Bay. This work included the construction of a power house and carhouse. For the same firm he supervised work on the heavy interurban extension from Terre Haute to Clinton, Ind.

He returned to the New Haven in 1904 and was placed in charge of the extensive improvements at New Haven. He developed the plans and started this work, but in 1906 he was placed in charge of the immense trolley construction program of the New Haven. In the four years that followed he supervised work on more than 100 miles of interurban type of trolley, the electrification of 50 miles of steam railroad track and the construction of more than 150 miles of transmission lines, together with power houses and substations, carhouses and miscellaneous structures. One of the carhouses included in this program of expansion was that at James Street, New Haven, with a capacity of 400 45-ft. cars. So far as is known, this was the largest single carhouse built up to that time.

In 1910, with the establishment of the



C. R. Harte

Connecticut Company as the trolley holding and operating subsidiary of the New Haven Railroad, Mr. Harte was transferred to it with the title of construction engineer, a position he has since held. Not long thereafter opposition began to develop to the New Haven's policy of developing the electric railway system to feed the steam road. When this opposition culminated in the separation decree of 1914, the construction program was correspondingly cut down, and the work of his department has been largely directed toward valuation, real estate and tax matters. Under the department, however, there was designed and built, among other things, the New Haven bus garage, one of the most up-to-date and best equipped electric railway garages.

Meanwhile the lack of any specification for overhead construction led to an immediate study by Mr. Harte along this line and the development of specifications which are the basis of the present A.E.R.E.A. standards, a result due very largely to the fact that manufacturers of material and contractors for its erection were invited to assist in the preparation of the code and did so.

Reverting to Mr. Harte's association affiliations he has been an active member of the A.E.R.E.A. since 1910, in which year he was a member of the committee on power distribution. Later he served two years as its chairman. He has been president and sponsor of the A.E.R.E.A. committee on heavy electric traction, joint sponsor of the engineering-accounting committee of that association and chairman of the standards committee of that association. He is senior electric railway representative on the American Engineering standards committee, American inductive co-ordination committee and the committee on revision of the national electrical safety code. He is vice-chairman of the A.E.S.C. and chairman of the rules committee of the A.E.S.C. He is electric railway vice-chairman of the American induction co-ordination committee. In addition he is a member of the A.E.R.E.A., American Society of Civil Engineers and an associate member of the A.I.E.E. Particularly in his work for the American Electric Railway Association Mr. Harte has striven to bring about the acceptance of standard practices. One of the things that he proposes to do in his new office is actively to promote the wider general application of the standards that have been evolved.

Journal Staff Expanded

Both the business and editorial staffs of ELECTRIC RAILWAY JOURNAL are strengthened by changes in the organization of the transportation unit, which comprises the JOURNAL and *Bus Transportation*.

L. F. Stoll, who has been sales manager of the engineering group of McGraw-Hill papers, comprising *Engineering News-Record, Coal Age, Chemical and Metallurgical Engineering* and *Engineering and Mining Journal-Press*, has been transferred to take executive charge of the transportation unit with the title of assistant vice-president.

Charles Gordon has been relieved of other duties in order to take direct charge of the editorial staff of ELECTRIC RAILWAY JOURNAL, with the title of editor. Morris Buck will continue as managing editor.

David Cameron, formerly sales manager of the two transportation papers, has been made a member of the advertising counselors' staff of the company.

T. F. Mueller is transferred from field work in the Detroit territory to the position of assistant sales manager in New York.

R. A. Feldon has joined the business staff as advertising representative in the Detroit territory.

These changes are part of a broad program for expanding the JOURNAL'S service to its industry.

C. D. Foltz Westinghouse Representative in Chicago

C. D. Foltz, representative of the Westinghouse Air Brake Company in charge of the Denver and Salt Lake City offices, has been appointed assistant western manager of the company, with headquarters at Chicago.

When only fifteen years old Mr. Foltz entered railroad work as a telegraph operator on the Wabash. In 1910 he became an inspector for the Westinghouse company in Salt Lake City and was afterward promoted to mechanical expert and representative at that office. In this position his field of activity was widened by the inclusion of the Denver office. His headquarters were moved from Salt Lake City to Denver during the year 1923.

Tom Elliott Talks on the Electric Railway Outlook

Vice-President and General Manager of the Cincinnati Car Company Places Responsibility for the Future on Both Manufacturers and Operators—Holds Unlimited Power Available to Be Chief Cause of Heavy Equipment

AN INTERVIEW

By Charles Gordon

THOMAS ELLIOTT, vice-president and general manager of the Cincinnati Car Company, stands today with a background of experience that rivals fiction in its romance and typifies the rugged road over which many of the outstanding figures in the industry have traveled. Though entitled to rank as a veteran, he has retained a freshness of viewpoint and an enthusiasm that belie the marks which pioneering years have left.

His accomplishments as a car builder are too well known to require repetition. He has been a courageous advocate of light-weight construction and has consistently sought improved designs to give strength without excessive weight. Some of the outstanding installations of light-weight equipment that have made enviable records in reduced operating and maintenance costs have been the products of his enterprise.

I had frequently discussed the subject of car development with Elliott, but not for publication. Now that he had consented to an interview, I sought to sound the keynote of his thinking on structural design. My first question was fortunate in the sense of the response it provoked.

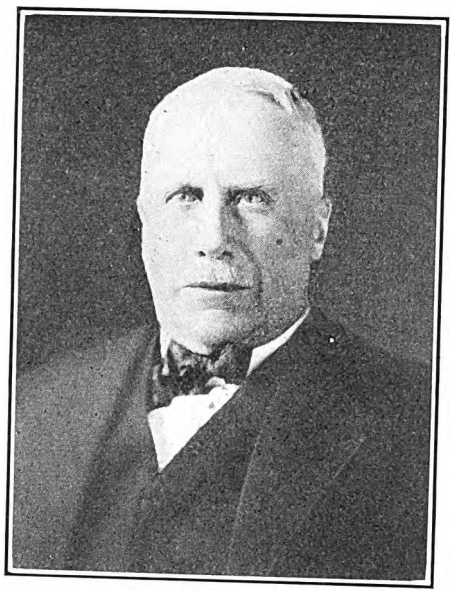
"What has constituted the greatest limitation to car construction development?" I asked.

"Lack of necessity and incentive," was the prompt reply. "There has been available with electric power an almost unlimited source of energy. Cars have consequently been merely assembled rather than scientifically designed. Excessive weight and high operating cost have been the result.

"As a mechanical and economic proposition," he continued, "transportation of people by rail is cheaper than on the highway, except when traffic is so extremely light that the investment in track is not justified. In view of the development of automotive vehicles and the rapid improvement of the bus, the time is getting short for railways to bring their properties up to date and for manufacturers to save their businesses by further improvement of their products. The opportunity will not continue indefinitely. Electric railways must be brought up to the modern idea of good transportation service."

This was, indeed, a frank statement on conditions in the industry. But Tom did not stop there. I had broached a subject in which he was keenly interested, and before I could put my next question he took me back a jump.

"Take the bicycle," he said. "In its day it was the finest designed and built transportation machine of which we have an example. It was largely instrumental in introducing the development of anti-friction bearings. Early bicycles weighed 175 lb. In their final form they were developed to the point where a 17-lb. vehicle carried a 200-lb. man with ease. This development took place when high grade material was scarce, but dependence on human motive power forced progress, because the bicycle which was easiest to propel was easiest to sell."



Thomas Elliott

Thus we traveled back in mind to a period beyond the advent of the automotive vehicle to the beginning of modern individual transportation machines. It is a habit Tom Elliott has of drawing illustrations for the analysis of modern problems from a sometimes forgotten experience of the past.

But despite this practice of drawing on past experience, he would not tell me his age. Nor would he allow me to guess it except on condition that I first matched my skill against his on fairway and green. But I knew his hobby and something about his score. Consequently I decided to omit his age. I can, however, record that he was born on a farm in the north of England. He landed his first job in the United States with the Hazzard Manufacturing Company at Wilkes-Barre, Pa. This company manufactured wire rope and cable. In those days wire rope for the propulsion of cable cars was coiled in continuous lengths on several flat cars for shipment. It was in one of these gangs that Elliott, with much ambition and little experience, entered what in an indirect way was a part of the transportation business.

For several years following he was employed in the shops of the Lehigh Valley Railroad. About 1888 he went to Tennessee to run a mine locomotive. He was delighted with the job, but it lasted only a week. His natural curiosity to know all about any piece of machinery with which he comes in contact led him to examine the inside of the boiler, and the next day he decided to look for work with a more attractive future.

Following this his experience was varied. He worked in a roundhouse at night. Then he took a job with the Knoxville Car Wheel Company. Later, a brief experience in dredge boat construction was brought to a sudden end by a flood which occurred on the Tennessee River.

As I proceeded to marshal my questions to draw out expressions of opinion, my mind reverted frequently to those early days of the Tom Elliott who now sat before me, still mentally objecting to the procedure of an interview for publication. But my interest lay largely with the future. I wanted his views on current tendencies and trends. So I asked about the status of the interurban roads of the country, which some people have claimed are headed for the scrap pile.

"There is no question but that they fill a fundamental need," he said. "Except in those instances where the lines were unjustified in the first place and should never have been built, they can be put on a profitable basis."

"Does properly designed light-weight equipment afford ample safety and comfort for average interurban condi-

THIS is the second of a series of interviews with the heads of car building plants and other prominent manufacturers. Rapidly growing interest in the improvement of electric railway equipment throughout the industry makes the views of these manufacturers particularly significant at this time. An interview with Samuel M. Curwen, president of the Brill Corporation, was published last week.

Digitized by Google

tions," I persisted, wishing to draw him out further on this topic.

Apparently my question was well directed and touched on a subject to which he had given much careful thought. Tom leaned across the corner of his desk, and though he spoke deliberately, as is his custom, he raised his voice slightly and answered without mincing words.

"One of the reasons for the heavy cars operated on some interurban lines is the fear and dread of assuming the responsibility of our own convictions that is inherent in all of us. This has resulted many times in blind adherence to weight, not because it has been proved that heavy cars are safer in a collision or derailment, but rather because this has generally been considered as justification for relief from responsibility."

I was impressed by this answer. Here was the basis on which Tom Elliott has built many light cars for interurban service—some for operation at speeds up to 60 m.p.h. I began to probe deeper for some of the earlier experiences and associations that lay behind this courageous statement.

Won to Electric Traction

It was while working as master mechanic and chief engineer of a cotton mill in Knoxville that Elliott began to hear about strange experiments on electric cars in Scranton. He listened at that time with a mixture of skepticism and interest. It may have been his early association with local transportation in the cable coiling days, or merely that strange fascination which the romance of transportation weaves, but in any event Tom continued to follow the news of these experiments.

W. G. McAdoo, later Secretary of the Treasury in Woodrow Wilson's Cabinet, bought the horse car lines in Knoxville and began to electrify them. Elliott watched with particular interest the construction of the power house. When the first car was finally operated under the new power in the streets of Knoxville he was convinced that he wanted to be a part of this new industry. M. R. McAdoo, brother of the owner, was the manager of the railway. Tom hunted him up and landed a job running the power plant.

That did not keep him busy long. With characteristic thoroughness he soon had leaky steam pipes tight and commutators bright. The job of welding an oil can looked like only a side line to one with as many ideas as Elliott. He bought a lathe and set it up in the engine room. Later he fixed up a brass furnace in one corner and started casting and finishing trolley wheels. Soon he began to rewind motor armatures in the power house. Ultimately, all of the car repair work was turned over to him.

In 1891 Elliott went to Atlanta with McAdoo. Here, two years later, he used what were then, so far as he knew, the first solid gears applied to car axles without keys. Some time later he began to build cars in the Atlanta shop. On the first of these the width of the customary side sill plate was increased from 6 in. to 18 in. In 1896 this plate construction was extended to the belt rail to form the continuous side girder type of construction that is even now so generally used. The idea came from watching a repair man who used a wide plate to cover a gash in the side of a car.

During this early car building experience Elliott began to favor the use of steel as a material for increasing strength and reducing weight in cars. On the interurban line operated at that time by the Atlanta company the single-truck cars had proved unsatisfactory from the standpoint of riding qualities and ability to stay on the track at satisfactory speed. Tom built some double-truck cars. As cars go today, they were heavy. They had four 50-hp. motors each, but their excessive weight made it impossible to run them to the end of the line due to the limited distribution copper available. "Here," Tom says, "was born a high regard for the importance of weight reduction in cars."

Having again thus built up the background, I swung once more to present-day conditions.

"Is there any difficulty in financing purchases of new cars where a railway is otherwise limited in its ability to sell its securities?"

"There is no difficulty. Proper financing arrangements for cars can be readily consummated."

Still I was not satisfied.

"Do you have any difficulty in disposing of electric railway equipment trust paper?"

"None whatever."

There were no qualifications in these answers; thus encouraged, I put my next question.

"In your opinion, does demand for individuality or inertia on the part of railway managements stand in the way of car development?"

Railways After Improvements

"My experience has been that railway managements are eager for new developments and that they will take any good scheme—and half of the bad ones—suggested by a car builder. They are looking for improvement and are willing to assume a large part of the trouble and expense of experimenting with new developments. The railways are hungry for new ideas."

Thus Tom Elliott proceeded to explode any assumption that operators are not interested in new developments advanced by the manufacturers. He had told me before this of his experience back in the days when the mechanical men in operating companies frequently worked with the crudest of facilities. Consequently, to me, his optimistic outlook on the demand for development was refreshing.

There are interesting anecdotes of Tom's early experiences as a master mechanic in Atlanta. When he first went to work there he found that the master mechanic was provided with a stable, several horses and a negro driver. Elliott had little use for these trappings of Southern luxury. He decided that the stable would make a good foundry. Acting on this idea, he succeeded in buying an old cupola for $35, incidentally including in the bargain a three-chime steamboat whistle, worth at that time about $200. He used trainmen apprentices who were sent to the shop for instruction to move his cupola and set it up. When the general manager discovered the character of training his new platform men were receiving Tom lost a fine source of cheap labor. He finally rigged up the cupola with an old railway motor and a good housing for a blower and began to make chilled iron wheels that had a life varying from three weeks to five years. Sand for molds was dug in a lot near the foundry.

Elliott left Atlanta in 1901 with M. R. McAdoo and went to the West Penn Railway, first as superintendent of motive power and later as manager. In 1903 he accepted a position with the Cincinnati Traction Company, some two years after W. Kesley Schoepf had taken charge of the property as president. Tom was chief engineer in charge of car maintenance, overhead line and power stations.

A short time before the Cincinnati company had started building cars in its new shops, a plant much larger than was needed for maintenance work alone. Tom became engaged in many outside jobs for his superiors, in addition to his regular duties. He was frequently brought into contact with the car building plant. Finally he was delegated to find a man to take charge of car building. After ten days, without success, he was called into the office and given the job himself. As a result he began devoting his entire attention to the car plant.

Co-operation Needed by Buyer and Builder

I asked Elliott whether, in his opinion, operating railways are justified in building their own cars under present conditions. There are several interesting thoughts in his reply.

"This depends entirely upon whether they can build a better car than they can buy. It is apparent that an operating management never makes its reputation by car building. Its primary job is to give good transportation service. When it engages in the work of building cars it diverts the attention of much of its personnel from operation and maintenance to manufacturing. Proper co-operation between operating companies and the car builders will result in better equipment than either can produce alone. Car builders are more familiar with the engineering features of design. Operators have the necessary experience to suggest improvements that make equipment popular with passengers and low in operating and maintenance cost.

"One primary disadvantage in a railway company building its own equipment," he continuel, "is that it does not get the benefit of the constructive criticism of other operators that is freely made to car builders."

Here seemed to be good thinking, unbiased by commercial expediency. It suggested another question.

"What, in your opinion, is the life of electric railway cars?"

"With proper maintenance, their life is indefinite. Retirement will take place due to factors outside the cars themselves. These include more suitable dimensions and operating and maintenance economies made possible by improvements in design, to say nothing

Digitized by Google

of increased attractiveness of new equipment resulting from development of the art. These factors, rather than the actual wearing out of the cars themselves, will dictate replacements."

Tom had shown throughout our discussion a definite tendency to place on the shoulders of the manufacturers themselves a large part of the responsibility for the future progress of the industry. As we came to the final question on the outlook for car building business in 1926, he maintained this position by summarizing his viewpoint in these words:

"There is now an active demand for new and improved types of cars. The extent of the business that will be placed during the year 1926 is largely dependent upon the efforts exerted by car builders to develop and sell their products."

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Bids Asked for 300 Cars and 150 Buses at Detroit

Awards impend at Detroit for more than $4,000,000 of car and bus equipment. H. U. Wallace, general manager of the Department of Street Railways at Detroit, Mich., has emphasized to the Board of Street Railway Commissioners the urgent need of the department for additional equipment. In a letter to the board on Feb. 22 Mr. Wallace said that every unit owned by the Department is now in constant service and in addition the department is renting 50 additional motor cars and trailers from the Detroit United Railway in an effort to meet the heavily increased demand for service. In spite of these efforts, however, the service falls short of adequately filling the demands. According to Mr. Wallace, at the present time the city system needs at least 100 additional cars.

He says that approximately 150 of the cars now operating are so worn out and obsolete that their operation represents a current liability in the form of excessive maintenance and upkeep costs. These cars should be scrapped immediately and replaced. Furthermore, the department will need an additional 150 street cars or large buses to meet the future demands of next fall and take care of the rapid population and territorial growth of the year.

Mr. Wallace says that in considering the motor coach problems it is apparent that the city system will need 75 additional large buses to handle present business satisfactorily and on a conservative estimate will require 50 more buses to establish additional routes in certain sections of the city which are urgently in need of transportation facilities.

In consequence he has recommended that the city advertise for prices and terms on the following equipment: 300 new street cars, with six months option on 150 additional cars; 150 new large double-deck buses, with six months option on additional buses.

Mr. Wallace says:

> As soon as we get these bids we will be able to determine what kind of terms we can get on the purchase of this equipment, and after obtaining the terms we can then definitely decide on the amount of equipment to purchase at this time.
>
> From various conferences that we have had with bus manufacturers and car manufacturers we have been led to believe that we will be able to procure equipment on terms that will permit of our paying for all of this equipment either out of the earnings from the equipment or out of the saving that we can make in the cost of operating new, light, modern cars in place of our present heavy and obsolete units.

The board has approved the request made by Mr. Wallace and the Department of Street Railways advertised on Feb. 24 for bids for the equipment mentioned by the railway manager in his letter. The awarding of the contracts is of course subject to approval by the City Council.

Brill Report Misquoted

In the digest of the report of the J. G. Brill Company published in the ELECTRIC RAILWAY JOURNAL for Feb. 13, page 307, the item of cost of operation was misstated due to the transposition of the figure of $560,938. The paragraph in which this figure appeared as contained in the report and as it should have been presented in the JOURNAL read:

> After deducting from earnings all cost of operations, including maintenance and repairs and depreciation for the year amounting to $560,938 and after setting aside out of earnings reserve for federal income taxes, not yet due, of $82,791, the result of the operations of all the plants of your company shows a net profit for the year of $571,269.

Ohmer Company Is Active

With its factories working day and night in an effort to keep the total of unfilled orders to a minimum, the Ohmer Fare Register Company, Dayton, Ohio, reports the volume of sales for the month of January to be considerably greater than any previous month in its history. More employees are engaged at the present time than has been the case since the close of the war. As compared with this time last year, there is an increase of 30 per cent in the number of men employed.

January was also the biggest month for export business in the history of the company, it was reported. Many large orders were received from Australia, New Zealand, South and Central America, England and Canada. The new types of ticket-printing fare registers for electric and steam railroad companies and motor bus lines, which were recently announced, are attracting attention from transportation officials throughout the world, and are being manufactured in increasingly largely numbers. It is anticipated that 1926 will prove a record year for the Ohmer Company.

Prize for Industrial Advertising Urged by Harvard Award

Recommendation for the establishment of an award for the best advertising campaign of industrial products was made on Feb. 22 by the jury of awards of the Harvard Advertising Awards, founded by Edward W. Bok. At the same time the names of the winners of awards already established in 1925 were announced by Wallace B. Donham, dean of the Harvard Business School. The annual award consists of cash prizes totaling $11,000 and a gold medal. The latter was awarded to Ernest E. Calkins, president of Calkins & Holden, Inc., New York advertising agency, for distinguished personal service to advertising.

Cash awards cover various phases of the advertising field, such as the national campaign most excellent in planning and execution; the most excellent local campaign of a manufacturer; research and development of an index of effective buying power for consumers by counties in the United States; distinguished individual advertisements, etc. It is significant that the jury of awards felt it advisable to recommend an additional award to stimulate excellence in industrial advertising.

The adoption of this recommendation would naturally mean a reapportionment of awards in existence at the present time.

Pennsylvania Orders Electric Passenger Locomotives

Contracts on all the motive machinery, controls and other electrical equipment for six large electric passenger locomotives and two double-cab switching locomotives have been awarded by the Pennsylvania Railroad to the Westinghouse Electric & Manufacturing Company. This equipment will be shipped to the Juniata shops of the Pennsylvania Railroad at Altoona, where the entire group of eight locomotives is to be built.

The six passenger locomotives, which have a continuous rating of 3,730 hp. each, and compare as regards both tractive effort and speed with the greatest steam locomotives in existence, will be put into operation in the New York division hauling heavy passenger trains between the Pennsylvania Terminal, in New York City, and Manhattan Transfer. These locomotives are in addition to two others of a similar type placed in service at Manhattan Transfer in 1924.

Design of the new equipment was handled by the engineering staff of the motive power department, Pennsylvania Railroad, under the personal direction of its chief, J. T. Wallis. The passenger units have a 2—8—2 wheel arrangement with a so-called "steeple" type cab construction. Motors are arranged two per jack shaft, and are mounted outside, and at either end, of

Digitized by Google

the driving wheelbase. Each jack shaft serves two pairs of drivers, the latter of which are 80 in. in diameter, or approximately 1 ft. higher than the average man. The connection between the motors and the jack shaft is by means of pinions and flexible gears. The gear ratio of the locomotives will permit a sustained speed of 70 m.p.h. When delivered and ready for service each locomotive will weigh approximately 400,000 lb., with a total length of 68 ft.

The two electric switching locomotives are of the so-called double-cab type for general yard work, of which quite a number already have been designed and ordered.

Purchase of Enormous Copper Smelter Announced

Hyman-Michaels Company, Chicago, Ill., announces the purchase through the United Commercial Company, San Francisco, of one of the largest copper smelters in the world. The purchase covers the Mammoth, Keystone and Kennett properties of the United States Smelting, Refining & Mining Company, located at Kennett, Cal. In addition to the plants, the purchase covers all personal properties, including a considerable amount of trackage and railroad equipment.

Pressed Steel Car Company Merges with Subsidiary

Stockholders of the Pressed Steel Car Company have approved the plan recently submitted by directors whereby a merger with Western Steel Car & Foundry, a subsidiary, will be effected and the company recapitalized. The name Pressed Steel Car will be continued. When the plan is consummated Pressed Steel Car Company will have an authorized capital of $16,200,000, par value, cumulative 7 per cent preferred and $46,300,000, par value, common stock, with outstanding issues of $15,000,000 preferred and $12,500,000 common.

Rolling Stock

Memphis Street Railway, Memphis, Tenn., has placed an order with the St. Louis Car Company, St. Louis, Mo., for 32 single-end cars, 46 ft. long.

Roanoke Railway & Electric Company, Roanoke, Va., an American Electric Power Company property, has ordered from the J. G. Brill Company six 28-ft. closed motor cars equipped with Brill 77-E trucks.

Tampa Electric Company, Tampa, Fla., has included in its 1926 budget the purchase of 25 double-truck cars. This item of the expansion program alone represents an expenditure in excess of $300,000.

Worcester Consolidated Street Railway, Worcester, Mass., needs 77 new cars, according to a recent survey made there, to bring the rolling stock equipment up to present-day requirements. The proposal now made is for the use of light-weight one-man, two-man cars. Reference is made elsewhere in this issue to the survey under which this fact and others with respect to service and equipment in Worcester were brought out.

Chileña de Electricidad, Santiago, Chile, has ordered from the Brill Company 30 28-ft. 3-in. closed car bodies to be equipped with Brill 177-E trucks.

Georgia Railway & Power Company, Atlanta, Ga., ordered in January of this year ten new one-man cars for its interurban line. The specifications of these cars follow:

Builder of car body	Cincinnati Car Company
Type of car	Single-end, double-truck interurban safety car for two-car train service
Seating capacity	51
Weights:	
Car body	18,000 lb.
Trucks	9,880 lb.
Equipment	8,365 lb.
Total	36,245 lb.
Bolster centers, length	26 ft. 3 in.
Length over all	45 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	11 ft. 8 in.
Body	All steel
Interior trim	Light mahogany
Headlining	Agasote
Roof	Arch
Air brakes	Safety Car Devices
Armature bearings	Sleeve General Electric
Axles	Brill Company Cambria hammered steel
Bumpers	Pressed steel
Car signal system	Faraday
Car trimmings	Bronze oxidized, Dayton
Center and side bearings	Brill, center bearings; Stucki, side bearings
Compressors	Western Traction Brake Company DH-16
Control	General Electric PC 5-K2
Couplers	Tomlinson, Form 10, car, air and electric
Curtain fixtures	Curtain Supply No. 90, pinch fixture, Rex rollers
Curtain material	Pantasote, grain Morocco, color No. 86
Destination signs	Keystone JRR and ILR
Door-operating mechanism	National Pneumatic
Energy-saving device	Economy meter
Fenders	H-B wheelguards
Gears and pinions	General Electric A-1
Hand brakes	Peacock staffless
Heater equipment	Unsettled
Headlights	Ohio Brass SDH roof type
Journal boxes	Brill
Lightning arresters	General Electric Aluminum A-11
Motors	Four GE-265-A, inside hung
Registers	Ohmer
Sanders	Ohio Brass, Form 2
Sash fixtures	Dayton wedge type
Seats	Hale & Kilburn 900A bucket type
Seating material	Genuine gray leather
Slack adjuster	American automatic
Springs	Brill Company
Step treads	Aluminum, Cincinnati Car
Trolley retrievers	Knutson 5-B
Trolley base	Ohio Brass, Form 4
Trolley wheels	Nuttall 6 in. diameter
Trucks	Brill 177-E-1
Ventilators	Nichols-Lintern Company type C
Wheels	26 in. steel E-26-S
Special devices	Signal lights; push-button control of doors, variable load brake, compensating fixture dome lights

Metal, Coal and Material Prices

Metals—New York	Feb. 23, 1926
Copper, electrolytic, cents per lb	14.25
Copper, wire base, cents per lb	16.00
Lead, cents per lb	9.10
Zinc, cents per lb	8.07
Tin, Straits, cents per lb	64.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.875
Somerset mine run, Boston, net tons	2.10
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.575
Central, Ill., screenings, Chicago, net tons	1.125
Kansas screenings, Kansas City, net tons	2.425
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.25
Weatherproof wire base, N.Y., cents per lb.	17.75
Cement, Chicago, net prices, without bags	2.10
Linseed oil (5-bbl. lots), N.Y., cents per lb.	11.60
White lead in oil (100-lb. keg), N. Y., cents per lb	15.50
Turpentine (bbl. lots), N. Y., per gal	$0.98

Trade Notes

Kelly, Cooke & Company, Philadelphia, Pa., have announced a change in location for their headquarters. Formerly located at 424 Chestnut Street, they have now taken offices in the Insurance Company of North America Building, the Parkway at Sixteenth Street.

Leon L. Wolf, president of the Leon L. Wolf Waterproof Fabric Company, Cincinnati, Ohio, has announced the appointment of Edwin Besuden to be sales promotion manager. Mr. Besuden formerly was connected with the Jewett Motor Car Company. He is well known among electric railway men. He will spend most of his time in the field, further stimulating the widening market for Wolf Kemi-suede, the new waterproof material for upholstery purposes in the automotive and electric railway fields.

Farley Osgood, for many years prominently identified with the electric light and power industry, has established consulting engineering offices in the National Bank of Commerce Building, New York. He will engage more particularly in the design, construction, operation and interconnection of public utilities. Mr. Osgood has been especially active in the affairs of the American Institute of Electrical Engineers and was signally honored with the presidency in 1924-1925. He is widely known as a remarkably able engineer.

Reo Motor Car Company, Lansing, Mich., states that, exclusive of administrative expenses, a fleet of six Reo 21-passenger six-cylinder model W buses has been operated in South Bend, Ind., at a cost of only 8¾ cents per bus-mile by the Chicago, South Bend & Northern Indiana Railway. Information as to operating costs was obtained from a statement recently made by George R. Green, general superintendent of the railroad. The fleet has been in operation since February, 1925.

New Advertising Literature

Electric Controller & Manufacturing Company, Cleveland, Ohio, has issued a leaflet which illustrates various applications for E, C & M separator magnets. Installation methods are also treated. Copies will gladly be supplied on request.

Metallo Gasket Company, New Brunswick, N. J., has issued catalog No. 26, entitled "Metallo Gaskets." In this are described various types of gaskets for use in pipe joints, air pumps, boilers, hand hose, and wherever else this equipment may be required. Gaskets for high and low pressure work and for ordinary and extreme conditions are available.

Korfund Company, Inc., New York, N. Y., has issued a bulletin entitled "How to Isolate Machine Vibrations." This points out the disadvantages of attempting to operate machinery without adequate protection from size and vibration, and states that Korfund plates of coarse natural cork are admirably adapted to meet these problems.

So Those in the Industry May Know

EVIDENCE continues to accumulate of the misinterpretation by the daily newspapers throughout the country of the facts with respect to the recent bus applications made in New York City. It is true that in some of the elements which it contains the joint offer made on behalf of the New York Railways and the Fifth Avenue Coach Company does differ from similar offers made in the past, but it does not presage the passing of the street car, as many of the newspapers have concluded in their editorial comments.

It cannot be expected that editors distant from New York will be informed about transit matters in that city. The whole situation is extremely complicated. A recapitulation of the bus offers, made some time ago, disclosed that there were more than 50 on file. Others have come in since then. Commentators on the latest offer should bear in mind that the 25 miles of track, whose use it is proposed to discontinue, represents only about one-fourth the total mileage of the system. Most important, however, the plan does not represent an idea that is new. There have been similar replacements elsewhere in the past, proportionately as great, but the railway has remained the backbone of the system. Moreover, sight must not be lost of the fact that under the latest bus proposal the fares will be both 5 and 10 cents, whereas the present carfare is 5 cents.

These comments are not intended to be critical of this particular application or any of the others. It is easy to see what a colossal task it would be to analyze and compare all the offers made. As a matter of fact, this is a work upon which the city has been engaged for months. The problem of deciding what is best for the city is the concern of the Board of Estimate. When that decision has been made the New York Transit Commission will then have its say. No matter what the city of New York may do, the commission will undoubtedly exercise authority that will fit the proposal accepted by the city into the general plan designed to better transportation facilities in the city.

One thing and only one thing is here intended. That is to call the attention of street railway men everywhere to the importance of learning the facts about the New York proposal and making every effort to disseminate them in their own communities. There has been an alarming tendency on the part of the daily press to jump at conclusions. Such phrases as "the beginning of the passing of the street car from the leading cities"; "it costs less to operate the buses"; "adoption of the bus in populous American communities is daily becoming more expedient"; "there's a lesson in this—the trolley is obsolescent," are all too frequent in the daily press comments on the New York proposal.

To turn the tables on these critics by using almost the very words of one of them, there is a lesson in this, but it is not the unusual lesson which most of them make it out to be. It is the lesson not of wholesale replacement, but the lesson of the proper articulation of the two methods of transportation and of the use of each under conditions which dictate a choice between the two. It is up to the individual railway operator to correct any comment in the daily papers in his territory based on conclusions which start with a wrong premise. No silly statements similar to those quoted should be permitted by them to go unchallenged.

Full Knowledge of the New York Bus Plan Desirable

INTERESTS of the New York Railways and the Fifth Avenue Coach Company have joined to form the newly organized New York City Omnibus Corporation for the purpose of operating a co-ordinated rail and bus service in Manhattan. There is included in the Omnibus Corporation's plan a proposal to eliminate some 25 miles of street car lines in favor of buses. This is out of a total of some 88 miles. In the proposal is also the suggestion that additional surface rail lines may be removed in favor of buses whenever this becomes practicable.

There exists now in New York a keen competition for bus franchises, and various contenders are making strenuous efforts to devise terms that will win the coveted grants and at the same time permit operation to be carried on at a profit. Unless operation is at a profit service will quickly become crippled by the inability properly to maintain equipment.

It is apparent that the proposal of the Omnibus Corporation includes considerations that may work to induce the city administration to grant this company a franchise over other contenders. In this effort, steps may be proposed which in themselves would not be considered were not the matter of protecting existing investment by control of bus operation on Manhattan Island at stake.

Again, there is another important factor in the proposal to abandon some rail lines. The particular lines in question are not profitable. In fact, they haven't had a chance for many years. True, there are perpetual franchises, but they provide for a 5-cent fare and many other operating handicaps. At the present time the north and south traveler in Manhattan has only the choice of a crowded rapid transit system, a slow surface car or an expensive automobile. There has been no provision for any intermediate form of transportation which would be more comfortable or attractive than the congested rapid transit lines and

Digitized by Google

at the same time much less expensive than an automobile or taxicab. The north and south surface lines might well have supplied such service, but the arbitrary fixed 5-cent fare has stood like a stone wall in the way of improvement.

There has been one exception to this condition, namely, the operation of the Fifth Avenue Coach Company at a 10-cent fare. This service has been popular not because of its speed, but because a passenger may make his trip without the indignities of crowding. The provision of such a preferred transportation service is a proper function of the bus. The bus offers a solution of the situation under the proposal to substitute 10-cent bus lines that are expected to permit a character of service that will supplement rather than duplicate that of the rapid transit lines. The proposal seems a logical one under the circumstances, but similar conditions encountered are not found in any other city in the country.

Certain proposed crosstown lines are designed strictly as feeders to north and south bus lines or other transit agencies. Here the hauls are very short and no attempt to provide a preferred service is contemplated. A 5-cent fare will be charged on these buses with an additional 5 cents for a transfer to the north and south lines. The plan is a good one from the standpoint of providing more and better distribution of crosstown transportation. This is an important requirement in New York. The peculiar combination of street spacing makes a bad transit problem at best, and the crosstown bus lines will help materially.

Much more could be added regarding the restrictions which have been placed on street car operation that tend to favor the use of buses. The expensive conduit construction is in itself a handicap to car operation. Street traffic conditions are more severe in New York than in the majority of American cities. Unregulated parking exists on many streets, cutting down the effective roadway. Speeds are necessarily very slow, particularly on the crosstown streets.

But these subjects are technical and in a sense they are details. The important fact is that the proposed bus plan for New York is designed to meet unusual and peculiar conditions that are common alone to that city, and reflect in no sense a comparison of the relative merits of bus and trolley in municipal transportation. Here the bus is being fitted into a particular situation in which it seems to offer certain advantages. There is nothing new or significant in this as regards the bus-trolley situation. A similar process is going on in various parts of the country, where unprofitable sections of rail line have been abandoned and bus service substituted where it is suitable. This is in accordance with what has been generally recognized as good practice in the application of the bus.

The primary danger now is from curbstone transportation experts who do not understand the situation. There is danger that hasty generalizations may be made on the basis of the action proposed for decidedly specialized conditions. Electric railway executives owe it as a duty to their communities and properties to make every effort to acquaint their communities with the facts. They will at the same time be doing a service in the interests of the development of the bus by preventing the popular mind from being misled regarding its proper functions as a transportation agency.

There Still Is Room for Modernization and Merchandising

FUNDAMENTAL soundness underlies the electric railway business. This was conceded by speakers at the first sectional conference of the Advisory Council of the American Electric Railway Association, held at Chicago last week. It was the feeling, however, that the public has not been sufficiently impressed with the need for public transportation. At any rate, work remains to be done in pointing out that it is futile to expect a system to be operated and improved to meet the needs of a growing community without assuring safety of capital and an adequate return.

That the railways can do much to improve their own situation was indicated by the remarks on popularizing service. The cars on a property represent only some 15 to 20 per cent of the total investment. Yet frequently they are allowed to become a very unattractive feature. Since they are the salesroom of the company they should be kept in first-class condition. And this can be done at an actual saving in cost, it was pointed out.

But with all this, confidence in one's own property is essential. Unless railway men are sold on their own business they cannot hope to win the required support and confidence from the public that is so essential to success. These are the words of one of the most successful men in the utility field. Having gained this confidence and the support of the public, the rest is easy. Capital in sufficient quantity should flow in to care for all needed rejuvenation of the properties.

A New Viewpoint on Depreciation

DEPRECIATION is an operating expense, but its amount depends on the rate of destruction of property value. Hence its determination involves the consideration of many diverse elements. Usually the treatment of this subject has been from a rather narrow viewpoint, based on some theory which some writer is propounding. Such a method usually neglects fundamental factors, and occasionally leads to erroneous conclusions.

Since in the long run depreciation must be assessed against the car rider if service is to continue, it is essential that the burden be spread equitably. The many factors involved make it very difficult to charge the exact amount against each passenger, and in rate cases this has been a point for frequent argument. The amount of the charge is in general fairly large, being in many cases at least half as great as the return on the investment.

A wealth of information and an advanced viewpoint are contained in the series of articles by the late W. H. Maltbie now running in this paper. Probably the greatest authority on the subject, he treated it in a lucid manner that makes it easy of understanding and easy of presentation before public authorities. Seldom has a subject been treated with greater breadth and thoroughness.

These articles, which were completed shortly before Mr. Maltbie's death, serve as a fitting monument to a man who had won an outstanding position in the industry as a counsellor and a friend. His passing leaves a distinct vacancy which will be hard to fill.

Dallas Permits Its Railway to Grow

DALLAS, TEX., is to have a 7-cent cash fare with a 6-cent ticket rate. The new rate is based on the recommendation of the supervisor of utilities to the Mayor and the City Commissioner after an exhaustive study of the situation. Except for some untoward circumstance the Dallas Railway could probably have gone on indefinitely on the old basis, but under the straight 6-cent fare it could not do the things it wanted to do and that it knew should be done to keep abreast of the growth of the city. Its margin of profit was too small to permit this.

It is an interesting story of public relations, this outcome at Dallas. The company laid its cards on the table last summer. The matter was discussed, but the disposition of the Mayor and the City Commissioners was to hold the company to strict accountability under the terms of its franchise contract, a modified service-at-cost grant. So far as the company is concerned this would have been the easiest way out for it, but its sense of public responsibility would not permit it meekly to accept such restrictions. So it renewed its request.

In return for a rate of fare which gives promise of doing more than merely permitting the company to exist, its officers have obligated themselves in no unmistakable terms. The railway and the city's supervisor of public utilities did all that was in their power to reach a basis workable from the standpoint of the railway and not unduly burdensome on the people of the city. If the railway had not been permitted to grow so as to meet its responsibilities the stigma would have rested upon the Mayor and the City Commissioners. Upward of $1,450,000 will now go back into the property. Surely 1 cent additional for each cash passenger is not much of a price to pay under the circumstances. As the Dallas *News* so aptly said, the grant of an increased fare, or rather the fractional increase in fare, "will enable the company to finance its needs, which are the needs of Dallas."

Planning Ahead of Present Needs

BURIED in the news items recently was a prediction made by Frank H. Alfred, president of the Père Marquette Railway, that the day was coming when trains would run over concrete roadbeds reinforced with steel trusses, and that cars would run on roller bearings, with a speed approaching that of airplanes. Considerable ingenuity would of course be required to overcome the mechanical difficulties presented in a proposal of this kind, but after all, the matter would probably resolve itself into the economic problem of whether such a project could be made to pay, and whether the time interval will become so important a factor in our lives. While at present it might appear that there is not likely to be a need for anything of this nature, who would have thought, only fifteen years ago, that the day was almost upon us when we would have, and really need, thousands of miles of pavement on our country thoroughfares? Even today these thoroughfares are becoming inadequate and the ingenuity of highway builders is taxed to find means of obtaining the maximum use of the right-of-way. To meet this demand super-highways are being developed in Detroit, and Chicago is now contemplating a similar plan.

Steam railroad development in late years, has not been in the matter of speed. Progress in that regard was pretty rapid during the latter half of the nineteenth century. It need only be recalled that engine number 999 made its record of 112.5 m.p.h. on the New York Central Railroad as early as 1893. Steam roads during the last quarter of a century have paid less attention to the matter of speed than to the better application of that speed. The improvements have been along the line of comfort, safety and increase of all-around efficiency. No one would like the idea of being whizzed along at 112 m.p.h. in 1893 type wooden cars.

If speed is needed, and needed for mass transportation, a development such as Mr. Alfred has suggested might conceivably be superior to airplanes because of its present advantage in the matter of having terminals located in the centers of cities, as it frequently requires a journey of an hour or more to reach an airplane field from the center of the city. No doubt there would be difficulties in the execution; but ideas like Mr. Alfred's are always in order. It is well to plan just a little ahead of the present needs.

P.R.T. Scores Once More with "Market Basket" Plan

PRICES may rise and prices may fall, but hereafter the Philadelphia Rapid Transit employee will go on his way, untroubled by such mundane considerations. This enviable state comes as a result of the "market basket" plan of wage adjustment which the men and company have just agreed upon. Two years of intensive research on the part of various committees of men and of employers' representatives have finally borne fruit in this agreement. Now the men will have the comforting assurance of a satisfactory standard of living, no matter what untoward economic crisis descends upon the country.

The plan also provides a stimulus toward increased operating efficiency among the employees, since they will share with the management in any surplus which may accrue over and above the dividend return on preferred stock. Points such as this would seem to indicate that Mitten Management has scored, as well as the men, in promoting a further spirit of mutual accord. A number of leading economists have given the terms of the agreement the stamp of their approval. From the theoretical standpoint it is par excellence—the last word in labor agreements.

Now it simply remains to determine how the mechanism of the plan will function in actual practice. The agreement provides that wage adjustments will be made once a year on the basis of an index figure determined by the cost of twelve typical market baskets, unless the fluctuation of the dollar's purchasing power exceeds 10 per cent for a period of three months or longer. As living costs take an upward trend the men will find more dollars in their pay envelopes. Conversely, as the cost of living decreases a corresponding reduction in pay will follow.

It is here that unusual care may well be exercised by the company, to make sure that the men do not feel they are being penalized. Two dollars less in pay a week is a very tangible thing. A reduction of two dollars in living costs is not so tangible. However, Mitten Management has been seeing eye to eye with its men for so long now in labor and wage-agreement matters that all such minor wrinkles will doubtless be ironed out without difficulty. A certain amount of educational work still remains to be done before the "market basket" plan has passed the test of time.

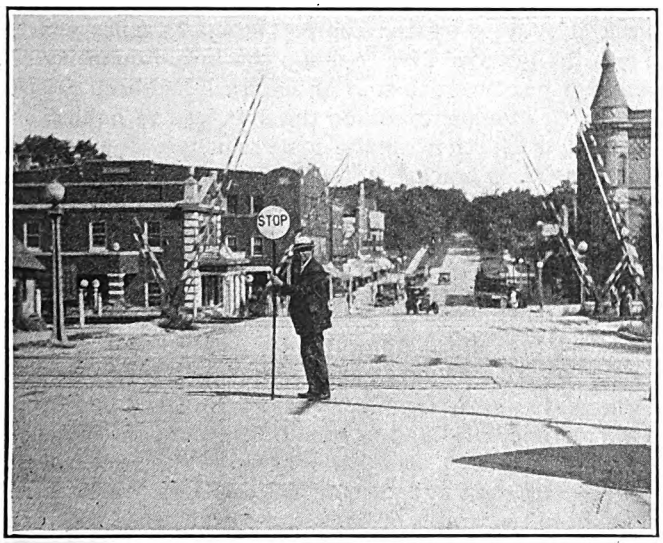
From Bankruptcy to Prosperity in Three Years

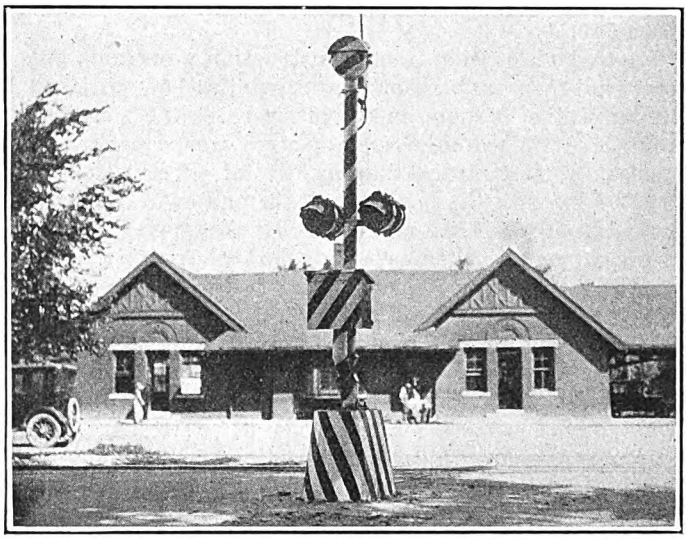
SECOND ARTICLE

Extensive Track Rehabilitation Program Carried Out by the Chicago, Aurora & Elgin Railroad—Substitution of Limestone for Gravel Ballast Has Reduced Maintenance Cost—Additional Crossing Protection Installed — Block Signals Protect Train Operation — Track Extensions Planned

IMMEDIATELY upon assuming control of the reorganized Chicago, Aurora & Elgin Railroad the new management inaugurated a comprehensive program for the rehabilitation of track. At that time the entire trackage of the system was ballasted with gravel, or gravel and cinders mixed. At the high speeds required to maintain schedules an excessive amount of track labor was needed, particularly in the fall, winter and spring months, to keep this track true to line and grade. Prior to the receivership the physical condition of the track had sunk to a low ebb. While considerable expenditures had been made by the receiver for the replacing of ties and the lining and surfacing of track, the result was far from satisfactory to the new management.



Method Formerly in General Use to Protect Grade Crossings on the Aurora-Elgin Line



Automatic Signals with Double Flashing Lights and Warning Bells Are Now Used at Many Locations

The first step was the ditching of the entire property with a steam ditcher, the material taken out being dumped upon the edges of fills, thereby increasing the factor of safety at these points. This served to drain the ballast and sub-grade, thus insuring a dry track. Through the cuts the ditches provide a place for snow removed from the track by plows.

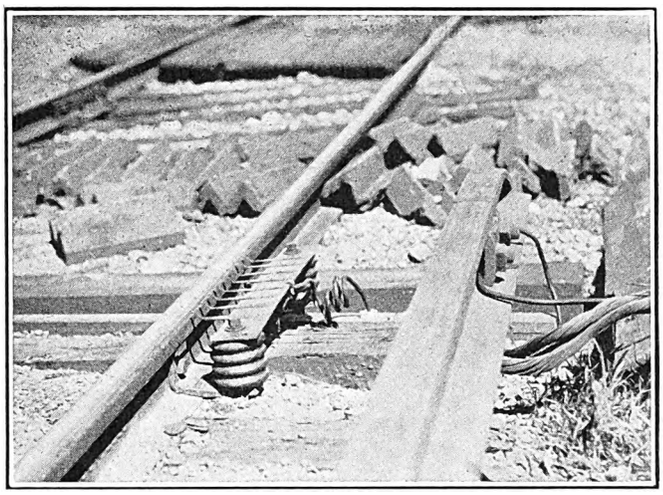
For the ditching work a ⅝-cu.yd. Erie railroad ditcher was mounted on a flat car and coupled to a locomotive tender which supplied water and coal for the steam-driven ditching machine. Two 20-yd. air-operated dump cars were used to remove the material from one portion of the right-of-way and redistribute it at points where it was needed to increase the width of the shoulder. Over the 15 miles of right-of-way 25,000 cu.yd. of material was removed.

After careful examination it was found that the 80-lb. A. S. C. E. rail, some of which had been laid only ten years before, was in good condition and suitable for use for several years to come. This rail was in 60-ft. lengths with four-hole angle-bar joints. At the time of rehabilitation many of these joints were bent and some rail was badly worn under the head. Therefore, all joints in the sections of track which were rock-ballasted were replaced with four-hole continuous joints made by the Rail Joint Company. It was unnecessary to replace any of the rail on tangent tracks, except on the section between Laramie Avenue, Chicago, and Forest Park, over which the Chicago Rapid Transit Company has operated its elevated service for many years. This rail was entirely renewed with 101-lb. A. R. E. A. section, as was also most of the rail on curves.

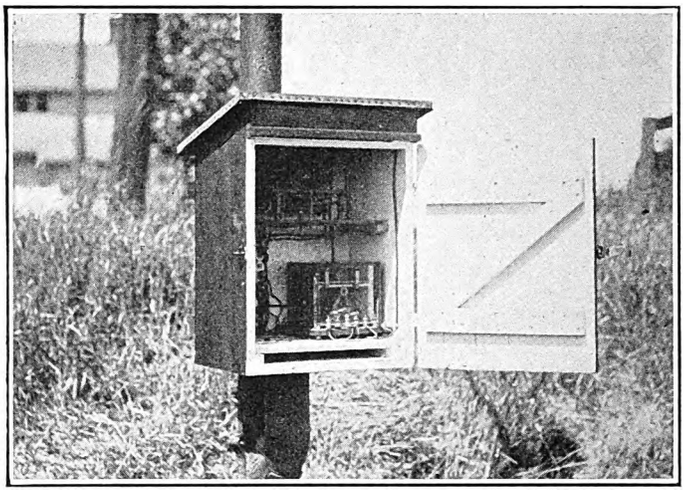
Old ties were replaced with treated oak and white cedar ties, rail anchors being placed, eight to the rail length, opposite joints at centers and quarters of rails. These have eliminated the skewing of the ties at the joints and reduced the creeping of the rail with its subsequent bad effect upon track alignment.

Extensive trackwork was carried on between the hours of 8:30 a.m. and 4:30 p.m. due to the comparatively lighter schedule during this period of the day. To expedite the work three additional crossovers were laid, so that the average distance between crossovers would be 1½ miles. At the ends of each crossover a dispatcher's shanty was erected and the two booths connected by means of telephone. With these facilities

Digitized by Google



Contact on Running Rail for Operating Crossing Signals Is of the Progressive Finger Type



Cabinet on Pole Opposite Finger Contact Contains Relays and Mercury Tube Mechanism for Operating Flashing Signals

it was possible to handle all train movements in both directions over a single track without any delay. The total number of men used for this work varied from 75 to 110.

As a part of the track construction program, but somewhat separate from the rehabilitation work on the main line, sidings and yards were built at various points. At Wheaton a freight yard was constructed, consisting of six tracks having a total effective length of 3,366 ft. with the necessary leads and switches from the main line. This additional trackage was needed as a clearing yard for east-west carload freight, which constitutes a large portion of the freight business between Aurora, Elgin and Chicago.

In addition to the freight yards sidings were constructed both for passenger and freight service. At Elmhurst 640 ft. of additional track was built for two sidings having a total capacity of twelve cars. At Laramie Avenue, Chicago, five sidings having a total length of 1,830 ft. were constructed. This trackage was necessary in order to store passenger cars used in the short route service between Elmhurst and Wells Street Terminal, Chicago. Prior to the installation of these sidings, it was the practice to "deadhead" between Wheaton and Wells Street Terminal cars which were to be used in the evening rush hour. The sidings at Laramie eliminate all of this dead mileage and the increased car storage at Elmhurst allows for the installation of short-route service terminating at that town during the morning and evening rush hours.

Reballasting of the double track starting at the Des Plaines River and extending to Wheaton, a distance of 19 miles, was completed in the summer and fall of 1922. In 1925 the line from Wheaton to Elgin, a distance of 16 miles, was reballasted. First the track was skeletonized to the bottom of the tie and the material thus removed was used for widening the shoulders. With portions of the track in this condition, it was possible to scrutinize the ties and replace those which would not last for two years. This resulted in the renewal of an average of 900 ties per single-track mile.

Reballasting was done with limestone ballast in sizes 1 in. to 3 in., placed under and around the ties to the extent of 0.4 cu.yd. per foot of single track. After a length of track had been skeletonized, the first dump of new stone was made on one track, this dump being sufficient to raise the grade of the track 6 in. and do the tamping. On this first dump, 0.25 cu.yd. per single-track foot was deposited. During reconstruction and ballasting, single-track operation was put into effect between crossovers located approximately 1½ miles apart. It was the practice first to dump the initial quantity of ballast on one track, then after the track had been raised and the ties tamped to dump the first load of ballast on the other track following the same sequence of operation as on the first track. After the two tracks had been raised sufficiently to insure at least 6 in. of stone ballast under the ties, in addition to the old foundation of gravel ballast which remained undisturbed, the finished dump of rock ballast was made which brought the ballasting up to the top surface of the tie and completed the shoulder at the tie and the fill in the devil strip.

Rodgers center dump ballast cars were used for this work, while the tie tamping was accomplished by means of three Ingersoll-Rand pneumatic tie tampers of four-tool capacity each. The distribution of the rock ballast was accomplished by means of sixteen cars, which were operated in two trains of eight cars each. The limestone was secured from a quarry along the railroad right-of-way. It was the practice to take three trains of ballast per day from the quarry to the point on the right-of-way where the ballasting was being done. One motor car was used for this work, one train being filled at the quarry while the other was being delivered to the point of application.

Signals and Crossing Protection Installed

Extensive development of crossing protection and signal devices took place during the rehabilitation period, with the result that crossing accidents have been reduced to a minimum. A definite method of deciding when, where and how crossing protection should be installed was inaugurated and a standard form of crossing sign and signal have been adopted. A committee made up of five men determines the type and location of crossing signals and signs. From the committee's recommendation, the question of automatic protection or a watchman is decided. The type of protection depends upon the traffic at the crossing.

Where the majority of the traffic is pedestrian an automatic signal is installed, while at crossings where teams and automobiles are in the majority flashing red lights—in a few locations watchmen—are employed. The center installation consists of a single standard on

Depreciation as an Operating Expense

SECOND ARTICLE

Determination of the Reserve—Replacement vs. Retirement as the Basis of Calculating Charges—Comparison of Separate Funds for Various Elements with a General Fund — What Is Average Life?

By W. H. Maltbie
Late General Counsel United Railways & Electric Company of Baltimore

SOME months ago, as the result of a conversation with one of the editors of this paper, the author undertook to prepare a series of articles on the subject of depreciation. This series was looked forward to with great interest, as Mr. Maltbie was an outstanding authority on the subjects of valuation and depreciation. After his death, the manuscript was located and forwarded to this paper through the kindness of J. H. Hanna, chairman of the A.E.R.A. committee on national relations sub-committee on depreciation, of which Mr. Maltbie was a member.

These articles were written from the viewpoint of the present investigation by the Interstate Commerce Commission of the whole subject of depreciation of electric railway property. This investigation was undertaken with a view to establishing definite rules and regulations covering the allowance of charges for depreciation as an operating expense on all roads subject to its jurisdiction. Since there is a possibility that any regulations of this sort established by the I. C. C. may be accepted as a precedent by various state commissions it is important that all street railway executives should be familiar with the present situation.

These three articles, dealing respectively with causes of depreciation, methods of setting up funds to provide for depreciation and practical methods of building up a retirement reserve, constitute a valuable contribution to the literature on the subject. They were probably the last creative work of the author.—EDITOR.

THE second point to be considered in the problem of depreciation is the question as to how large the reserve shall be, and the answer to the question depends upon the purpose for which the reserve is accumulated.

Students of the subject are divided into two schools. The first school holds that the reserve is intended merely to refund to the investor the amount of his investment when the property is outworn. If the replacing property costs more, the investor is supposed to furnish more capital; if it costs less, he has free capital which he may withdraw from the investment. The other school holds that the sum to be accumulated should be sufficient to purchase a duplicate unit of equipment. The first school maintains the investment, the second school maintains the plant. The first school builds a retirement reserve, the second a replacement reserve. The first school, knowing the cost of the unit of property, must estimate the amount of salvage which can be secured at the time of its retirement. The second school must estimate not only the amount of probable salvage but also the probable cost of replacement. It is evident, therefore, that while neither school can be positive as to the definite figure which must be accumulated in the reserve, the estimate for a replacement reserve is of necessity less definite than that for a retirement reserve.

The estimated value of salvage is usually but a small proportion of the total cost of the unit of property and therefore an error in this is not of vital importance. It is true that during the World War value recovered for salvage was frequently much greater than had been anticipated and in some cases greater than the total original cost of the property retired. But this variation yielded an excess sum, and therefore did not create any financial embarrassment.

For the replacement reserve, however, it is necessary to estimate in advance the cost of the new replacing unit of property. For short life property in a period when economic conditions have brought about a well-defined unit cost trend such a prophecy may be reasonably accurate, but for long life property, or for all properties in periods of rapid economic change, such prophecies are practically worthless, and the amount of the depreciation reserve must be changed frequently, or even from year to year as the replacement cost changes. Consider, for example, a single unit of property whose replacement cost has followed the index number for metals and metal products of the United States Bureau of Labor statistics. Assume an investment made Jan. 1, 1913, in entirely depreciable property, of $100,000, with a 20-year life. Then in the accumulation of a retirement reserve there will be a charge against operation of $5,000 per year. If it is desired, however, to accumulate a replacement reserve, the amount which should be in the reserve fluctuates in accordance with the following table:

Year	Index	Proper Reserve	Necessary Contribution
1913	100	$5,000	$5,000
1914	85	8,500	3,500
1915	99	14,850	6,350
1916	162	32,400	17,500
1917	231	57,750	25,350

It is obvious that it is not possible to plan practically for a reserve which must meet such sharp variations.

If, however, we are dealing not with a single unit of property, but with a large aggregate of units of different classes and types, it is possible to meet this objection against the replacement reserve.

The amount of the reserve is affected somewhat by the anticipated reason for the retirement of the prop-

Digitized by Google

erty, since this reason may have a direct effect upon the salvage value to be recovered. Thus a company engaged entirely in interurban service may anticipate the retirement of cars on account of their inadequate carrying capacity, and consequently give them a short life with a relatively high salvage value as the amount to be realized on resale, while a company doing a more diversified business would plan to shift these cars from an interurban branch to urban service if they became inadequate for interurban service, and would consequently make no allowance for salvage other than scrap or junk value.

Length of Future Life

It is not sufficient, however, to know merely the total reserve which should be accumulated by the time the equipment is to be retired. It is necessary to know the annual appropriation to the reserve. This demands knowledge at the beginning as to the number of years during which the unit of property will be in service.

It is obvious, first of all, that there is no possible way of determining with any certainty the future life of an individual unit of property, and that any estimate made must be in many cases nothing more than a guess.

For the owner of a single piece of equipment, such, for example, as a single car, this problem of determining the future life of the car is of vital importance. He must estimate its life before it wears out, which, assuming proper maintenance, will be a long term of years. He must also estimate the length of time until it becomes obsolete, which will probably be a shorter term, and he must also estimate the length of time until it becomes inadequate, which may be a still shorter term. Then, if he wishes to play safe, he must adopt as his life period the shortest one of the three. Moreover, since he is dealing with a single unit, he is not helped particularly by any knowledge of average life. If, for example, he knew that in the past history of the property with which he was connected the average life until inadequacy had been ten years, and he therefore estimates ten years as the life of the one unit with which he is now dealing, he is simply taking even chances on losing money, since there will be as many instances of inadequacy below the average as above. His only safe method is to use the minimum life term and not the average. In other words, if an executive is dealing with a single unit and desires to play safe he should accumulate its retirement cost in the minimum life which can be reasonably anticipated, and even then he is taking his chances against retirement through non-insurable accidents within a still shorter period.

Unit, Class or General Reserve?

When, however, we cease to deal with a single unit and deal with an aggregate of units, either all of the same class, or of different classes, a number of new problems arise.

The first and most important question to settle is whether we will set up a reserve for each individual unit of property, a reserve for all units of a given class or a general reserve to be used for retirements of any property belonging to the company.

If we decide to set up a reserve for each unit of property then the appropriation to that reserve must stop whenever the unit is retired from service, or, if it should overlive its estimated life, at the expiration of the estimated life. The result of this system is a deficit on short-lived property which must be charged to operation or to surplus. If it were possible to charge it to operation, the result would be that the users of that particular year would pay not only their share of the original cost of the article, but also the deficit in the payments of the users of the preceding years, and therefore one of the primary objects of the accumulation of a depreciation reserve, the equalization of cost to users of successive years, is destroyed. Moreover, it is practically impossible to charge this deficit against operation because rates of fare cannot be raised and lowered on account of unexpected retirements. The consequence is that the actual cost is charged against the owner of the property, either by being charged against his accumulated surplus or by increasing operating expense and decreasing his return for the year in question. In consequence the owner loses the protection which the accumulation of the reserve was designed to give him, namely, the protection of his right to collect from the users of his service not only the cost of operating but the cost of the equipment worn out in service.

Nor has the owner any chance to recoup this loss, for while the number of years of life beyond the average may equal the number of years of life less than the average, the reserve for the individual unit cannot justly receive any appropriation after it contains the full retirement cost. Therefore there can be no appropriation to any unit reserve in excess of the original cost of the unit, and therefore nothing wherewith to balance the owner's loss on the short-lived unit. To make the matter more specific, assume that two cars are purchased and given an estimated life of 20 years, and that one of them lasts for eighteen and the other for 22 years. Assume, moreover, that the depreciable value of the cars is $10,000 each, so that the annual appropriation for depreciation is $500. When the first car goes out of service at the end of eighteen years there will only be $9,000 in its reserve. No more can be charged in its reserve, because it is no longer in existence. The $1,000 must therefore be charged either in its last year, which is impossible, since rates cannot be changed, or must be charged against the owner and taken as a loss. At the end of the twentieth year the second car will have the full $10,000 in its reserve and no more can be charged against it. If rates are adjusted so as to pay only the depreciation appropriation and a fair return, the users of this car in the 21st and 22d years are having a part of their service paid for by the users who contributed the deficit in the eighteenth year. If, on the other hand, the rates are left unchanged both in the eighteenth and 21st and 22d years, the owner has a chance in the 21st and 22d years to recoup the thousand-dollar loss incurred in the eighteenth year, but it will come to him not as a recognized recoupment, but as an apparent excess over a fair return, and, if of sufficient magnitude, may lead to a public demand for reduction of charges.

So long as an individual reserve is set up for each unit of equipment or other property it is evident that the owner must protect himself by using, as in the case of the owner who owns a single unit, a minimum rather than any average life. If, however, the reserve is set up for groups of units, conditions change. Consider, for example, the case of a road having just purchased a lot of 100 cars of the same model. If instead of setting up 100 separate reserves, one for each car, a

Digitized by Google

single reserve is set up for the 100 cars, it is possible, so far as the influence of wear and non-insurable accident is concerned, to use an average figure, realizing that the longer-lived units of equipment will make good any deficits created by the passing out of the short-lived units. But, so far as obsolescence and inadequacy is concerned, these cars, if they go out at all, will go out together, and therefore the minimum life period must be adopted in order to protect the owner against these dangers. If, however, as is frequently the case, this company owns not only these cars but many others of other designs and models, and carries a single reserve for its rolling stock, there is less danger of it all going out at one time through either obsolescence or inadequacy, and average figures may be used with the expectation that those patterns or models which exceed the average life will make good the deficits created by those which do not reach the average.

If we go a step farther and set up a single reserve for the entire property, it becomes possible to minimize still further the influence of obsolescence and inadequacy on our life periods. If our cars become obsolete earlier than we anticipate there is a chance that our power plant, our boilers, our substation equipment will exceed our estimated life.

The whole situation seems to boil down to this: There will always be cases in which individual units go out earlier than is anticipated. If a reserve is created for the individual unit, this means a loss, but if a reserve is created for a group, the broader and more diversified the members of that group, the better chance there is of recouping through excess life the deficits created by short life.

Average Lives

But this possibility of extending the life term rests upon our ability to determine an average life, and doing business on a basis of averages is extremely dangerous unless certain fundamental scientific principles are strictly observed.

The first of these is that the averages used must be deduced from a sufficiently large number of definitely reported instances to eliminate the influence of individual cases or even the influence of sub-groups. If you were trying, for example, to determine for the first time the average human life, there would be no better way than to record the age at death of all reported deaths. The average at the end of the first ten entries may be anything from two or three years up to eighty or more. The tenth entry may make a marked change in your average, the hundredth entry a much smaller one, the thousandth entry, by itself, would not make any appreciable change in the average, but you may at this point run into the deaths of a different group or a different community, or the results of some accident or epidemic, and find an appreciable change. You finally reach, however, a point where your average is practically unchanged, whether you add a single entry, or a thousand, or a million. Whenever this point of sound average is reached, it is safe to use it as the basis of financial transactions, provided the second fundamental principle is observed.

The second fundamental principle is that financial transactions may not be based upon the sound average deduced as above unless it is applied to a group large enough to yield of itself a sound average. Thus if the study of a million cases leads to an average life expectancy of 30 years, it is not safe, therefore, to insure a single individual, or ten individuals, or a hundred individuals upon that basis; but an examination of the data will show that it is possible to determine a smaller group, which selected at random from the larger group will yield approximately the same average. An insurance company will then plan its business with a view of spreading its risk over the number of lives, as a minimum, in this smaller group and over sufficient territory to bring into play all of the occupations and conditions which entered into the original estimate (unless, of course, it attempts to eliminate some of those which tend to shorten life).

Now, unfortunately, neither of these conditions can be met in studying the life of electric railway property. Retirements and ages at retirement have not been recorded, so that there exists no sound average life on which to base financial transactions, and therefore the first cannot now be met.

Determination of Useful Average Life Hopeless

The hope of some time determining definite life tables upon which general depreciation ratios may be set up, although still held by theoretical students of the question, receives but little encouragement from practical men in the street railway industry. The American Electric Railway Engineering Association attempted the problem in 1911, but after careful study pronounced it hopeless, and abandoned it, and a joint committee of the Engineering and Accounting Associations reached the same conclusion and requested to be excused from further consideration of the subject in 1925.

The reasons for this conclusion are comparatively simple and are perhaps best understood by considering special illustrations. Consider track. The life of the tie is a question of decay and not at all a question of amount of use. Decay itself is a question of the quality of the original tie and of the character of the base in which it is imbedded. The latter varies from property to property and from point to point on the same property. The former varies from property to property and from tie to tie on the same property. The life of the rail is almost entirely a question of wear, complicated in some cases by corrosion of the rail base. The amount of wear is a question not of years, but of car movements and, in the case of rail in paved streets, of other vehicular movement as well. Car movements vary from point to point upon the same property and change from year to year at the same point with the readjustment of traffic in a way that cannot be definitely predicted. Other vehicular movement cannot be predicted at all, and the gradual disappearance of the iron-tired vehicle from city streets and to a certain extent the modern bonding of track probably vitiate the entire previous experience.

The life of a car is a question of maintenance, not only of the car itself, but of the track over which it runs, of the weather conditions under which it operates and of the extent to which its motors are subjected to overload, while obsolescence, which no man can predict with any certainty, and inadequacy, which is a purely local phenomenon, equally uncertain, are probably much more important than mere wear.

But even if the data were available and the sound average had been computed, it could not be applied to the property of any particular company, since the number of units operated by that company will be relatively small and all of them subject to the same set of local conditions which modify service life and which

Digitized by Google

have been eliminated or minimized in the sound average. If, for example, the data were available, were collected and digested, and showed a sound average life for rolling stock of 25 years, that information would not form a satisfactory basis for a depreciation reserve for company A, which recently wrote me that in its judgment every car became obsolete after fifteen years of service and should be retired, or for company B, which wrote me that it was rebuilding cars already in operation for over 20 years and anticipated drawing from 20 to 25 years additional service out of them before they were again put through the rebuilding process.

The life of any particular unit of equipment is, as noted above, in greater or less degree a function of climatic condition, of the amount of use, of the standard of maintenance, of changes in the art and of the amount and character of community development. All of these differ from location to location and company to company. A sound average can only be found by the equalization of these differences, but a figure can be applicable to a single company only provided it does not equalize these differences. On the other hand, each of these elements, excepting possibly climatic conditions, changes from decade to decade for an individual company, and therefore the experience of the individual company, in addition to covering too small a number of illustrations, is, by the possibility of a change in the very elements which determine the length of life, made an unsafe basis for financial transactions.

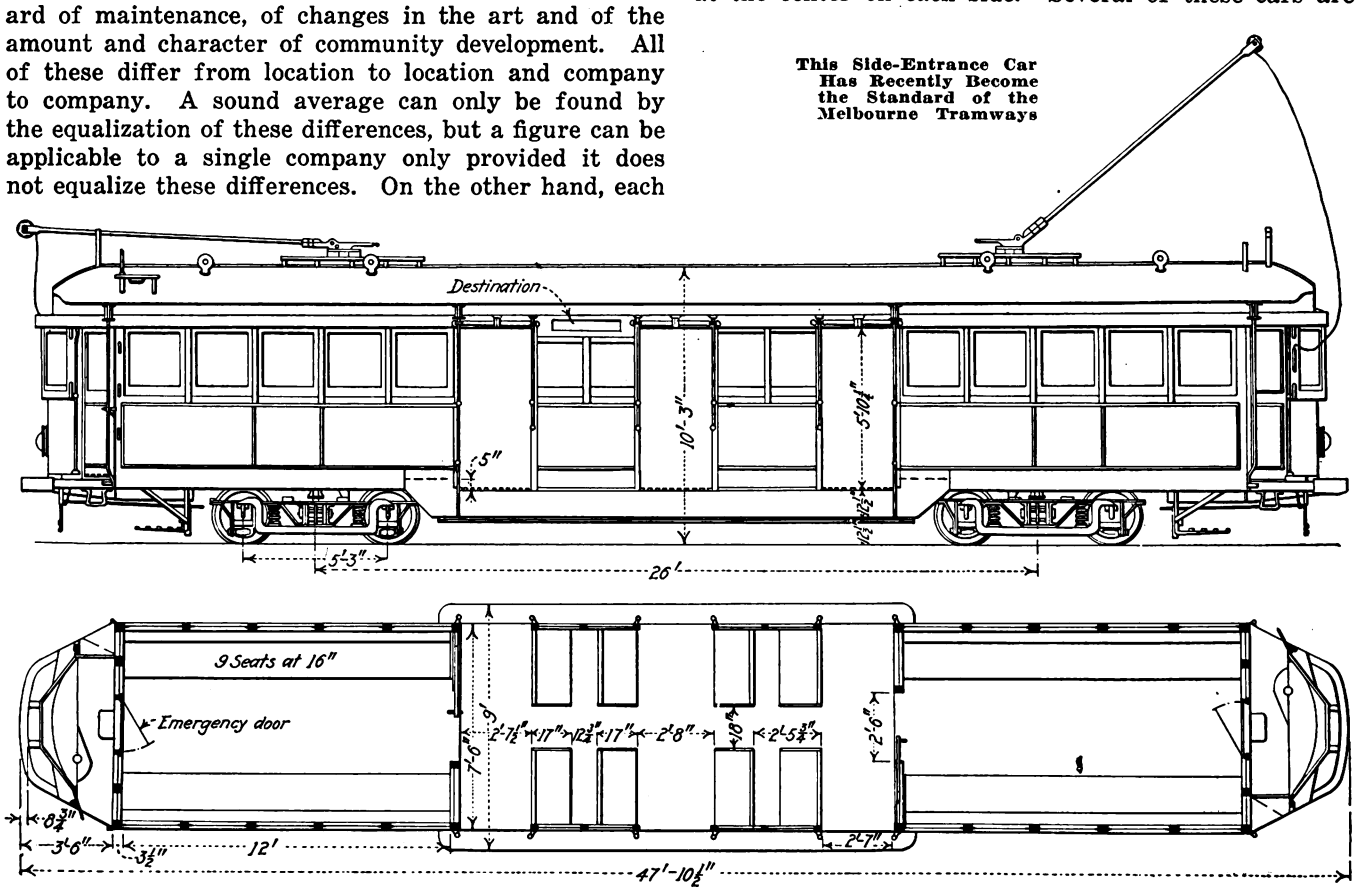
New Promotion System in Vogue in Los Angeles

EXAMINATION of the 114 men who were tentatively appointed as line instructors under the new promotion system of the Los Angeles Railway, Los Angeles, Cal., was conducted recently by Dan Healy, chief instructor. The examination covered the general rules for motormen and conductors which were compiled and given to the instructors in printed form on Nov. 1. They were given 30 days to study the points that must be drilled into the minds of new men. About 40 men were called into the instruction department at a time. The examination was conducted orally by Mr. Healy, and time was allowed for discussion of points on which there was a difference of opinion. Mr. Healy said he was highly pleased with the way the line instructors have learned the essential points of their work and predicted that very few would fall down on the examination.

Melbourne Adopts Three-Door Car as Standard

MULTI-SIDE DOOR cross-bench cars are no longer standard on the Melbourne Tramways. It has adopted a center entrance and exit car with three doors at the center on each side. Several of these cars are now in service and have proved satisfactory. A feature of the car is that the side entrances are not equipped with doors. The mild climate of Melbourne in winter makes it unnecessary for protection against the weather, and the experience with these cars indicates that doors were not necessary to prevent accidents in boarding and alighting.

This Side-Entrance Car Has Recently Become the Standard of the Melbourne Tramways



There are, however, bulkhead doors at the entrance to the end compartment, which seat eight on each side or sixteen to the compartment. The total seating capacity of the car is 52. The car is equipped with 26-in. wheels and four motors, one on each axle. The weight of the car empty is 17.11 tons.

A number of the main dimensions of the car are shown in the accompanying drawing, which is from the *Electrical Engineer of Australia and New Zealand.*

The electric railway system in Melbourne consists of about 160 single-track miles, covering about 90 route-miles. About 27 single-track miles will be added during the next twelve months.

Double-Deck Tramcars in the Shopping District of Johannesburg. The Center Poles Shown Have Now Been Removed

Tramway Operation Progressive in the Witwatersrand

Johannesburg Has Double-Deck Car Bodies on American Underframes—Schedule Speed Is High—Competition of Privately Owned Buses Has Been Serious, but Is Now Being Met by Operation of Tramway-Owned Buses

By M. Edward

JOHANNESBURG, the central city of the Witwatersrand, has what is claimed to be the largest electric railway system operating double-deck cars in the Southern Hemisphere. The whole of the Witwatersrand, that famous 60-mile strip of gold-bearing reef in the Transvaal, has proved itself the most progressive part of the Union of South Africa, particularly in the mechanical field. Johannesburg has a black and white population of about 300,000 in a municipal area with a 6-mile radius. As the cars are only run for the benefit of the white population, the system caters to approximately 160,000 people in a comparatively large area.

Substitution of electricity for horse power was begun in 1906, the municipality buying out the company then operating the horse cars. Politics has not played much part in the management of the system, which is vested in a committee that operates it on entirely business lines. Most of the street cars in South African cities are operated by the municipalities, the exceptions being in Cape Town, Port Elizabeth and Kimberley. These company-operated tramways are not as large as the Johannesburg municipal system. There is a trend in South Africa toward state and municipal ownership of large public enterprises. For instance, the railways are owned and operated by the government, as are the telephones and telegraphs, and in practically every city and town the power stations are municipal property.

Power-generating facilities in Johannesburg are also municipally owned. In the operation of the street cars only the actual cost of electricity supplied is charged against them, no overhead being included.

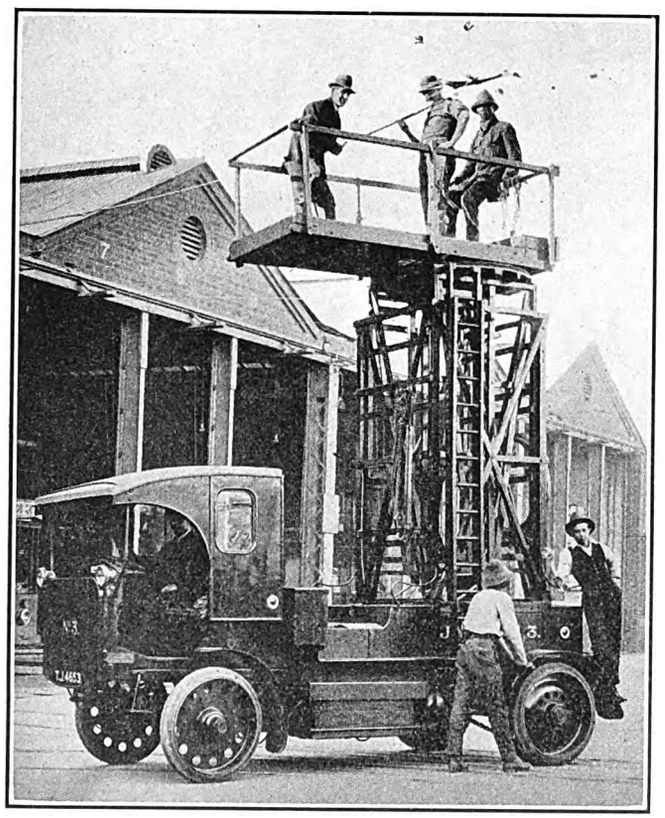
From the beginning double-deck cars have been used in Johannesburg, the system being modeled on the English plan. Originally the city of Glasgow, which is famous throughout the British Empire for its tramways, was looked to for guidance. Now, however, a system peculiar to the needs of Johannesburg has evolved. More than 90 per cent of the 135 English-built cars brought out in the first few years are still in operation. The first bodies were built in Great Britain and only assembled in South Africa. Today it is the practice to build the bodies locally and large shops have been constructed for this purpose. During the past few years more than 60 American double-truck underframes have been bought from the J. G. Brill Company and extraordinarily good-looking 75-80-passenger double-deck bodies have been built on them in Johannesburg. Most of these cars are equipped with four 50-hp. motors, while some have four 35-hp. motors. Of the English-built cars only twenty are of the double-truck or "bogie" type, but even the original small four-wheel double-decker can seat more than 60 passengers and has given excellent service in spite of consistent overloading.

Single-deck cars are by no means rare in South

Digitized by Google

Africa, as they are used in Kimberley and Pretoria exclusively and in Cape Town and Port Elizabeth in conjunction with double-deckers. It was only in 1925, however, that Johannesburg citizens first saw a single-deck car on their tracks. The double-deck cars have proved satisfactory for city and suburban traffic in Johannesburg, but the tramway committee has now decided to try out a number of small four-wheel single-deckers, the bodies being built locally on some of the original underframes first brought out for use as double-deckers. These small cars seat only about 30 passengers and they are used mostly during the slack periods of the day. It is said that they are proving successful and are saving power when small loads are to be handled.

When the traffic is heavy the double-deckers are used, supplemented by single-deck cars run alternately with



Electric Tower Truck of the Johannesburg Municipal Tramways. Gasoline Trucks Also Are Used

them. This is practically a "car-and-a-half" system and its use is said to be due to the competition of privately owned motor buses, which have assailed the Municipal Tramways in practically every section. More than 50 miles of route are operated by the tramways and the total trackage is 80 miles. This is being extended, but it is thought that the 100-mile mark will hardly be reached in view of the change of policy necessitated by the motor bus competition.

FIGHTING PRIVATELY OWNED LINES

A bitter war has been in progress during the past three years and it now appears to be reaching its final stages. The municipality had it in its power, of course, seriously to hamper privately operated motor buses, but public opinion was too strong and consequently the war was waged with perhaps more restraint than had the cars been owned by a company. As far back as 1912 petrol-electric buses were used as feeders by the Municipal Tramways, but they were discontinued when further sections of track had been laid. The manager of the tramways has long advocated buses as being necessary to co-operate with the street cars, and at last it looks as if this is to be done. The bus companies won an important lawsuit in their protest against municipal regulations that sought to tie them down to certain streets, and it now seems almost certain that municipal buses will be put into operation to assist the street cars in the fight. It is asserted that the use of these municipal buses will be continued instead of the laying of further track.

An interesting fact in connection with the buses is that they are all single-deckers and it does not seem likely that double-deck vehicles will be put on the streets as they are claimed to be unsuitable for the type of traffic to be handled. Yet the operation of double-deck street cars has been entirely successful; a paradoxical state of affairs which can hardly be explained. The double-deck street cars are liked by the public and it has been almost as difficult a task to introduce the new single-deckers as to introduce double-deck rail vehicles in New York. It seems to be a case of what the public is used to.

In America there seems to be an impression that double-deck street cars are necessarily slow. This idea has probably become fixed for two reasons. In England the street car systems are undoubtedly less speedy than in America, and as the cars are mostly double-deckers the reason for slowness has been placed there. The other reason is that the passenger upstairs is inclined to imagine that the car is traveling more slowly because of the distance from the ground. In view of the prevalence of the idea that double-deckers are almost always slow and cumbersome, it is interesting to note that the Johannesburg system is as speedy as the average city and suburban system in America.

On the whole system an average speed of more than 10 m.p.h. is maintained. This is fast when the number of stops and the density of city traffic is taken into consideration. Although traffic is naturally not as dense as in large American cities, it is of a mixed character that makes it peculiarly difficult. Everything from ox wagons and rickshas to automobiles and motor trucks is met with and tie-ups are frequent in spite of good police supervision.

Routing has been planned to serve to the best advantage both the city and suburban travel. In most cases the ordinary city-type track has been laid in the center of the town, changing to sleeper track about 2 to 3 miles out. In one or two instances, however, it has been found possible to change to sleeper track laid at the side of the road within ¾ mile of the central terminus. This central terminus is right in the heart of the city next to the city hall, and ample space is provided for a number of tracks and for turning cars not scheduled on straight-through runs. While most cars now stop and turn at the terminus, some go through to other suburbs, and this practice is to be continued and extended.

About 60 suburbs are served, some of them 6 miles and more from the center of the city. On the eastward and westward routes, along the gold-bearing reef, the cars run in competition with the government railways and good speed has to be made. The question of stopping places in the city has always been a difficult one owing to vested interests, and until quite recently many attempts to reduce the number were frustrated. Now, however, most city stops are a distance of two or three blocks apart, the blocks being small and the total distance from signal to signal around 120 yd. Imme-

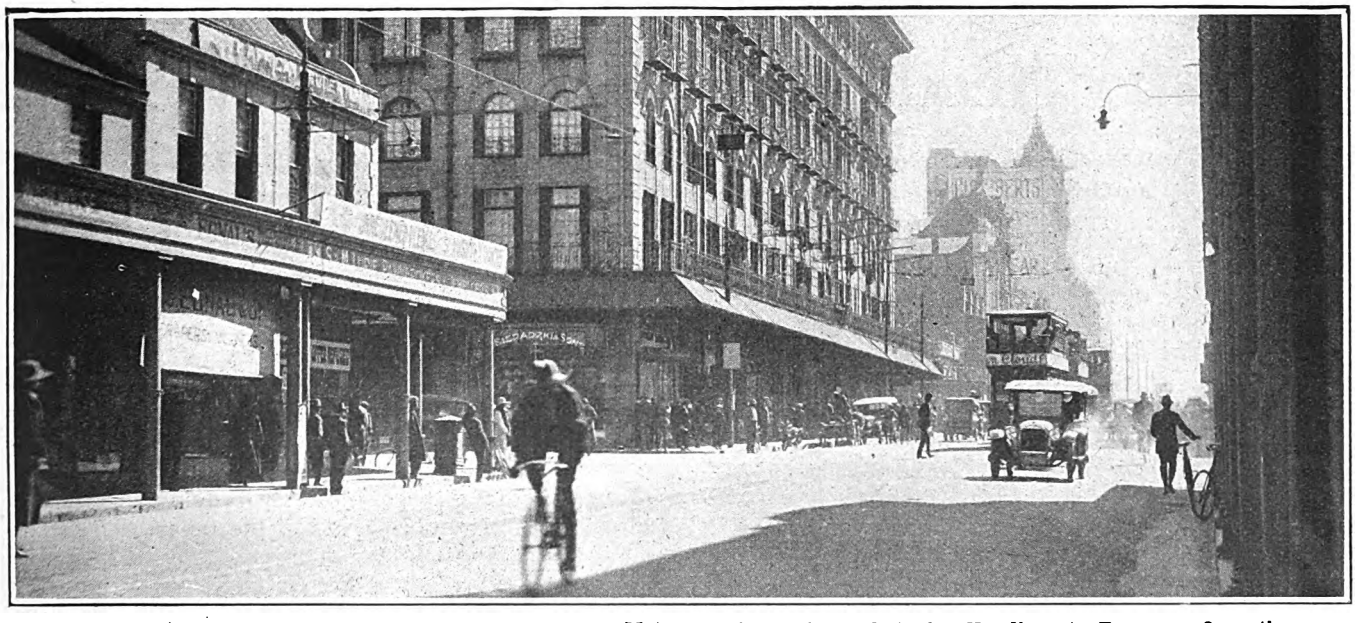
Digitized by Google

diately the cars get outside the city limits the stops get less frequent, distances of 240 yd. being quite usual.

Even the oldest cars have been kept in excellent condition and can accelerate rapidly. They are equipped only with hand brakes, however, with magnetic rail clamps for emergency. All the new vehicles have air brakes and attempts will be made to equip the entire 200 passenger cars with Westinghouse brakes in the near future. On no cars are the motormen protected by glass screens. This is done at the request of the men that they go unshielded. In 1920 a glass-screened car was put into service, but the motormen said they found it too warm. Really cold weather and long rains are infrequent in Johannesburg, and the question of protection for motormen has been finally dropped. All the cars have tops over the top decks, however, and the new types provide glass side protection for passengers up as well as down stairs.

Speed of the slowest cars is between 18 and 20 m.p.h. on the level, while the latest can do up to 25, developing more on long runs. Speed is well maintained by good distribution of power and there is no perceptible slowing down over distant sections. The power is boosted on some of the many long hills. New cars travel up the mile-long 8½ per cent grade of the Zoo hill at 16 m.p.h. The track is so well laid here that speeds of 30 m.p.h. are made on the down grade, with compulsory stops for brake-testing purposes. Operation on this hill is typical of that on many other long and steep grades in the suburbs. In the twenty years of electric car operation in Johannesburg the system has earned a name for safety as well as speed, for fatal accidents have been few. Only two cars have turned over in all this time, and only one of these accidents was attended with a fatal result to a passenger. While motormen are allowed to speed their cars on long, straight stretches where the track is on the side of the road and does not interfere with other traffic, great care is taken at crossings, points and curves, and derailments have thus been brought to a minimum.

Few cities are as dependent on their street car systems as Johannesburg. The railroad serves only a few suburbs on the east and west and the buses serve only one or two districts not touched by the cars. The citizens have got the "home-to-lunch" habit strongly developed and it is only residents of the far-away suburbs who stay in the city between 1 p.m. and 2 p.m. To meet this desire the tramway department operates an excellent express car system from about 12.45 p.m. on all lines to distances of 4 miles. The cars used for expresses are the latest ones with American chassis and some runs worth mentioning are made. From the Town Hall to Parkview is four miles and the busy luncher can rely on getting there at best in twelve minutes or at worst in fifteen. The ordinary time is 22½ minutes. From the Town Hall to Melville is 3½ miles and express car time is thirteen minutes. The luncher can be sure of getting to his home and back to his work at an average speed of between 15 and 20 m.p.h. So good are the expresses that many a citizen uses a street car instead of his automobile for his lunchtime excursion. It is by service such as this that the trams have become popular in Johannesburg, and although a large section of the public went to buses as something new, thinking that it would get service that was even faster, the wave is now on the turn and the street cars are more than holding their own. The buses, while faster at first because they had fewer stops to make until they became popular, are now very little speedier than the street cars and have to take chances in the way of speed in traffic to maintain any superiority. Moreover, they are not so reliable as the cars.



Mixed Traffic, Including Everything from Oxcarts to Motor Trucks, Is Somewhat of a Handicap to Tramway Operation

The most infrequent schedule on which cars are operated to the less populous suburbs is 22½ minutes, with specials in between during rush hours. On some lines, however, the public has what amounts to a two-minute service and suburbs at a moderate distance have cars every 7½ or fifteen minutes. The privately owned buses have not been able to maintain this frequent headway. The losses due to bus competition have not been in any way more severe than has been the case where wars have been waged in American cities, and the street cars in Johannesburg, after about eighteen months of loss, have started to show substantial profits. The service has always been considered a profitable one and the operating figures indicate that it is economically managed. Revenue averages between $200,000 and $250,000 per month, a small amount of this being obtained through advertising spaces sold inside and outside the cars. An average of about 90 cars is

Digitized by Google

operated during slack hours and 140 and more during rush hours. Passengers carried monthly average between 3,800,000 and 4,000,000, so that it will be realized the cars work a great part of the day. Earnings average about 5 cents per passenger, although there is no flat rate, the zone system being used.

The zones are 2d. (4 cents) cash, a zone being an average length of a mile for the near suburbs and 1½ miles for long-distance runs. For instance, it is possible to travel from the central terminus to Rosebank, a distance of more than 6 miles, for 16 cents cash, with a reduction of 33⅓ per cent for coupon holders. Coupons are printed in books of eighteen for 48 cents, and consequently the coupon-holding number of passengers is large. Cash fares are in the minority. It has been found better in practice to charge comparatively high cash fares and the lowest possible rates for regular travelers. It is thus possible to travel about 6 miles for a fraction over 10 cents. Receipts average around 42 cents per car-mile and costs about 40 cents.

Various tickets have been used from time to time, in practice the colored system having proved out well. The conductors punch the tickets with the usual small registering collectors and they have to keep logs as well. The bottom portion of the coupons is detached by the conductor and the coupon is punched with ordinary clippers. The zone system presents a few more difficulties in organization and fare collection than the flat rate and there is talk of trying out the latter in the near future. The zone fares have worked so well, however, that it would hardly seem advisable to rule them out.

The Johannesburg Tramway system cannot be called interurban, but the cars connect up with the systems of buses and trackless trams of adoining municipalities. The last direct contact with trackless cars went a few years ago when Germiston gave up this system for buses. It is possible to travel from Johannesburg to Springs on the East Rand, a distance of 30 miles, by street car, bus and trackless car, although the train is always used for through journeys.

Industry Needs Merchandising Viewpoint

First Sectional Conference of the Advisory Council, Held in Chicago, Develops an Optimistic View of the Electric Railway Situation—Leaders Demand Confidence and Courage—Need for Improved Cars Emphasized

"THERE is a growing feeling that the clouds on the electric railway horizon are being rapidly dispelled by renewed confidence and initiative on the part of its leaders."

B. C. Cobb, chairman of the Advisory Council of the American Electric Railway Association, sounded this note of optimism in opening the first "owner-manager" sectional conference, held in Chicago on Feb. 24 and 25. Approximately 100 railway executives representing properties throughout the Central territory met at the invitation of Managing Director Storrs for a frank discussion of some of the basic factors in the electric railway situation. There was no formal program. The plan for the meeting as arranged by Mr. Storrs was simply to give an opportunity for those who are endeavoring to foresee the destiny of the industry to analyze current tendencies and to exchange ideas.

Taking the needs of the industry as his theme, Samuel Insull called for renewed courage on the part of its leaders. "The crying need of the electric railways is capital," he said. "Unless a utility has the confidence of the public, its securities are not a good investment. Confidence is the backbone of good public relations." But he added that the first step in the rejuvenation of the electric railway industry is to build confidence in their own industry on the part of railway executives and employees. "Unless railway men are 'sold' on their own business," he maintained, "they cannot hope to win the required support and confidence from the public that are so essential to success."

Mr. Insull did not mince his words. He expressed doubt as to whether railway men in general have learned how to sell transportation. He deplored the tendency to follow old-time precedents and habits. "A modern merchandising viewpoint to meet the new competitive conditions in the transportation business is needed," he said. He called attention to the all-important matter of rates of fare and pointed out that the fixed fare, although simple to collect, does not always make a balance sheet that will attract necessary new capital. He questioned frankly whether or not railway men understand yet how to sell their service and expressed doubt as to whether the fundamental economics of the transportation business is thoroughly understood.

"Once the fundamentals are thoroughly understood and confidence is restored within the industry itself as well as in the minds of the public it serves, a long step toward the restoration of the electric railway industry will have been taken," declared Mr. Insull. With public confidence and good will, the avenues to badly needed capital will be opened up. He advocated widely distributed ownership of utility securities in the community served as the greatest single safeguard from the attacks of unscrupulous politicians.

INDUSTRY IS SOUND

Continuing where Mr. Insull left off, Henry L. Doherty declared that nothing fundamental has affected the soundness of any branch of the utility business. If sufficient thought on the part of communities can be directed toward a basic understanding of the position which transportation occupies as a fundamental necessity to community development, relief from traffic difficulties, unfair tax burdens and inadequate fares can be obtained, he maintained. Just as it is a perfectly idle thought to assume that any modern community can get along and develop without an adequate system of transportation, he pointed out, so also is it futile to expect that such a system can be operated and improved to meet the needs of a community without assuring the safety and an adequate return on the invested capital.

Mr. Doherty called attention to the inevitable result of failure on the part of the public to recognize these

Digitized by Google

basic principles. This, he said, results in the deterioration of service to an extent which imposes a heavy loss on the community in the form of retarded development, and ultimately brings a heavy additional expense for rehabilitating a crippled transportation system.

LITTLE TO FEAR FROM BUS

"The railway industry has little to fear from the bus," he declared. "If this new vehicle can successfully compete with rail lines, this fact should be established as soon as possible and immediate steps taken to develop transportation systems with that end in view. Up to the present time, experience with the bus has given no indication that it will replace rail lines except in limited instances. Only a united front on the part of the industry will establish these facts in the mind of the public."

Mr. Doherty also touched on the fundamental economics of railway fares. In transportation as in other branches of the industry, he explained, a large part of the cost is represented by the readiness to serve. Although the passenger benefits from this readiness to serve, the expense of meeting his actual use of the service is a comparatively small part of the total cost of establishing and maintaining facilities whose cost is fixed regardless of the amount of service used. The provision of these facilities, according to Mr. Doherty's views, affects the value of property in the community. Thus by assessing all or part of the readiness-to-serve cost in the form of a tax on the benefited property, the car rider himself would be required to pay only for the service which he actually uses.

Co-ordination of all forms of community transportation was held to be essential to the elimination of unnecessary duplication and waste. As part of such a complete co-ordinated system, he advocated that taxicabs should be considered as a public utility. In this way the service given by rail lines and buses would be made complete.

Other speakers included Britton I. Budd, G. A. Richardson, A. L. Drum, H. B. Flowers, Gen. Guy E. Tripp, Walter A. Draper, Capt. L. Vickers, A. C. Blinn, John J. Stanley, J. P. Barnes, T. A. Kenny, J. H. Alexander, B. W. Arnold, Dudley Montgomery and H. V. Bozell. In addition to the general status of the industry, public and employee relations, car development and bus operation constituted some of the subjects discussed.

CAR IS SALESROOM OF TRANSPORTATION SERVICE

"The sale and delivery of electric railway service is lodged in the car itself," said A. L. Drum in discussing the part which the electric railway car must play in popularizing electric railway service. Despite the merchandising importance of the cars on a given property, he asserted, they represent only between 15 per cent and 20 per cent of the total investment. Thus he explained that improvements in cars offer a means of popularizing electric railway service at a comparatively small cost in comparison with the total investment involved. It has been repeatedly demonstrated, he insisted, that improved light-weight cars will give savings of from 4 to 5 cents per car-mile in comparison with older and heavy equipment. Thus improved equipment offers the opportunity of making savings that approximate 15 per cent of the operating expenses of the average property. This, he estimated, would frequently add 50 per cent to the net earnings of such a property. Mr. Drum also cited an example of the saving in track construction cost which could be made through the use of light-weight cars. In this instance a property having 6 miles of track to rebuild found that through the use of lighter track construction made possible by lighter-weight cars the saving in track cost would pay the total cost of the new cars.

EXPRESSES FAITH IN IMPROVED CARS

Faith in Mr. Drum's proposal for improving the attractiveness of cars was expressed by Gen. Guy E. Tripp. The railway industry faces problems not met by other branches of the utility business, he explained. This is due to the existence of competition in transportation. Here, however, the situation is unique because the electric railways are a public utility and must provide a complete service. Since they are also subject to regulation both as to rates and service, the factors in competition cannot be given free play as in the case of other business enterprises. He held, nevertheless, that railways must recognize the necessity of meeting competition and that since regulatory bodies are partly responsible for the results of their operation, railway management should continue to press for relief from restrictive tax burdens. He advocated increased effort in placing before the public the necessity for a rate of fare which will permit a fair return to be paid on invested capital. He expressed confidence in the future of electric railways and maintained that they can be put on a paying basis.

Further comment on Mr. Drum's remarks regarding the importance of the car in popularizing electric railway service was added by Britton I. Budd. He declared that Mr. Drum's suggestion was vital to the industry. Equipment and service which were at one time satisfactory no longer meet the demands of the modern public. The public today, he explained, has become educated to luxury and speed. In some smaller cities automobiles pass electric cars at will. Under such conditions the speed of cars should and can be increased. On interurban properties when autos pass the electric trains a bad sales psychology is developed. He insisted that electric railways which expect to build up traffic must furnish the speedy transportation demanded by the public.

There has been a failure on the part of cities to plan their transportation requirements in advance, according to Mr. Budd. This has materially affected the development of such communities. When traffic congestion in the business district of a city interferes with the transaction of business, it results in the development of outlying community centers. This process, he pointed out, is rapidly taking place in some of our large cities and will continue until some means is found of relieving the situation in the principal business district.

There are three principal factors in the success of transportation service, according to G. A. Richardson. From the standpoint of management, these consist, first, of selling the organization itself; second, giving proper service and, third, with the help of enthusiastic employees and efficient service, selling the public. Experience in bus operation and the importance of human contact between management and men supported by application of the golden rule in employee relations formed additional subjects for discussion. Chairman Cobb expressed gratification at the success of this initial conference in bringing together financial leaders and operators for the discussion of problems important to the success and development of the industry.

Association News & Discussions

Southern Equipment Men Hold Annual Meeting in Mobile

Delegates Consider Questionnaire on Maintenance Practice Comprising 54 Topics—Papers on Gas-Electric Bus, Controller Maintenance and Repair Practice in New Orleans Also Presented

A THREE-DAY session of the Electric Railway Association of Equipment Men, Southern Properties, was held at the Battle House, Mobile, Ala., on Feb. 24-26. During the period since it was organized some four years ago this association has established an enviable record for the assistance which it has given its members in solving their equipment problems. Two meetings are held each year at which questions relating to the every-day equipment practice of the companies are considered at an informal "round table," and a few papers are presented. At these meetings and during the year maintenance performance records, particularly the number of pull-ins per 1,000 car-miles for all of the different properties, are compiled and compared, and in other ways the association aims to improve the standard of maintenance and exchange helpful information.

The sessions at Mobile were presided over by A. D. McWhorter, general superintendent of the Memphis Street Railway and president of the association, and some 50 representatives of member companies and supply men were present.

The opening of the first session was the occasion for everyone to become acquainted, after which President McWhorter spoke of the importance which reliable equipment had in creating and maintaining good public relations. After all, transportation was what the public wanted, and it was the duty of the equipment men to see that this was supplied by clean, comfortable cars which would carry the passengers safely to their destination, in a speedy manner. He also explained the postponement of the meeting for a month by the fact that he and the secretary, Mr. Taurman, had been called to make a report on the Havana Electric Railway. This line, Mr. McWhorter said, has 34 miles of double track and a total single-track equivalent of 97 miles, there being 63 miles of route. The ratio of inhabitants in the city to miles of route is quite high, being 8,100, as compared with 2,650 in New Orleans, 2,300 in Memphis and 2,120 in Birmingham. The population of the city per square mile is high and the number of revenue passengers per square mile is also high. The conditions of street congestion are quite bad. The company has 2,700 trainmen, including 50 colored motormen, and the schedule speed of the cars is 8½ m.p.h. Only four passengers are permitted to stand on a car. There is considerable jitney and taxicab competition, the former being known in Havana as "guagua" and the latter as "alquela." The jitneys are Fords or other low-priced automobiles or converted trucks and charge a 5-cent fare. The taxicabs are very numerous and charge 20 cents per zone.

The report of the committee on classification of pull-ins was presented by the chairman, W. H. McAloney, superintendent of equipment Georgia Railway & Power Company. After discussion the classification given in the adjoining table was adopted.

Three formal papers were also presented at the session on the first day, namely: "The Gas-Electric Bus," by J. C. Thirlwall, General Electric Company, Schenectady; "How We Improved Our Pull-in Records in 1925," by Frank T. Dawkins, electrical engineer of that company, and "The Overhauling of Controllers," by T. R. Bristol, assistant superintendent of equipment Georgia Railway & Power Company, Atlanta, Ga. Mr. Bristol's paper is published in abstract elsewhere in this issue. The other papers will be abstracted in an early issue. A. Taurman, superintendent of equipment, way and structures Birmingham Electric Company, gave a talk on car inspection at Havana, Cuba, which he had recently visited. He spoke of the climatic and other conditions in Havana, some of which made equipment maintenance simple, but others, like the narrow streets, added to the difficulties. He said the property was well maintained.

There was a discussion on radio detection of defective cars and reduction of inductive interference. John Gerson of the Charleston Consolidated Railway & Lighting Company contributed the results of some tests made on that property, and other speakers gave facts in regard to the detection by radio equipment of leaky transformers by power companies.

The accompanying charts are reproduced from a blueprint pamphlet given to each delegate, giving records of

Delegates and Guests at the Mobile Meeting of the Electric Railway Association, Equipment Men, Southern Properties, Feb. 24-26

PULL-IN CLASSIFICATION ADOPTED FEB. 25, 1926

Chargeable to Equipment Account	
Armature, grounded.	Headlights.
Armature bands.	Signal lights.
Armature shaft.	Door switch.
Armature bearing hot.	Heaters.
	Electric bells.
Axle bearing hot.	Lightning.
Commutator.	Car charged.
Brush yoke.	Axles.
Brushes and holder.	Wheels.
Fields.	Journals and boxes.
Fields jumper.	Hot journals.
Motor leads.	Hand brakes.
Gears and pinions.	Slack adjusters.
Gear cases.	Brake rigging.
Other motor trouble.	Other truck troubles.
Trolleys.	Doors and riggings.
Circuit breakers.	Door treadles.
Line breakers.	Windows.

Average Miles per Pull-in for 1925

miles per pull-in on different member properties since they joined the association. As will be seen, these give an almost continuous record of improvement in maintenance conditions since the association was organized and records began to be compiled.

Round-Table Discussion

The greater part of the remaining sessions of the association were given over to the discussion of a series of 54 questions which were printed in advance and were considered seriatim. A summary follows:

The first question related to experience with devices to eliminate water from air-brake systems. It developed that no companies are using any method except that of draining the tank and paying especial attention to piping. The consensus of opinion was that proper installation of piping would eliminate the trouble.

On the question of side wear on brushes of modern ventilated motors with high-speed armatures it was the belief that most ventilated motors showed this trouble. The latest practice of taking the air from the top of the motor, thus eliminating most of the dirt and consequently the principal cause of the side wear, it was thought, would greatly reduce this trouble.

On the use of Rico oilers for modern motors it was found that none of the companies had any extensive experience.

Most members are using pit wheel grinders; two reported employing wheel truing brakeshoes.

The majority of companies represented use baking ovens of sheet iron, lined with asbestos and electrically heated. One company reported it had built an oven of fire brick and clay and considered it superior to the more common sheet iron and asbestos type.

A great variety of practice was found as regards the material used in which to dip armatures. Two companies use a varnish on their armatures after they have been dipped and dried out thoroughly.

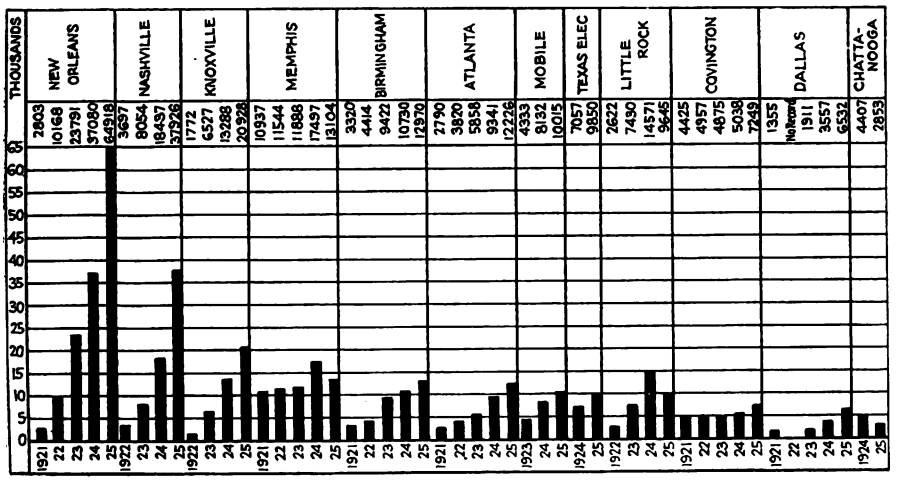
Several delegates reported great trouble with broken motor bolts even when using the best heat-treated bolts. Others find the ordinary bolt adequate. It was suggested that some of the trouble with threads stripping may be caused by too great tightening of the nuts.

Between enamel and lacquer for car painting most of the companies are using the former, though one, on the last 40 cars ordered, specified 25 to be finished in enamel and fifteen in lacquer. It was thought that there is not much difference in cost, but enamel dries more quickly. The chief trouble in paint maintenance is in the bottom door panels and the bottom sash stiles. Metal sash frames have been ordered by at least one company.

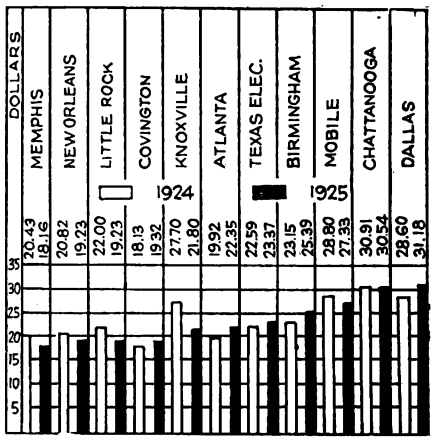
The next question related to the accounts to which time for brake and truck inspectors replacing brakeshoes and tightening motor and truck bolts and minor repairs was charged. One company, after a trial period, decided to charge the time of the inspectors, 70 per cent to inspection and 30 per cent to maintenance. On other roads, time cards are used.

Between bronze and malleable iron and babbitt for axle bearings, most members prefer the former. At least one company adds a film of babbitt about $\frac{1}{8}$ in. to its bronze armature bearings.

No companies reported waxing cars, though two Southern companies, not in the association, are said to do this every six months. On the question of white cars it was reported that one company, not in the association, which



Average Miles per Pull-in by Years 1921-1925



Comparative Maintenance of Equipment Costs

had adopted this color was giving it up because it showed dirt so easily.

Two companies are using aluminum field coils, one having used them for from four to five years.

Educational Courses Given

Several companies are giving, or have given, courses in maintenance to shop men. On one system lectures were given by the master mechanic and engineers, at the shop, for one hour a week. Half of this period was on company time, the other half on the men's time, and no one was accepted for the course unless he signed up and agreed to stay through the course. It proved very popular. Another company sent seventeen or eighteen of its men to an engineering night school and several give talks to their men from time to time, especially on the cost of material used in maintenance. Four companies have issued instruction books for the use of its men.

The use of welding for repairing broken armature shafts is not common, the general opinion being against this practice, though some companies manufacture their own armature shafts out of old 4-in. heat-treated axles.

Acetylene, electric and thermit welding are used for repairing broken motor frames, though electric welding is the most commonly used. One company scarfs the crack with acetylene, then uses the electric weld for filling up the crack.

The two principal causes for chipped flanges on cast iron wheels given were obstructions like bolts, in the rail groove and improperly repaired special work which had been welded by the track department but not ground out properly. Most of the companies use a difference of $\frac{1}{4}$ in. between wheel gage and track gage, but one company reported considerable trouble with a difference of more than $\frac{1}{8}$ in. Most of the companies said there had been an increase in flats on cast-iron wheels, due, it was thought, largely to the misuse of sand by the motormen, but also partly to more sensitive brakes. One company recommended the use of grease lubrication on the air-brake valve rather than oil, because oil gets dry and the motorman, in making a stop, throws the valve to the emergency position by mistake. Several of the companies are using steel wheels to a greater or less

Digitized by Google

extent and report a mileage from them of from three to four times that of cast-iron wheels.

One company reported the use of trolley shoes on its interurban lines and its representative believed the supply of current was more uniform and there was a great reduction in wear on the wire from sparking. The chief trouble came when inspectors increased the trolley pressure to 40 lb., whereas half of that was adequate. One Southern company not in the association, which is using shoes exclusively, was reported to be greasing its trolley wire once a month.

In general, the companies which use circuit breakers do not also use fuses. A variation in practice was found in the location of the fuses, being sometimes on the platform and sometimes under the car.

Short Ground Leads Desirable for Lightning Arresters

An equal variety of practice was found in the position of the lightning arrester. One company using electrolytic arresters carries them under the car where they are easy to inspect. Another, using aluminum arresters, places them on the top of the car, where they are inspected by the trolley base inspector. The argument for placing them on top was that it gave a shorter and direct ground.

The principal modern makes of gears and pinions have users among all the companies represented. Some records for gears given were 500,000 miles and for pinions 200,000 miles. One company reported a make of gear used since 1911 with none yet worn out. Another uses cheap gears with old motors, expecting both can be discarded about the same time.

Air gongs are used by several of the companies but some trouble was reported with the cylinder type of gong from freezing. This trouble is not experienced with the ball type. One company is using rotary gongs, worked by the foot.

Periods of washing cars vary from every day to every week, though most of the companies have their cars swept out every time they return to the barn. Soap is used by a few companies but generally only on the floors. One company with linoleum flooring said it had to be washed once a day.

One company is using a battery testing machine for testing armatures and fields without removing them from the car. Others have the Century tester.

Slat Seats Favored in the South

A vigorous discussion developed over the proper material for seats, the majority opinion being strongly in favor of slat seats. In one city these are required by a rule of the board of health. The coverings discussed were rattan, leather, plush and a material in which rubber is a constituent. Plush was criticised as hard to keep clean, expensive to maintain, and soiling the clothing of passengers in hot weather. One delegate declared that in the South with plush seats it would be necessary to use slip covers in hot weather.

In general, solid carbon brushes are used on motors, although some companies prefer the split type. A variety of makes are used.

Some companies use water for scrubbing the floors sometimes applied through a hose, but others do not permit the use of water within car. Those who use it admitted that it might be detrimental.

In general, sentiment favored the use of single-end cars on account of their lower first cost and cost of maintenance. By the use of a line switch and motorman's valve at the rear end, these cars can now be arranged for emergency backing. One company reported the recent purchase of 30 single-end cars for $30,000 less than double-truck cars would have cost, with increased seating capacity and reduced weight, but considerable money had to be spent in providing loops. It was admitted that the single-end car was less flexible from a transportation standpoint.

Welfare work in the form of group insurance, loans to needy members, etc., is common among the properties represented in the organization and is usually conducted through the mutual benefit association.

Different methods are used in installing window glass. Putty and beads are used by some, rubber by others, and one company uses rubber on the top sash but putty on the bottom sash.

A few companies are using non-scale air pipe and find it satisfactory. Both air operated and electrically operated registers are used to some extent.

Two companies said they were using home-made waste reclaimers. Attention was called by one of those present to the satisfactory results obtained by the centrifugal machine.

Most of the companies have a certain amount of all-rubber motor lead cable in use, though in most cases for less than two years. One case of the use of this type of cable for four years was reported. Three or four companies also reported the use for a short time of the new General Electric D.B. 986 line breaker with L.B. 2-A handles.

The final subject discussed was the desirability of dispensing with trapdoors in the floor. The principal objection seemed to be the difficulty in adjusting motor brushes, but it was reported that this could be done by feel, after some experience. Inspection of motor leads also gave some trouble when there was no trapdoor.

Election of Officers and Other Business

The technical sessions of the association lasted for the first two days of the meeting. On the evening of Feb. 25 all those in attendance at the convention were the guests of the Mobile Light & Railroad Company, at a fish dinner, served in the Battle House. Mobile is famous for the delicious flavor of the fish caught near its harbor and about 50 delegates enjoyed the hospitality of the company.

On Friday morning a short business meeting was held at which A. Taurman presented his report as secretary and treasurer. It showed that the association, on the basis of $50 a year annual dues for each company, was in good financial condition. For officers for the coming year, the nominating committee, consisting of S. M. Coffin, Mobile; W. H. Curtis, Little Rock, and J. J. Vaughan, Memphis, proposed the present incumbents for another term. They were unanimously re-elected.

Invitations for the place of the July meeting were received from the Chattanooga Light & Railway Company to meet in Chattanooga, from the Central Electric Railway Association to hold a joint meeting with that association on its boat trip next summer, and from the Ohio Brass Company to meet in Mansfield, Ohio. It was finally decided to hold the next meeting in Chattanooga, Tenn., on July 28, 29 and 30.

Resolutions were passed thanking the officers for their services during the year and expressing the appreciation of the association to the local committee, consisting of F. F. Rossman, vice-president and general manager, and S. M. Coffin, superintendent of equipment Mobile Light & Railroad Company, for their hospitality and the enjoyable time had by all. The meeting then adjourned.

After the meetings had finished the members and their guests were taken on an automobile ride, through the courtesy of the officers of the local system, to see the city and the points of railway and historic interest.

COMING MEETINGS
OF
Electric Railway and Allied Associations

March 8-11—National Railway Appliance Association, annual exhibition, Coliseum and Annex, Chicago, Ill.

March 9-11 — Oklahoma Utilities Association, annual convention, Mayo Hotel, Tulsa, Okla.

March 11—Pacific Railway Club, ninth annual meeting, Fairmont Hotel, San Francisco, Cal.

March 12 — Pennsylvania Street Railway Association, annual meeting, William Penn Hotel, Pittsburgh, Pa.

March 17-18—Central Electric Traffic Association, Portage Hotel, Akron, Ohio.

March 17-18—Illinois Electric Railways Association, Illinois State Electric Association and Illinois Gas Association, annual joint convention, Springfield, Ill.

March 23-25—National Conference on Street and Highway Safety, Washington, D. C.

March 29-31—National Conference on City Planning, St. Petersburg, Fla., April 1—West Palm Beach, Fla.

April 13-16—Southwestern Public Service Association, Galveston, Tex.

June 2-4—Canadian Electric Railway Association, annual convention, Quebec, Canada.

June 28-July 2 — Central Electric Railway Association, summer meeting, S. S. South American, Buffalo, N. Y., to Chicago, Ill.

Oct. 4-8—American Electric Railway Association, annual convention, location not yet determined.

Shop Practice in Overhauling Controllers*

By T. R. Bristol
Assistant Superintendent of Equipment Georgia Railway & Power Company

CONTROLLERS are not removed periodically for overhauling. When cars are overhauled controllers are not removed unless there is evidence of an insulation breakdown. This can be readily ascertained when the repairman has the insulating partition back of the controller cylinder out for cleaning, as the wiring is then visible.

When cars are overhauled the controllers are given a light overhauling on the car, which consists of removing the main cylinder and insulation partition back of the cylinder. An inspection of insulation on wiring and frame is made. The insulated partition is thoroughly cleaned of all copper dust and smoke and given a coat of insulating varnish. The controller cylinder is taken to the repair bench and new segments put on where necessary. Segments are cleaned up by filing. The top and bottom bearings are checked for wear, and bushings are renewed where necessary. The reverse cylinder is taken out and segments are filed smooth.

Main and reverse cylinders are assembled in the controller and fingers are renewed where necessary. Any rough fingers are removed, new ones installed and old ones are filed up in spare moments. Fingers are aligned properly and cut out switch blades are checked for tension and renewed where necessary. The series stop, star wheel pawls and springs are checked and repairs made if needed. The controller is then lubricated and its jacket is given a thorough cleaning with gasoline and brush, and the inside insulated covering is given two coats of shellac. This method may be termed light overhauling.

Controllers removed from cars for defects are given a general overhauling. They are completely stripped, with the exception that wiring is not removed from the finger board or from the back of the connection board. The frame, top cover, main and reverse cylinder, connection board and finger board are sand blasted to remove all copper dust, smoke and carbonized spots. Parts which may be damaged by sand blasting are taped up.

We are considering a modern sand-blast equipment and in all probability will install it this year. It is known as the down-draft method, and consists mainly of a steel room with a special flooring and ceiling. Fresh air is drawn into the room through the ceiling by a suction fan and distributed evenly to all parts of the room. The floor consists of steel grating through which air and sand are drawn into a large hopper. Sand blasting is done on the floor or on a bench as convenience dictates.

It was deemed necessary to sand blast controllers because scraping and brushing did not eliminate all copper dust, carbonized spots and dirt. The insulation on the back is removed regardless of its appearance, because it has been found to contain moisture and considerable trouble was traced to this condition.

After sand blasting, the back is given two coats of clear insulating varnish. The asbestos paper is given one coat of clear insulating varnish on one side and fastened to the back while wet. After drying the asbestos paper is given a coat of insulating varnish to insure its being moisture-proof.

Main and reverse cylinders are cleaned up, segments filed smooth and renewals made where necessary. Then they are given two coats of clear insulating varnish. In cases where cylinders are found out of round, they are trued up in the lathe. It is only occasionally that we find a cylinder out of round, this usually being on old controllers which were not built on jigs.

Top and bottom bearings are checked up for lost motion. On K-35 controllers, having brass bushings, new bushings are inserted. K-28 controllers originally did not have a bushing in the bottom bearing. When putting on line breaker attachments we found considerable lost motion in the bearings which affected operation of the line breaker attachment. We bored out the bottom bearing and put in a removable bushing, similar to that in the K-35 controller. To do this it was necessary to reduce the shaft diameter at the bearing from 1 in. to $\frac{7}{8}$ in. in order to get a bushing with $\frac{1}{8}$ in. wall thickness.

The top bearing (in top plate) is brazed up and rebored where necessary. The bearing is first bored out oversize and then brazed up solid, to prevent breaking through into the old metal when reboring. Finger and connection boards and wiring are repaired and given two coats of clear insulating varnish and assembled in the controller. The controller is built up complete and after alignment of fingers is given an 1,100-volt alternating-current ground test for five minutes.

We have discontinued the use of molded insulating finger and connection boards, because we found that any burned place which will carbonize material will give further trouble, as it cannot be scraped out clean. We make finger and connection boards of hard wood, either cherry or maple, and after finishing put them in the oven and bake for six hours, at 200 deg. F.; then boil them in paraffin for about five hours. By this process we have found that the paraffin penetrates through the entire wood fiber.

Controller magnets are tested by checking the resistance. The outside insulation is removed and a resistance test is made. The resistance testing machine consists of a 6-volt storage battery, ammeter and variable resistance, all connected in series. The magnet coil is connected in series in the battery circuit, and the resistance unit is adjusted so a circuit of $2\frac{1}{2}$ amp. is flowing through the circuit. A millivolt meter is bridged across the magnet coil and the drop is noted. A low reading indicates shorted turns in the magnet coil. A high reading indicates a poor connection. The test is made primarily to detect poor connections, as wrong resistance and shorted turns have never been found. Repairs are made to the magnet coil and it is again checked for resistance, after which it is heated for two hours, dipped in plastic for one hour and baked for twelve hours.

After baking, the binding insulation is put on; for the K-6 and K-11 controllers it consists of two layers of $1\frac{1}{2}$-in. asbestos tape and one layer of field webbing. The coil is dipped in plastic and baked for twelve hours.

The outer insulation of K-6 and K-11 magnets is merely a shield to protect the windings, three layers being sufficient. The K-28 controller magnets are slipped on an iron core and must be insulated against grounds. One layer of varnished cambric is first applied, then two layers of asbestos tape and one layer of $\frac{3}{4}$-in. linen tape are added. The coil is then dipped and baked. The design of the K-28 controller does not permit of heavier insulation on the controller magnet or we would probably add another layer of tape as a further protection.

*Abstract of paper presented at annual meeting of Electric Railway Association of Equipment Men, Southern Properties, held at Mobile, Ala., Feb. 24-26, 1926.

Making Trolley Company Complete Transportation Agency

New England Street Railway Club Discusses Bus and Taxicab Operation—Care in Establishing Co-ordinated Service Recommended

MORE light on the relations between bus and trolley was shed at the meeting of the New England Street Railway Club held Feb. 25 at the Copley-Plaza Hotel in Boston. This was scheduled for Feb. 4, but postponed on account of the blizzard that struck the territory. On the original program was a paper by G. T. Seeley, vice-president Chicago Motor Coach Company. While not presented, this paper will be published in the bulletin of the club, it was announced. The annual meeting of the club, to be held March 25, will be a "ladies' night" affair.

Papers on the relationship of the bus and trolley were given by W. B. Spencer, assistant to the president United Electric Railways, Providence; Edward Dana, general manager Boston Elevated Railway, and M. C. Horine, sales engineer Mack Trucks, Inc., New York. To supplement these J. A. Queeney, vice-president Mitten Management, Inc., gave impromptu the details of how the Philadelphia Rapid Transit Company had recently entered the taxicab business.

In picturing the trolley as the big brother and the bus as the little sister, and in urging trolley companies to become transportation companies, although not to a delirious extent, Mr. Spencer had the support of the other speakers. He illustrated possible growth by reference to a crosstown line in Providence. This started on a 60-minute headway. In about a year it had developed so that six-minute service was necessary. During that period revenue increased from 31 to 36 cents per

Digitized by Google

bus-mile in round figures. Mr. Spencer called attention to the field for small capacity buses. A twelve-passenger size making two or three trips an hour could replace a 40-passenger trolley, the latter run on an hourly headway. This would keep out transportation "bootleggers," or individuals running small automobiles in defiance of regulatory authorities.

Mr. Dana warned against the blandishments of bus salesmen and urged his auditors not to pay too much attention to bus costs. The bus should be looked at just the same as the turnstile or a rotary substation, all useful parts of the property and to be used to make the property profitable as a whole. In spite of the huge increase in the number of buses operated by the Boston Elevated (Mr. Dana explained that from nothing five years ago the system has grown to represent nearly 175 units) the mileage operated by the trolleys had increased, and it was expected that it would increase in the future. At the same time the bus should be developed in accordance with good business judgment.

Little sister is growing up and has become better looking, according to Mr. Horine. He held that the bus furnished a separate class of service which should be charged for at a higher price wherever possible and operated on a distinctive basis. It was dangerous, he thought, to carry over the "trolley mind" to bus operation. As examples of this he mentioned the failure to call streets, which has become quite general on trolleys. The bus was so low that passengers did not see the street signs or numbers well, so that drivers should always be careful to announce the street names. Mr. Horine also urged better route marking, quieter fare-registering devices and an effort all along the line to give a higher class service on the buses. Cleanliness and also the appearance of the drivers he believed to be more important than on the trolley. He would eliminate straps in buses, because of the bad name given them through yellow journalism. Reduced fares for school children frequently led to inconvenience for regular patrons and so special trips should be run to carry the children.

The 25-passenger bus, Mr. Horine declared, was the best for all around work; double-deckers had a place, but should not be used when they meant such infrequent headway as to result in a loss of passengers to other forms of transportation.

Mr. Queeney stirred the assembly to an appreciative demonstration when he recited an incident indicating that the efforts to become an all around company might have its limits. The owner of a local funeral business wanted to sell out to the P.R.T. and represented the value of the property by figures showing the diversification of the load factor. These indicated that there were 462 deaths a day in Philadelphia; of these, 37 per cent were Catholics and were buried in the morning, and the others in the afternoon. Most of the weddings were in the morning, and these also represented possible business. Mr. Queeney turned it down as it was more of a personal than a public business. Still he believed that the trolley company should not hesitate to take up any vehicle that could be operated at a profit. Trolley revenues, he maintained, had dropped off steadily in general for years and the only thing to do was to take up some new form of transportation. He cited the gas industry as an example of one that has come back after every one said it was doomed when electricity was introduced. The present trolley systems will come back to prosperity in just the same way, he prophesied, if they are willing to become a transportation industry. He would first have the trolley company take in the bus and then the taxi. If people wanted to ride on roller skates he suggested furnishing even them.

The Philadelphia system has taken delivery so far of 250 buses and has carried 11,000,000 passengers in six months. This year Mr. Queeney looks for a business of not less than 30,000,000 passengers. Bus operation would be extended as fast as required. Commenting on the recent purchase of a taxicab company by the P.R.T., he said he could see no reason why this type of business should not be handled if people wanted the service and if it was making inroads into the other business of the transportation company. The purchase of the Yellow Cab Company in Philadelphia involved 950 taxicabs, which last year carried 10,000,000 passengers. There are about 1,500 or 1,600 taxicabs in Philadelphia, he said, and these will be bought if they can be secured at a fair price that will be approved by the State Public Service Commission.

According to Mr. Queeney, the taxicab business in New York City is taking in more money than the street cars. There are 18,000 taxicabs there, earning from $25,000,000 to $30,000,000 a year. If the present rate of growth is maintained in Chicago the same condition will exist in another two years.

Bus maintenance was taken up at an afternoon session, when systems and methods used in their organizations were described by C. V. Wood, Jr., superintendent bus division United Electric Railways, Providence; H. I. Sullivan, automotive engineer Eastern Massachusetts Street Railway, and D. S. McKay, supervisor of automotive equipment Boston Elevated Railway.

American Association News

Wheel Gages

SEVERAL new standards for wheel gages were decided on at a meeting of special committee No. 8 of the way and structures committee assigned to study the subject of various types of wheel gages, which held a meeting at association headquarters, New York, Feb. 26. The following were present: C. W. Squier, chairman; C. A. Alden, W. S. Adams, Hugh Savage and A. W. Baker.

It was recommended that the two standard A.R.A. wheel contours which now appear in the Manual should be designated as *E* and *F*. Contour *E* is A.R.A. standard for chilled iron wheels as adopted in 1909, and *F* is A.R.A contour for steel and steel-tired wheels standardized in 1920.

The committee decided to recommend the use of the standard A.R.A. mounting and check gage for mounting wheels with A.R.A. contours. This gage is to have a center point added similar to the A.E.R.E.A. standard wheel mounting gage. The committee reviewed the present association standards of limit of wear gages for standard contours, and also the various types which are used by the American Railway Association. The present association standards provide only for a limit of flange thickness. It was considered desirable that these gages should also provide maximum and minimum limits of flange height, and new designs for gages will be prepared with these additions.

In considering revisions of the wheel checking gage as submitted by the 1925 equipment committee, it was decided to resubmit the gage with all references to the A.R.A. contours omitted, so that this gage will apply only to contours *A*, *B*, *C* and *D*.

The subject of taping wheels was discussed and it was decided to submit a wheel circumference measure for wheels similar to that used by the American Railway Association. The dimensions, however, will be modified so as to meet the present practice as to the point for taping narrow tread wheels.

Special Reports Available

SPECIAL reports as listed below have been prepared by the Bureau of Information and Service of the American Electric Railway Association and are available to member companies upon request:

Bulletin No. 69.—Wages of Trainmen.—This is an entirely new edition of our regular wage bulletin, based on replies of approximately 500 companies to a questionnaire sent out in February. It shows the present wage scale, the effective date and date of expiration, the previous scale, union affiliations of trainmen, number of men employed, contract conditions governing wage scale, and the average weekly wage earned by regular and extra men under the scale.

Bulletin No. 70—Wages of Bus Men.—This compilation shows substantially the same information for bus operators as is shown in our bulletin of trainmen's wages, namely, present scale of pay, effective date and date of expiration, union affiliations of bus men, number of bus men employed, average weekly wages earned under the scale, etc. The data of more than 150 companies are included in this bulletin.

Bulletin No. 71.—Public Ownership and Operation of Electric Railways, Part 2, Canadian Companies.—This is a compilation of the outstanding facts concerning the public acquisition and operation of electric railways in Canada. It includes a list of publicly owned or operated railways, a history of the events leading up to their acquisition, the terms on which they were aken over, and statistical data on the results of their operation under public management.

In addition to the above, supplements to the Fare Bulletin and Cost of Living Studies (Bulletin No. 72) have been prepared so as to bring them down to date.

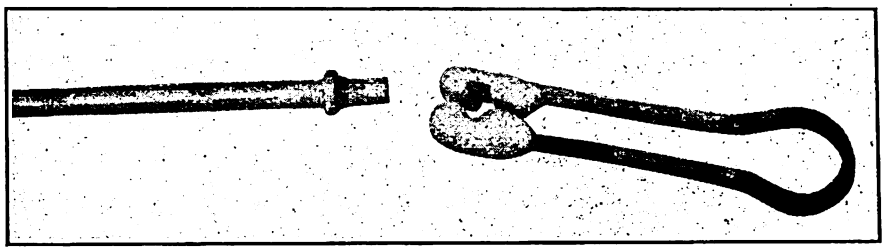
Maintenance of Equipment

Door Handle Fit Made in One Operation

WITH manually operated folding doors and steps, it is the practice of the Eighth Avenue Railroad, New York, N. Y., to use an upright rod on which a handle fits for operating the mechanism. The handle fits become worn through service, so that it is necessary to bring these back to size. The expense of forming the handle fit on these rods has been reduced considerably by use of a die to form the end of the handle by means of a blow from the drop hammer.

The accompanying illustration shows the die used for forming and also the end of one of the rods with the handle fit completed. In practice, the rods are heated and upended so as to increase the size. Then the die is placed around the hot part and with one blow of the hammer the entire fit at the end of the rod and a lower shoulder are completed.



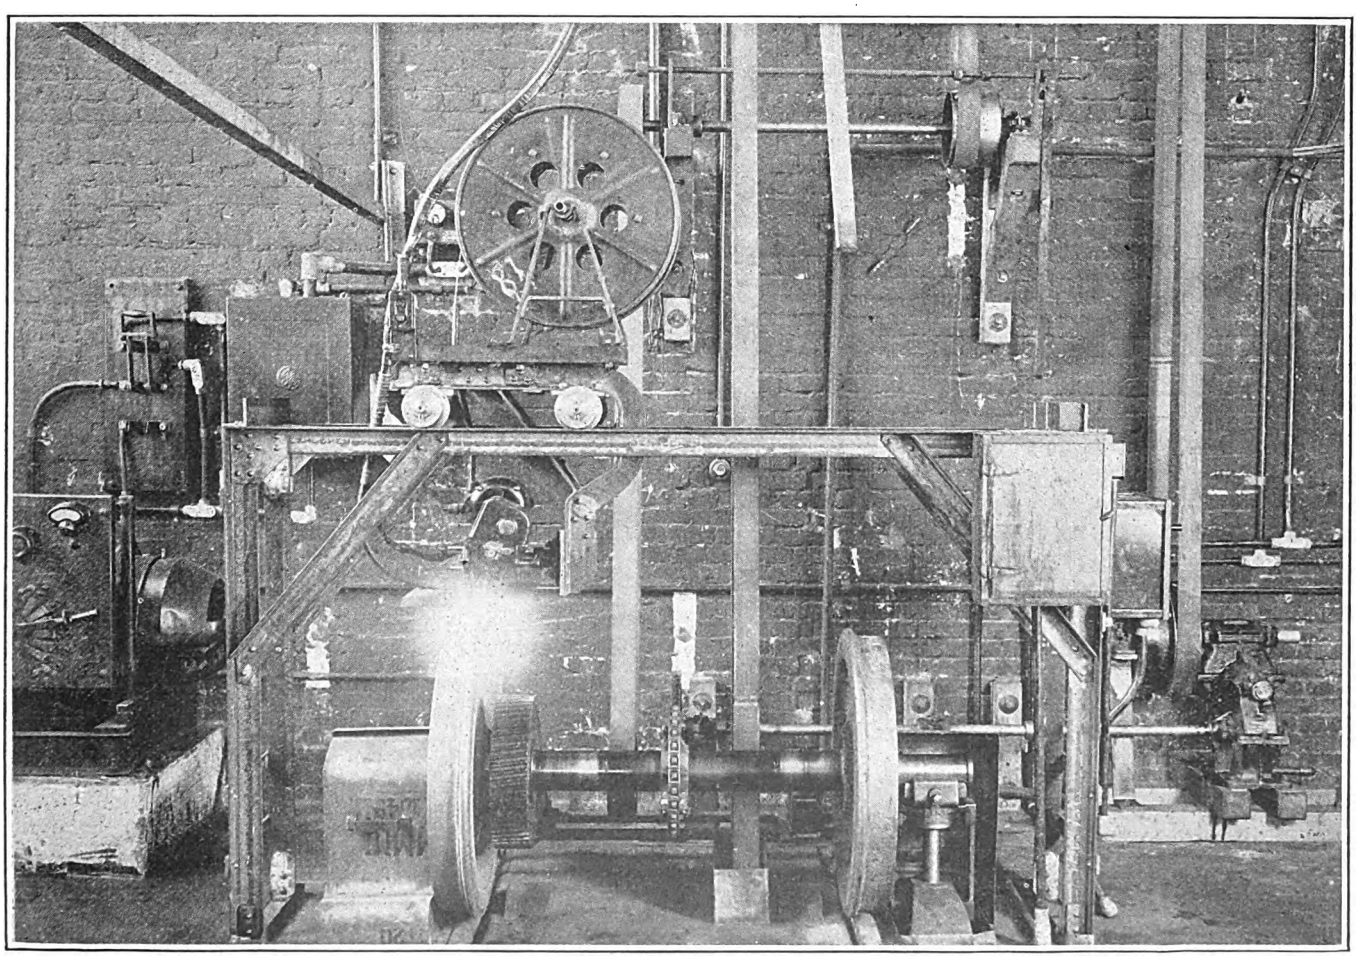
Making Handle Fits for Door and Step Operation
At left—A rod completed with handle fit at the end. At right—Die used to shape the end of the rod.

Flexible Arrangement for Welding Wheel Flanges

By J. R. Brittain
Mechanical Engineer Los Angeles Railway, Los Angeles, Cal.

AUTOMATIC arc welding of steel wheel flanges by means of a metallic electrode is standard practice in the shops of the Los Angeles Railway, Los Angeles, Cal. The equipment used consists of a General Electric automatic welding head with supporting equipment and driving apparatus for the wheels designed in the mechanical engineer's office of the company. The entire mounting for the equipment was constructed in the shops of the Los Angeles Railway. An accompanying illustration shows the general arrangement.

The welding head feeds the wire



Equipment Used to Weld Wheel Flanges in the Shops of the Los Angeles Railway

Digitized by Google

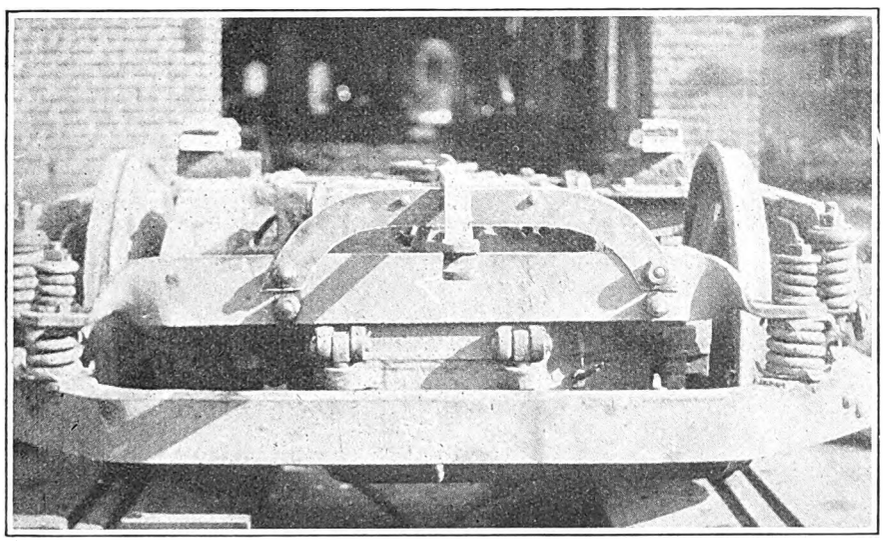
electrodes uniformly to the work at three different speeds, which are under the control of the operator. Wheels to be repaired are brought to the welding room track and are rolled to the welding outfit. Mechanically operated jacks raise the wheels from the track so as to allow free rotation. Standard bearings are used on the heads of the jacks so that the actual journals of the axle revolve in these bearings. A steel carriage mounted on a steel frame supports the welding head and also the reel which holds the metallic electrode wire. The carriage may be moved freely along the top of the framework and is brought over the second wheel when work on the first is completed.

To rotate the wheels, a split sprocket is adjusted to the axle and a link chain is slipped over its teeth so as to connect with a companion sprocket located on the driving axle about 4 ft. back of the wheel axle. The equipment used to drive consists of a 2-hp. variable speed motor with a maximum speed of 1,000 r.p.m. and a minimum speed of 500 r.p.m. This motor is connected by belts and pulleys with a speed reducer which is especially designed to bring the speed from 1,000 r.p.m. to one-third of one revolution per minute. On the reducer shaft are mounted two pulleys of different diameters, by means of which the speed can be reduced again so as to obtain travel at the periphery of the wheel ranging from 7.99 in. per minute to 32 in. per minute. The speeds intervening between these maximum and minimum limits are obtained by regulating the speed of the motor through a rheostat. In this manner, the wheels to be welded are revolved at exactly the same speed as that with which the electrode is fed to the welding head.

In order to keep the area to be welded continually clean and bright and to insure a steady arc, good penetration and a satisfactory weld, a set of circular steel wire brushes are mounted so as to be operated mechanically. These bear against the surfaces of the wheels and run at a speed of about 1,000 r.p.m.

Keeping Brake Rods Off Motor Cases

SOME time ago the Virginia Electric & Power Company had trouble on its Richmond, Va., cars with wear between the brake rod and the top of the motor. The trouble was most marked on some cars equipped with maximum traction trucks, when there was not much clearance over the motor, and with motors which were rather high, like GE-57, 67 and 90 and Westinghouse 101-B. However, the condition existed to some extent on a considerable proportion of the old double-truck equipment.



This Arch Support Prevents the Brake Rod from Chafing on the Top of the Motor

After some experimenting, W. J. Hicks, master mechanic of the company, decided to provide a wearing support for the brake rod to rest on. The results have been so satisfactory that the double trucks under all cars are being equipped with this support as the cars go through the shops. The end view of a truck equipped with this device, reproduced on this page, shows the general form and purpose of this support.

This arch support is made up of two pieces. One is a 1½-in. x ⅜-in. iron bar forged to the shape shown and riveted to the cross bar of the truck. The other piece is a 1½-in. angle bolted along the top of this arch bar to provide the flat surface on which the brake rod can rest and slide. A flat brake rod instead of round rod has to be used because of the small clearance above the support.

The device shown has eliminated all of the trouble from this cause formerly experienced.

New Equipment Available

Special Ballast Dipper

IN THE last few years ballast cleaning has become a matter of importance to maintenance of way officials, and as the handling of this material is very costly, particularly so on busy lines, much thought has been devoted to new methods of handling. To meet this demand the American Hoist & Derrick Company, St. Paul, Minn., has designed and built a special dipper stick on which the dipper is set at a rakish angle to permit it to dig in close to the ends of the ties.

For loading ballast with the American railroad ditcher equipped with the new special ballast shovel the usual dump car work train line-up is used. Due to its construction, the shovel is always operated over the right-hand side of the flat car on which it works. This means that when operating on one track of a double-track system the ditcher removes ballast from the space between ties to a depth of approximately 20 in. below the ties. This distance between ends of ties varies from 4 ft. 6 in. to 5 ft. 6 in. When the distance between ends of ties is 5 ft. 6 in. a 30-cu.yd. dump car filled reasonably full represents 75 ft. of ballast dug from between ties. This 75-ft. distance increases as the distance between the ends of ties decreases.

With one car filled, the ditcher turns through 180 deg. and operates over the other side of the flat car, now facing the second dump car. It fills this second dump car with foul ballast removed from the shoulder of the roadbed, and again a reasonably well-filled car represents about 75 ft. of roadbed ready for new ballast. The new dipper design is of great convenience in this work.

Overlapping Joint in Gear Case

THE new malleable-iron gear case of the GE-265 railway motor of the General Electric Company incorporates an overlapping joint, a unique feature which keeps out dirt and moisture and which affords a means of making adjustments to compensate for any wear of the supporting brackets. The case embodies the advantages of malleable iron rigidity and strength, yet its weight is no greater than that of the gear case formerly used with this lightweight motor.

Six Metal-Working Machines Combined

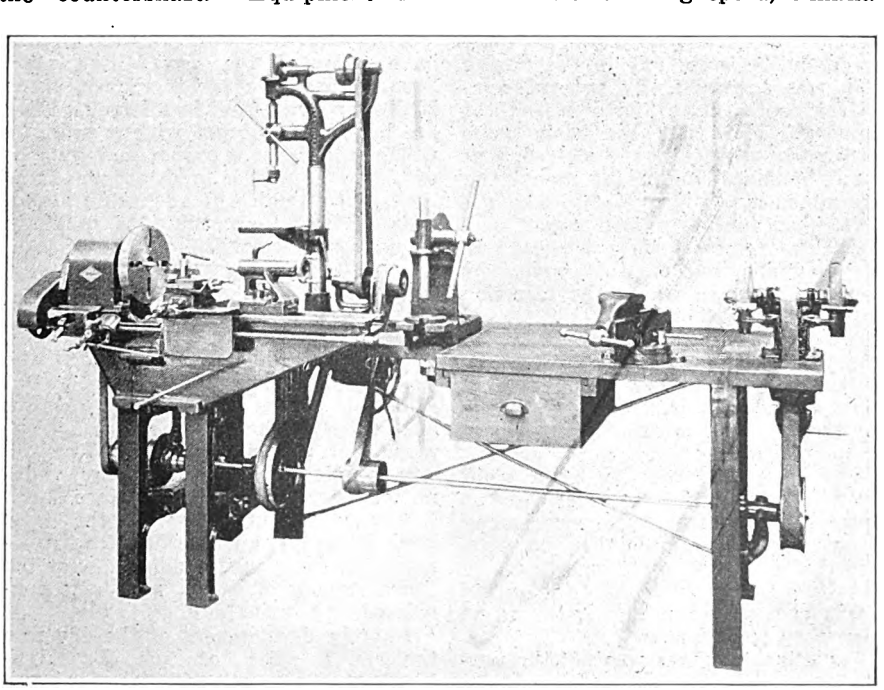
A GROUP of metal-working machines designed to handle the every-day jobs in a garage or small electric railway shop has been developed by the Artisan Manufacturing Company, Cincinnati, Ohio.

The outfit consists of a lathe, drill press, arbor press, vise and grinder head combined with a machinist's work bench. A ½-hp. electric motor is used to drive the machines, as shown in the accompanying illustration. Belt drive from another source of power is optional.

The bench has a hardwood top, 7 ft. x 30 in., with cast-iron legs bolted to it. The lathe has an 11-in. swing over the bed and is 24 in. between centers. It is controlled separately through a friction clutch on the countershaft. Equipment includes large and small face plates, chuck, five tools and four drop-forged lathe dogs. The drill press is rigidly fastened to the left side of the bench and is controlled through tight and loose pulleys. The drill has a capacity of 10 in. and the spindle can travel 3½ in. Table diameter is 8 in. The arbor press is located to the right of the lathe. It will take work up to 10 in. diameter, arbors up to 1¼ in., has a plunger movement of 8 in., a leverage of 36 to 1 and exerts a pressure of approximately 1 ton.

A 36-lb. machinist's vise is included. Its jaws are 3½ in. wide and open to 5 in. Two 6x1-in. emery wheels, one fine and one coarse, are mounted on the grinder at the right of the bench. A double-pulley idler is used to control its drive from a belt which ordinarily hangs loose. One rigid countershaft, running in three self-aligning babbitted bearings, drives all machines.

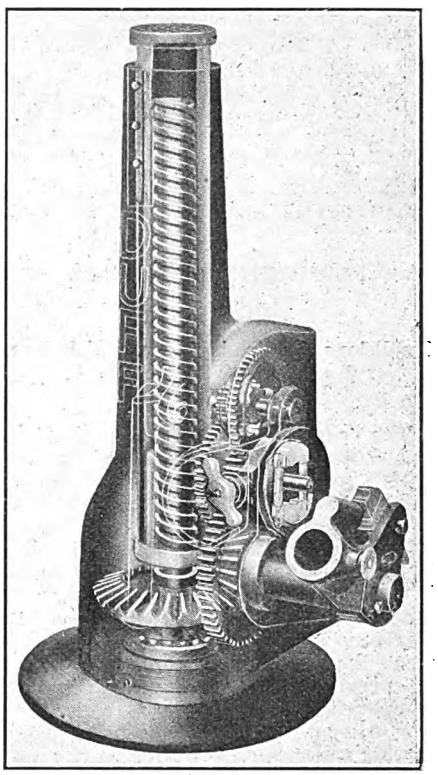
Crated for shipment, the outfit weighs about 1,000 lb. and is 7 ft. 6 in. long, 30 in. wide, 39 in. high.



This Combined Unit Has Six Metal-Working Machines

Lowering Speed Control Feature of New Jack

EMBODYING many features not previously used in jack construction, a new line of self-lowering jacks is being placed on the market by the Duff Manufacturing Company, Pittsburgh, Pa. These jacks range in capacity from 15 to 50 tons, and a special feature is the governor control which assures absolute control of the lowering speed, elimination of possibility of accidents through sudden or uneven dropping of the load, and provides a jack which may be slowed down gradually or stopped instantly at any point without shock or strain on the mechanism. The governor makes it possible in cases where two or more jacks are used together to provide a uniform lowering speed, so that one jack will not lower more rapidly than the other. This eliminates tipping or uneven lowering.



Self-Lowering Jack with Governor Speed Control

The new design has a drop-forged steel top and the standard is prevented from screwing out from under the load by use of an oversized key. A triple pawl holds the clutch with three drop-forged, heat-treated steel pawls. These hold and raise with each stroke. There is but one pawl on the lever socket. In the first position the pawl will raise the load in the usual manner. The second position is neutral. The third position is used for running the standard down without load.

A positive lock which also acts as a brake when lowering the jack gradually holds up the load. Thus, no dependence is placed on springs. A positive stop at the base of the standard prevents overextending the jack beyond the safe limit of the raise. A one-piece shell holds all working parts and bearings in an integral unit and assures perfect alignment of all parts.

The News of the Industry

Springfield Report Presented

Conditions Outlined Under Which New Haven Road Is Prepared to Spend $1,500,000

The expenditure of approximately $1,500,000 in rehabilitating the Springfield Street Railway, Springfield, Mass., will be recommended to the board of directors of the New York, New Haven & Hartford Railroad. Vice-President E. G. Buckland of the railroad made it plain to Mayor Fordis C. Parker and the City Council on Feb. 25 that the company was prepared to proceed, provided the city will support the railroad in carrying out its program, including co-operation in obtaining state legislation to restore control to the railroad of this and other electric railway properties held by the New England Investment & Security Company, and that the city adopt recommendations contained in the report of the joint committee of survey. This committee comprised Clark V. Wood, president of the Springfield Street Railway; W. J. Flickinger, representative of the New York, New Haven & Hartford, and J. T. Battis Woodruff, representative of the city. The Mayor said he would call a meeting of the City Council to determine what course the city would pursue in relation to the conditions set forth.

Improvements recommended to be made include, among other things, the purchase of 50 new cars of the modern one-man type, an enlargement of the bus service, improved arrangements at the Main and Carew Streets carhouse to relieve street congestion due to the running of many cars in and out, double-tracking of Belmont Avenue as far east as Girard Siding and Sumner Avenue as far east as White Street, reduction of the number of car stops in certain cases, greater use of Dwight Street for cars now being routed through Main Street, and improvements of the roadbeds.

Recommendations of changes by the city include the widening of Belmont Avenue between Bellevue Avenue and Oakland Street, widening of Worthington Street between Chestnut and Federal Streets, widening of South Main Street, widening of Main Street between Railroad and Hampden Streets, opening of a new street between Walnut and Oak Streets, to relieve congestion in State Street; extension of Locust Street from Main Street to Columbus Avenue, removal of tree belts at street railway turnouts wherever the distance from rail to curb is less than 18 ft., fewer pedestrian crossings in Main Street and prohibition of all parking in Main Street from Liberty Street to Locust Street between 4.30 p.m. and 6 p.m.

The last-named recommendation, dealing with a question that for months past has been a subject of agitation, is opposed by the merchants. It appears likely to become the principal point of contention in the attempt to bring the parties to an agreement on matters covered by the report of the joint committee.

Survey on in Syracuse

A general planning survey of the city of Syracuse, N. Y., aimed to determine the best methods of eliminating grade crossings and improve general traffic conditions, is being conducted under direction of Frederick H. Fay, Boston expert in transportation and planning. Data have been presented by transit and other agencies, among them the New York State Railways, the Syracuse & Eastern Railway and the Auburn & Syracuse Railroad.

Benjamin E. Tilton, vice-president and general manager of the New York State Railways, reported on passenger and freight statistics for the corporation's Oneida line for 1925 and also for 1920. The number of passengers carried in 1920 was 643,403 and in 1925 the total was 412,717. A falling off in freight shipments also was reported. Harvey D. Gross, general manager, furnished similar data concerning the Syracuse & Eastern and Talmadge C. Cherry, president, on the Auburn & Syracuse line.

"Market Basket" Will Fix P.R.T. Wages

Purchasing Power of Dollar Is to Be Sole Factor in Wage Adjustments—Base Pay Reduced—Economists Heartily Approve Plan —Yearly Readjustment Except in Emergencies

EMPLOYEES of the Philadelphia Rapid Transit Company, Philadelphia, Pa., have accepted a reduction of 3½ cents an hour in their base pay, as a result of the recent "market basket" agreement adopted by joint action of employers' and employees' committees. Hereafter wages will be adjusted on a basis of the purchasing power of the dollar, so that employees will no longer be faced with the possibility of lowered living standards.

This unusual step was taken following a period of two years of intensive research work carried on by the men's own committees. The basic pay of 73½ cents an hour, which is 3½ cents less than the basic pay in use during 1925, was arrived at by general committees representing the men and the company. Hereafter the basic wage agreement will not be altered, the actual amount paid to the men being determined by an index figure which is based upon twelve typical market baskets. The prices of these baskets will be determined from month to month by a bureau working under the direction of the general committees.

To insure stability necessary to proper budgeting, adjustments of wages are not to be made more than once in every calendar year, except when the purchasing power of the dollar varies ten points or more from the market basket index and remains at a point beyond that variation for a period of at least three months. The purchasing power of the dollar shows no such sudden rise or fall in the past, save in time of panic or war inflation, when it was everywhere necessary to adopt emergency measures.

Reduction of wages was not the purpose for which the present decrease of 3½ cents an hour was adopted, the company announced. Rather it was felt desirable so to arrange the wage scale that a part of the employee's remuneration would be dependent upon his own operating efficiency. Provision is now made for a fee to management, based on gross earnings of the P. R. T. property, and payable only after the earning of a return to the owners. Part of this fee will comprise the management's compensation and expenses and part will go to the men in payment for their increased productive effort. Thus the employees will have opportunity for an ever-increasing enjoyment of the goods of this world as they increase their own value to the company.

A number of outstanding economists have approved the new Mitten plan. Among these are Irving Fisher, Jacob H. Hollander and W. Jett Lauck. They are heartily in accord with a program which will insure a proper maintenance of home standards and at the same time give promise of advancing standards of living according to gains in productive efficiency.

More Bus Applications in New York

Application has been made to the Board of Estimate of New York by the Equitable Coach Company to operate bus routes in all boroughs except Richmond. It was submitted on Feb. 26. The applications for franchises submitted by the Manhattan Surface Coach Company, a subsidiary of the New York Railways, and the Surface Transportation Company, a subsidiary of the Third Avenue Railway, were also considered the same day.

Another development of the day was the joint offer of the Brooklyn-Manhattan Transit Corporation and the Brooklyn City Railroad to under-

Digitized by Google

take borough-wide bus operation in Brooklyn. In a letter to the Board of Estimate the presidents of the two companies declared their willingness to undertake the operation of a comprehensive Brooklyn bus system without giving any details. A definite offer will undoubtedly be made later and presumably the two companies will be willing to exchange some surface line franchises for bus franchises, as other companies owning surface lines have indicated a readiness to do.

The Equitable Coach Company is backed by the J. G. White interests. Its plea was regarded as presenting so many favorable features that Mayor Walker and his associates were said to have been considerably impressed, although, of course, the Board of Estimate members would make no decision on the granting of franchises until all the applicants have been heard.

Another feature of the Equitable offer, which was said to have appealed to the Mayor, was a provision for a 5-cent fare. This rate would be applied to a zone system, but the Mayor and his colleagues were informed that such a plan would benefit the short-haul riders, usually comprising the greater number of bus passengers.

The offer of the Brooklyn companies, signed by William S. Menden, president of the B.-M. T., and H. Hobart Porter, president of the Brooklyn City Railroad, read:

> In line with their obligation to give to the public the best possible transportation, the B.-M. T. Corporation and the Brooklyn City Railroad are prepared to form a bus company to be financed by them and to operate a Brooklyn borough-wide system of buses so to be co-ordinated with existing rapid transit lines and buses as to give to the public the best of service at the lowest possible cost.
>
> They therefore request the opportunity to confer with the members of the Board of Estimate to discuss terms upon which they may co-operate with the city through such proposed new corporation with city representation and supervision to insure co-ordination with existing lines and maximum service to the public. The operating experience on existing facilities of the B.-M. T. and Brooklyn City companies would seem to create the opportunity for agreement as to bus operations in Brooklyn on better terms than might be otherwise obtained.

Work of Expanding Chicago Rapid Transit Being Pushed

Service over the lines of the Chicago Rapid Transit Company to the additional west side communities of Maywood, Bellwood and Westchester is planned to start about May 1.

At present the terminus of the "L" service on the Garfield Park branch of the Rapid Transit Lines is at Des Plaines Avenue, Forest Park. As a result of the operating agreement, service will be extended westward over the Chicago, Aurora & Elgin Railroad to Bellwood and thence southward to Roosevelt Road, Westchester.

Excellent progress is being made in constructing the new track from Bellwood to Westchester. The roadbed has been completed, the tracks laid and third rail installed and three stations and an interlocking tower at Bellwood Junction are under construction.

Another important Rapid Transit Company development is the announcement of plans to construct a new terminal on Wells Street between Jackson Boulevard and Van Buren Street, Chicago, at an estimated cost of $160,000.

The new structure will serve as a terminal for the Aurora & Elgin, as well as furnishing increased loop facilities for the Rapid Transit Lines. It will be a three-story structure, embodying all the latest improvements for the comfort and convenience of the traveling public.

An innovation in station construction will be the placing of the waiting room of the third floor—the track level. A mezzanine will provide a women's rest room and a men's smoking room. On the first floor will be the ticket offices, a passenger concourse, telephone booths and concessions.

Construction work is expected to start early in April. Plans call for completion of the new terminal within six months from the time work is started.

They're at It Again

Phoenix Agitated Over Its Railway Problem—Visiting "Experts" See It a Financial One

Railway operation in the "great open spaces" may not be subject to the foibles of Old Man Weather, but nevertheless it has its problems. Particularly is this true where the destinies of the railway property are in the lap of the municipal government. Take Phoenix, Ariz., for example. The hue and cry which burst upon the normally quiet existence of that thriving community some time ago—contingent on the attempts of certain local citizens to allay the grievous ailments of the property without recourse to outside assistance—finally died away without any one's having so far forgotten himself as to resort to the faithful old "shootin' irons."

But the armistice was not destined to be long-lived. On the surface all was serene, but turmoil was beneath. The city fathers, gazing with mild distrust upon the efforts of their fellow citizens, began to cast about for some one who could tackle the local situation with the sangfroid of the cosmopolite. Nor was it necessary for them to search far. Within the bounds of their own fair domain were found two men who possessed the qualifications which the pilots of the local ship of state considered essential. They were Commander Abner B. Clements, U.S.N., retired, who is spending the winter in Phoenix, and J. Frederick Richardson, formerly prominent in various congressional investigations into aviation and Shipping Board conditions, who contemplates engaging in newspaper publishing in Arizona.

"Ah, ha," said the promulgators of Phoenix laws, "Here are the men who can solve our knotty problem." Forthwith, announcements were made in the local papers to the effect that two eminent authorities on street railway affairs had at last been found to prescribe the hoped-for panacea for the city's transportation ills. This investigation, furthermore, was to cost the city not one red cent, since the two gentlemen, acting in a most generous mood, had been kind enough to donate their services.

After a cursory examination of the task in hand, Commander Clements and Mr. Richardson informed Mayor Jefferson that the street railway situation was not a transportation problem so much as a financing problem.

No sooner had this announcement been made than more pyrotechnics became visible over the Phoenix horizon. A committee of citizens waited upon the city commissioners and delivered themselves of certain pertinent remarks. They professed to be much interested in the reasoning which led to the choice of a former navy man and an authority on aviation and Shipping Board affairs as experts on street railway conditions in arid Arizona. Said they: "These men have reported things to you about a system which you have known for years—that what is wrong with the street railway situation is a financial rather than a railway problem." Great was the professed astonishment of the committee at the conclusions at which the eminent investigators had arrived.

Since, after all, the investigation was costing them no money, the citizens' committee was moved once again to discuss things by word of mouth, rather than with the once popular "persuaders" of the wild 'n' woolly west, so nary a drop of any man's blood was spilled in the Council chamber that morning. Things are now in a simmering stage once more, while the investigators proceed to "investigate" in unruffled fashion. It is noteworthy that the central theme of discourse among the members of the City Commission whenever railway affairs are mentioned seems no more to deal with ways and means of disposing of the property to private interests, but rather with ways and means of making the railway every day and in every way a better municipal property.

Commission Approves Conowingo Project

The Philadelphia Electric Company's petition for approval of the Conowingo project, a $52,200,000 hydro-electric development along the Susquehanna River in Maryland, was allowed recently by the Public Service Commission of Pennsylvania. The decision followed a series of hearings in Philadelphia extending over several months. The testimony also was reviewed by the Public Service Commission of Maryland and a representative of the Federal Power Commission.

The Philadelphia Rapid Transit Company, Philadelphia, Pa., single largest user of Philadelphia Electric current, said that the financial set-up was calculated to increase in rates to consumers. This company's contentions in the main were upheld by the commission, and the Philadelphia Electric Company shortly thereafter complied with the commission's ruling.

Recently the commission received a formal communication from the Philadelphia Rapid Transit Company that, inasmuch as the revisions made in the petitions complied and dispensed with its objections to the Conowingo project, the objections were formally withdrawn.

Electric Road Wins Switching Case

In a decision by Justice Brandeis, the United States Supreme Court on March 1 upheld an order issued by the Interstate Commerce Commission directing that three steam railroads cease discrimination against the Chicago, Lake Shore & South Bend Railway, an electric road operating between South Bend, Ind., and Kensington, a station within the limits of Chicago, in the matter of switching arrangements at Michigan City, Ind. The decision upheld that of the federal district court in dismissing a petition for an injunction against the I.C.C. order sought by the steam railroads.

Originally, the Lake Shore secured an order against the Lake Erie & Western, with which it has physical connection at Michigan City, to remove unjust discrimination for refusal to establish joint through rates and to make switching arrangements. The Lake Erie removed the discrimination by making the arrangements with the Lake Shore.

The Chicago, Indianapolis & Louisville, the Michigan Central and the Père Marquette, all of them steam railroads, also enter Michigan City, but they were not parties to the original action. When unjust discrimination was alleged against them and an order was issued by the I.C.C., they sought an injunction, alleging they had no physical connection with the electric road, that the latter was not essentially a freight carrier and that it has little equipment to exchange with them. The findings of fact of the Interstate Commerce Commission were assailed. The district court refused to grant the writ to the steam railroads. This decision is upheld by the Supreme Court. As a result reciprocal switching arrangements between the steam railroads and the electric line must be established at Michigan City.

Accident Faker Gets Two-Year Sentence

Another accident faker has been brought to book. He is known as Harry Peters. It is said that in a period of about a year he had operated against about thirty railways. That is important, but not quite so important as are his apprehension and subsequent sentence at Elizabeth, N. J., on Feb. 15 to serve a two-year term in prison.

On Jan. 16 the Public Service Railway, Newark, N. J., caused the arrest of Peters (of 1435 N. 29th Street, Philadelphia, Pa.) on the charge of obtaining money under false pretenses from the railway at Elizabeth, on Oct. 7, 1925. On Oct. 6 he was a passenger in a one-man car in Elizabeth and occupied a seat in the rear of the car. An electric light bulb broke. Peters alleged that it had fallen out of the socket, broken, and that the glass had got into his right eye. He was taken to a doctor, who treated the eye, and the railway representative at Elizabeth settled with him for $100. It was then discovered that he had obtained $75 in a similar manner at the Camden office of the company on Sept. 15, 1924, on account of an alleged accident. He at that time gave the fictitious address of Seventh and Penn Streets, Reading, Pa. In each instance he represented himself as being in the long-distance trucking business.

It has since been learned that he operated against the New York Railways and the Third Avenue Railway, New York City; the United Railways & Electric Company, Baltimore, Md.; Philadelphia Rapid Transit Company, the Morris County Traction Company, Morristown, N. J.; the New York, New Haven & Hartford Railroad, the New York Central Railroad, the Erie Railroad, the Baltimore & Ohio Railroad and the Lehigh Valley Railroad.

New Agreement in Chicago Under Discussion

With eleven months of Chicago's car franchises remaining to run, politicians are pulling in many directions and getting nowhere in particular toward working out new agreements. Heretofore there has been the practically unanimous ground of a unified system of surface and elevated lines with a subway, but for the first time a proposal has been made to submit separate ordinances. The Mayor, attacked on all sides, has practically stepped out of the negotiations.

A sub-committee has completed the draft of what it hopes will become the City Council's traction ordinance policy.

Cost plus is one item. A committee of engineers would fix the maximum and minimum figures of the fare fund, determining increases or reductions.

The Surface Lines would continue to pay 55 per cent of its net receipts to the city.

Home rule would be provided by the creation of a commission of five to take over the state commission's responsibilities in Chicago.

Extensions would be built on the basis of gross revenues. A percentage, undecided, would be fixed as the annual outlay.

The report recommends unification of all the lines.

The franchises would be based on the terminable permit principle.

Traction flared up freshly as a political issue by charges of Alderman Arthur F. Albert that a political faction was dictating the future of transportation in the state. He mentioned Senator Richard J. Barr, author of a terminable permit bill in the last Legislature that is to be made the basis of legislation offered to the next assembly. He said:

> The gang that controls the sanitary district has the nerve to shout "home rule" as a platform. The trustees are in a close alliance with the arch foes of home rule and if they get their candidates across Chicago will never have another thing to say about its own streets in the future.

One-Man Car Service in Milwaukee Put Off

The long-heralded installation by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., of one-man car service on its Walnut Street line has been temporarily suspended because the commission is anxious to have the facts and figures presented at the public rehearing in Milwaukee on the matter before a new and final order is issued. So far as the railway is concerned it planned to start the new service on March 1 in accordance with an order issued several weeks ago by the Railroad Commission.

The new order will be issued probably within two weeks and may provide for a trial test of one-man car service in order that claims of both advocates and opponents may be fullly tested. This trial may be conducted by operating one-half of the cars with a one-man crew and the remaining cars with two-men or otherwise by operating all of the cars, except during rush-hour specials, with one-man crews for a certain period. By operating one-half of the cars with one man, members of the commission brought out that the contention of the railway that these cars can maintain satisfactory schedules can be tried out. S. B. Way, president of the company, said:

> The company is confident that actual operation will demonstrate the improved service possible only with one-man cars of the type the company is required by the commission to furnish and that the fears of the comparatively small number of people who have so far expressed themselves will be found groundless.

Electric Road Planned for Florida

It is planned to build an electric railway to link up Central Florida cities with the East and West Coast and open up the great ridge and lake sections of interior Florida. To this end a corporation to be known as the Florida Service Electric Railways will be formed with a capitalization of $10,000,000. The road is to be built in separate units. The first will run from Orlando through Apopka and north to Palatka. The second unit would extend from Orlando to Tampa and St. Petersburg and the third unit through Sanford to Daytona Beach and ultimately link up with Jacksonville to the north, with Miami as its southern terminal. Orlando's location, geographically the heart of Florida and the greatest center of central Florida's population, is believed to be the most desirable from which to operate. Officers of the Apopka Chamber of Commerce have the matter in hand for promotion.

Question of Public Control Renewed in Boston

Considerable discussion is developing over the proposition whether the public operation of the Boston Elevated Railway, Boston, Mass., should be extended for a period of 30 years, as was proposed by the special legislative commission. One of the factors entering into this recent discussion is the Boston Chamber of Commerce. That body has voted to indorse the proposition and has sent a communication to this effect to the legislative committees on street railways and metropolitan affairs. The Chamber of Commerce concludes it is for the best interest of the car riders and the community that public control of the Elevated be maintained for at least 30 years more, as this will pave the way to obtain capital and permit service to be improved. At the same time the chamber favors the general policy that public control ought to be only a temporary expedient.

Eight-Hour Bill Killed in Massachusetts

The Massachusetts trolleymen's eight-hour bill has been defeated in the Legislature by a vote of 18 to 10. Senator Frank B. Phinney, Dorchester, opposed the bill on the ground that it would place a restriction on business. He charged the bill was an attempt to increase the pay of the employees, who hope to get nine hours pay for eight hours work. Senator Gifford, Salem, who favored the bill at its inception, voted against it. He felt that neither the public nor the railways was in a position to stand the extra expense it surely would involve.

J. N. Shannahan Honored by Employees

If John N. Shannahan, retiring president of the Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va., ever had any doubt of the affection in which he was held by the employees of that system and the esteem in which he is held by the people of the Virginia Peninsula, it was dispelled recently when tribute was paid to him by the employees who have been under him during his fifteen years as head of the system. Men and women expressed in terms stronger than mere words their implicit faith in him. As a climax Mr. Shanahan was presented a testimonial handsomely bound in leather, engraved with his name in gold on the back, containing the personal signature of every officer, director and employee in the system.

Holyoke Power Agreement Case Postponed

The Turners Falls Power & Electric Company, the Holyoke Water Power Company and the Holyoke Street Railway have virtually come to an agreement for the settlement of the controversy raised by the petition of the first-named company to the Massachusetts Public Utilities Commission for a franchise to enter the city of Holyoke to connect and operate the power house to be purchased from the railway as part of a general contract to sell energy to that company. Under the plan now awaiting final adoption the Turners Falls company will withdraw its petition and the Holyoke Water Power Company will supply energy for the power house, on condition that the Holyoke Water Power Company shall buy from the Turners Falls company an amount of energy equivalent to that sold by the Holyoke Water Power Company to the railway. The car company will pay to the Holyoke Water Power Company the same price for energy it would have paid to the Turners Falls company under the arrangement proposed but not approved by the State Department. The Turners Falls company will take over the car company's power plant for $400,000, as previously agreed, and will then convey it to the Holyoke Water Power Company for a market value to be determined.

The Public Utilities Commission had called a rehearing on the petition for March 1, but it granted a postponement to March 22, on assurances that an agreement had been reached on many of the details. Since the original hearing last year the personnel of the commission has changed.

New Jersey Governor Against Federal Rate Interference

Governor Moore of New Jersey has called on the Legislature to petition Congress to enact legislation to limit the jurisdiction of United States courts in the regulation of public utility rates within the states. It is his opinion that the practice of public utility companies in rate cases of applying to the federal statutory court for injunctive relief has been carried on to such an extent in recent years as practically to oust the state of its jurisdiction in the regulation of rates of such companies. He says that the problem of regulation of the service and rates of such companies should be solely within the state's jurisdiction. The Governor said:

> I believe it is an undue interference of the federal statutory court to intervene in the matter of regulation of rates of the companies of the state. This is now done by immediate application for injunction to the federal courts, the effect of which is to suspend immediately the rates of such companies as determined by the board upon a hearing after notice, and after full consideration of all matters necessarily and properly considered in rate cases, and thereby makes futile the effort on the part of the state to regulate the rates of utility companies which exist by virtue of a charter given them by this state.

Everman Plan Accepted in Dallas

The recent Everman recommendation, the basis of which was to increase the fare of the Dallas Railway, Dallas, Tex., to 7 cents, with the provision that five tokens could be purchased for 30 cents, has been accepted, with a few minor changes, by the directors of that company.

The passage of the ordinance has been delayed a few days due to the fact that J. J. Collins, city attorney, who is to supervise the preparation of the ordinance, has been sick. Those closely in touch with the situation feel that if the city attorney's condition will permit a conference will be held at a very early date and the ordinance will be passed without delay virtually as recommended by Mr. Everman, supervisor of public utilities for the city.

The railway, the populace and the officials of Dallas are in agreement on this new program, which will provide funds to make extensions and purchase additional equipment urgently needed.

Obsolete Cars Burned in Spokane

Thirty-six street cars, worn-out and obsolete, have been consumed by the flames in a series of bonfires held under the direction of G. H. Darby, master mechanic of the Spokane United Railways, Spokane, Wash.

The cars were stripped of all worth-while material and were then tipped off their trucks. The trucks were dismantled while the old car bodies were soaked with oil and burned.

Transit Bill for New York Reported Favorably

The Senate Judiciary Committee on March 2 reported favorably Senator Nicoll's constitutional amendment authorizing New York City to increase its debt after Jan. 1, 1928, to an amount not exceeding $300,000,000, said increase to be used for the construction or equipment, or both, of new rapid transit lines. The debts so incurred are not to be included in computing the city's debt limit.

Messrs. Sawyer and Eales Arrive in Australia

Cablegrams from Sydney, Australia, tell of the safe arrival there of W. H. Sawyer, president of the East St. Louis & Suburban Railway, East St. Louis, Ill., and H. W. Eales, chief electrical engineer of the Union Electric Light & Power Company, St. Louis, Mo., who have gone to Australia to conduct a survey of power there for the Victorian government.

Omaha Franchise Ordinance Introduced

The street railway committee of the City Council of Omaha, Neb., has made its report to the committee of the whole. The report of the committee was adopted at this meeting and the city attorney instructed to prepare an ordinance in favor of the Omaha & Council Bluffs Street Railway embodying the terms and provisions recommended by the committee. The measure has since come up on first reading. It seems probable now that the matter will be ready for submission to the voters of the city some time this spring.

Three Railway Systems Connect in Wisconsin

Three of the largest electric railway systems in Wisconsin have been interconnected at Sixth and Clybourn Streets, joining the Chicago, North Shore & Milwaukee Railroad, Milwaukee, Electric Railway & Light Company and the Milwaukee Northern Railway. An interchange of express cars running from Chicago on the North Shore to Milwaukee and then west to Waukesha, Oconomowoc and Watertown on the Milwaukee Electric Railway line, or north to Sheboygan on the Milwaukee Northern, and vice versa, is thus made possible. Arrangements will be made to handle the exchange on excursion trains.

Hearings on Syracuse and Utica Fares on March 10

The Public Service Commission of New York will hold a hearing at Albany on March 10 on the petition of the New York State Railways for permission to charge a 10-cent cash fare or 7½-cent ticket fare in Syracuse and vicinity. A second hearing on the petition of the company for permission to charge an increased fare in Utica and vicinity will also be held on March 10. The Utica proceeding will be conducted in the morning. That on Syracuse will be held in the afternoon.

News Notes

Wage Increase in Sacramento Under Consideration.—Employees of the Pacific Gas & Electric Company, Sacramento, Cal., have petitioned for a wage of $6 for nine hours work with time and one-half for overtime. The present pay is on an hourly basis starting at 51 cents for a beginner and reaching 60 cents for a one-man car operator who has been employed by the company for more than one year. E. W. Florence, division manager of the company, said that the request of employees for more pay would be considered.

Special Review Number at Vancouver.—The British Columbia Electric Railway, Vancouver, B. C., Canada, has issued a special review number of its employees' magazine dated March, 1926. The early development and progress of the company are described by means of entertaining reading, attractive pictures and instructive charts. The March issue contains nearly 50 pages.

Commuters' Rates Out of Louisville Advanced.—The State Railroad Commission has granted the Louisville Railway permission to advance commuters' rates on all of its interurban lines out of Louisville, Ky., operated as the Louisville & Interurban Railroad. This will result in about a 21 per cent increase in ticket books, with no change made in basic rate on cash fares, which is 3 cents a mile. The commutation rates range from seven-tenths of a cent per mile to 1½ cents a mile. About three months ago rates were raised within the city of Louisville by 1 cent and ½ cent on school books. The company had endeavored to discontinue commutation books entirely, but the commission refused to grant the discontinuation. There are seven lines operated out of Louisville, including the Orell, Prospect, Lagrange, Shelbyville, Okolona, Fern Creek and Jeffersontown.

Jitney Permits Still the Issue in Tacoma.—Efforts of Mayor A. V. Fawcett of Tacoma, Wash., to have further permits granted for jitneys which will run in competition with the Tacoma Railway & Power Company have been blocked by the City Commissioners, who favor holding off such permits until the new Council is seated in June. The new men who will become councilmen have announced that they will endeavor to solve the transportation problem, and City Commissioners do not wish to complicate the situation by granting further permits for jitney lines.

Former Application Renewed in Wheeling. — The Wheeling Traction Company, Wheeling, W. Va., has filed a petition with the Public Service Commission to reopen its former application for increased rates, which the commission recently denied. The company declares it has new evidence to introduce in the case. However, no date has been set for a hearing. In a recent application the company sought permission to sell nine tickets for 50 cents, instead of the customary ten for the same amount. The proposition was rejected, as figures advanced for consideration were said to have taken in interstate rates. If another hearing is granted, figures concerning the operation of cars only in the West Virginia side will be placed before the commission. The application was filed by H. L. Mitchell, vice-president of the Wheeling Traction Company.

Safety Isles Planned. — The United Railways, St. Louis, Mo., in co-operation with the St. Louis Board of Education and the Police Department, will construct concrete isles of safety at several avenues. The St. Louis Board of Public Service has been requested to issue permits for the placing of the isles in the streets. The St. Louis Street Department had no funds available for this work so the United Railways donated $1,500, the Board of Education $1,500 and the police $500 to install the isles and protecting "blinker" traffic signals.

Changes at Colorado Springs.—The fare on the cars of the Colorado Springs & Interurban Railway has been reduced from 10 cents to two tickets for 15 cents in that city. The "pass system" has been eliminated. At the same time rail operation was discontinued on the Wahsatch lines and buses started.

Weekly Pass for Greensburg, Pa.—The West Penn Railways added a $1 weekly pass for the one-zone area covered by a cash fare of 8 cents or a ticket fare of 6¼ cents effective March 1. The application is for an experimental period ending May 30, 1926. This is the second weekly pass on the coke region lines of the West Penn Railways. The first was the similar $1 pass at Connellsville, in use since June 1, 1925. The Kittanning & Ford City division, West Penn Railways, installed four multi-zone passes Sept. 20, 1925.

Do You Want a Woman's Page?—In order to test out the interest in a woman's page as a new feature of the *Southern Public Utilities Magazine*, the Southern Public Utilities Company, Charlotte, N. C., is offering three prizes of $5, $3 and $2 respectively for the three best woman's pages submitted. The editor, John Paul Lucas, is interested in knowing if the women readers would co-operate in making a woman's page really worth while and valuable.

Senate Committee Kills Public Service Inquiry.—The committee on finance of the Senate of Pennsylvania has killed the Barr resolution calling before the Senate members of the Public Service Commission to give testimony respecting the decision on the Philadelphia Rapid Transit Company fare case.

Recent Bus Developments

Bus Operation Now Ruled by Arkansas Board

Regulation of buses has been assumed by the Arkansas Railroad Commission under its general authority over common carriers authorized by the railroad commission act of 1921. Its action has been upheld by the Attorney-General. A set of rules and regulations governing bus operation was put in effect on Jan. 1.

This provides that operators of buses must obtain from the commission a revocable certificate of convenience for each route. Operators in business at the time of the adoption of the regulations shall be granted a certificate upon showing that they have complied with the regulations. There must be filed with the commission time schedules, showing rates, mileage and towns on the route. Buses must be maintained in a sanitary condition, heated in cold weather and properly lighted.

Bonding or insurance against accident liability is required. The largest bond is for $50,000 for buses over 20 passenger capacity. Damages to one person are limited to $5,000. Bonds of $1,000 are required for the protection of property. Establishment of a central depot by each company is required. All buses of more than five-passenger capacity must carry a fire extinguisher.

Taxicabs, hotel buses, school buses, sightseeing buses, real estate buses and buses used in private business only are exempt from the rules, as are also buses operating exclusively within the limits of a municipal corporation and other municipalities contiguous thereto.

As mentioned before, no special law has been passed providing for the regulation of buses. Because of this, court action involving the authority of the commission seems likely.

Commission Approves Sale of Bus Routes to Tractions

Approval has been given by the Public Service Commission of Indiana to the sale of all but two of the remaining routes of the Indiana Red Ball lines and the routes of the Hoosier State lines to the Union Traction Company and the Indiana Motor Transit Company, a subsidiary of the Terre Haute, Indianapolis & Eastern Traction Company. Only six other independent lines will be in operation out of Indianapolis when the sales are completed. In the order approving the sale, the commission prohibits the purchasing companies from capitalizing the $32,788 paid for operator's certificates.

The T. H., I. & E. subsidiary is to buy Red Ball certificates to Richmond, Lafayette, Crawfordsville and Martinsville for a consideration of $15,000, excluding equipment. The Union Traction Company is to buy certificates on the Red Ball's routes to Sheridan and Noblesville for $2,400. The Rockville certificate will be sold to Platter & Baldwin for $1,388. Union Traction also is buying the Hoosier Stage line certificates to Muncie and Marion for $14,000. Fred I. Jones, receiver of one of the bus lines and sponsor for the others, declared the sales were made to prevent dissipation of remaining assets.

Digitized by Google

New Feeder Line in Toledo

The Community Traction Company, Toledo, Ohio, on Feb. 16 started the operation of a feeder bus on Glendale Avenue and Wildwood Road, in the southern section of the city, an extension of the Broadway line, under a new plan of lease direct from the manufacturers with option to purchase. The bus, has a seating capacity of 25. It was furnished by Mack Trucks.

Other feeder buses are being leased from independent operators. The City Council in providing for feeder bus operation denied the right to the company to spend any money to purchase buses, but forced it to lease. It is felt that a change in this policy may result soon following establishment of other lines and their operation at a cost of about twice the revenue collected on them.

Bus Lines at Gary in Separate Company

The Shore Line Motor Coach Company has been formed by Insull interests to take over various bus lines formerly operated as feeder and auxiliary services by the Gary Railways, Gary, Ind. The bus lines radiate from Gary, Ind., and may be extended. The bus line probably will be controlled by the Midland Utilities Company.

Greater Authority Over Buses Wanted in New York

To the New York State Public Service Commission "it seems apparent that the substitution of buses for trolley lines which have ceased to be profitable or in territories which may better be served by buses is inevitable." In discussing the future of bus operation in its report to the Legislature the commission sees the need of an adequate inspection force and the need for further authority for the regulation of the buses. That body said:

> The close of the year finds the bus lines just beginning to function at their best. In the next season there is every reason to believe there will be a further consolidation with wider extensions which will ultimately provide the state with a class of service of the first order. The development of these routes logically follows the completion of state highways. The present comprehensive system of highways invites the establishment of more extensive and better equipped lines.
>
> With the continued growth, the amount of business carried by bus lines in this state, the need for further authority for the regulation of these agencies is constantly apparent. This commission has made recommendations upon this subject in former reports. In the opinion of the commission there should be added to the present public service commission law an article specifying in detail the supervision which the Legislature desires the commission to exercise over bus lines. The law now contains such an article covering every other class of utilities over which the commission exercises regulatory powers. The necessity for legislation upon this subject is recognized not only by the commission and the general public but also by the operators of bus lines. The preparation of proposed bus legislation should have the active co-operation of all interested parties. It is the earnest hope of the commission that adequate bus legislation may be enacted at an early date.

Two other recommendations upon this subject contained in the last annual report of the commission are again renewed, namely, an amendment to Section 5 of the public service commission law specifying more in detail as to the authority of the Public Service Commission and the Transit Commission where a bus line is partly within and partly without the territorial limits of the city of New York, and an amendment of the railroad law which will permit street railways to engage in auxiliary bus transportation business without the necessity of forming separate corporations for that purpose.

New Bus Viewed in Portland, Ore.

A party of railway officials of the Seattle Municipal Railway, Seattle, Wash., City Councilmen, bus representatives and traction men recently spent two days in Portland, Ore., studying the operation of bus lines as feeders for railway lines as worked out by the Portland Electric Power Company. Interest was especially keen in a new parlor observation type stage for service between Seattle and Everett. The new type was evolved by the Pacific Northwest Traction Company. A feature of the bus is an observation cupola at the rear, accommodating twelve passengers. The cupola is raised 5 ft. to insure an unobstructed view.

Permit Sought for Extended Service.—The Key System Transit Company has applied to the California Railroad Commission for a certificate of public convenience to operate bus service between Oakland and Hayward.

Program of Rehabilitation Under Way. — Immediate extension of the Rockford City Traction Company service at Rockford, Ill., has been announced by Adam Gschwindt, receiver of the company, who has purchased six new buses for immediate use. The buses are taken under lease from the Yellow Truck & Coach Manufacturing Company with a view to their purchase. This indicates a policy of the receiver to attempt rehabilitation of the lines by adequate service to the public. There are now ten buses in service.

Bus Application Under Advisement.—The Illinois Commerce Commission has under advisement the application of the East St. Louis & Suburban Railway, through the Alton, Granite & St. Louis Traction Company, to operate a bus line between Alton, Ill., and St. Louis, Mo., via Brooklyn, Venice, Madison, Granite City, Nameoki, Mitchell, Hartford, Woodriver and East Alton. At the hearing on the application in East St. Louis, Ill., representatives of the Illinois Traction System and the Alton & Woodriver Bus Company objected to the new buses accepting local fares in the territory now served by the Illinois Traction and the Alton & Woodriver Bus Company.

New Scale of Fares on Bus Lines.—For convenience of passengers on the Sylvan Hills and Atlanta Avenue bus lines of the Georgia Railway & Power Company, Atlanta, Ga., who desire to use only the buses, the fare has been reduced from 10 to 5 cents. No transfers to streets cars are given with 5-cent fares. The change in no way affects the arrangement by which 10 cents is charged for combination bus and car rides. Previously a straight 10-cent fare was charged, with street car transfers issued if desired. Now the charge will be 5 cents for all except those who desire to continue their journey by street car. For those transferring from street car to bus, a 3-cent charge, in addition to the 7-cent street car fare, will continue to be in effect.

New Lines Out of Springfield Planned.—The Illinois Traction System will shortly apply to the Illinois Commerce Commission for certificates of convenience and necessity for the operation of a number of intercity bus lines radiating out of Springfield, Ill. The new bus lines will be supplementary to the present interurban lines operated by the company.

Buses Desired on Five-Mile Line.—The Willapa Electric Company, operating the electric railway between Raymond and South Bend, Wash., has appealed to the State Department of Public Works for permission to discontinue the line and substitute buses. J. R. Snider, manager of the company, expresses the opinion that the line, which is now losing money, may be made profit-earning by the substitution of motor equipment. It is proposed to purchase three buses, each seating twenty or more passengers. The car tracks will be torn up and the equipment sold. The line is 5 miles long.

Seeks to Replace Car Service.—The Menominee & Marinette Light & Traction Company has petitioned the City Council of Marinette, Wis., for permission to replace street car service with bus service, on a trial basis at least, on its unprofitable Hall-Pierce Avenue line. If the Council approves of the change a similar fare will be charged, with transfer privileges for bus and railway patrons.

Three Lines in Akron Approved.—After twice refusing to permit the Northern Ohio Traction & Light Company, Akron, Ohio, to operate express buses at a 10-cent fare the City Council has passed an ordinance sanctioning three such lines. The first will be an extension of the 10-cent express line that has been running from Cuyahoga Falls on the north to South Main and Cedar Streets, with no stops in Akron. Stops will be permitted at points to be selected by the city safety director. Free transfers will be issued from express buses to other buses or street cars. A 3-cent transfer will be issued from street cars to regular or express buses. Express bus stops will be regulated by the city safety director.

Wants Buses Substituted.—The Denver & South Platte Railway, operating the electric railway from Englewood to Littleton, Col., about 6 miles, has asked the State Public Utilities Commission for permission to abandon its tram cars and to substitute buses. The reason for the change is an economical one, the railway failing to pay. The matter is under advisement. To carry out the bus features the company has incorporated the Denver & South Platte Transportation Company, capitalized at $25,000. H. W. Hartman is one of the incorporators. The city fathers of Englewood wish to pave South Broadway, but say that the work will have to wait the outcome of the railway's move to abolish the cars. The cars have been operating eighteen years.

Last Details Under Way

Final Moves Being Made in Kansas City Railways Receivership Sale Case

At the continued hearing on Feb. 24 on the confirmation of the sale of the Kansas City Railways property, Blatchford Downing, attorney for the second mortgage bondholders, was permitted to take depositions in the case before a notary public. Mr. Downing had previously contended that such depositions should be legalized for the occasion. Powell Groner, attorney for the Newman syndicate, purchasers of the property under foreclosure sale, said a special commission should be appointed for the purpose. Mr. Downing will begin taking the depositions on March 9 in New York City and will then go to Washington, Detroit and Chicago to obtain further statements from other parties resident in these cities.

Frank P. Sebree, attorney for the stockholders of the defunct railway, expressed the wish to ask Mr. Newman how much his interest in the first mortgage bonds had cost him.

Judge Stone was requested by R. J. Higgins, attorney for the trustees, to eliminate that part of Mr. Sebree's objections. Mr. Newman's own attorney, Powell Groner, said his client is willing to meet any and all queries, but Mr. Groner intimated that the price paid for the bonds by Mr. Newman is of no concern to any one else. Decision in the matter of the elimination of such questions was reserved, but a remark attributed to the court appears to indicate that this line of attack will be futile in so far as the court is concerned.

The Newman syndicate is credited with having offered the holders of the second mortgage bonds a settlement of 20 cents on the dollar, but the offer was refused. Mr. Groner expressed the doubt that all of the holders of second mortgage bonds understood the liberal terms which had been offered them and rejected. It was also intimated that Mr. Groner plans to make some depositions for his own side of the case while he is in New York.

In speaking of the offer that his clients had rejected, Mr. Downing said that his clients always had a hand outstretched to receive a plausible offer, but they had always discovered that the reorganization managers were trying to lure them around the corner on one pretext or another.

Judge Stone expressed regret that proceedings are being prolonged. He set April 12 as the date for a hearing on the depositions and the grounds for other objections.

Attorneys in the case were urged to arrive at some agreed valuation of the property, so that the adequacy of Mr. Groner's bid of $8,000,000, made at the sale under foreclosure, might be argued intelligently.

On Feb. 25 the Kansas City Public Service Company was granted permission to operate in Kansas as a Missouri corporation. Simultaneously the Wyandotte Railways was chartered to own the railways properties in Kansas City, Kan.

The most recent action of the charter board removes one of the last remaining obstacles to the operation of the railways properties in Kansas, although the delay of the hearing on the confirmation of the foreclosure sale augurs for the elapse of some months before the public service company shall have the actual operation of the property.

Chicago, Aurora & Elgin Corporation Sold—New Officers

Thomas Conway, Jr., and associates of Philadelphia have sold to Samuel Insull and associates of Chicago their stock holdings, constituting a majority in interest, in the Chicago, Aurora & Elgin Corporation, which in turn controls through stock ownership the Chicago, Aurora & Elgin Railroad, owning and operating a high-speed electric railroad serving the western suburban districts of Chicago.

At a meeting of the board of directors of the Chicago, Aurora & Elgin Corporation, held in Philadelphia, Alba B. Johnson, Samuel B. Stinson, A. E. Pfahler, Gordon B. Anderson and E. C. Faber resigned as directors of the Chicago, Aurora & Elgin Corporation, and Samuel Insull, Britton I. Budd, R. Floyd Clinch, B. J. Fallon, J. H. Gulick and G. R. Jones were elected as their successors. At the request of Mr. Insull, Mr. Conway has consented to remain a director of the holding company for the time being. Lewis B. Williams, Cleveland, and A. B. Conant, Boston, also continue as directors.

As soon as the necessary corporate action can be taken, Mr. Conway and his associates will retire as officers and directors of Chicago, Aurora & Elgin Railroad Company. J. H. McClure will retire as vice-president and general manager and will go to Dayton, Ohio, as the operating head of the Cincinnati & Dayton Electric Railway, which is about to be taken over by Mr. Conway and associates.

Another Step Nearer Foreclosure in St. Louis

United States District Judge Faris has ordered the St. Louis Union Trust Company, trustee under the mortgage securing the $30,300,000 general 4 per cent bonds of the United Railways, St. Louis, Mo., to issue an additional $6,000,000 of such bonds to the reorganization committee through Receiver Rolla Wells to be exchanged for $4,100,000 in underlying bonds and $1,900,000 in cash. The unissued portion of the general 4s, totaling $3,700,000, will be canceled. The order by Judge Faris paves the way for Receiver Wells to complete his contract with the reorganization committee. This provides that Mr. Wells shall use the $1,900,000 cash received for the new bonds and $2,300,000 funds now on hand to pay off $4,200,000 of receiver's certificates.

There is now only one more legal matter to be disposed of prior to the sale of the property at foreclosure. This is the presentation of unsecured claims.

Gary Railways on Dividend Basis

Operating revenue of the Gary Railways, Gary, Ind., in 1925 was $1,204,729, according to the annual report of the company made public on Feb. 24.

The Gary Railways is one of the operating subsidiaries of the Midland Utilities Company. It furnishes local transportation service in Gary, and operates lines connecting the steel manufacturing city with East Chicago, Hammond, Valparaiso and Hobart.

The name of the company was changed from Gary Street Railway to Gary Railways in August, 1925, and the properties of the Gary & Valparaiso Railway, Gary Connecting Railroad and Gary & Hobart Traction Company were purchased and all merged into one system.

Passengers carried by the company in 1925 totaled 15,597,784, compared with 12,527,906 in 1924. The month of December was the largest in the history of the company, 1,559,872 passengers being carried.

Preferred dividends paid during 1925 amounted to $7,662. Common dividends declared amount to $84,969.

The company obtained during the year a wide distribution of its class A preferred stock in the territory which it serves. A sale of this stock by employees under the customer-ownership plan began on Sept. 8, 1925, and ended Dec. 31, 1925. During this period 4,257 shares were sold, of which 3,036 were purchased by residents of the Calumet district of northwestern Indiana in which the company operates. A large number of such shares were sold on a

INCOME ACCOUNT OF THE GARY RAILWAYS

	1925	1924
Operating revenue	$1,204,729	$998,418
Operating expenses	927,693	773,289
Net operating revenue	$277,036	$225,128
Other charges, including taxes	88,176	73,813
Total income	$188,859	$151,315
Interest on funded debt	73,795	69,523
Net income	$115,064	$81,792
Dividends declared	92,631	.....
Balance to surplus	$22,432	$81,792

Surplus Dec. 31, 1925		$209,070

Digitized by Google

monthly savings plan and were not issued at the close of the year. In the city of Gary 2,336 shares were sold to 1,442 subscribers. This was an average of 1.7 shares per subscriber. In the Gary Railways organization 92.58 per cent of the employees subscribed for stock.

Since 1918 $1,500,000 has been spent in modernizing the company's property. Track mileage has been increased 50 per cent in this interval, car equipment almost 200 per cent, power equipment 200 per cent and car mileage operated more than 100 per cent.

The Gary Railways was one of the first street railways in the country to adopt both efficient light-weight safety cars and trail trains. Auxiliary motor coach service has been established as a feeder to the regular railway service to "pioneer" into newly developed residential sections of the city where the population does not yet justify railway service.

The Gary Street Railway in 1918 carried 7,529,381 passengers. In 1925 15,597,784 were carried, or an increase of 107 per cent over 1918.

The gross revenue of the railway property in Gary increased from $385,579 to $998,418 in seven years.

The company operates its cars over 72 miles of track and 79 motor passenger cars and fourteen trailers are used.

The industrial zone within which the Gary Railways operates has a population of approximately 200,000 people. It is a territory that is growing rapidly and the Gary Railways has steadily increased its service and facilities for serving the public and to meet the demands of this industrial growth.

Two Long Island Properties Sold

The property of the New York & Long Island Traction Company was sold by former Lieutenant-Governor Wood, acting as referee in a foreclosure action brought by the Union Trust Company, Cleveland, on Feb. 25 in the Nassau County Court House at Mineola, L. I. Louis Carruthers, who represented a committee of the bondholders, bid $300,000 for the property as a whole. It was then offered in units. The bids for the units totaled $308,100.

The five franchises held by the town of Hempstead and the various villages went to the H. E. Salzberg Company, 50 Church Street, Manhattan. The remainder of the property was taken by the bondholders. There was some lively bidding for the real estate at Hempstead and at Rockville Centre, but the committee took it at $50,000 for each parcel. The committee also bought in the right-of-way over the route between Hicks Neck, west of Freeport, westerly into Rockaway Avenue, Queens, for $115,000.

The rolling stock, including 45 cars, was bought in by Mr. Carruthers for the committee at $11,250. The tracks, including 41 miles, and overhead equipment went to the committee, also represented by Arthur G. Peacock, counsel for the company, at $22,500. The machinery and office equipment went to the committee for $9,500. Mr. Peacock said the line would be abandoned, but he thought service would be continued until the buyers had taken title within 30 days and the courts had dismissed all proceedings.

The sale on Feb. 25 was followed on Feb. 26 by the sale of the rolling stock, buildings, equipment and franchises of the Long Island Electric Railroad. This property went to the American Community Corporation, a real estate concern of Brooklyn. The railway brought $115,000.

$98,196 Decrease in Net in Louisville

Automatic Increase in Fare Followed Reduction in Barometer Fund Below $200,000

All directors and officers were reelected by the Louisville Railway, Louisville, Ky., at the annual meeting of stockholders. Judge Alex P. Humphrey resigned as general counsel for the company. He was succeeded by his son Churchill Humphrey, who had been assistant general counsel. J. J. Blackerby became the employee representative on the board of directors. He is a trainman.

The statement of earnings for the year ended Dec. 31, 1925, compared with 1924 is shown in the table below.

The year 1925 was the third of operation under the ordinance which became effective on Sept. 17, 1922. The net result of three years operation was a reduction of the barometer fund from $350,000 to less than $200,000. As a result the automatic fare provision of the ordinance became effective on Feb. 1, 1926, and the fare was increased from five tickets for 30 cents and 7-cent cash fare to five tickets for 35 cents and 7-cent cash fare.

Passenger traffic during the early months of 1925 was somewhat lighter than for the corresponding period in 1924. The last three months of the year showed considerable gain in traffic, however, and the total passenger traffic, compared with the preceding three years was as follows:

1922	Total passengers carried	91,899,745
1923	Total passengers carried	97,670,397
1924	Total passengers carried	97,739,267
1925	Total passengers carried	97,134,565

President Barnes says the problem of the cars maintaining their scheduled time is becoming more and more difficult to solve. The number of automobile licenses issued in Louisville during the last four years was as follows:

	1922	1923	1924	1925
Trucks	5,551	6,250	7,400	8,083
Private automobiles	26,650	29,891	40,916	46,379
Motorcycles	.....	.....	235	247
Dealers	.....	.....	88	97
	32,201	36,141	48,639	54,806

In this connection Mr. Barnes says the elimination of jitneys would do much toward relieving congestion in the central part of the city and would give considerable additional revenue to the system.

By request of the Board of Public Works and of the Board of Safety, the first loading platform was put in service on Broadway at Fourth Street on Jan. 14, 1926. These loading platforms will be placed at transfer points on Broadway, the other loading points being protected by concrete posts. It is believed that they will be of considerable service to the car passengers and will also speed up automobile traffic on Broadway.

During the year 68 cars were vestibuled and equipped with rear doors and folding steps.

Power economies put into effect in 1923 and 1924 have continued to show good results. The comparative costs of power station operation and maintenance are as follows:

	1922	1923	1924	1925
Car-miles operated, system	13,283,844	13,934,309	14,071,118	13,749,956
Kilowatt-hours, system	51,293,156	52,709,508	53,914,663	52,723,099
Cost of maintenance and operation of power plants	$535,380	$514,843	$454,949	$414,818

COMPARATIVE INCOME STATEMENT OF THE LOUISVILLE RAILWAY

	1925	1924
Operating revenues:		
Revenue from transportation	$4,239,571	$4,247,314
Other operating revenues	189,544	202,364
Total operating revenues	$4,429,115	$4,449,678
Operating expenses	2,962,512	*2,952,612
Net revenue from operations	$1,466,602	$1,497,066
Taxes	431,000	401,000
Operating income	$1,035,602	$1,096,066
Non-operating income:		
Louisville & Interurban Railroad	88,637	126,365
Other non-operating income	10,432	12,165
Total non-operating income	$99,070	$138,530
Gross income	$1,134,673	$1,234,597
Deductions from gross income:		
Interest on bonds and notes	651,750	651,750
Miscellaneous debits	2,366	4,093
Total deductions	$654,116	$655,843
Balance available for dividends on stock	$480,557	$578,753

*Adjusted.

Power has been generated exclusively by the High Street power station since April 7, 1924, although the use of one power house has necessitated a higher degree of maintenance to see that the machinery is operative. Although the Campbell Street plant has been closed down, it is being kept in condition so that in emergency it can be put into service and produce its full complement of power. According to Mr. Barnes the purchase of 8.9 per cent of the company's power requirements from the Louisville Gas & Electric Company since November, 1924, has proved satisfactory and economical.

The company now has 182 miles of single track, of which 140.85 miles is in paved street. Mr. Barnes says:

> Figured on an average life of 25 years in paved street, this would require an average annual replacement of 5.63 miles or 29,726 ft. It will be noticed from the replacement figures for the past four years, which are below this average, that we may expect heavier expenditures in track replacement. The present annual depreciation allowance of $175,000 does not provide for depreciation on track or roadway, so that all our expenditures for these purposes must be carried as maintenance.

The intensive safety work on the

Digitized by Google

property in all departments has been followed up as in previous years. The increased efficiency of operation as a result of this campaign is reflected in the following figures:

	1922	1923	1924	1925
Accidents.....	3,272	3,404	1,825	1,534
Miles operated per accident.....	3,323	3,380	6,390	7,432

This improvement is made in spite of the large increase in number of automobiles and trucks operated. The safety dinners have been continued that are given monthly to the carhouse operating the greatest number of miles per accident, those carhouses also being invited that operate in excess of 25,000 miles per accident. To these safety dinners are also invited the other units on the property that operate three months without an accident.

One hundred and seventy-nine employees of the three companies operated in 1925 without an accident compared with 136 in 1924.

The Louisville Railway Co-operative Association continues to function admirably. The number of employees on the three properties on Dec. 31, 1925, was 1,664. Of these 1,330 are members of the association; a great proportion of the balance of non-members of the association are not eligible on account of age or the temporary nature of their employment.

Of the Connelly award Mr. Barnes said:

During 1925 the company lost one of its most faithful employees, Anthony F. Connelly, chief inspector, who died on Dec. 3. In recognition of his services to the company for a period of more than 50 years, one of the company directors, who does not wish his name to appear, has offered an award, hereafter to be called the "Anthony F. Connelly Award," which will consist of a suitable certificate, a medal and purse of $75 and to which the company will add a trip to the annual American Electric Railway Association convention, to be given to that employee who shall be nominated by fellow-employees and selected as most worthy by an award committee. The award is to be based upon sustained record of excellent public service throughout the year or upon one or more individual instances of unusual and outstanding public service, whichever in the opinion of the award committee constitutes the greatest contribution to public welfare and to the public service record of the company.

Fifty names have been submitted for the 1925 Connelly award. From among them the committee will select the winner. Announcement of the winner will be made in the very near future.

At the close of business on Dec. 31, 1925, all the accumulative and current dividends on the preferred stock had been paid.

Loss in January in Toledo

A net loss of $3,789 to the stabilizing fund resulted from January business of the Community Traction Company, Toledo, Ohio. Gross revenue was cut $20,462 under what it was in January, 1925. The decrease is chiefly due to falling off in riding and lower interurban rentals. Operating costs were $226,767 this January as against $230,613 for January, 1925. Revenue passengers carried totaled 4,344,174 in January compared with 4,477,301 in a similar month of last year.

The company now has 49 one-man cars in operation and a considerable saving has been effected in this operation despite the increase in car mileage from 561,566 passenger car-miles last year to 579,919 car-miles January, 1926.

Traffic, Fare and Wage Figures for January

The number of revenue passengers carried by electric railways during January compared with 4,477,301 in the Electric Railway Association, was slightly greater than the number carried in January, 1925. The rate of increase as compared with the rate shown in the latter months of 1925 is somewhat retarded. The following are the figures for revenue passengers reported by 209 companies for the months of January, 1926, and 1925.

January, 1926	746,133,280
January, 1925	742,450,394
Increase, per cent	0.50

Average cash fares in 272 cities of 25,000 population and over:

Feb. 1, 1926	Jan. 1, 1926	Feb. 1, 1925
7.6470 cents	7.6213 cents	7.4963 cents

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Feb. 1, 1926	Jan. 1, 1926	Feb. 1, 1925
Average hourly rate, cents	56.52	56.30	55.98
Index No. (1913 = 100 per cent)	207.61	206.61	205.43

Hampton Property in Virginia Public Service

Purchase of the Southside Virginia Power Company and formation of a holding company to control Virginia properties has been announced by Fitkin Utilities, Inc. The new holding company will be known as the Virginia Public Service Corporation.

The Southside Virginia Power Company was purchased from Charles and Ira Vaughan, Philadelphia. It operates hydro-electric plants in the south central part of Virginia which distributes through a transmission system at 66,000 volts. The system is connected with the Roanoke Rapids plant of the Virginia Electric Power Company, Richmond.

The Virginia Public Service Corporation becomes a subsidiary of the National Public Service Corporation and includes the Alexandria Light & Power Company, Virginia Western Power Company, Virginia Northern Power Company and Newport News & Hampton Railway, Gas & Electric Company.

Net Income on B.-M. T. Higher.—For the seven months period ended Jan. 31, 1926, operating revenues of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., and affiliated corporations were $26,142,270, against $25,062,625 for a similar period in 1925. The total operating expenses increased from $16,432,352 for the seven months period of 1925 to $17,008,778 in 1926. The gross income was $7,936,636, against $7,484,157 for the 1925 period. After the consideration of income deductions, net income was $3,378,057 for the seven months period ended Jan. 31, 1926, compared with $2,938,133 for a similar period ended Jan. 31 the year previous.

Net Income Increases.—An increase in the net income of the United Railways & Electric Company, Baltimore, in January, after fixed charges, compared with the similar month of last year is shown by the company's report. The total for this January was $70,135, compared with $35,530 for the previous January. Revenue passengers increased from 18,764,851 in January, 1925, to 18,952,322 this January.

Net Income on Brooklyn City Higher.—For the seven months period ended Jan. 31, 1926, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $6,652,393, against $6,625,686 for the seven months period ended Jan. 31, 1925. The net corporate income after income deductions was $852,619 for this year's period, against $819,106 for the seven months period ended Jan. 31, 1925.

Records Show Another Payment on Seattle Purchase.—Another payment has been made by the city of Seattle, Wash., on the street railway purchased from the Puget Sound Power & Light Company in 1918. Ed L. Terry, city treasurer, telegraphed $1,344,825 to the city's fiscal agent in New York to meet payments due March 1. Of this sum, $833,000 is payment on the principal and $291,700 on interest on the railway purchase. The rest was to meet payments on other municipal bonds. The remainder due on the $15,000,000 purchase price of the Seattle Municipal Railway is $10,835,000.

Service Abandoned Until April.—Local trolley service on the New York State Railways in Canandaigua, N. Y., during the winter was discontinued on Feb. 17. Under the terms of its franchise the company is not obliged to furnish trolley service from Dec. 1 to April 1, although this provision has never before been invoked. This action by the railway follows rejection by the city of the company's proposal to replace its electric system with a year-round bus service. Such opposition to this plan developed at hearings that the traction company abandoned the scheme.

January Results in St. Paul Disappointing.—With an increased rate of fare for tokens from 6 cents to six tokens for 40 cents the St. Paul City Railway, St. Paul, Minn., made only $1,924 more in January, 1926, than in January, 1925. Instead of carrying an estimated total of 6,709,000 passengers the number was 6,280,000. Unusually light snows and high temperature are believed to have cut the trolley travel appreciably. The income was about $27,000 short of the allowed 7½ per cent on $16,000,000 valuation. Total operating revenue for the month was $429,263, compared with $425,157 in 1925, but operating expenses advanced from $312,414 to $320,874. On the other hand, through reduction in taxes by the board of abatement of $6,562 for the month the expenses were reduced that amount. Equipment costing $9,000 was extra expense. Gross income for January was an increase of $1,924, or $73,191, compared with $71,266 in 1925.

Personal Items

Tom Elliott Mill Executive

Officer of Car Building Company Becomes President of Big Southern Ginning Company

Thomas Elliott, vice-president and general manager of the Cincinnati Car Company, Winton Place, Cincinnati, Ohio, has been elected president of the Continental Gin Company, with headquarters at Birmingham, Ala. The company has its main plant in Birmingham, with other plants at Prattville, Ala.; Dallas, Memphis and Atlanta for the manufacture of cotton gins, cotton seed crushers, steam engines, Diesel engines and other machinery to operate the gins and crushers. Mr. Elliott and several influential Southern business men recently acquired extensive interests in the company. He expects eventually to take up his residence in Birmingham, but has made no arrangements to leave the car company and will retain some connection with it.

A Field Familiar to Mr. Elliott

Offhand it might seem that this was a big jump by Mr. Elliott from car building to mill manufacturing after 22 years spent in the former, but it is really nothing of the kind. As indicated incidentally in the interview with Mr. Elliott which was published in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 27, page 385, he has back of him an experience along mechanical lines covering many years spent in the South in territory in which the Continental Gin Company now operates. In fact, his appointment to the post at Birmingham is a testimonial to his abilities from associates with whom he first came in contact when he was serving as a master mechanic for the street railways at Atlanta under the McAdoo régime.

His new work is really a throwback to the old days, for in the early '90s he was the master mechanic and chief engineer of a cotton mill at Knoxville, Tenn. One of the big things that he did on this job was to eliminate roll breakage trouble, a source of constant annoyance in all mill operations up to that time.

From Railway Operator to Car Builder

Tom Elliott got into the car building business because he was known never to shirk a job. He went to Cincinnati ostensibly as chief engineer of the Cincinnati Traction Company in charge of cars, overhead lines and the power station. New shops were built too large for the immediate requirements of the system for repair work and it was decided to start construction of cars. Mr. Elliott was drafted for this work temporarily by W. Kesley Schoepf, then president, with instructions to find a man to take charge of the car plant. Impatient of what appeared to him to be delay on the part of Mr. Elliott in filling the post, Mr. Schoepf a few days later calmly announced to Mr. Elliott that since he had not found the man for the job, Mr. Elliott would have to take it for himself. So the destiny was shaped of the man who later became vice-president and general manager of the Cincinnati Car Company.

Everett W. Sweezy General Manager at Alliance

Everett W. Sweezy is the new general manager of the Stark Electric Railroad, Alliance, Ohio. Occasionally a very big job falls to the lot of a young man. This is what happened in the case of Mr. Sweezy, whose sheepskin can hardly show any indication of age, for it is only four years ago that he was graduated from Harvard University. Immediately thereafter he went into business, joining Harris, Forbes & Company, New York, investment bankers, who have specialized in utility issues. He held this position until last summer.

E. W. Sweezy

In his short apprenticeship he impressed his superiors with his ambition and courage. When the need arose in Alliance for some one to command a losing concern, Mr. Sweezy was selected to assist in developing the 32 miles of interurban which operates between Canton and Salem. He has now been studying the transportation problem there for about six months. The company, sold late last year to Eastern capitalists, was forced into the bus business because of competition with the railway. This was before Mr. Sweezy went to that city. His experience, however, has made him a stanch believer in the electric railway as opposed to the bus. Recently he stated that buses were not a serious competitor of a modern street railway service. Largely as a result of his urging, officials of the Stark Electric Railroad have outlined an improvement program for this summer in which about $400,000 will be spent.

D. C. McClure Resigns at St. Joseph

D. C. McClure, who has been general superintendent of the St. Joseph Railway, Light & Power Company, St. Joseph, Mo., for the past two years, has resigned and has gone to Chicago to serve as vice-president of the Central Public Service Company. This company has its headquarters in Chicago, but the actual working organization is spread out over six states. Some of its properties are in Canada. These units are light, gas and power companies in towns of from eight to forty thousand.

Mr. McClure went to the company at St. Joseph two years ago from the Public Service Company of Colorado. He has been with the Doherty organization since 1913 with the exception of two years spent in the army during the World War.

Mr. Kuertz Leaves Cincinnati Post

W. Jerome Kuertz, street railroad director of Cincinnati, Ohio, for the last six years, stepped out of office on March 1 to resume his law practice. Mr. Kuertz tendered his resignation to Col. C. O. Sherrill, city manager, on Jan. 1, but was asked by the city manager to remain in office until various matters connected with the electric railway and motor bus situation in Cincinnati were settled.

Mr. Kuertz established a fine record while in office. He took an important part in the negotiations which brought about the return of the electric railway system to the Cincinnati Street Railway from the Cincinnati Traction Company.

Mr. Kuertz succeeded W. C. Culkins, executive vice-president of the Cincinnati Chamber of Commerce, as street railroad director. Prior to that time, Mr. Kuertz was assistant city solicitor. When former Mayor George P. Carrel was elected four years ago, he reappointed him.

William Kerber, resident manager of the M. A. Hanna Company, is likely to be Mr. Kuertz's successor.

J. E. Carnes Heads Cincinnati Bus Division

Appointment of Jesse E. Carnes in charge of the bus transportation department of the Cincinnati Street Railway, Cincinnati, Ohio, has been announced by J. P. Stewart, general manager. The bus transportation division is a new department. It will be kept entirely separate from the street railway, both in its personnel and auditing.

The railway plans to operate a number of bus routes in connection with its electric system. Mr. Carnes became associated with the company in 1904 as a conductor. Later he was transferred to the schedule department. For the last five years he has been an inspector. The headquarters of the new department will be in the old Reading power house, which is being converted into a garage. Mr. Carnes will be assisted by John Helmlick and Dewey Newport.

A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

C. S. Sale Outlines Production Plans

American Car & Foundry Motors Will Operate Two Plants—Colonel Hall in Charge of Production

Major engineering construction activities of the American Car & Foundry Motors Corporation will be concentrated at the Detroit plant, formerly used for railway car manufacture, according to a recent statement made by C. S. Sale, president of the company. Although some rearrangement of tools and equipment is required for the conversion of this plant, it is in general well adapted to bus production, and the necessary changes have already been started and are progressing rapidly.

Facilities now available at the Detroit plant will make possible the production of 30 vehicles a day. These, together with the property available for expansion there, are expected to take care of production requirements for some time. It is thought this plant will be completed for manufacturing operations about May 1 of this year. Present plans call for the concentration of all standard bus and track construction in Detroit. Special units, on the other hand, will probably be handled at the Fageol plant at Kent, Ohio, as there is a continual demand for various modifications of standard chassis, such as special treads, seating arrangements or other body features. The capacity of the Kent plant will be particularly suited to this work.

In line with the general policy of providing all forms of equipment required by existing transportation agencies maintained by the new Brill Corporation, American Car & Foundry Motors will produce trucks particularly adapted for railway requirements, as well as buses and motors. The first type of truck to be produced will be for high-speed, heavy-duty service on pneumatic tires. Work has also been started on the design of a new smaller bus unit than the standard Fageol chassis. This will embody a smaller six-cylinder engine, which, although of smaller bore and reduced power output, will incorporate the standard Hall-Scott engine design features, which have been so popular on the larger engines. Present plans contemplate the starting of production on these smaller buses some time in July of this year, according to Mr. Sale. In addition, it is expected that the first truck unit will be available by September.

Absorption of the Hall-Scott Motor Corporation brings into the Car & Foundry Motors plant, as vice-president in charge of engineering and production, Col. E. J. Hall, who won world-wide renown during the war as one of the co-designers of the famous Liberty airplane motor. American Car & Foundry Motors shares the good fortune of other companies marshaled under the Brill Corporation banner, in being unusually well equipped with executives and engineering talent of the first order.

New Cars Built for Portsmouth

Portsmouth Public Service Company, Portsmouth, Ohio, recently purchased three new cars from the Cincinnati Car Company, Winton Place, Ohio. These cars are arranged for one or two-man operation, with passengers entering at the front door and leaving at the rear when operated by one man. Each will seat 55 passengers. The seat cushions and backs are of a deep spring construction upholstered in genuine brown Spanish leather. Vestibule seats are of the folding type.

Dimensions and general information follow:

Weights:		
Body	12,155	lb.
Electrical equipment, including four G.E. 25-hp. motors	5,012	lb.
Air brakes, including safety control	1,385	lb.
Trucks	8,248	lb.
Total	26,800	lb.
Length over all	42 ft. 11	in.
Length over body	33 ft. 3	in.
Length of platform	4 ft. 10	in.
Rail to top of trolley base	10 ft. 5 11/16	in.
Rail to bottom of side sill	28 11/16	in.
Rail to step	16	in.
Step to platform	14	in.
Width over all	8 ft. 6 1/8	in.
Post centers	30	in.
Clear height inside	7 ft. 3	in.
Width of seat	37	in.
Width of aisle	25	in.
Door opening	42	in.
Truck centers	23 ft. 9	in.
Wheelbase	5 ft. 0	in.
Size of wheels	26	in.
Doors	Sliding	
Type of heaters	Electric	
Type of ventilators	Exhaust	
Vestibule seats	Folding	

Edward Buker Forms New Concern

Formation of a new firm to handle seating material and seating equipment for steam and electric railways and buses is announced by Edward Buker. The firm will be known as the Coach & Car Equipment Corporation. Its headquarters will be in the Railway Exchange Building, Chicago, Ill.

Mr. Buker heads the organization. He was formerly manager of railroad sales for the Heywood-Wakefield Company, with headquarters in Chicago. He has had long experience in railway affairs, both in actual railway practice and in affiliated manufacturing lines. After he was graduated from the University of Illinois, in 1908, he served for three years as a car apprentice with the Pullman Company. Next he served a number of years in steam railroad work and then entered the employ of the Galena Signal Oil Company in 1919 as a mechanical expert and salesman. A year later he was appointed Western sales manager of the Rome Iron Works. In 1920 he became manager of railroad sales for the Heywood-Wakefield Company.

Brake Shoe Profits Rise

American Brake Shoe & Foundry Company for 1925 reports net operating profit of $2,786,607, against $2,454,904. The earnings, after allowing for preferred dividend requirements, equaled $13.57 a share earned on the 156,093 shares no par value common stock outstanding, against $11.54 a share earned on the common in 1924. After payment of dividends and other deductions the surplus was $1,188,712 and the profit and loss surplus was $8,119,314.

Joseph B. Terbell, chairman, in his report to stockholders, said:

> Our working capital position, which had been depleted during the past few years on account of additions to capital assets, is now $9,569,412. Orders so far received in 1926 show a slight increase over the same period last year.

Edwin B. Meissner Foresees Industry Awakening to Its Opportunity

President of St. Louis Car Company Discusses Status of Car Design Development—Senses a New Spirit of Optimism and Enthusiasm—Believes Industry Is Taking the Initiative in Building Increased Traffic and Good Will

AN INTERVIEW

By Charles Gordon

"THERE is apparent a new spirit in the electric railway industry. There is present a renewed confidence and a revived courage. Enthusiasm has been rapidly growing ever since the last Atlantic City convention. The road ahead looks wider and straighter. The public is awakening to its own needs. It is clearing the route to progress and the industry is becoming alert to the possibilities."

The speaker was Edwin B. Meissner, president St. Louis Car Company. He was answering a question regarding the outlook for the industry. But I attached to his words a deeper significance. To me they seemed in a sense an expression of gratification at the fruition of a cherished desire. They defined not only an existing situation but a long-sought objective. They indicated something of the viewpoint which has supported Ed Meissner in his steady climb from the position of an office boy at $8 a week to the control and presidency, at the age of 41, of the second largest electric car building company in the industry.

We talked in his unpretentious office in St. Louis. With the characteristic reticence of electric railway men toward talking for publication, which has sometimes been a handicap to the exchange of ideas in the industry, he hesitated at an interview. But we met on common ground—a mutual interest in the upbuilding and rejuvenation of an industry.

My first question drew the response quoted at the beginning of this article. It suggests something of the spirit which has dominated the man in maintaining confidence in car building as an enterprise and the electric railway field as a market. Back in 1911 he was suddenly plunged into this business after a long apprenticeship in electric railway operation. That had been a severe apprenticeship, but it developed the determination and persistence that enabled him to wring success from an enterprise beset with many difficulties and discouragements.

When the late John I. Beggs purchased control of the St. Louis Car Company in 1911, Mr. Meissner was taken to St. Louis from the Milwaukee Electric Railway & Light Company and made assistant to the president. In 1916 Mr. Beggs retired from active contact with the car company and Mr. Meissner became vice-president and general manager. In 1924 he was made president. In November, 1925, he demonstrated his continuing faith in the car building business by purchasing Mr. Beggs' controlling interest in the company. At the same time he did something more. He took into partnership all department heads, shop foremen and a large percentage of his employees through the medium of stock ownership. Thus he not only demonstrated his own confidence in the electric railway industry, but he also enlisted that of his subordinates and employees.

Edwin B. Meissner

When he became identified with the car company, it had in its wake a series of reversals and financial difficulties that presented far from an attractive background on which to build. During the succeeding five years the road continued to be a rugged one. To Mr. Meissner's energy and faith largely is attributable the company's survival and progress.

Thus his expression of confidence in the electric railway industry impressed me as being amply supported by the record of his own contact with it. The testimony offered by his experience added conviction to his words and gave increased significance to his views. As we delved further into various phases of present conditions he answered my questions freely, reacting to the opportunity of contributing from his own enthusiasm to the upbuilding of the industry's spirit.

"What has been the principal factor during recent years in limiting the devopment of electric railway equipment?" I asked.

"A delayed awakening to the necessity of improvement," he replied. "Many operators, and their financial superiors, have in a sense lacked an appreciation of the need and demand for something better in railway equipment than has been in use for a number of years. There was a general feeling that electric railway cars were about as efficient and satisfactory as could be desired or expected. This opinion was in the minds of both operators and manufacturers. When competition from automotive vehicles arose, the electric railway industry failed to take the necessary steps promptly to meet the situation. Effort was concentrated on economy rather than on improvements which would attract patronage.

On my further question as to whether a change in viewpoint is materializing, he continued: "Most emphatically yes! Operators and builders alike are today giving increased attention to the factors which make cars more attractive as well as to those that produce economy. Thought is being directed to the lines and appearance of cars in the effort to make them more inviting. Color combinations of exterior and interior are attracting attention as never before."

"Do you think that attractiveness of equipment affects riding even when used for mass transportation in city service?" I persisted.

"For a long time there was only one way to ride," he said. "The public had no choice. It had to be satisfied. The railway industry was lulled into a sense of security—and some carelessness. The automobile brought competition. It brought novelty. It brought unaccustomed luxury. It was backed by the most intensive sales effort the country has ever known. Its use spread from pleasure to business. Comfort, conven-

THIS is the third of a series of interviews with the heads of car building plants and other prominent manufacturers. Rapidly growing interest in the improvement of electric railway equipment throughout the industry makes the views of these manufacturers particularly significant at this time.

Digitized by Google

ience and speed formed an irresistible combination. The cost of transportation became a secondary factor. The American people found something that pleased them and they were ready to forget the cost. Electric railways began to feel the effect in the form of depleted revenues, while their own operating costs mounted rapidly during wartime and post-wartime conditions. The industry struggled for several years but was at a loss to find a way of meeting the new conditions. Economies effected through curtailment of service only aggravated the condition. But today there has emerged a new point of view. The industry has taken the offensive. Improved, attractive equipment has proved itself to be an effective weapon. Congestion and parking difficulties have become allies. Experience is now showing that passenger patronage can be won back to the comparative safety and economy of electric car riding by the provision of equipment which appeals to the American sense of progress and pride."

Here was a summary of the situation that called for further discussion. "Do you feel that the condition of electric railway equipment affects a company's relations with the public in the community it serves." I asked.

"There is no question of that. The public reacts favorably to visible evidence of progress and improvement. Regulatory bodies in turn reflect the viewpoint of the public that they represent. Improved equipment offers the opportunity of winning a more friendly attitude from both the public and its representatives. It is encouraging to note that there is a decided tendency to recognize the problems of the railway industry. Visible evidence of the desire to effect improvements, which is afforded by new and attractive equipment, will lend additional impetus to the present tendency to relieve railways from unfair, restrictive regulatory and taxation burdens."

The subject of regulation naturally suggested rate of fare.

"I believe that the public is fair," he said. "It is more interested in the character of service than in the small difference in cost which usually determines the color of the transportation company's balance sheet. That it is willing to pay for improved service has been demonstrated in several cities where the management has made an earnest effort to provide it. New, lightweight and attractive cars will win a rate of fare ample to support good service and at the same time pay a proper return to the investor. There are many properties today on which improved cars equipped with modern devices for safety and speed have resulted in increased riding and a friendly public disposed to grant financial and operating relief to the railway."

"How do you view the outlook for the small property?" I asked.

"There is ample opportunity for the average small property to improve its situation. Because of the more intimate contact which the small town manager has with his public, he must be particularly alert to the opportunity which this offers. I have in mind a comparatively small property which was about 'on the rocks' because of automotive competition aggravated by the condition of its own cars. These were old, poorly maintained and expensive to operate. The management, taking courage from the example of others who had improved their situation under similar conditions, replaced the old equipment with five new cars. The public responded immediately. Today this little property is in sound condition. Lack of faith in its management would long since have resulted in complete abandonment."

It seemed desirable to develop these subjects further, but there were many other questions in my mind. One of these was noise reduction, and I therefore swung to that. "What are the prospects for reducing the noise of car operation?" I asked.

"Modern cars are in general much less noisy than older equipment," was the reply. "This is partly attributable to lighter weight combined with improved truck and spring design." Much of the noise of present car operation is caused by old heavy and run-down equipment. The cars built during the last few years show a decided improvement in this direction. It must be borne in mind that quiet car operation is dependent upon the condition of the track. Rail joints, crossings and special work in poor condition will cause noisy operation despite improvements in the cars themselves. But modern light-weight cars in themselves make it possible to keep the track on a given property in much better condition. Forgetting for the moment the matter of economy in track construction cost that light cars make possible, it has proved next to impossible, even on expensive types of construction, to keep track in proper condition when joints and crossings are subjected to the pounding of heavy obsolete equipment."

"What, in your opinion, is the outlook for the interurban road?" I asked next.

"The interurban road is coming back strong. Highway congestion is having its inevitable effect. The interurban lines, to a large extent operating on private right-of-way, can be equipped to make faster time and insure a greater degree of safety than is possible on the public highway. Much has been accomplished in improving interurban service by the application of equipment that makes possible frequent headways and high acceleration and braking rates combined with increased passenger comfort."

"Do you consider that light-weight interurban cars can be built for safe operation up to maximum speeds of say 50 or 60 m.p.h.?"

"Under present conditions I would say that the ideal formula from the standpoint of safety and comfort is roughly 1,000 lb. for each mile per hour maximum speed. That is to say, a 50,000-lb. car seems to me to afford the ideal combination of weight and strength for 50 m.p.h. maximum speed operation, whereas higher speeds would probably dictate slightly heavier cars."

"In your opinion, are there any advantages in building cars for such service to weigh above these figures?"

"That to a large degree is a matter of personal opinion and choice for safety and comfort. There seems little reason for increasing weight above 60,000 lb. This, of course, depends upon the size of car desired. For a 50-ft. over-all car, I would set 60,000 lb. as a maximum for operation at speeds of 60 m.p.h. It must be remembered, however, that the advantages of frequent service tend to favor comparatively small cars of the lightest possible construction consistent with safety and comfort. Also that more rapid acceleration and braking obtained with such cars holds down the maximum speed required to make a given schedule speed."

"Does experience in the construction of light-weight cars indicate that it is possible to give the degree of riding comfort in such equipment that can be obtained with heavy construction?"

"Light weight affords the opportunity for improved service through quick acceleration. Riding comfort is dependent on truck and spring design rather than on weight. The automobile industry has learned that weight is not necessary to easy riding. On the contrary some of the comparatively light cars achieve as good as or better riding than do much heavier designs even on rough roads."

"Does the equipment trust method of financing new cars offer a satisfactory method of replacing existing obsolete equipment?"

"I had the privilege of being called on to take part in the discussion at one of the meetings during the October convention of the American Electric Railway Association and the subject of purchasing cars on a deferred payment plan basis was brought up during that meeting. I made a statement that properties in reasonably good standing can purchase cars on a basis of a small per cent down payment with the balance spread over a period of from three to five years and at a cost very little above the cash price. Interest rates on such paper are reasonable because car trust paper is recognized in banking circles as one of the best investment securities."

On the outlook for car building business in 1926 Mr. Meissner said:

"Prospects for the year are very bright. Several sizable orders have been placed and many inquiries are being received. The need of much new equipment is being considered throughout the country. The importance of modernization, which was the keynote of our last convention, seems to have taken hold generally. There is a new spirit in the industry and I look for increasing activity during the current year. By next fall I feel that the industry will have clearly manifested a determination to modernize its equipment and definitely to take the offensive in establishing the convenience, comfort and attractiveness of the service that can be offered by electric railways."

New Westinghouse Company in Japan

Westinghouse products will be distributed thoroughout the Japanese Empire by the Westinghouse Electric Company of Japan, newly organized as a subsidiary of the Westinghouse Electric International Company, to give proper service to the many old as well as the new users of Westinghouse apparatus in Japan. The principal office is in Tokyo.

Bus Maintains Its Position in Limelight

Economic Trends and Present Tendencies in Design Are Pointed Out by Manufacturers—Future of Co-ordinated Bus and Trolley Service Is Predicted—Spirit of Optimism Prevails

SINCE at least 35 per cent of all electric railway lines in the country are now operating co-ordinated bus and trolley service, interest among the operators may naturally be expected to remain at a high point concerning the present and future trends of the bus. Some individuals may be thoroughly "sold" on the bus, believing implicitly in its future; others may be skeptical concerning the surety of that future, but all must agree that the present finds the bus very much alive and one of the greatest aids which the canny operator may turn to his advantage.

By far and large, the balance of opinion among the companies which now operate buses in conjunction with their trolley services seems to favor an attitude of confidence in the future of the bus. Naturally, then, economic trends, tendencies of design, possibilities of further co-ordination of bus and street car service, and such similar subjects continue to occupy a position of importance in the eyes of the industry.

In an effort to give a well-rounded consideration to these various subjects a number of the leading manufacturers of buses were interviewed. Replies from these sources contained much interesting data, and in general the producers were inclined to agree rather closely on the more general phases of the question.

It must be remembered that bus service may roughly be divided into two classes, the first being the application of buses to handling mass transportation in crowded metropolitan districts and the second interurban and commuter service to outlying districts. In the former it is quite natural that emphasis is placed on increased capacities and less attention given to the matter of comfort and of esthetic appearance. In the latter type, however, the trend is all toward the de luxe idea, and there is the opportunity to supply service which will rival the private automobile for comfort and flexibility.

Naturally the adoption of de luxe equipment, enlarged seats, increased knee room, smaller and more attractive appearing vehicles must result in increased fares to the rider. But the average individual is pretty well sold on the idea that "something for nothing" is very much of an anomaly in this world and he is generally willing to pay a fair return for the greater comfort which is his in the newer type of equipment. While the street car is up against certain definite conditions which will prevent the carrying out of this de luxe idea beyond certain limits, because of the fact that it is essentially applicable to mass transportation and must be operated to meet the requirements of the greatest number of people, the bus is not bound by such factors. It may be used in co-ordination with street cars to provide a well-rounded transportation system, adapted alike to the desires and requirements of the banker and the laborer.

Future Rests with Railways

Speaking of the competition between the bus and the previously established forms of transportation A. J. Brosseau, president of the International Motor Company, has this to say:

> It has been said by men in a position to understand the trend of the bus-train-trolley situation that the bus will never supplant completely existing forms of transportation, but will supplement them with the peculiar type of service which the fixed track transit lines cannot supply. It is my sincere belief that the bus question will simmer down shortly to operation on a sound, economic basis. If it is found that it is cheaper to operate buses over a certain route, the bus will be run, but if rail operation is better and cheaper, the rail is the thing.
>
> Existing transportation companies are the logical operators of buses from every viewpoint. They have the capital and the ability to carry on bus operation in a manner that will bring back their former patrons. There is profit in the bus business or it would not continue to exist and to thrive. That profit might just as well be made by the companies who were the pioneers in transportation as by the newcomers.

Carrying on this same vein of thought, Charles H. Wondries, manager of the bus sales department of the Studebaker Corporation, says:

> I believe that this present year will witness the elimination of a great deal of wasteful competition and duplication of service, either through the failure of incompetent operators or the consolidation of competing lines. This step in the development of any business is necessary and will do more than any other thing to promote a healthy and sound growth of bus transportation.

Need for Standardization

Some manufacturers remark the tendency among street railway companies to think that they can design more suitable buses than the producers of that equipment. This, they say, is a continuation of the same tendency that is expressed in the purchase of electric railway rolling stock, wherein each operating company specifies an individual type of car, while in reality a very few types, standardized in their principal features, would doubtless be a whole lot better. In other words a great many of the changes specified by the operating companies are just that—changes and not improvements. The electric railway engineers should get together with the engineers of the bus manufacturers and lay out certain accepted standard designs and then agree to take those standardized models for their own use. In this way the manufacturers believe that a very material saving could be effected in the cost of finished buses.

Types of Buses

No discussion of this nature would be complete without some reference to the gas-electric bus. It looms large in the future because of several very important operating advantages which it has over the mechanical drive. It is still an open question, however, as to whether the gas-electric will effect a saving in operating cost for the reason that it adds considerably to the weight of the job and increases tire and gasoline costs somewhat.

Fageol Motors Company believes that for interurban service what they term the "semi-headroom coach," having the general appearance of an enlarged automobile but with large plate glass windows and luxurious finishings, is apparently the best job and that it will take the place of many of the sedan types which are now making the long runs between cities.

This company also states that there is a noticeable trend toward greater power and a greater number of cylinders. It goes on to say:

> This tendency has been so fast that while we had expected to build about 50 per cent four-cylinder and 50 per cent six-cylinder engines last year, the demand got clear ahead of us, and approximately 80 per cent of our total production was equipped with six-cylinder bus engines. Those manufacturers who have not yet developed the six-cylinder engine will be at a great disadvantage before the present year is over.

On the matter of "service" offered by some manufacturers in connection with their equipment, opinion is divided. Some take the view that this is a highly desirable feature, while others are outspoken in their criticism. The latter group feels that as the railways become more and more familiar with bus operating practice and maintenance methods they will depend less and less upon the service offered by bus manufacturers, preferring to take care of their own maintenance after the established practices in connection with their regular rolling stock. This will put the sales advantage with the manufacturers who are conducting their sales policies along the lines followed by companies selling other equipment in larger volume to the railways, namely, direct factory representation. Thus the distributor, dealer and factory branch will be largely eliminated.

Savings from this step in marketing cost may be expected to reach 50 to 75 per cent, in the opinion of this manufacturer, and he believes that it will be only a matter of a short time before the railways as a whole will realize that this is a sound practice in marketing bus equipment for their use. He says: "The so-called 'service' features offered by the ordinary motor truck marketing system really constitute a very expensive crutch, which is paid for three or four times before you get it, and at least double its regular value after you get it."

Needed Improvements

A number of needed improvements in the bus field in general were suggested. Important among these is the need for an improved type of power transmission, which will get away from the selective type transmission and give a smoothness of accleration comparable to gas-electric operation, but at the same time will eliminate the extra weight necessary for the gas-electric drive. Steering gears of greater strength and durability are also to be desired.

Baggage arrangement is another leading problem in operation over the longer routes. Manufacturers are giving considerable thought to the manner in which baggage should be handled

Digitized by Google

in intercity runs with parlor car types of buses. It seems probable, in the opinion of one official, that this problem will eventually be met by the adoption of separate fast trucks which will enable the companies to accept trunks or packages up to the customary railway limit.

All of the bus manufacturers have passed the practical weight limit, states one concern, and they must begin to scale down on the bulk of material that goes into the units. At the same time the equipment must maintain present capacities or possibly carry even more passengers. Lighter and stronger materials are necessary, together with designs that will give adequate strength, with less material.

Babbitt Metal Consumption in January

The Department of Commerce announces the total apparent consumption of babbitt metal, based on reports received from 27 firms, as 5,151,926 lb. in January, as compared with 4,878,806 in December and 5,683,183 in January, 1925. This consumption is calculated from sales by manufacturers and consumption by those firms (among them several important railroad systems) which consume their own production. In the following table the sales of babbitt metal are shown separately from the consumption in the producing plants:

BABBITT METAL CONSUMPTION

(As shown by sales and consumption by producers, in pounds)

1925	Total (Apparent Consumption)	Sales (By Manufacturers)	Consumption (By Producers)
January	5,683,183	4,620,815	1,062,368
February	5,164,619	4,103,340	1,061,279
March	5,644,288	4,395,901	1,248,387
April	5,126,416	3,928,136	1,198,280
May	5,081,668	4,189,558	892,110
June	5,074,966	4,085,125	989,841
July	5,184,196	3,694,386	1,489,810
August	5,441,823	4,068,706	1,373,117
September	4,621,033	3,579,780	1,041,253

Pressed Steel Car and G. E. Get $5,000,000 Brooklyn Order

Application has been made by the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., to the Transit Commission for approval of a plan for awarding contracts to the General Electric Company and the Pressed Steel Car Company for 67 articulated three-car units. Announcement that the corporation planned to purchase the equipment was made last December.

The order will comprise 201 steel subway car bodies, each three-car unit including four trucks with motors on each truck. The Pressed Steel Car Company submitted the contract for bodies and trucks approved by the B.-M. T. directors and the General Electric Company submitted the approved contract for motors and other electrical equipment. The total cost of the order will be about $5,000,000.

Rolling Stock

Springfield Street Railway, Springfield, Mass., has included the purchase of 50 new cars in its program of improvement outlined for that city, provided the local government meets certain recommendations suggested to it as essential to the proper working out of the plan, digested elsewhere in this issue.

Hydro-Electric Railways, Toronto, Canada, is planning the purchase of twenty double-truck cars for use in Windsor.

Chicago & Joliet Electric Railway, Joliet, Ill., has announced plans to purchase ten new interurban cars for its Joliet to Chicago service. Seven builders have supplied specifications for the new cars and will be asked to submit bids. Each car will have a 52-passenger capacity.

Track and Line

Cincinnati Street Railway, Cincinnati, Ohio, has made application to the Director of Street Railroads of the city to relay the car tracks on Madison Road from Vista Avenue to Elmhurst Place, a distance of ½ mile.

Erie Railways, Erie, Pa., will double-track West Eighth Street from a point 150 ft. east of Poplar Street to a point 100 ft. west of Cascade Street. Under the terms of the ordinance the company is to widen the thoroughfare a full foot on either side between Cherry and Cascade Streets at its own expense.

Memphis Street Railway, Memphis, Tenn., is now improving two projects in trackage, one in the north section and the other in the south. Trilby rail weighing 122 lb. is being put down on both improvements, replacing 70-lb. rail. The equivalent of 4,300 ft. of single track is being installed on the first job and 1,300 ft. on the second.

Pacific Electric Railway, Los Angeles, Cal., will replace with heavier rail 14.7 miles of inbound track between Valley Junction and Vineland near El Monte. This improvement will be started shortly and will entail an expenditure of $296,000. D. W. Pontius, vice-president and general manager of the railway, stated that 90-lb. rails would replace the 70-lb. previously used on this section, which is a part of the main line to Pomona.

Metal, Coal and Material Prices

Metals—New York	Mar. 2, 1926
Copper, electrolytic, cents per lb	14.125
Copper, wire base, cents per lb	16.00
Lead, cents per lb	8.87
Zinc, cents per lb	7.68
Tin, Straits, cents per lb	63.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.725
Somerset mine run, Boston, net tons	2.175
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.575
Central, Ill., screenings, Chicago, net tons	1.125
Kansas screenings, Kansas City, net tons	2.425
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.25
Weatherproof wire base, N.Y., cents per lb.	18.00
Cement, Chicago, net prices, without bags	2.10
Linseed oil (5-bbl. lots), N.Y., cents per lb.	10.08
White lead in oil (100-lb. keg), N. Y., cents per lb	15.50
Turpentine (bbl. lots), N. Y., per gal	$0.98

Power Houses, Shops and Buildings

Cedar Rapids & Marion City Railway, Cedar Rapids, Iowa, has announced plans for the construction of a carhouse, tracks and overhead wiring at its South First Street property at a cost of $225,000. The change will be made to accommodate expansion of the Quaker Oats plant. The new carhouse site is 300 x 140 ft. and two blocks of new track will be laid.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has completed the erection of its new $150,000 garage on Kinnickinnic Avenue, built to house the company's 130 buses. The garage is 183 ft. long and 240 ft. deep.

Altoona & Logan Valley Electric Railway, Altoona, Pa., generating 3,000 kw. for the operation of the cars in Altoona, Juniata, Hollidaysburg and Tyrone, will abandon its power plant and buy power from the Penn Central Light & Power Company, Altoona. Four substations will be erected by the Penn Central, one station at Hutchinsons, east of Altoona, to include two 750-kw. rotaries; one station at Twentieth Street, Altoona, to include two 750-kw. rotaries; one at Lakemont Park Hill, to contain one 500 and one 200-kw. rotary; one at Fostoria, 6 miles from Altoona, to contain two 200-kw. and one 100-kw. rotaries. Work on the substations will be started at once.

Chicago & Joliet Electric Railway, Joliet, Ill., plans to build two new substations at a cost of $240,000. The power stations will provide power for the Joliet city and Lockport lines and the present St. Louis Street plant will be abandoned when the new ones are opened.

Trade Notes

Wagner Electric Corporation, St. Louis, Mo., announces the removal of its Omaha office to 2566 Leavenworth Street on Jan. 25.

F. H. Reagan has been elected president of the Locke Insulator Corporation, Baltimore, Md.

Concrete Products Company of America announces the removal on March 1 of its Eastern sales office from the Chamber of Commerce Building, Newark, N. J., to 1812 Packard Building, Philadelphia, Pa.

H. S. Durant has been appointed manager of the cold rolled strip and spring sales department of the American Steel & Wire Company, Chicago. He succeeds Lewis Johnson, who died recently.

C. V. Root recently joined the Electric Service Supplies Company, Chicago. In 1912 he became affiliated with Stone & Webster and enlisted in 1917. Since then he has been connected with the Western Electric Company, Davis Company and Westinghouse Company. Mr. Root is to cover the Chicago territory in the interests of floodlighting.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Publishing Company, Inc.

CHARLES GORDON, *Editor*

Volume 67 New York, Saturday, March 13, 1926 *Number* 11

Small Properties, Too, Can Benefit from Modernization

OFTEN it is thought that modernization can pay only on large electric railway properties. Such is not the case, however. In a recent issue appeared an article telling how Zanesville, Ohio, is rebuilding its rail service by new cars operated on reconstructed tracks. Study of the comparative operating statements of 1924 and 1925, after a full year of operation of twenty new cars, demonstrates clearly that these cars were responsible for the lion's share of the $48,000 saving in operating expenses.

It is hardly necessary to expand at length on this theme, as the figures speak for themselves. Only a short time ago ELECTRIC RAILWAY JOURNAL told how the Buffalo and Erie was saved from the scrap heap and turned into an earning property by application of similar principles. In a still earlier issue the modernization of the lines connecting the Attleboros in Massachusetts was described. Other examples of this kind that might be mentioned are the New Haven & Shore Line Railway and the Cumberland Traction Company.

Of course certain conditions must exist in order to make possible a profitable rehabilitation of this kind. For one thing, adequate traffic must be available. Most important, however, is the possessing of vision and foresight—and a management with the courage of its convictions.

Changing Public Attitude May Bring Relief from Unwarranted Imposts

MORE and more publicity and public relations work on the part of the utilities is continually urged, and certainly it should go on. The electric light and power industry has done a masterful job in this respect. The gas industry has done well. The steam railroads and the electric railways have followed suit, but have not measured up in their effort to the power companies. Each utility, fortunately, is profiting to a certain extent by the public relations work of the others.

It is becoming more apparent all the time that out of this combined effort there has already come a profound change in the public attitude. The frequency with which men in public office are making political capital out of the utilities is clearly diminishing. City councils and legislatures are tending more and more to grant the appeals of the railways. Courts and juries are fairer in their damage claim awards.

Out of this improving attitude will come the opportunity for obtaining relief from burdensome imposts which never have been in the best interests of the public, but from which until recently it was almost hopeless to expect relief. Such burdens include the cost of street paving and paving repair, free transportation of policemen, firemen and postmen, franchise taxes and various other imposts whose justification, if there ever was any, dates back to the days of the horse car. But with the public becoming very much enlightened on these matters and with the growth of a general disposition to be fair to the utilities, steps taken to remove the unjust obligations may be expected to meet with greater sucess than in the past. In other words, past failures to obtain relief from these burdens are of little significance now in the light of new public understanding. As time goes on, renewed effort to win such relief in the interest of improved service is more than warranted. Certainly the car rider should not have to pay for anything that does not contribute to the service he receives.

Capital Is an Immediate Need

PERHAPS the greatest need of the electric railways today is capital. How to get it is a problem that is puzzling many managements. Were capital readily available, there are many improvements that could be made, which, modernizing the system, would materially enhance its ability to earn a satisfactory return on the investment.

Much progress has been made during the last five years in improving the status of the industry. Relations with the public are better. The essentiality and permanence of the electric railway have been established. The place of the bus with respect to the rail systems is being better understood. The fixed fare idea has been overcome in most communities. Other fundamentals in the railway situation have been similarly improved. The course to follow, looking toward modernizing the railways and merchandising the rides, has been pretty clearly charted. But it all requires capital.

Seeking capital the railways find that the financial market reflects past conditions, not present. Investors are not yet aware of the very much better position that the electric railways occupy. This makes new financing difficult, and without a greater flow of capital to the industry improvement in earnings is slow.

Employee and customer ownership as a means of distributing securities can be applied to electric railways, as it has been to central stations. It is but a few years ago that electric light companies were forced to resort to this form of financing because the usual methods were too expensive. Now money for junior securities is flowing in so readily to this industry that there is a tendency to revert back to the sale of bonds through banking channels because such money can be secured at very low rates.

No less an authority on utility finance than Samuel Insull said recently that he would far rather sell junior securities of his companies to customers at a discount and with a point or two higher interest rate than to finance by means of senior securities sold at par

Digitized by Google

but distributed to investors all over the country. If it can be shown to be wise to put further money into a railway property, that money can be secured through the employee-customer ownership plan with its further advantage of stockholder influence on public relations.

The procedure is simple. First, the executives must be sold on their own company. Then the employees may be sold a financial interest and partnership in the business. Together, then, management and employees have the confidence and enthusiasm which are necessary in selling securities to the public. Once this thing gets started it is like a snowball. The initial capital brings certain improvement in the plant—probably new cars first, because they are the show window of the business. The new cars reduce operating costs and attract additional passengers, so that the net earnings are substantially improved. Improved earnings attract more capital—more capital and more stockholder friends. And so the cycle goes on cumulatively. The difficult period is the start. The course of action is well charted. The industry needs only the will to proceed.

Lo! the Poor Phoenix Railway Not at Death's Door After All

WHEN a horse is sick, call a veterinarian; when a person is sick, call a doctor; but when a street car system is ill even unto death, call an ex-navy man and a specialist in aviation affairs for learned consultation. Such, apparently, was the line of reasoning adopted by the city authorities of Phœnix, Ariz., recently, when they persuaded Commander Abner B. Clements, U.S.N., retired, and J. Frederick Richardson, an expert investigator into the status of air service and Shipping Board affairs, to make a comprehensive survey of the street railway situation, with a view to suggesting ways and means of resuscitating the innocent victim of circumstance.

These two worthies, who happened to be visiting Phœnix at the time, proceeded to make a cursory examination of the patient's condition, and immediately ascertained that the illness was of an economic nature and had nothing to do with operating conditions on the road. They prescribed a bit of osteopathic treatment to the financing of the company and assured the Mayor and City Commissioners that this would soon put the invalid back on its feet once more.

Perhaps the eminent consultants were entirely correct in their diagnosis, but on the face of the thing it is not greatly to be wondered at that a number of citizens of Arizona's capital were moved to a bit of rude humor in discussing these developments. They had witnessed the failure of the city fathers to adopt the so-called Alexander plan, which had been proposed by a group of public-spirited local citizens to meet the exigencies of the situation and which had received the approbation of the special committee of citizens appointed by the former Mayor to settle the transportation question once and for all. Now two gentlemen from the East, with no apparent acquaintance in railway affairs, had presumed to dispose of the whole matter with the simple statement that a little proper financing would do the trick.

The constant turmoil which has surrounded railway affairs ever since the properties passed into the hands of the city some months ago would seem to indicate that a real solution will never be found as long as the railway remains under municipal control. City politics and operating efficiency are frequently poured into the same dish, with the same salubrious results that oil and water would give. If the Phœnix politicians are unwilling to trust local interests with the destinies of the railway they should continue with their avowed intention of finding outside interests who will take it over and properly rehabilitate the property. If financing is needed, and it unquestionably is, it should be provided by private rather than public capital.

Highway Crossing Signs that Father Used Are Not Sufficient Today

"DESPITE the 'Safety First' crusade, despite the glaring newspaper headlines telling of the grizzly harvest of death upon the highways, and despite the knowledge that more people were killed by automobiles last year in the United States than now live in some of the populous counties of Texas and more people injured than now live in the city of Dallas, this tournament with death goes on." Such is a single paragraph from the annual report of Texas Electric Railway. Here is a concrete expression of the ever-increasing reckless driving that Jack Beall sees so clearly.

There is perhaps no problem so vital to the operation of electric railways as that of safety. Not only is it of paramount interest as viewed from the financial aspect of the railroad itself, but from the humanitarian angle as well it demands the most intimate attention. There probably is no industry that has contributed more than that of the electric railways to the promotion of safety work of a public nature, but certainly the work is not done. More co-operation is necessary and even greater effort must be expended before this self-destruction can be curbed.

Mr. Beall continues in his annual report: "In some states the law requires the driver of an automobile to stop before going over a railroad crossing. It is an easy thing to do. It is the safe thing to do. With this done there would be no crossing accidents. Would this be an unreasonable requirement of the auto driver? The laws of Texas now require all railway trains to stop before going over the tracks of another railway unless the crossing is otherwise protected. Likewise, all interurban cars are brought to a full stop before going over railroad crossings. Under city ordinances, street cars must stop before going over a railroad crossing. The law imposes this duty upon the railway companies in the interest of human safety and surely the law may properly require of a man as much care for the protection of himself, his wife, or his children as it now requires of a railroad for the protection of its passengers. . . ."

In Pennsylvania it is almost impossible for an autoist to recover from a railway if a collision occurs unless the driver can prove that he "stopped, looked and listened" before crossing the track. Even so, automobile drivers pay but little attention to this condition. It would appear that immediate effort must be directed toward continued education of the drivers and to the end of providing more and better warning signals at railway crossings.

Crossing protection is in a measure similar to the signal system of a railway. In early days of slow and infrequent trains even single-track roads could be safely dispatched by the old system of train orders. Many

Digitized by Google

are today. As the frequency and speed of trains increased, these orders were supplemented by a very elaborate system of block signals, automatic in their operation. In olden days the familiar crossing signal constructed of wood and placed on the edge of the railroad right-of-way was sufficient to warn the driver of a team of horses that he was about to cross a railroad track. Today, horse-drawn vehicles are of minor importance. Fast-moving automobiles have not only taken their place, but have exceeded them in numbers many times over. Besides this, night driving has become more and more a thing to be reckoned with.

Despite these conditions very little has been done to improve the average highway warning signs used at crossings over railroads. The same old wooden crossing sign is placed on the edge of the right-of-way, so close to the track that the driver has little or no warning that he is approaching the railroad tracks. At night these signs are hard to see, and too often the automobile driver does not realize that he is about to cross a track until he actually feels his car go over the rails.

Regulatory bodies today are demanding train control for the more important Class I railroads to increase protection. It might be better to turn their attention to protecting automobilists as well. Crossing signs should be farther back from the railroad track, with two of them, if necessary, one on each side. One of these at least should be illuminated at night either directly or by reflection from headlights. The expense should not be great. But however large it might be, it is of little consequence compared with the cost if a bad accident was caused by their absence.

Cleveland a Good Choice for 1926 Convention

SELECTION of Cleveland for the 45th convention of the American Electric Railway Association is a very fortunate choice. The new public auditorium is one of the finest and best equipped exhibition halls in the country. The floor space of the auditorium will be augmented by the construction of a large building directly adjoining. In addition there will be provision for display of cars and for outdoor exhibits, so that construction machinery can be shown in operation, something impossible in previous exhibits.

The committee in charge has been assured that hotel accommodations will be ample. Investigation has shown that the hotel space reserved for the association will include as many rooms as were utilized last year at Atlantic City. The downtown hotels are as near the auditorium as the most of the Boardwalk hotels are to the pier.

As to cost, everything favors Cleveland. With increases asked this year by the various Atlantic City interests, there should be a material saving all along the line. The price set for space, 75 cents per square foot, is the same that would have been necessary had the convention gone to Atlantic City this year. In the matter of handling and placing exhibit material, the advantage of having available rail facilities directly into the building is worth a great deal and will reduce costs.

Cleveland as the convention city for this year has many advantages apart from those mentioned. The association has gone to Atlantic City for the past three years, breaking the old custom of alternating with some city further west. Cleveland is centrally located, and many companies can send large delegations at a moderate cost, where but a few officers could go to Atlantic City for the same expenditure. There are many important developments in the central territory, particularly in the bus field, so that it is well to make it possible for delegates to spend some time inspecting them before or after the convention.

Many of the manufacturers have their plants near Cleveland, so that it will not be difficult for them to send excellent exhibits. It will be particularly helpful to have working exhibits. The layout will be such that all the buses can be shown together and to advantage. This will be a great advance over last year's situation, which was not entirely satisfactory to any one.

With all these conditions so favorable, everything points to this year as offering possibilities for the best convention in the history of the association. Railway men and manufacturers should see to it that this prediction is borne out.

Trial by Jury as a Means of Making Cars More Comfortable

IF THE PROOF of a pudding is in the eating, surely the real test of a seat is in the sitting. That at least was the thought that actuated the management of the Chicago, Aurora & Elgin Railroad to select a jury from among its employees to try the merits of different types of car seats. Men and women, tall and short, fat and lean, were chosen to perform this judicial function. The old standard seat used on the cars of this company was tried along with modifications suggested by various seat manufacturers and others proposed in a report made by a committee of the Society of Automotive Engineers dealing with automobile design.

Several interesting points were brought out by the comments of the jury. It was the consensus of opinion that the old standard seats were too high from the floor. The women particularly objected to this feature. Moreover, it was found that the most comfortable design was one in which the cushion slanted slightly backward instead of being horizontal. Investigation was made also to discover the proper angle to have between the back of the seat and the cushion. Details of the findings of the jury are given in an article in this issue.

After a new standard seat design was selected based on the findings of the jury, the matter of car steps was considered. Here again the comments of a diverse group of people were found to be very illuminating. The step arrangement finally included in the design of new cars built for this company differed in several important respects from the arrangement formerly used.

Whether or not the type of seat and step found most satisfactory for the Chicago, Aurora & Elgin Railroad would prove equally satisfactory under other conditions is impossible to tell. The point is, however, that the method of selection used by this company developed a design satisfactory for its own use, as proved by the favorable comment received from passengers after the cars began operation. While the plan of selection used is perhaps a novel one, it may well be worth consideration by other managers contemplating the purchase of new equipment.

Transportation Men Must Supply Facts

Newspaper Comment on New York City Bus Proposal Reflects Colossal Misunderstanding by Press Not Only of New York Conditions, but of General Transportation Question—Great Need for Railway Men to Correct Popular Impression that Is Both False and Misleading

NEWSPAPER comments on the plan recently advanced for the partial substitution of buses for street cars in New York continue in an unending stream. Here and there among these expressions of opinion are found commentators who show some real appreciation of the conditions underlying this latest suggestion, but by and large these comments from papers other than those published in New York show very little understanding of the New York problem. What is far more important, they reflect a lack of knowledge of the fundamental factors in the local transportation problem of the country. Therein does the danger lie to the industry—not only the railway but the bus itself. With the end in view of presenting the situation for the information of the industry, two editorials were published in the JOURNAL last week. Extracts reproduced here from expressions of opinion by newspapers show how wide is the misapprehension of the New York situation and how far afield is much of the editorial thinking, best illustrated by a single phrase in the statement of one of the commentators that "this proposal marks the beginning of the end of surface lines not only in New York but in other cities."

Traction men can ill afford to stand idly by and permit such comment to be spread broadcast without attempting to correct it. Transportation is an engineering and economic problem. The place of the bus is becoming more clearly established as its development proceeds. Unless the public is properly educated to its functions untold damage may be done, not only to existing railway investments but to the future of the bus itself. Demand for wholesale and unwarranted substitution of buses for street cars would force the bus to assume the burdens of a mass transportation agency. It would tend to drag bus fares to the level of railway fares. It would seriously prevent the development of the preferred type of service to which the bus is inherently adapted. Both railway and bus operators should unite in correcting the misunderstanding of the New York situation. A digest of current newspaper opinion shows the character of the comment that is now going to the public.

Necessarily the clippings that have so far come to hand reflect for the most part the sentiment of papers in the East, but the number of items presages a deluge of similar comments by papers from all parts of the country, with the distortion of facts likely to vary with the square of the distance. Captions are harmless that read "Buses and Electric Cars," "Street Cars or Buses?" "Bus Is Here to Stay," "Experimentation in Buses in New York," "Buses and Trolley Cars," but it can hardly be said that captions are either constructive or in accordance with the facts that read "Discarding the Street Cars," "Banishing the Street Car," "Buses Crowding Out Surface Cars," as many of the comments were headed.

The subject was taken up by some of the syndicates. One of these with a string of papers prepared for distribution a story reviewing very briefly the history of transportation in New York City. It carried in at least one instance the heading "New York Driving Trolleys Off Streets to Give Way to More Modern Motor Bus." That in itself was bad enough, but the writer of the story was apparently put to it to find a striking first paragraph with which to entice his reader. This is what he concocted:

"And now it seems that the street car, which these many days has been getting in the way of impatient motorists, is on its bumpety way to the discard, at least so far as New York is concerned. Those paternal souls, the city fathers, have before them a scheme by which the last of these somewhat obsolete vehicles would give way within the near future to the more tractable motor bus.

SOME UNUSUALLY UNFAIR COMMENT

One may dip into the pile of comments almost anywhere and run across expressions similar to that of the Chicago *Journal* to the effect that "the trolley is obsolescent." That paper expresses the opinion that New York may discuss the question of fares and "may obstruct the abandonment of the electric surface cars," but it says that "the notice of the consolidation of the two companies dooms the surface car which runs on steel tracks and steel wheels."

The *Jersey Observer* holds to a similar view. It says that "the surface trolley will vanish from the streets of New York if the plans submitted are accepted by the city officials." That, in substance, is the opening sentence of its editorial "Buses Crowding Out Surface Cars." That paper then pretends to give its readers a summary of the proposal. Its view is that it "costs less to operate the buses."

SUBJECT REACHES CANADA

The Toronto *Globe* contrasts the situation in that city with that in New York. It revives the old idea of the survival of the fittest. Apparently forgetting that the fittest is the best only for a particular environment, it proceeds to generalize. The *Globe* holds to the view that "it cannot be denied that surface lines slow up traffic and contribute to congestion, while it is possible with the elastic bus system to use more streets and distribute traffic to better advantage." It sees hope for the street railway only in speeding up service.

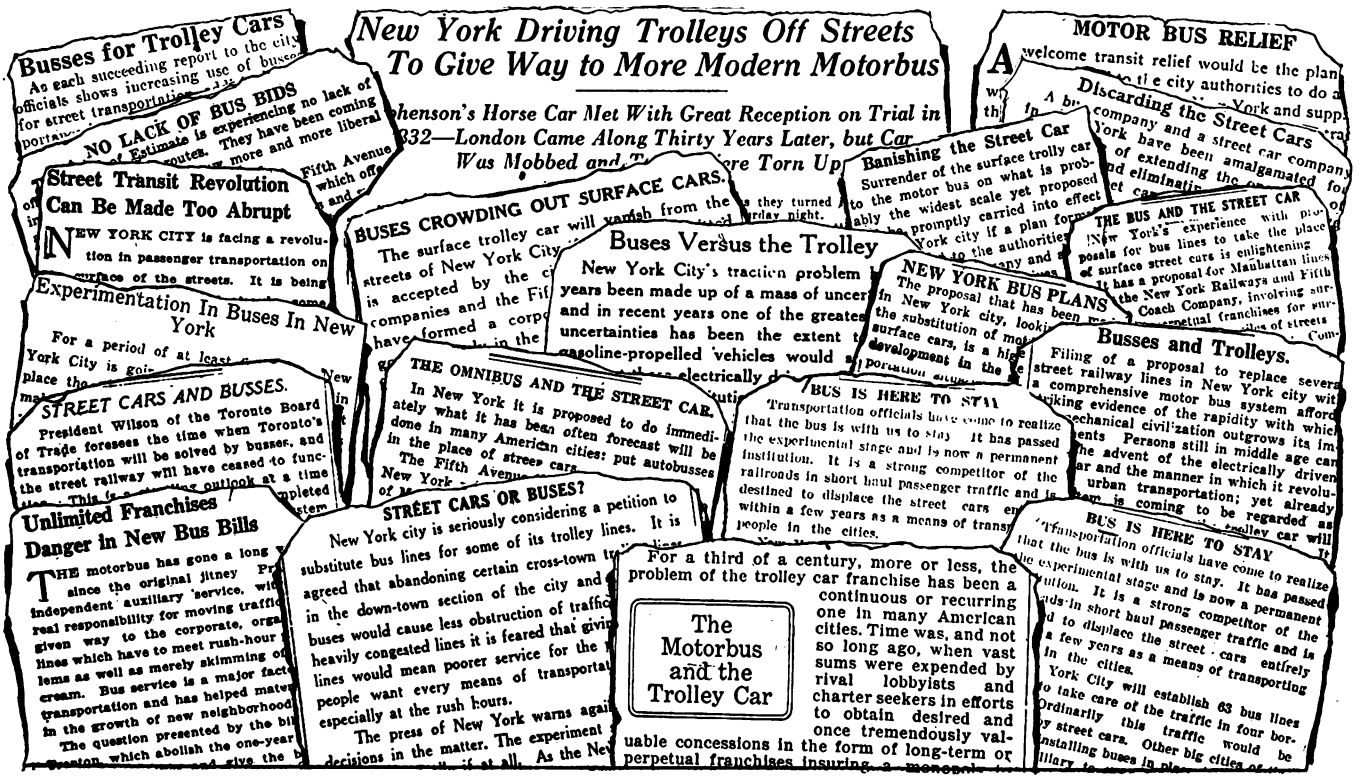
The Philadelphia *Record* expresses the view that the electric railway "is coming to be regarded as archaic and conceivably the trolley car will one day survive only as a museum relic." It sees in its own city a change under way to the bus and it says "it is certain at least that in our overcrowded cities the electric railway is to be largely displaced by the motor bus." Its idea is that "congestion in the business districts of popular cities has become so serious that car tracks and trolley wires

Digitized by Google

and poles present obstacles to traffic which are productive not only of costly delay and inconvenience, but likewise of danger to life and property." The view which it holds is that "the elimination of the electric railway from all such thoroughfares will ultimately be required." It says that "the obvious means of meeting the needs of public transportation is the motor-driven omnibus." In a concluding paragraph that paper tells its readers that "the enormous surface traffic in the city of London is handled exclusively by motor bus services." It then says that "the adoption of the same method in popular American communities is daily becoming more expedient."

Opinion expressed by the Philadelphia *Ledger* is to it thinks that the acceptance of the proposal "will be a step in that direction." It expresses the belief that "if buses can be provided of sufficiently flexible capacity to meet requirements at all hours of the day, banishment of the street cars on the scale proposed should result in the giving of better and perhaps safer service."

As the *Wall Street News* sees it the people of New York "hold no brief for the trolley or for the bus *per se*." It says that "this threat of wholesale substitution has been constantly in the background, affecting seriously the credit of the street railways and making it easy to draw the hasty conclusion that the days of the trolley were numbered." It calls attention to the fact that the figures of passengers carried on the trol-



Tons of Newspaper Comment Conveyed in Captions to Editorials

the effect that the "talk of substituting bus services for many of the existing crosstown and other trolley lines in New York City is in line with the modern drift in the street railway field." It says of the bus that "if its wider adoption will mean the ultimate removal of the tracks in crowded city centers the innovation will be welcome."

More Conservative Viewpoints

The Asheville, N. C., *Times* says that "the announcement makes clear the fact that the trolley car is not being discarded entirely and that there are some who have considerable doubt as to the advantages of the bus." It sees "the passing of the trolley as a fact, if at the end of the test period it is found the bus is cheaper to operate and that it is safe and more easily handled in traffic."

The Springfield *Republican* refers to the New York proposal as a "bold offer." Its opinion is that "the surface railroad has had hard work to keep above water, as street traffic congestion has constantly reduced the efficiency and the patronage of New York's surface lines." It does not expect that the execution of the proposal will make "New York a trolleyless city," but leys in Manhattan last year speak for themselves, in that these lines transported almost half as many passengers as did the Interborough in the subway and some 2,000,000 more than did the elevated lines. It says that one result of the franker discussion of the place of the bus "as a substitute for the trolley will be a wider realization of the magnitude of the service which the trolley is rendering today." It raises a question about "the extent to which the trolleys themselves could meet the demand for improved service if given a 10-cent fare on the long hauls."

Much more conservative than many of the other comments is an editorial in the Syracuse *Post-Standard*. That paper says that "it is proposed in New York to do immediately what it has been often forecast will be done in many American cities: put auto buses in place of street cars." After this opening sentence it discusses the terms of the proposal submitted and says in conclusion that "the New York proposal does not necessarily mean a revolution in other cities." As the Springfield, Mass., *News* sees it the New York proposal "is a highly significant development in the modern transportation situation." It sees New York as a possible "experiment station wherein all the cities of the

Digitized by Google

country could study the problem of bus substitution for trolleys before deciding whether or not it would be wise for them to follow suit."

Experiments with the bus, cautions the Holyoke *Telegram,* should be undertaken gradually if at all. That paper, however, holds that "if one or the other competitor must be abandoned it seems more rational to abandon the trolley lines." The *Telegram* says "it does seem as if a reasonable compromise could be adopted between the two modes of transportation, preserving the merits of both." From observations which it has made of the problem, that paper says that the compromise of which it speaks "has worked well in cities where the trolley systems have taken over the bus lines on seriously competitive routes, dropped track lines that do not pay and used their own buses instead."

It is regarded by the Philadelphia *Bulletin* as advantageous to the city of New York "to have such a number and variety of bus plans laid before it for consideration, regardless of the open question whether the bus is able at all times and under all circumstances to give better transportation service than the street car." The New York *Review* pretends to the belief that "cars on tracks in crowded cities have served their purpose and outlived their usefulness and a more pliable and modern system of transportation is required." In conclusion it says that "buses in place of trolleys, no matter what the fare, will be an improvement devoutly to be thankful for."

Comment by the *Christian Science Monitor* takes a different tack than that of many of its contemporaries. That paper discusses the gradual evolution in transportation. It refers to the offer "as a sweeping proposal" and says that if the offer is accepted the change "would be as revolutionary as that wrought when the trolley rendered the old-time horse car obsolete." It says the plan "marks but another phase of that somewhat more gradual change which is taking place on the country roads and highways." Its idea is that "the bus franchise which today is so highly regarded may, a few years hence, be offered in exchange for the exclusive privilege of operating air taxicabs over a prescribed area."

The Newark *Star-Eagle* says that the New York suggestion has accentuated the importance of the question "whether the trolley should not be abolished." Its treatment of the subject was very short. It sees the Public Service Railway confronted with "conditions similar to those in the metropolis." In conclusion that paper said that "trolley cars may remain convenient for interurban travel, but the lines should be taken off congested streets."

Press of Metropolis More Cautious

So far as acceptance or rejection of the New York proposal is concerned, the New York *World* says "there should be no hurry in the matter." That paper is cognizant of the number of passengers being carried by the surface lines and says: "Particularly should the city go slow in substituting buses for up and down town surface roads in active operation." In conclusion it says that "no risks must be taken in substitutions that any of this traffic be forced into the already congested subway and elevated channels." According to it "bus substitution on a broadening scale has come. The day of the surface railway is evidently waning and from downtown Manhattan it has already gone."

Buses are "destined to play a much larger part in New York transportation," according to the New York *Herald.* It says this is "the one feature on which we are all in agreement." Under the circumstances it counsels public officials to move slowly, "developing and modifying as experience teaches us." More light is needed on "the most efficient type of bus, the cost of operation, on long and short hauls, question of standees and the element of time."

New York City is "facing a revolution in passenger transportation on the surface of the streets," according to the Newark *News.* It says that "neither in New York nor in Newark will the bus push the trolley off the track with a single shove." If that should be tried "it will cause disruption of traffic, financial disaster and create unnecessary perils to life and limb." It says that "the passing of the trolley should not be so abrupt as to cause a total loss to those owning them." Substitution of the bus for the trolley "will not be warranted until it has been demonstrated that the bus can in all contingencies perform the task better than the street car." This New Jersey paper sees in the increased use of buses in its own city "incidents showing the drift in street transportation." It says the "importance of the trolley is on the decline." In its opinion the working out of the problem in New York "will be watched in every part of the country, and in no city with more interest than Newark, where we already have more than a speaking acquaintance with both the good and the bad points of the bus."

The Brooklyn *Daily Eagle* says "it is manifestly desirable to get rid of some surface lines over which little more than a show of service is maintained," but that it is "manifestly desirable to preserve other surface lines, especially in this borough and Queens." The *Standard Union,* also of Brooklyn, says "there ought to be no haste in scrapping the trolley lines in any borough." As it sees it, the principal question to be answered is "whether the car-riding public wants them retained." Its idea is that "if a negative answer can be verified let them (the trolleys) go, but not until then." The Brooklyn *Times* says that the omnibus service must be thoroughly correlated with trolley and subway and such elevated lines as are allowed to continue in the streets. It says "there should be no creation of independent companies to complicate the transit situation of the future." The New York *News* points out that "with a whole system of transportation eliminated and replaced by bus lines the passenger's choice would be narrowed almost to the point of no choice." That paper's concern was not so much with the question of the bus versus the trolley car as it was with trying to make a popular issue out of the 5-cent fare.

"Too much is at stake to warrant hasty action on applications for bus franchises," is the opinion of the New York *Post.* As it saw the matter, "ultimately the surface car may disappear. But ultimately may not mean today or tomorrow. Last year the surface cars in Manhattan carried more than 350,000,000. They serve 2,000,000 more persons than were served by the elevated and nearly half as many as were served by the congested Interborough." The *Post* holds to the belief that "it will take some experimenting to discover whether the bus at present is adapted to city-wide use."

By no means does this exhaust the comment. It takes no account of editorials beginning to appear in the central and the far West. The extracts do, however, show the trend of thought, while the number of the papers which used the topic for a text shows the extent to which it is receiving public attention.

New Altitude Record for the P.R.T. in Recent Stock Sale

Issue of $10,000,000 Considerably Oversubscribed in Ten Days—List of Stockholders Reads Like an Outline of All Human Activities—A Large Block Still Held in Reserve

"BUTCHER, baker, candlestick maker"—every trade, every profession, practically every walk of life is represented among the purchasers of the recent $10,000,000 preferred stock issue of the Philadelphia Rapid Transit Company. The bank president does not scorn to stand in line at the subway entrance to make his weekly payment on his subscription, nor is the office girl so needful of a "boyish bob" that she cannot spare a dollar a week toward a single share in this novel investment scheme. It is savings reduced to the last word in simplicity.

This undertaking was no exception to the general rule of Mitten Management to do things in a thoroughgoing way. As evidence, but ten days was required to oversubscribe an issue of $10,000,000—a million dollars a day—and the people of Philadelphia evidently would have been quite willing to take on several more millions at the same time had the opportunity been given to them.

Results such as these are not to be obtained from any hasty overnight planning. Before even a breath of rumor had become current in the city concerning the possibility of a major stock issue, a campaign complete to the last and most minute detail had been worked out by the company. No general with the fate of a nation in his hands ever went into battle with a more carefully outlined plan of action.

Cannily, P. R. T. decided with this issue, as with the one of a year ago, to kill two birds with one stone. In other words, it was not only desired to secure a certain sum of money, but also further to cement the bond of co-operation and friendship between the traction company and its patrons. Obviously, one of the best means of accomplishing this latter end was to induce the aforesaid patrons to become joint owners of the company, since no man is prone to criticise too fiercely something in which he himself is financially interested. This does not imply that the operation of P. R. T. is open to criticism by its patrons, but a pointed analogy may be drawn with the case of the man who owns a few shares of stock in a certain oil company. Quite naturally he will be inclined to replenish his gasoline supply with the product of the concern which is paying him dividends. In other words, when car rides mean dollars in the pockets of the stockholders, Philadelphians will be more inclined to make use of the public transportation facilities if they have even a very small financial interest in them.

Probably the most interesting phase of the entire development in connection with this stock issue is the element of democracy which characterizes the list of purchasers. This spirit was, of course, deliberately fostered by the publicity department of the company itself in preparing for the campaign. A very complete series of advertisements was run in all of the Philadelphia papers, Jan. 21 to Feb. 1. Not only did

Riders on the Cars of the P. R. T. Were Certainly Kept Well Posted by Informative Advertisements

Digitized by Google

these graphic sales arguments appeal to the various elements of the working class and to professional men and others falling into the salary category, but emphasis was also laid on an appeal to certain primitive instincts and emotions, such as providing for the financial safety of wives and children, teaching the habits of thrift to boys and girls, preparing for independent old age, and similar appeals. Besides the regular English newspapers of Philadelphia, the advertising program was expanded to include two German publications, an Italian, a Jewish and a Hungarian paper, and one paper which catered wholly to the negro population. This was done because it was found in the previous campaign that a large percentage of the purchasers of P. R. T. stock had been made up of the foreign element.

Investors Appreciate Time-Payment Plan

The sale, which was closed, considerably oversubscribed, on the evening of Feb. 1, was a 7 per cent preferred stock issue of 200,000 shares at $50 par value. The stock was open to subscription by individuals in lots of one to 20 shares, which might either be paid for in full or purchased at the rate of $1 per share per week until the full amount had been paid over. The latter alternative, of course, is a very real boon to the individual in straitened financial circumstances, especially since no interest charges are made on such portions of the subscription which remain to be paid. Many expressions of appreciation have been received by P. R. T. for this opportunity which has been extended to the small investor. Typical of these, the following excerpt is cited from the letter of a woman subscriber: "I am buying two shares of your stock. I think it was a remarkable idea to help poor people who really could not afford to pay cash for it and would like to own something for a rainy day. I am all through paying now, and hope soon to be in a position to buy some more."

No one was permitted to purchase more than 20 shares of stock of this one issue, since the company desired to make its list of stockholders just as extensive as possible. The safety of this investment is unquestioned by the stockholders, so wholesome is the respect with which Mitten Managament is regarded by Philadelphians generally.

Operation of the campaign was as follows: Applications for the purchase of stock were made either in person or by mail to the various offices of P. R. T. securities. Following acceptance of the application by the company, those subscribers who had signified their desire to avail themselves of the installment plan of purchase were notified to begin making their weekly payments. Since these may be made to any subway or elevated cashier or to any conductor of the company, the acme of convenience is accorded to the stockholders. In case any individual decides that he cannot go on with his payments, all money paid up to that time will be returned and the stock resold to another person. A receipt is given for each payment and when the full amount has been paid in the stock certificate becomes the property of the subscriber.

This stock is callable at $55 a share. Money derived from the sale of the present issue will be used toward:

Making ordinary extensions and improvements to the transit system.

Building track extensions to serve the Sesqui-Centennial Exposition and to encourage the building of homes in South Philadelphia.

Building and improving motor bus garages, carhouses and power stations.

Purchasing and rehabilitating the Frankford, Tacony & Holmesburg Railway.

Retiring senior securities and replacing in P. R. T. treasury money temporarily taken from P. R. T. reserves for improvements and extensions.

Employees of P. R. T. were encouraged not only to further the sale of stock among patrons of the company but to invest in the securities themselves. All such stock subscriptions are paid for by deduction from pay envelopes. This gives P. R. T. employees two types of saving, the savings fund and the wage fund.

In February, 1925, the first large block of P. R. T. 7 per cent preferred stock was placed on the market; 60,000 shares was the size of the issue and 14,000 car riders oversubscribed this issue in six days. This was no mean record in itself, but the record of the second issue has completely overshadowed it. The remaining block of 100,000 shares is being held in reserve and may later be placed on the market to finance the purchase of the taxicabs by P. R. T.

A List of Typical P.R.T. Stockholders

Nurse	Manicurist	Nickel Plater
Writer	Bench Hand	Carpet Cleaner
Plasterer	Landscape Gardener	Caterer
Florist	Chauffeur	Hairdresser

Confectioner	Chemist	Bootblack
Tree Surgeon		

Insurance Plan Popular with Chicago Employees

A NEW feature for the benefit of employees of the Chicago Rapid Transit Company and their dependents in the form of group insurance was introduced by the company at the beginning of 1925. Through an arrangement with the Metropolitan Life Insurance Company, policies for $1,000 life insurance and an additional $1,000 in case of death through accident and also carrying a permanent disability benefit were provided. This was so attractive to employees that at the end of 1925 the company extended the plan so as to permit the insured employees to double their insurance protection, each now being insured for $2,000 ordinary life insurance and for $2,000 additional in case of accidental death. The cost is paid partly by the company, and 5,506, or 95 per cent of the total of employees, are protected by this plan. The total face amount of the group life insurance policy covering the employees in the service of the company is now $9,468,000, this being doubled as respects deaths from accident.

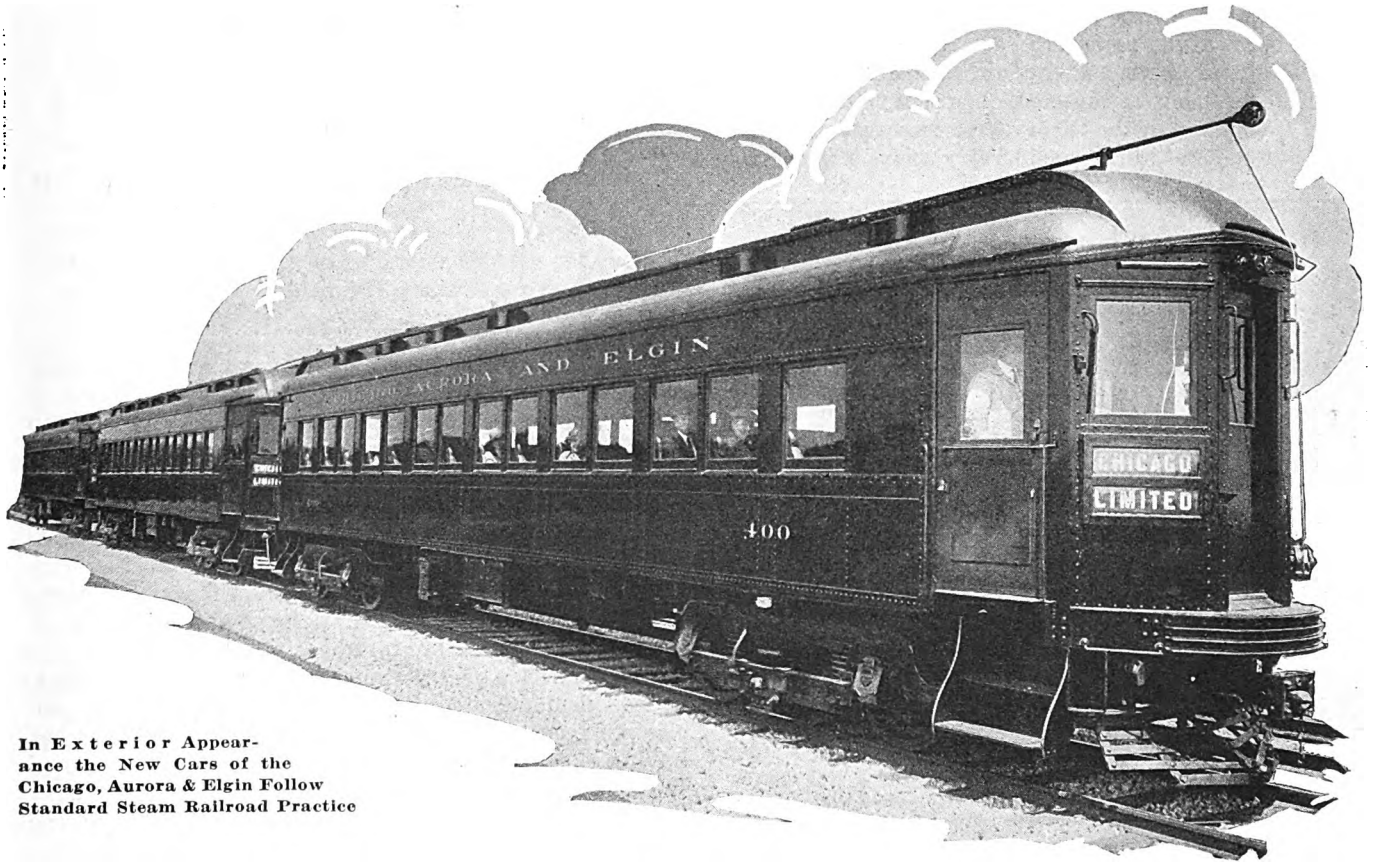
New Cars Attract Traffic to the Chicago, Aurora & Elgin Railroad in Competition with High-Class Steam Road Service—Careful Studies Made to Determine Most Comfortable Type of Seat and Most Convenient Step Arrangement—Shop Facilities Have Been Increased—Purchase of More New Rolling Stock Planned



In Exterior Appearance the New Cars of the Chicago, Aurora & Elgin Follow Standard Steam Railroad Practice

REALIZING that the successful merchandising of transportation can only be accomplished with attractive, comfortable cars, twenty all-steel, 51-ton, 58-passenger cars were purchased from the Pullman Company by the Chicago, Aurora & Elgin Railroad as part of its rehabilitation program. To attract traffic in competition with the high-class service offered by the steam carriers the management believed it necessary to have not only a smooth roadbed protected with block signals and a power supply sufficient to move trains at high speed, but a type of car which was equal to the equipment operated by the steam carriers. The cars which were on hand at the time the new company was organized were comparatively modern in appearance, and after a thorough rehabilitation could be made suitable for rush-hour and local service. It was therefore decided that the new equipment should be designed for high-speed, long-distance through service, serving the terminal cities of Aurora, Elgin, Batavia, Geneva and St. Charles in the Fox River Valley, and the towns of Wheaton, Glen Ellyn and Lombard in the suburban belt.

In view of the fact that a one-way trip of these trains consumed at least one hour, the matter of the comfort of the passengers was considered to be of prime importance. The designing of the new cars began with the development of a thoroughly comfortable seat. Various manufacturers of seats were requested to furnish samples, which were installed in the older cars for study and criticism. These seats all had good points but none was thought to be entirely satisfactory.

Believing that automobile manufacturers had made great progress in working out the problem of a comfortable seat, Dr. Thomas Conway, Jr., president of the company, resolved to apply the principles and tests used by a committee of the American Society of Automotive Engineers, which had made a most extensive study of seat designs for high-class automobiles. A detailed drawing was made showing:

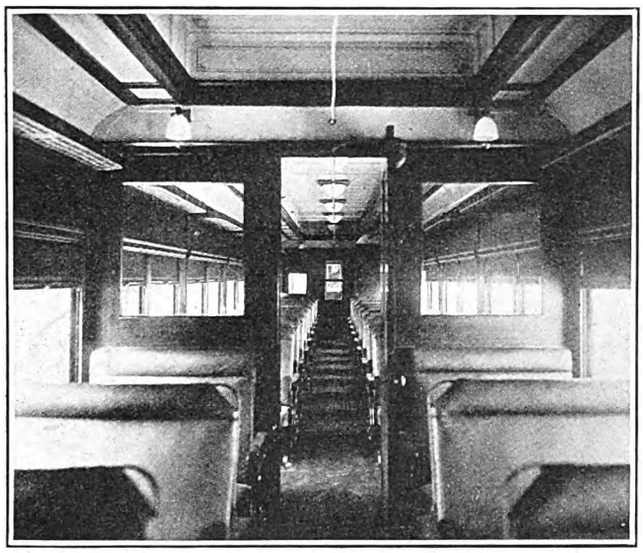
1. The then standard car seat in use on the property.
2. A sample seat recommended by Hale & Kilburn.
3. The recommendations of the special committee of the American Society of Automotive Engineers.

Study of these drawings disclosed radical differences.

Digitized by Google

between the prevailing practice of automobile manufacturers and that of the car builders. For instance, the height of the cushion of the car seats ranged from 18 in. to 19 in. above the floor, while the height recommended by the automotive committee was 14 in. The distance from the front of the seat cushion to the foot rest in the case of the car seats ranged from 21½ in. to 22¼ in.; the leading automobile manufacturers were using a range from 17 in. to 21 in.; the special committee of automotive engineers recommended 18 in. as the proper distance.

A radical difference in practice was also clearly brought out as regards the relation of the angle of the seat to the back. The distinguishing characteristic of the automobile seat is the strict adherence to the rule that the plane of the back and the plane of the seat should be at right angles to each other. The practice in building car seats had theretofore been to make the angle of the back to the cushion greater than a right angle. Working on the theory that the seats of a high-class automobile were considerably more comfortable



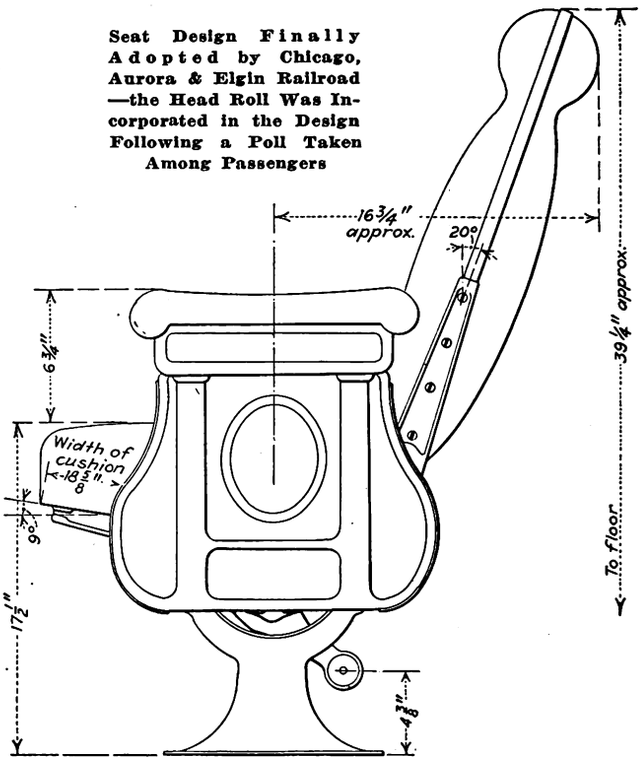
The Car Interior Is Divided into a Main and a Smoking Compartment by a Glass Partition. Note the Characteristic Pullman Appearance

than those of the average railway passenger coach, a special committee, headed by W. L. Butler, assistant to the president, began a series of experiments for the purpose of determining what change should be made in the car seats for the purpose of making them as comfortable to the average rider as the high-class automobile seat. In order to assist him in this endeavor, a jury, composed of an equal number of men and women, of all sizes, widths and ages, was selected from among the officers and employees and their families. They entered with great interest into the study of the problem before them, and by making changes and adaptations in the car seats, the following facts were conclusively demonstrated, as shown by the reports of the jury:

1. That the height of the cushion of the existing car seats from the floor was too high for the comfort of the average woman passenger. They had been designed by men along lines which were most comfortable for men. The average woman could not keep her feet on the floor and, therefore, was more subject to the oscillations of the car than the average man.

2. That the chief reason why the average passenger

Seat Design Finally Adopted by Chicago, Aurora & Elgin Railroad —the Head Roll Was Incorporated in the Design Following a Poll Taken Among Passengers



coach seat is less comfortable than an automobile seat was the pitch of the seat itself; the backward slope of the cushion of an automobile seat is much greater than a railway coach seat. When a railway coach seat was given the same pitch, a marked improvement was reported by every member of the jury.

3. When changes were made to bring about a right-angle correlation between the center line at the back and the bearing surface of the cushion it was the unanimous opinion of the jury that the comfort of the railway seat was much improved.

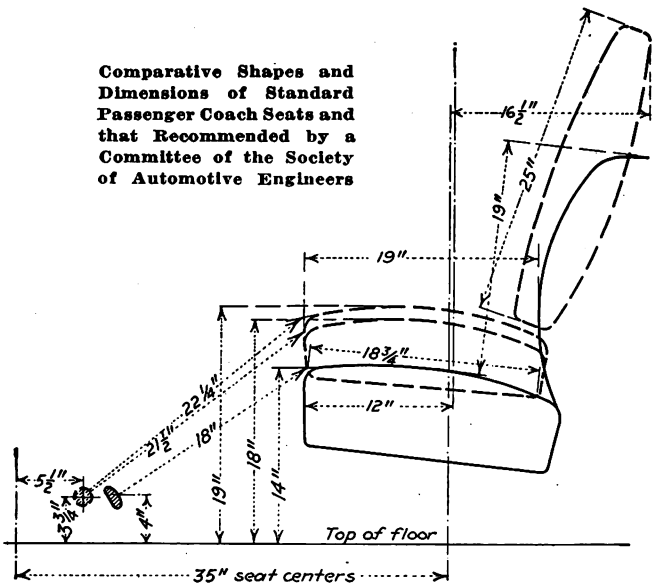
After a series of experiments in the company's shops, it was demonstrated that from the standpoint of all classes of passengers the most satisfactory seat was one having a height of 17½ in. from the floor to the top of the cushion; a width of cushion of 18⅝ in.; arm rests 6¾ in. above the cushion, and a backward slope of the cushion 9 deg. from the horizontal with the back cushion at right angles to the plane of the seat cushion. By questionnaires distributed among the passengers it was demonstrated that there was an overwhelming preference for a head roll on the seats. Accordingly these were incorporated in the design.

This type of seat has proved to be tremendously popular with the traveling public and most flattering comments have been received with respect to it. In fact, the company has been somewhat embarrassed by the criticisms which were received from through passengers whenever service conditions required the operation of cars having the older type of seats, which long-distance passengers say are far less comfortable.

Step Arrangement Investigated

Another matter concerning which an interesting study was made was the design of car steps. Aurora-Elgin coaches adhere to the same standards as those of the steam railroads; that is to say, flush platforms are used, center sills running continuously from bumper to bumper. Platform heights are governed by the elevated platforms in Chicago. A variety of conditions are encountered; at some points passengers board from the

Digitized by Google



Comparative Shapes and Dimensions of Standard Passenger Coach Seats and that Recommended by a Committee of the Society of Automotive Engineers

street level, at others from station platforms the surface of which is above the level of the rail, while at other points passengers board from elevated platforms, the level of which is practically identical with the level of the car platforms. Third rail clearances and the necessity of clearing vehicles while operating in the streets also had to be considered. The same jury was used in studying this problem. It was agreed by all members of the jury that the then standard car step was not entirely satisfactory, particularly to women and people of advanced age.

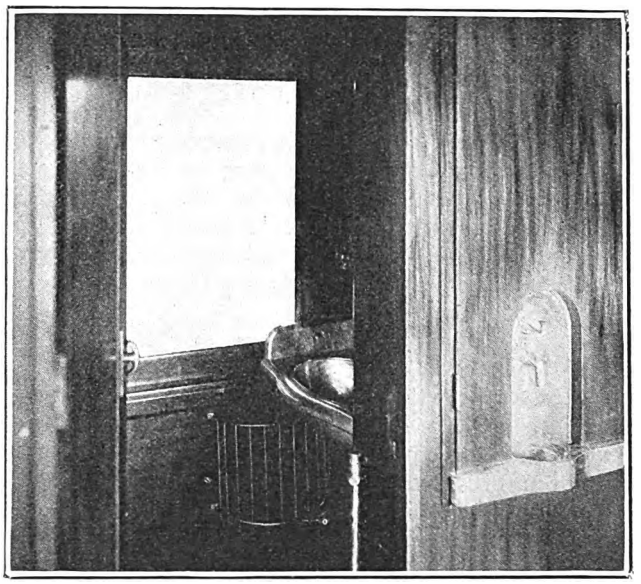
For the purpose of assisting in the study of this problem, a long platform was built at standard height and various types of steps used upon this and other properties operating under generally similar conditions were experimented with. The technical committee, headed by Mr. Butler, also constructed various modifications of these steps and installed them side by side with those used elsewhere for the purpose of affording a comparison. It was discovered that the real test of a step is encountered when a passenger is carrying a bundle or, more particularly, a child. Thereafter all tests were made with members of the jury carrying sand bags or other similar bundles. The defects of the various types of steps immediately became clearly apparent.

All published literature concerning the problem of step design and construction was combed for suggestions and principles and the results thereof applied in so far as possible. With this as a basis and by the process of cut and try the most satisfactory type of step, from the standpoint of every type of passenger, was evolved and specifications thereof worked out and embodied in the new cars. It was found in practice that these steps were most favorably commented upon by passengers, because of ease of boarding and alighting, and the greater sense of security the passenger enjoyed in using them as compared with the older type of steps. It has also been found that when loading from the street or ground platforms the speed of loading is materially increased with the new type of step.

Car Bodies of Heavy Steel Construction

After working out these fundamental problems a body design embodying safety and comfort of the passenger, long service life, easy riding qualities—particularly at very high speeds—and low maintenance costs was evolved step by step. The car body, of steel construction throughout with the exception of floors, window sash and doors, is carried on a heavy steel channel sub-frame which is mounted on Commonwealth Steel Company's solid frame trucks. These trucks are of heavy construction and are provided with special elliptic springs and double equalizer bar suspension. Both trucks are equipped with two G.E. 254, 140-hp. motors, inside hung, and 37-in. diameter rolled-steel wheels. The motors are of the interpole ventilated type with tapped fields and are geared 2.16 to 1, giving the car a free running speed of 72 m.p.h. As the power conductor is a third rail upon which operates a shoe held to it by gravity, each truck is equipped with two air-operated sleet scrapers to combat sleet difficulties. One is mounted on the insulator bar on each side of the truck and is controlled manually from the motorman's cab.

Inasmuch as this equipment must operate over the tracks of the Chicago Rapid Transit Company from Laramie Avenue to Wells Street Terminal it was necessary to construct the cars within certain limitations.



Convenient Lavatory Facilities Are Provided in the New Cars

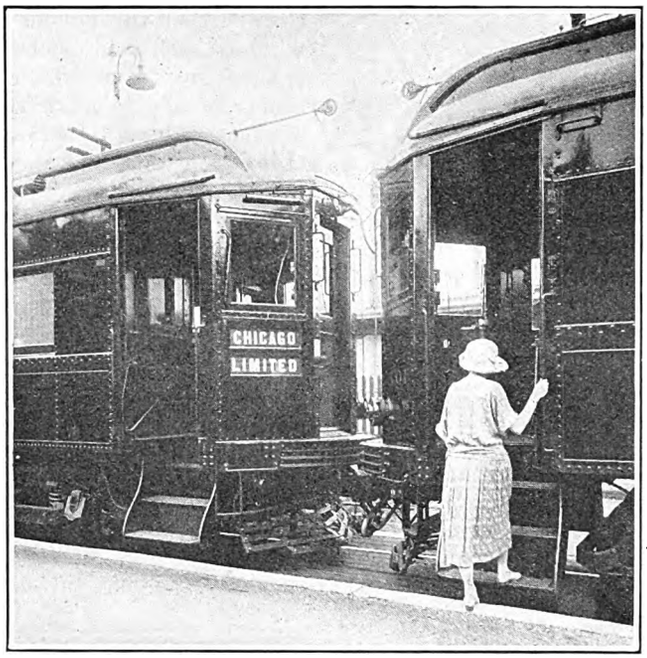
The width was restricted to 8 ft. 10 in., the distance between truck centers limited to 34 ft. 3 in., and the overhang at the ends of the car had to be reduced to a minimum. These restrictions were necessary in order that the cars might pass the elevated platforms. The car is also mounted so that it will operate on 90-ft. radius curves, which are found on the elevated structure.

The exterior of the car is painted in a brilliant red which is striped and decorated in gold leaf, with the name of the company in gold letters on the wide letterboard above the single sash windows. The car has a monitor type roof, similar to standard steam railroad car practice. As the car is designed for double-end operation, steps have been provided on both sides of each end. The step wells are covered by means of a steel trapdoor, with the vestibule closing door shut against the trap.

Two trolley poles are mounted on the roof, in order that the car may be operated over the tracks in the cities which require overhead trolley systems. The motorman's apparatus is located on the inside of the dash on the right-hand side of the car. On the outside of the dash on the right-hand side is located a Hunter

Digitized by Google

destination sign. The windows in the end of the car have been made especially long, somewhat accentuating the height of the car body. The bumpers are of steel construction and are provided with anti-climbers. Tomlinson automatic car and air couplers were installed with provision for coupling the supply and train air lines. Standard air hose has been provided at each end of the car for use in case the coupler becomes inoperative, or when coupling with some of the older equipment not provided with Tomlinson couplers. An adapter link is provided for coupling between the two types of couplers.



Steps Were Specially Designed for Convenience of Passengers Carrying Bundles and Children

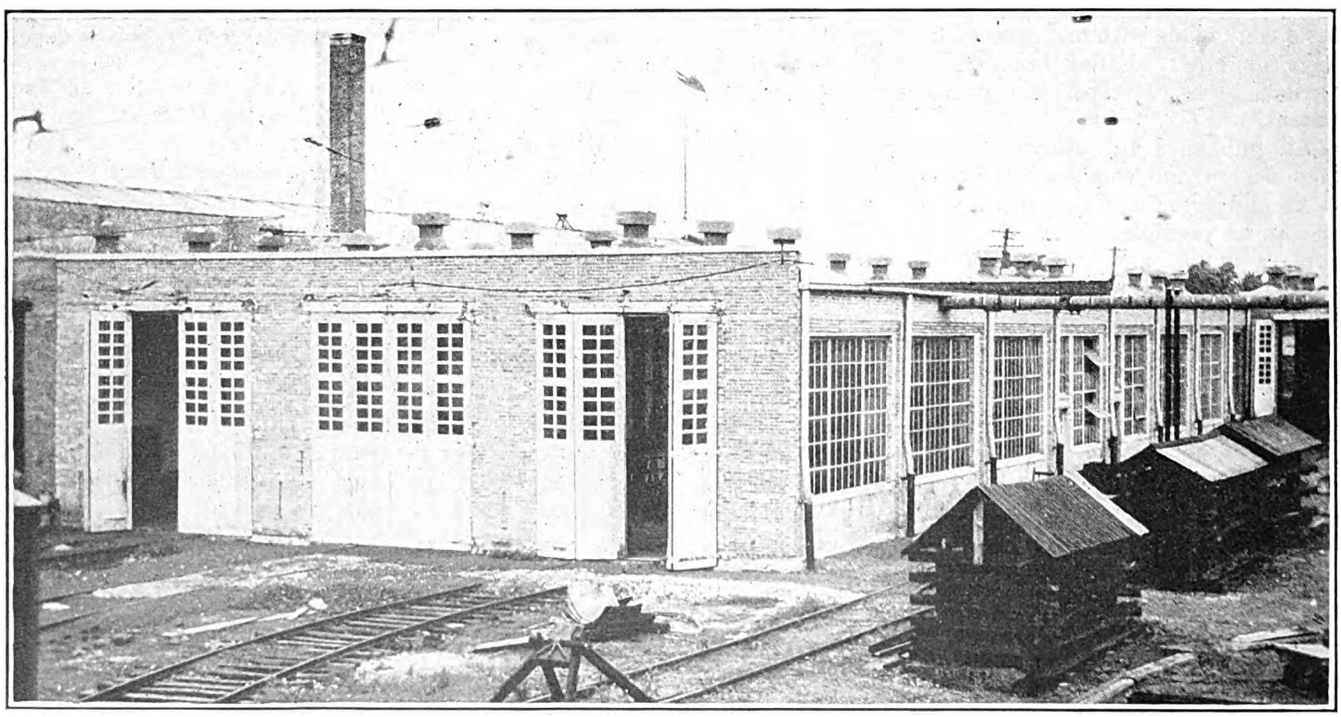
A pleasing interior appearance is obtained with the red mahogany finish and the cream enameled ceiling. Black leather upholstered seats, a white maple floor and plate glass partitions between the two sections of the car add to its attractiveness. Above the single sash windows is a wide panel upon which are mounted parcel racks. A row of dome lights is mounted down the center of the ceiling.

The car body is divided into a smoking and main compartment by a steel partition, the upper half of which is glazed with beveled plate glass. A swinging door with an air door check closes the passageway between the two compartments. Seats for 45 passengers have been provided in the main compartment, while thirteen may be accommodated in the smoking compartment. On one side of the aisle at the rear end of the car body is a toilet room which is furnished with a flush type toilet, a corner style washbowl, a plate glass mirror and electric heaters. A 50-gal. water supply tank is carried overhead in order to furnish the water for the bowl and lavatory. The length of the room is 6 ft. 4 in., the width 2 ft. 4 in., and the height 6 ft. 4 in.

All car windows are glazed with heavy plate glass, while the sash is arranged to raise, being provided with O. M. Edwards type of lock and catch. The side windows are covered with Pantasote curtains with fixtures furnished by the National Lock Washer Company. In the smoking compartment a clothes locker was furnished for the use of the trainmen. This has a width of 30 in., a depth of 9½ in., and a height of 6 ft. 10 in.

Electric heating has been provided by means of a Consolidated thermostatically controlled electric heater mounted under each seat. The interior illumination is effected by means of eighteen lamps. Eight 100-watt dome lamps are in series with a selector switch and pilot lamp located on one of the platforms. In addition to these eight heavy-wattage lamps, ten lamps are mounted in brackets provided with frosted shades located along the sides of the car body in order to light the corners. These small lamps are of 36-watt capacity and have no compensating feature.

As the cars are designed for train operation, provision was made for connecting the control circuits be-



Addition Made to Wheaton Shop Has Increased Its Capacity by Eight Cars

Digitized by Google

tween cars by means of a train-line conductor jumper. The receptacle for this jumper is located underneath the bumper. In addition to this electrical connection, a bus line has been provided for the main current circuit in order that the crossing and highway gaps in the third rail will not cause an interruption in the lighting and operation of the train. This bus line is held in receptacles mounted above the car-to-car vestibule door. In addition to this overhead connection, a buzzer circuit jumper is also mounted above the car-to-car vestibule door. The signal to the motorman is given from any car of the train by a buzzer which is actuated by means of the customary bell cord.

ADDITIONAL SHOP FACILITIES PROVIDED

To handle the new rolling stock an addition was made to the main shop building at Wheaton to accommodate eight cars. A new paint shop measuring 60 ft. x 80 ft. has three tracks each capable of receiving one car. A carpenter shop measuring 60 ft. x 140 ft. accommodates four cars over shallow inspection pits. A wash track adjacent to the carpenter shop is inclosed by a building 20 ft. x 65 ft., capable of receiving one car. These new buildings are of one-story brick construction, built adjacent to the old shops, with one wall common to both the old shop and the addition. The outer side wall of the addition is of brick pilaster construction with fully 60 per cent of the wall area of glass mounted in steel sash. Swinging doors at the ends inclose the track openings in cold or inclement weather. A cement floor is laid throughout the additions, while the wood planked and beamed ceiling is supported on steel columns. Sliding fireproof doors close the openings between the various sections of the addition and the passageway between the new addition and the old building.

Plans are in formation for the purchase of a new type of equipment designed for local service. The tremendous growth in the suburban district east of Wheaton now requires the purchase of additional equipment for use in this service. Conditions under which this local equipment must operate are severe. In order to furnish rapid service to points as far west as Wheaton and to meet the competition of the Northwestern Railroad, it is necessary to make a schedule providing for running time of less than one hour between Wells Street Terminal, Chicago, and Wheaton—a distance of 25 miles. In doing this stops averaging one every two-thirds of a mile must be made. This requires a free running speed of from 55 to 60 m.p.h. and very rapid acceleration and deceleration. It is believed that a car which will seat 56 passengers and meet these conditions can be constructed which will weigh not to exceed 75,000 lb., including electric multiple-unit control apparatus and all other mechanical and electric accessories.

Property Expansion in St. Louis

PLANS have been made for a six-story building with arcade features to cost $500,000 at the western terminal of the Wellston division of the United Railways, Hodiamont and Eastern Avenues, St. Louis, Mo. The railway had sold the east half of the block to N. Pelligreen, president of the Pelligreen Construction & Investment Company, 816 Pine Street, who will build the new structure as soon as existing leases expire. Under the arrangement with Mr. Pelligreen the station for the Wellston, St. Charles and Kirkwood-Ferguson Street car lines will remain at the western end of the block. This station will be enlarged when reorganization of the street car company is perfected. Through the agreement Mr. Pelligreen will convey to the car company a front of 25 ft. on Hodiamont, 119 ft. on Theodosia and 120 ft. along the right-of-way of the Kirkwood-Ferguson line to provide a loop for the Wellston cars.

Pittsburgh's Request for Suggestions Receives Hearty Response

DURING the week of Jan. 27, 1926, the Pittsburgh Railways placed 50,000 copies of a suggestion blank in the containers that usually supply copies of the *Transit Guest*. Each blank bore the simple introduction "Pittsburgh Railways Company, Commercial Department. Gentlemen: I desire to submit the following suggestion. . . ." After a blank space, a second statement read: "The adoption of this suggestion will result in the following advantages. . . ." Space was also left for the name and address of the customer making the suggestion. Envelopes were also provided by the company.

When the customer had completed his suggestion, he placed it in the envelope and turned it in to one of the conductors or motormen. So great was the demand for these suggestion forms that the supply was exhausted during the third day. Most of the passengers took the forms home and worked up the suggestions there.

More than 3,000 replies containing written signed suggestions were received in five days and have been coming in at the rate of 50 per day since then. Disregarding a portion of about 10 per cent of the replies, which were flippant and semi-humorous comment, the remainder divides into a large variety of suggestions on both operating and equipment subjects. Among suggestions made on the subject of fares were proposals for a school children's weekly pass; for an extension of the adult weekly pass to outer zones, and requests for additional transfer privileges. Other suggestions were for a $1.25 instead of a $1.50 weekly pass and a 10-cent cash fare, omitting the 8½-cent token. Very few patrons made any reference to nickel fares. There are already in use a number of short-haul 5-cent routes.

Despite the obvious impossibility of providing express service under the short headway conditions on most of the lines, numerous suggestions were made to run the second or third cars in the schedule as express cars. The subject of loading and unloading places in downtown districts also led to many suggestions. Other proposals included extensions of routes, installation of clocks, signs inside the cars to indicate the name and course of the route, local schedule cards for passengers, totally opposite ideas of heating and ventilation, objections to spitting by fellow passengers, widely different views of stop spacing, bunching of cars, more shelters, token vending machines, etc.

All suggestions are being classified and will be faithfully considered in due course. Every answer is being acknowledged in a form letter, signed by W. H. Boyce, commercial manager, reading as follows:

> Dear Patrons: Your suggestion has been received, and we thank you for the interest you have shown in our problems.
>
> Due to the very great number of suggestions that have come in and the necessity of making investigations, a detailed answer cannot be made at this time, but will be made later. Very truly yours, W. H. BOYCE.

Will Interstate Loop Plan Improve Commuter Transportation?

Relief for North Jersey Is Urgently Needed as Present Facilities Are Near the Saturation Point — Plan Proposed by the North Jersey Transit Commission Is Analyzed and Objections to Certain Features Are Outlined—Some Possible Modifications Are Suggested

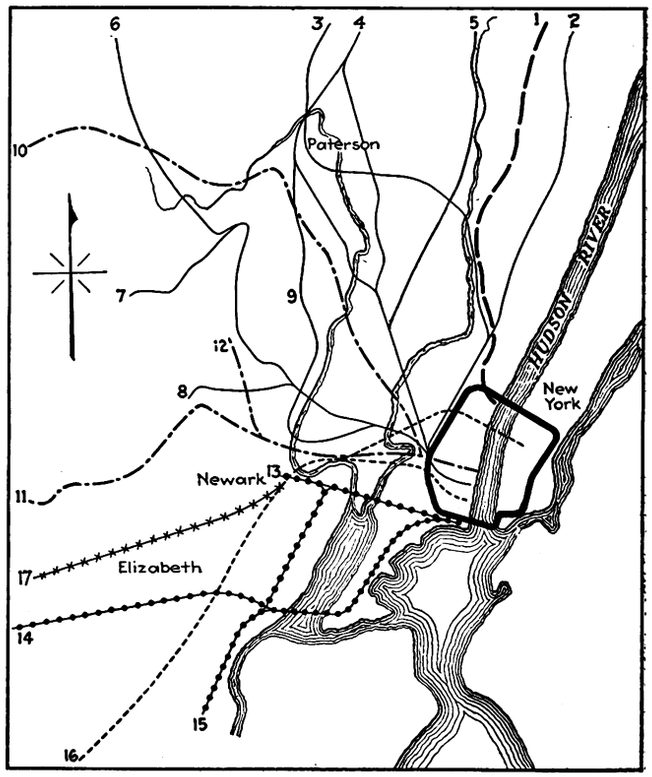
By John A. Miller, Jr.
Associate Editor ELECTRIC RAILWAY JOURNAL

FOR some years past traffic on the rail lines carrying New Jersey commuters to and from New York City has been growing steadily and existing facilities have now nearly reached the saturation point. As the traffic problems of the various steam railroads that handle this business are radically different, the development of any plan to relieve the present congestion is a complex problem. A possible solution has been suggested by the North Jersey Transit Commission in a recent report to the State Legislature, an abstract of which was published in this paper Feb. 6. From the point of view of providing the most satisfactory transportation at the least cost, however, the plan appears to be possible of improvement in certain respects.

Congestion exists on the various railroads for different reasons. In the case of the Erie Railroad, which carries the largest number of commuters of any steam railroad in this territory, the limiting factor is the twelve-track terminal at Jersey City. During the maximum half hour, 23 inbound trains must be handled on these twelve tracks, eleven of which are stub-end and one of the pull-through type. At Croxton, about 2 miles west of the waterfront terminal, the eight routes of the Erie begin to diverge. Beyond that point the track capacity is ample for present traffic and could in fact accommodate a considerably greater density than now exists. The problem of the Erie, therefore, is the enlargement of its terminal facilities. However, space is not available along the waterfront for this purpose.

In the case of the Lackawanna Railroad, which operates sixteen inbound trains during the maximum half hour, the limiting factor is a four-track tunnel under Bergen Hill. This tunnel is approximately 1 mile in length. Because the smoke of steam operation makes visibility poor no train is allowed to enter the tunnel until the leading train has cleared the opposite end. Consequently a headway between three and four minutes is the minimum which can be operated on one track. At its waterfront terminal the Lackawanna has seventeen tracks which provide ample capacity for the needs of the present and the immediate future. A substantial increase in service could be provided if it were possible to operate trains on a shorter headway in the tunnel. Some congestion, however, exists on the main line of this railroad as far west as Roseville Avenue, where the Montclair Branch diverges.

The problem of the Central Railroad of New Jersey is primarily that of getting its passengers across the Hudson River to New York City, ferries being the only means now available. The locations of its Communipaw terminal and approaches are such that increased track facilities can be provided without great difficulty whenever needed. Similarly, the problem of the West Shore Railroad is largely one of getting its passengers across the river. The site of this railroad terminal in Weehawken is so far north of the business center of New York City that a long ferry ride is involved for a large



Present Commuter Lines and Proposed Loop

Distribution of North Jersey commuters in Manhattan by means of the proposed interstate loop is complicated by the diversity of routes on the Jersey side. Altogether there are seventeen routes, not counting the Newark branch of the Hudson & Manhattan Railroad. These are:

1—West Shore Railroad.
2—Northern Railroad of New Jersey (Erie).
3—New York, Susquehanna & Western Railroad (Erie).
4—Erie Railroad—Main line.
5—New Jersey & New York Railroad (Erie).

part of its commuters. The trackage of the terminal itself and its approaches are not now overcrowded.

In the cases of the Pennsylvania Railroad and the Newark branch of the Hudson & Manhattan Railroad, through service to New York by tunnels under the Hudson River is now provided. Extensive improvements have already been planned by these roads to facilitate the handling of their traffic between Newark and New York. With the completion of this project the Pennsylvania and the Newark Branch of the H. & M. probably will be able to handle their commuter traffic comfortably for some years to come, especially if proposed new facilities relieve the H. & M. local lines to some extent.

As the first step of an elaborate plan to relieve congestion the North Jersey commission recommends the building of a two-track interstate loop line having connections with all the commuter railroads. The route would be about 17 miles long, running north and south in New Jersey between Bergen Hill and the Hackensack River, with tunnels under the Hudson River to the Battery and to 57th Street, New York City. A low-level subway, probably under Lexington Avenue, would complete the loop. Passengers would transfer to and from the railroad trains at the intersections of these roads and the loop line. Cost of construction and equipment for this interstate loop, not including power facilities, is estimated at $194,000,000.

Statistics of present traffic, however, show that the volume is greater than could be handled on a two-track loop. During the maximum half hour 64 trains arrive at the waterfront terminals on the New Jersey side. These trains bring somewhat more than 42,000 passengers bound for New York City. Distribution of trains and passengers among the various railroads is shown in the following table:

ARRIVALS AT HUDSON RIVER TERMINALS DURING MAXIMUM HALF HOUR

Railroad	Trains	Passengers
Erie	23	17,924
Lackawanna	16	11,459
Central of New Jersey	17	6,902
West Shore	3	3,586
Pennsylvania (Jersey City)	5	2,500
Total	64	42,371

Commuter traffic is increasing at a rate of about 5 per cent per year. Before the construction of the interstate loop could be completed the number of passengers arriving during the maximum half hour would probably have increased to about 50,000. From these calculations trains operated over the electrified division of the Pennsylvania Railroad into its 32d Street Station, New York City, and on the Newark branch of the Hudson & Manhattan Railroad have been omitted for the reasons given in a preceding paragraph.

Service on the interstate loop line during the maximum half hour, according to the report, would consist of 36 trains of eleven cars each, or 396 cars altogether. Of this number of trains one-half would move in each direction, or eighteen to the Battery and eighteen to 57th Street. The report of the commission assumes that the passengers on the incoming railroad trains would divide equally between the northbound and the southbound loop trains and that with an average load of 100 passengers per car a total load of 39,600 passengers could be carried on 36 trains. At that rate the carrying capacity of the interstate loop line would be less than the present traffic.

Operation of eighteen trains per track during the maximum half hour is equivalent to an average headway of 100 seconds. This is the shortest headway which it has been found feasible to operate with ten-car trains on the lines of the Interborough Rapid Transit Company in New York City. The Hudson & Manhattan Railroad with shorter trains operates a 90-second headway during the rush hour and believes that this is the shortest headway which can be operated with safety on one track. From this it appears that the estimate of the commission represents very nearly the maximum service which can be rendered by the proposed interstate loop line.

Existing means of transportation between the waterfront terminals and Manhattan would have to be retained to care for the excess over the capacity of the loop line. That would mean that the terminals themselves would have to be retained and to a great extent the railroad operation would continue to be throttled by, the same bottle necks which limit it today. While it might be theoretically possible for some of the trains to end their trips at the transfer stations on the Hackensack Meadows, such curtailment of service would be a serious inconvenience to passengers desiring to reach the waterfront terminals to take the ferries and Hudson & Manhattan tubes.

That large numbers of commuters would prefer the present ferry and tube service to that offered by the proposed loop line seems probable. On account of the high cost of construction the report states that a 15-cent fare will be required on the interstate loop unless interest and sinking fund charges can be eliminated. Moreover, the routing is somewhat circuitous and would not deliver all of the passengers conveniently near their destinations.

Investigation by the commission showed that the ultimate destinations of the inbound railroad passengers were widely distributed. Expressed in per cent of the total number of passengers, the destinations may be classified approximately as follows:

District	East of Broadway	West of Broadway	Total
Below Chambers Street	—	—	38
Between Chambers and Fourteenth Streets	7	7	14
Between Fourteenth and 33d Streets	7½	7½	15
Between 33d and 42d Streets	6	6	12
Between 42d and 59th Streets	5	5	10
North of 59th Street	2½	2½	5
Brooklyn	—	—	5
Queens	—	—	1
Total			100

This classification is based on the findings of the commission that traffic is fairly evenly divided between passengers destined to points east of Broadway and those to points west. It is believed that the proportion is approximately constant for the different districts.

Assuming that the loop line will be convenient for all passengers below Chambers Street and for those on the east side of town above that street, about 66 per cent of all inbound railroad passengers would be brought to points within ten minutes walk of their ultimate destinations. If the other 34 per cent of the commuters used the loop line they would be compelled to transfer to some other transportation agency in New York. Moreover, the proposed route would involve a detour of several miles for a substantial proportion of the commuters. For example, a passenger on the Lackawanna Railroad wishing to reach the 34th Street

Digitized by Google

district in Manhattan would be obliged to go north from Hoboken to the 57th Street tunnel and down again on the New York side or to go south as far as the Battery and up again to 34th Street. A similar situation would exist with regard to the Erie commuters desiring to reach the mid-town business district of Manhattan.

Use of the present west side subway in New York is suggested by the commission as a means of reaching sections somewhat remote from the route of the interstate loop, transfer from the loop to the subway being made at 57th Street and Broadway. A serious objection to this arrangement is that the section between 96th and 42d Streets is the maximum load area on the north-and-south rapid transit lines. Passengers from the interstate loop line would be compelled to board southbound subway trains in the area where the maximum load was being carried in order to reach destinations below 57th Street. They would, therefore, add to the existing congestion at its very worst point.

The existing suburban steam railway lines in New Jersey separate into seventeen distinct branches, requiring individual train service. On account of the length of these lines each of the seventeen at present has from two to three and sometimes four classes of trains —local, express and semi-express, or trains running express on the outer end of the line and local nearer the city, and vice versa. Assuming that the train service of each of the seventeen lines be of two classes, express and local, then at least 34 different kinds of trains must be run around the loop, in two directions, in order to give service to each one of the outlying stations on all of the different lines from the stations on the loop to Manhattan Island. Something like twenty minutes will intervene in the service under the heaviest rush-hour conditions to any of the outlying local stations.

In order that such a loop system be at all convenient, it must run at reasonably frequent intervals in both directions from the Meadows Transfer throughout the day for the purpose of carrying these suburban passengers to destinations on Manhattan Island. If the service is not frequent it will be unattractive. From the suburban time-tables of the New Jersey railroads, however, it will be seen that frequent service is provided during short rush-hour periods night and morning, while only a scattered service, sometimes at one-hour or two-hour intervals, is given during the rest of the day. Moreover, the habits of the people living in these suburban communities are so similar that transportation service is required on nearly all the lines at approximately the same hours. This would inevitably result in very uneven loading of the loop trains during the middle of the day. It would not be possible to render the loop service by short trains, as is usually done in the off peak, because capacity would have to be available to accommodate entire steam railroad trainloads. In the intervals between trains the traffic would be almost nothing. Additional to the objection of the lack of capacity of this two-track loop for rush hours, therefore, is its uneconomical frequent operation throughout the rest of the day.

Several of the difficulties which would be involved in the operations of such a loop, circuitous routing, a high fare, etc., apparently arise from a desire to furnish two different kinds of transportation service by a single agency. The problem of the North Jersey commuter has two distinct sides. These involve, first, the transportation of residents of suburban communities to Manhattan Island, and, second, their distribution after arrival. While it would no doubt be a convenient arrangement to make the trip from one's home to one's place of business in a single vehicle, the scattered character of the residential districts in North Jersey and the diversity of locations of places of business in New York City render such a proceeding almost impossible.

Distribution of passengers by the transportation agency which they use for the greater part of their journey is hardly feasible when the distribution must be along a line at right angles to the general direction of the railroad. A system for carrying North Jersey commuters to New York and distributing them there must necessarily have the general shape of the letter T. Experience shows that efficiency in operation of a route having this shape is almost impossible to attain. For practical transportation purposes it may be said that the resident of New Jersey who goes to business every day in New York City becomes a New Yorker after crossing the river. The problems connected with his movements about the city are the problems of transportation in New York and can hardly be undertaken by New Jersey railroads.

Possibilities of the Battery Line

A preliminary project recommended in the report of the commission to be undertaken before the construction of its interstate loop is the building of a rapid transit line from a Meadows transfer station near Croxton through the Communipaw terminal of the Central Railroad of New Jersey and under the Hudson River to the Battery. The major problems of two or perhaps three of the railroads would be solved by such a plan. The Erie could move its terminal from the waterfront to Croxton and secure as much additional track capacity as might be desired. Tube connection between the Central Railroad terminal and New York City would be provided. The West Shore Railroad could easily extend its service south to Croxton and thus secure rapid transit connection to Manhattan. Passengers desiring to reach uptown points in Manhattan could use the New York rapid transit facilities, moving in a direction opposite to the rush. If desired, through operation probably could be arranged with the subway lines now terminating at the lower end of Manhattan Island, or with the proposed Westchester subway.

Such an arrangement would be open to the same criticism on account of the circuitous routing necessary to reach uptown Manhattan, as is the loop plan. For that reason, the Battery line could hardly be considered a complete project in itself, but might better be undertaken in conjunction with a second rapid transit route to provide more direct service uptown. This could be done by continuing the line eastward from Croxton through a second tunnel under the Hudson River and across to the east side of the island, intersecting all north and south rapid transit lines. Transfer could then be made either north or south at points where capacity was available. An alternative plan would be the extension of the Fourteenth Street subway of the B.-M.T. to Croxton. In either case there seems to be no good reason why the two arms of such a system should be connected in New York to form a loop. A substantial part of the estimated high cost of the proposed interstate line is accounted for by the low-level subway under Lexington Avenue, and this would be true, though to a less degree, with a smaller loop. Resulting advantages would hardly compensate for the large outlay.

While it might be possible to arrange for service of

Digitized by Google

the Lackawanna Railroad to terminate at the proposed transfer station at Croxton, it may be doubted if this would be a satisfactory arrangement. The present waterfront terminal of this railroad is modern in design and ample in capacity to care for traffic for some time in the future. Ferries will probably be needed for many years to take care of vehicular traffic, which is growing more rapidly than can be accommodated by the tunnels and bridges now planned. A large volume of passenger traffic can be handled by this means at little additional expense. Ferries are popular with the commuters and extremely convenient for reaching many districts on the west side of Manhattan Island. Moreover, the total elimination of ferry service would place an extremely heavy load on the rapid transit facilities and would necessitate a more expensive construction program than would be necessary if the ferries were continued.

Increased service on the Lackawanna can best be secured, it would seem, either by taking the roof off the tunnel, which would permit a closer spacing of trains, or by electrification, which would eliminate smoke in the tunnel and thus permit its division into several blocks. The latter plan would also do much to relieve congestion on the main line between Hoboken and Roseville Avenue.

Suggestions have been made from time to time that the New Jersey railroads be electrified and extended under the Hudson River directly into New York City, as has been done in the case of the Pennsylvania. Although this would be convenient for the passengers, it would involve an enormous expenditure, and would tend to continue rather than eliminate the bottle necks. Take the case of the Erie alone. To accommodate the 23 inbound trains which now arrive at Jersey City during the maximum half hour would require a four-track tunnel under the Hudson or a storage yard in New York City large enough to absorb many of the trains before they are shunted back to the yards on the New Jersey side. To be really effective this plan would require also electrification of all the eight branches of the Erie, involving heavy additional expenditures.

At best the traffic capacity of the railroads would not be greatly increased by extending their lines to Manhattan, and future expansion would be limited by the capacity of the under-river tunnels.

Consideration of these various factors leads to the conclusion that increased facilities for New Jersey commuter traffic can best be had by the construction of a new rapid transit line, similar in plan to the Battery route proposed by the commission. Another line to reach midtown New York would also be needed, but this should not be so far uptown as 57th Street, nor does it appear desirable that the two lines should be connected to form a loop.

B.-M. T. Renews Lloyd's Contract

THE Brooklyn-Manhattan Rapid Transit Company has renewed a contract with Lloyd's of London providing indemnity for losses exceeding $50,000 resulting from a single accident casualty or wreck. The amount of the premium was not announced. Travis H. Whitney, vice-president, said that the policy covered physical damages that might result to railroad property besides damage claims awarded in the courts. The contract was made a year ago. It is said the railway has never made any claims under the Lloyd's contract.

Regenerative Braking Tried on Multiple-Unit Trains

Machines Mounted on Trailer Axles Act as Boosters During Acceleration and Brakes During Retardation —Tests Being Made on Chicago Elevated Lines

BY L. M. ASPINWALL
Railway Equipment Engineer Westinghouse Electric & Manufacturing Company

WHILE regenerative braking has been in use for some years on electric locomotives operating on long, heavy grades, tests have been made recently with a view to applying this principle to multiple-unit operation. In such service the runs are generally comparatively short and the schedule speeds high, with the result that braking is started at high speeds and a large proportion of the energy taken from the line is wasted in heat at the brake shoes. On this account the application of regenerative braking offers possibilities of thoroughly beneficial returns.

Runs of ½ mile in length with braking started at a speed of 30 m.p.h. are not uncommon in this class of service. Under these conditions the energy wasted at the brake shoes is only slightly less than that portion of the energy taken from the line which is actually used to propel the car. Under such conditions it is quite evident that if a considerable portion of this wasted energy can be saved without undue complication of the equipment the proposition is worthy of serious consideration.

RAPID RETARDATION AND FREQUENT STOPS COMPLICATE THE PROBLEM

Regenerative braking on electric locomotives is a comparatively simple matter, for in this case the usual problem is to maintain a constant speed down a long grade. With multiple-unit trains operating on a high schedule speed with frequent stops the problem becomes a much more difficult one. In this case it is necessary to be able to start braking instantly at widely varying speeds, to be able to maintain a practically constant rate of braking over a period during which the speed is rapidly falling and, finally, to glide smoothly from regeneration to air braking for the final stop.

The Westinghouse Electric & Manufacturing Company has devoted considerable study to this problem, and in 1923-24 extensive tests were made on a stationary flywheel outfit with a system of regeneration which gave promise of being suitable for application to electric car service. The system was particularly suitable for two-motor, double-truck cars of the type which are common in subway and elevated service. Briefly, the system was as follows: Two axle-driven machines mounted on the trailer axles supply exciting current for the fields of the main motors during the braking period and act as motors during the period of acceleration. On account of this motoring action during acceleration these machines are designated as "boosters." The booster armatures are connected in series with the main motors during acceleration and their fields are separately excited.

The design and gearing of the axle machines are such that when motoring they add approximately 25 per cent to the tractive effort supplied by the main motors. This additional tractive effort is obtained principally from energy which usually is wasted in resistance, so that this is a gain aside from the regenerative feature. The

Digitized by Google

tractive effort added by the "boosters" makes it possible to obtain the same accelerating rate with less energy from the line and lower duty on the main motors, thus making them more able to withstand the additional load of regenerative braking. If the motors are of ample capacity, this added tractive effort can be used to obtain a higher acceleration and a consequent increase in schedule, without any additional load on the motors or additional energy from the line.

Another outstanding feature in the system is the use of a constant time element sequence switch for bringing in the correct switches during the braking period and for regulating the field strength of the "booster." The system also embodies means for regulating the regenerative currents, for balancing the generated voltage against the line voltage and for cutting in and out the air brake so that it will act in proper conjunction with the regenerative system.

Chicago Rapid Transit Cars Equipped for Test

The tests made on the flywheel outfit were so promising that it was decided as a next step to try the system out in operation on several cars. Two standard Chicago Rapid Transit Company steel cars were equipped with regenerative apparatus so that further tests could be made under service conditions. One of these cars was operated last fall for some months on the test track of the Westinghouse company at East Pittsburgh. The results obtained during these tests were very gratifying and corresponded closely to the calculated figures. The regular equipment on the car consisted of two Westinghouse type 567-R-1 motors with a gear ratio of 17:60 and Westinghouse automatic electro-pneumatic control. The equipment added for regeneration comprised two "booster" motors, an air-operated sequence switch, four electro-pneumatic switches, two engineer's brake valve switches and several relays. The weight of the added equipment is approximately 4,500 lb. and the total weight of car with the additional equipment is about 79,000 lb. The equipment on this car is so arranged that the master controller and engineer's brake valve are handled in precisely the same manner as in the case of the ordinary non-regenerative equipment. When the master controller handle is thrown to the "full on" position the acceleration takes place in the usual manner, except that the "boosters" act as motors and assist the main motors to bring the car up to speed. When full parallel position is reached the "boosters" are automatically cut out of circuit.

When the master controller handle is thrown to the "off" position the proper connections are automatically established so that the main motor fields are excited by the "boosters" to such a strength that a voltage equal to a little more than line voltage will be generated across the motor armatures. This generated voltage is automatically maintained within fixed limits as the car drifts to lower speeds, so that this "standby" position is maintained ready to start braking at any instant.

When braking is desired the engineer's brake valve handle is moved to "service" position and the desired reduction in brake pipe pressure is made in the usual manner. The moving of the brake handle to "service" closes a pair of contacts in an attachment which is mounted on top of the engineer's brake valve in place of the usual handle guard. This action closes the line switches and throws the motors onto the line. At the same moment that the line switches are closed the fields of the "boosters," which are exciting the main motors, are strengthened by cutting out a certain amount of resistance and the sequence switch which governs these fields starts to revolve at a constant speed.

The result of these operations is to start regenerative braking immediately when the handle is moved to "service" position. These take place before the air brake has had time to come into action. The current which is regenerated to the line closes a series relay and blocks off the connection between the brake cylinder and the triple valve so that no air passes to the cylinder in spite of the fact that a reduction has been made in the brake pipe pressure. The sequence switch as it revolves at constant speed gradually cuts out resistance in the "booster" fields and at the same time carries the motor connections through a bridging transition from the parallel to a series combination, with the result that the regenerative braking is maintained at a practically constant rate down to a speed of approximately 10 m.p.h. At a speed of approximately 12 m.p.h. the air brake is automatically cut in, and when the pressure in the brake cylinder has reached a given value the regenerative braking is cut out automatically. The pressure attained in the brake cylinder at this time is governed by the reduction which was made in the brake pipe pressure at the time that regenerative braking was started.

During the tests on this car the transition from regenerative to air braking was made so smoothly that it was hard to detect when the change took place without watching the instruments which were in circuit. The final spotting of the car is taken care of in the usual way by manipulating the air brake. The connections on the car are such that if regenerative braking fails to act for any reason, the air brake comes into action in the regular way. The emergency or the engineer's brake valve is left intact so that air braking is always obtained on this position.

Substantial Savings Can Be Made by Regenerative Braking

The proportion of energy which can be returned to the line naturally varies with the length of run. Assuming a yearly mileage of 40,000, runs averaging ½ mile in length and power at 1.5 cents per kilowatt-hour, the value of the power returned per car would amount, in round numbers, to approximately $550 per annum. The indications are that a net reduction in energy consumption of approximately 25 per cent may be obtained by the adoption of regeneration in typical elevated railway service.

Aside from the question of energy saved by the use of regenerative braking, the saving in brake shoe maintenance and wheel wear are items of considerable importance. It seems reasonable to expect that the life of brake shoes on a multiple-unit train equipped with regenerative control would be increased four or five times. A reduction in brake shoe dust, which is an enemy to electrical equipment, should make a trend toward a reduction in the general equipment maintenance.

The first car which has received very elaborate laboratory tests and a second car equipped with identical apparatus are being tested under service conditions in typical Chicago Elevated service. It is expected that some interesting data will be forthcoming shortly from these tests which will be of much value to operators of rapid transit lines.

The Readers' Forum

EDITOR'S NOTE

Comments on the recent report of the North Jersey Transit Commission and the analysis of it published elsewhere in this issue were asked for from a number of engineers and transportation men who are keenly interested in it. Several replies are published below. This paper will be glad to receive and publish any other helpful comments on this important subject.

All-Rail Delivery of Passengers in Manhattan

ERIE RAILROAD

NEW YORK CITY, March 3, 1926.

To the Editor:

Referring to your request for comment from me concerning the proposed rapid transit plan for north Jersey, I may say that nothing more important confronts that state today than the problem of transportation of the suburban population to New York City. If the state continues to grow as it has in the past, a comprehensive scheme something like that suggested in the report of the North Jersey Transit Commission must be adopted.

The Erie Railroad has reached its saturation point in the handling of the vast army of commuters morning and evening. Passenger trains operate on an 88-second headway into the Jersey City terminal during the rush hour and the station tracks are fully occupied. Waterfront property at Jersey City and at Weehawken is an essential part of the Erie Railroad system, just as much as the tracks in Illinois, Indiana and the other states traversed. A terminal cannot be developed in Jersey City of sufficient size to take care of the future commuter business without the loss of freight facilities, on which the railroads have to depend for a living.

There is only one practical thing to do. That is to create an all-rail delivery of passengers to Manhattan Island. The destinations of passengers are widely scattered, of course, but the greater preponderance are destined to the lower end of the island. With the development of the 42d Street zone, with its great office buildings and with the intermediate cloak and suit development, it will be physically impossible, however, to handle about 35 per cent of the passengers without change.

An outer station in the vicinity of Croxton is practical. A station at that place should be built on the loop plan with a connecting subway system for the distribution of passengers to the downtown district and to the district around Fourteenth Street and to the north. This distribution might be brought about by extension of the Hudson & Manhattan lines to the station at Croxton and construction of additional tracks under the river between Exchange Place, Jersey City, and the Hudson terminal, as well as additional tracks uptown when needed. Probably an extension could be made into the 42d Street zone.

Another scheme would be the operation of the New York subways from a point near the Battery across to the Central Railroad of New Jersey station and thence through a section of Jersey City susceptible of great development to the Croxton station and back across the river to Manhattan near Fourteenth Street. Downtown subway trains in the morning could thus be utilized for an uptown load after leaving the distributing station on the New Jersey side. Southbound subway trains which were emptied at Fourteenth Street could be sent across to the Croxton station to pick up a downtown load.

To my mind, a loop from the centralized station to 57th Street is too far north. I do not desire to comment on the various loop lines outside of the centralized station in New Jersey other than to say that north Jersey is pretty well provided with passenger lines now, and until such time as their capacity has been reached and some scheme worked out to finance their electrical operation, we can afford to wait for this development. When such time arrives, if certain of these lines are electrified, trains can be run through to destinations in New York City without change at the so-called outer stations.

J. J. MANTELL,
Vice-President New York Region Erie Railroad.

Analysis Will Stimulate Discussion

THE NORTH JERSEY TRANSIT COMMISSION

HOBOKEN, N. J., March 2, 1926.

To the Editor:

Mr. Miller's article impresses me as a keen analysis of the situation and as an illuminating and fresh point of view on a very difficult subject. Its publication can only result in salutary stimulation of discussion.

In the main, my comment is that Mr. Miller possibly has not taken the ultimate conditions into account. The North Jersey Transit Commission is aiming at more than assisting present commuter transit and providing intracity communication in metropolitan New Jersey. It is endeavoring to contribute to an ultimate scheme of regional transit in the whole metropolitan area on both sides of the river.

Perhaps, too, he has not considered that our complete plan suggests river crossings such as those at 41st and Fourteenth Streets, which are not properly part of the proposed north Jersey system, or, also, that we are figuring upon transfer of the majority who take the west side subways at a point in lower Manhattan rather than at 57th Street, where no provision is made for such transfer.

His forecast of the extent to which the capacity of the proposed interstate loop will immediately be absorbed is not susceptible of disproof, being based on a judgment of probabilities. But we cannot imagine the entire number of passengers arriving at the waterfront crowding into our lines. The Hudson & Manhattan will always carry a respectable share and there are factors other than the commuter which will involve the continuation of ferry service for many years.

Our optimism has never been equal to the hope of a system adequate at once to make the ferries unnecessary. Our system would be the beginning. As facilities increase, the curtailing of ferry service would gradually follow. I may say that we were only deterred from recommending, now, eight lines under the river by the financial necessity of keeping down the initial cost.

From the ultimate point of view, personally, I feel there is not much difference between any of the plans proposed. The more river crossings, the better the distribution, but the more crossings, also the greater the cost. Over a long period, undoubtedly, river crossings will multiply.

B. H. SAUNDERS,
Chairman.

Alternative Methods of Handling Commuter Traffic

PARSONS, KLAPP, BRINCKERHOFF & DOUGLAS
NEW YORK, March 11, 1926.

To the Editor:

In reply to your request for an expression of opinion upon your analysis of the North Jersey Transit Commission's report, I would say that I am glad to see a technical discussion of the suburban problem undertaken. I hope you will give our Westchester plan similar treatment.

The feature of your article and the Jersey commission's plan which most interests me is the broad basic question of whether a plan based upon the loop idea entering Manhattan at the Battery and leaving at 57th Street or 125th Street is sound as compared with a number of direct east and west lines.

I made an analysis of this New York metropolitan transportation situation in a paper prepared at the request of the American Society of Civil Engineers in 1920. I arrived at that time at the conclusion that to encourage and promote a more uniform distribution and development of the wider New York metropolitan district a system of east and west and north and south lines traversing Manhattan Island and the metropolitan area should be built. The thought was to encourage wider distribution of the factory, office and other employment centers on Manhattan Island, Long Island and in New Jersey by providing station stops at intervals along these east and west lines. These same lines would deliver people by a direct route to their Manhattan destination and supply transfer to all north and south lines on Manhattan.

Subsequent study made for the Westchester commission convinces me still further of the soundness of this basic idea of transit development for the central part of the metropolitan district.

If we can combine direct routing of passengers to their employment places with a system of lines also tending to lessen Manhattan congestion, we will be both "taking people where they want to go by the shortest route and encouraging them to go where they ought to go at the same time."

The Westchester plan in order to be financially possible must consist in its first step of a single line delivering its passengers to points along the north and south axis of Manhattan.

Instead of the interstate loop of the Jersey commission's plan, the Westchester plan proposes an extension of the Westchester tracks south from their terminal below the City Hall, Manhattan, via the Battery and the Jersey Central to the Meadows Transfer. All the functioning of the south end of the interstate loop and distribution north along the axis of Manhattan would be provided by carrying the Jersey passengers between the Meadows Transfer and southern Manhattan with the Westchester trains and such loading will be on empty trains in the reverse direction to their own traffic.

The extension, as we propose, of the Interborough 42d Street tube to New Durham and on the surface to the Meadows Transfer will serve more conveniently the Jersey traffic seeking the shopping, theater and midtown business district than the 57th Street route of the interstate loop. This takes the place of the north end of the loop by extension of an existing line and the use of equipment now loaded only one way.

The reverse direction use of the Westchester line would save millions of dollars for the long Lexington Avenue side of the interstate loop. Instead of separate equipment required by the initial plan of operation of the interstate loop, the car capacity would, under the Westchester plan, be supplied by the B.-M. T. on its Fourteenth Street route, the Interborough on its Queensboro route and Westchester by the extension of its trip to the Meadows Transfer.

The sums of money required for this type of transportation are so great that it appears to me it is vital to load all trains in both directions and extend present lines when possible, so as to avoid duplication of expenditure. The interstate loop trains would be loaded in only one direction and take a long (17-mile) circuitous route.

I have commuted from Jersey to Manhattan for the past eighteen years and have used at times practically every steam railway, ferry and tube system. My American Jersey commuter mind does not take kindly to riding on a long belt line, à la London, or Paris. When we Jerseymen leave our "beautiful suburban homes" to earn our daily bread on Manhattan Island the shortest, most direct way in and out suits our ideas best. I am also sure New York residents and transit officials do not want us riding up and down their narrow congested island if it can be avoided.

HENRY M. BRINCKERHOFF.

Commission Plan Has Two Objects

RIDGEWOOD, N. J., March 2, 1926.

To the Editor:

The North Jersey Rapid Transit Commission is particularly anxious for criticisms of the plan for improved transit for the New Jersey area as outlined in its recent report, and the members fully recognize the responsibility resting upon them in attempting to solve the very complex problem of present and future transit.

We had in mind two very definite purposes in the plan outlined; first, to distribute the commuter in Manhattan as near as possible to his destination; second, to afford an opportunity for travel between the principal points in north Jersey with the least possible inconvenience.

Mr. Miller's criticisms are constructive and may call forth other comments and suggestions which will be helpful. I think, however, that he has overestimated the number of persons who will transfer at 57th Street on the west side for destination south of 57th Street. It is our belief that passengers for the west side will travel through the Battery tunnel and change at Rector Street for points north of that point and south of 57th Street on the west side, thereby traveling with the lighter flow of traffic.

It is also well to consider that it is the expectation of the commission that the Hudson & Manhattan will make connection with the Meadows Transfer, as it was never intended that the H. & M. should be relieved of all but the Newark traffic.

Your attention is also called to the very excellent report of Mr. Lewis to the Regional Plan Committee,* which has just been received. From a hasty reading this report seems to be an indorsement of the plan of the North Jersey Commission.

DANIEL A. GARBER,
Vice-Chairman North Jersey Transit Commission.

*An abstract of this report appears on page 458.

Improving the Pull-In Record at New Orleans During 1925*

By Frank T. Dawkins
Engineer Rolling Stock and Shops Department, N. O. P. S., Inc.

IN DECEMBER of last year a record of 636,000 miles per pull-in was achieved by the rolling stock and shops department of New Orleans Public Service, Inc. This enviable record, while unique and showing the possibilities of the systems which we have installed, should not be taken as a standard. However, our record for the year 1925, with 190,644 miles per pull-in as compared with 130,725 miles per pull-in in 1924, shows conclusively that the system we installed and which will be outlined in this paper has accomplished wonderful results.

The first step is the checking over of the car by the foreman of the shop and the engineer, who make complete notes of conditions in order to be in a better position to direct the work and have a check against the final test of the car. The previous performance data of this car are of great importance in giving the car an accurate inspection. These data are furnished by the different reports from carhouses.

The car is run over one of the car hoists and a crew of men placed on it. Motor leads are disconnected and the car body is raised from the trucks. The crew then runs the trucks out from under the car and removes motors from the truck. The motors are sent to the motor assembly room by means of a traveling electric crane. The truck is given a thorough inspection after it has been well cleaned. If found in a good condition, except for tightening of bolts, it is supposed to be placed back under the car. If the trucks are found in a bad condition, the brake levers and rods shall be removed, holes rebushed with case-hardened bushings and case-hardened pins used in all places. Springs shall be thoroughly inspected and, where necessary, replaced. In general, all worn parts are to be replaced with new and loose parts tightened.

When the motor is received in the motor assembly room it is gone over by the engineer. The resistance of fields and armatures is checked and the condition of bearings, brush-holders, pinions, motor leads, motor shells, etc., is examined. The motor is then taken apart and the armature and fields are sent into the armature and field department for dipping and baking. If bearings are worn to such an extent that it would be harmful to the motor to let them out for 40,000 miles more, they are sent into the bearing department. A difference of 0.020 in. between bearing and shaft is the limit of wear, this being determined by micrometer measurements. If any parts on the motor frame housing or axle caps have flaws or are worn, they are sent into the machine shop for repairs.

When the armatures and fields are received in their department they are given resistance, short and open circuit tests and a ground test, and if found all right their dressings are removed. They are placed over the dust collector opening in the room and all dust removed from them. They are then placed in an oven to preheat. After the specified time for preheating, they are taken out and dipped in insulating varnish long enough to become saturated. They are then replaced in the oven for the final baking, after which they are removed from the oven, allowed to cool and final dressings put on. In order to give the field coils a better treatment, impregnating tanks are being designed by the engineering department. The commutator is turned and slotted and it is given its final test for opens and shorts and a 1,500-volt ground test by the engineer. Bearings are fitted on and they are sent into the motor assembly room. The bearings that require rebabbitting are cleaned in a solution of hot Oakite and water to remove all grease and dirt. They are then placed in the melting out furnace and all babbitt removed from bearing shell.

Next the shell is dipped in acid and given a thorough cleaning and dried off. It is then swabbed with zinc chloride and all surfaces not to be tinned are coated with a solution. Following this it is dipped in a second tank containing half and half solder, which is kept at a temperature of between 770 deg. and 824 deg. F., by means of an electric pyrometer. This operation is repeated once more. The bearing is then ready to be babbitted. If the bearing is poured at once, the heat from the tinning is sufficient for the pouring operation, but if allowed to remain for some time it must be heated again. The bearing shell is then mounted on a mandrel and babbitt from a third tank poured into the shell by means of a self-skimming ladle. The babbitt is kept at a temperature between 860 and 900 deg. F. by means of an electric pyrometer.

After the armature and fields have been received back in the motor assembly room, the motor is ready to be assembled. The motor shell is cleaned thoroughly and the inside is given a coating of air drying insulating varnish by means of a spray gun. The fields are placed in the motor shell and all field connecting cables are placed so they cannot by any means rub against the shell. Next the armature is placed in the shell, all housing bolts tightened, axle bearings fitted and if the old pinion is in good condition and shows no flaws it is placed back on the motor. The motor is then placed on the test floor and given its final tests—resistance, ground test, low-voltage running test and load test by the engineer. The motor is painted and is ready to be placed on the truck. Care is taken that the pinion and gear mesh correctly to eliminate as much noise from this source as possible.

After the electrician and carpenter have thoroughly inspected the car and all of its accessory equipment, the motor is placed on the truck, gear cases bolted up and axle collars placed in position. The trucks are then run under the car, which is lowered. Motor leads are connected and placed in spreaders and brake rods connected. The brake equipment is then gone over. Extreme care is taken in inspecting and overhauling this equipment and foundation brake rigging. The compressor is removed from the car and sent into the compressor room for overhauling. A repaired compressor is placed on the car. The compressor sent in for overhauling is opened up, field and armature removed and sent into the field and armature department, where they are given the same test and overhauling that the motor armature and fields received. All parts of the compressor are thoroughly cleaned and bearings are tested for wear. If in need of repair, they are removed and replaced with new or rebabbitted bearings. All loose or defective bolts are replaced, valves removed and cleaned, vent cleaned out, back head and piston removed, cylinder cleaned, reassembled and tested for leakage. The compressor is then reassembled, refilled with oil and given a performance test on the bench for rate of pumping up to capacity and pressure. If the cylinder is badly worn the compressor is sent into the machine shop, where cylinders are bored, bushed up and finished to standard size. A careful inspection is given to all other items of brake equipment and they are cleaned, adjusted and replaced when necessary.

Trolley wheels and harps are properly lined up and lubricated, the trolley pole inspected, the trolley base thoroughly gone over and lubricated, and, if in need of repair, it is removed and replaced with an extra one. The car is then ready for its final inspection, which is made by the engineer. The resistance of all car wiring, motors and resistors is taken by means of a Kelvin bridge ohmmeter. This resistance is checked against standard resistance for this type of equipment and if found off, it is checked back to its source and repaired. A variance of 5 per cent is allowed each way. The cable, wiring

*Abstract of paper presented at annual meeting of Electric Railway Association of Equipment Men, Southern Properties, held at Mobile, Ala., Feb. 24-26, 1926.

Digitized by Google

and controllers are given a 1,250-volt insulation test. After all electrical equipment has been checked, the air equipment is gone over and checked against its standards. The trucks and car body are then given a final inspection and the car is run out on the line for trial. It is then cleaned and sent back to the carhouse. After it is received there it is inspected for hot journal, axle brasses and armature bearings before it is placed back in service.

In this overhauling system a complete set of records is kept of all the cars, their operating condition, equipment and data pertaining to their road performance previous to this overhauling period, so that when the car is received for overhauling its performance may be known in giving it the required test.

Advantages of Electric Drive for Gasoline Buses*

By J. C. THIRLWALL
Special Railway Engineer General Electric Company

DURING the past ten months more than 300 large-capacity gasoline buses equipped with electric transmission have been put in operation. Their operation, in Philadelphia, Albany, Atlanta, Kansas City and Miami, has already demonstrated a number of very positive advantages over the ordinary type of mechanical drive using clutch and transmission gearing.

A long series of road tests on a sample equipment had indicated that it should be possible, with electric drive, to operate materially higher schedule speeds in frequent-stop service; to reduce maximum engine speed and total engine revolutions in such service; to provide greater comfort and safety to the passengers; and to relieve the driver of a considerable part of the physical and mental fatigue incident to repeated shifting of gears. The actual operation of the fleets that have been similarly equipped have proved that our conclusions were well founded.

In both Philadelphia and Albany, schedule speeds decidedly faster than it has been possible to maintain with the old mechanically-driven buses are being made with the gas-electric types, the increase being in the neighborhood of 20 per cent for actual running time, and more than 10 per cent in miles operated per crew-hour, which includes all layovers. In both places public appreciation of the speed, smoothness and quietness of the new buses has been shown by letters of commendation and by a gratifying amount of riding.

Several factors contribute to the ability of gas-electric buses to make higher average speeds in city service. Of chief importance is the elimination of the time lost in shifting gears during each acceleration or on grades. An expert driver, trying to make a fast schedule, can shift gears and let the clutch into complete engagement in about 1½ seconds; the average driver, trying to avoid jerking the bus and clashing gears, takes from 2½ to three seconds per shift. On level runs with four-speed transmission, drivers usually start on second, and have three shifts to make at each acceleration, which consume at least four to five seconds and usually seven to eight seconds. During these intermissions, not only is the engine doing no useful work but there is an actual retardation of bus speed.

To make up for these sags in the acceleration curve, altogether too many drivers will race their engine up to dangerous speeds in second or third so as to get the benefit of high power output from the engine and high tractive effort at the rear wheels. Moreover, unless the engine speed is brought up higher than is safe in third gear, its speed when starting on high gear is so low as seriously to reduce the rate of acceleration. These features are inherent in mechanical transmission where the engine speeds are directly proportional to the revolutions per minute of the wheels, and in each gear position the engine speed and its power output must climb from a relatively low point to its more efficient range.

With the electric drive the characteristics of the generator and motors are such that the engine can be brought in less than one second from idling to high output speed, and from there on up to maximum safe output with no intermissions or lag. The result is operation at the most efficient part of the speed curve, a more constant power output and a very appreciably higher rate of acceleration for the bus.

In actual service, tests show that on either the Fageol or Yellow coaches, the maximum engine speeds attained are about 1,700 r.p.m. (this being on long runs at full bus speed, or in climbing along severe grades); and normally in frequent stop service, maximum speeds of not more than 1,500 r.p.m. Similar tests with mechanical drive, when attempting to maintain similar schedules, showed maximum engine speed of from 2,000 to 2,600 r.p.m. in the intermediate gear positions.

The torsional strains during acceleration on the engine, chassis, clutch and gearing are recognized as contributing to high maintenance costs, and the surges of torque and changes in cylinder pressures due to too rapid clutch engagement are a factor in cracking the fuel and causing knocking due to explosive combustion. The lack of such torque surges in the electric transmission permits of the use of higher engine compressions on advanced sparks and increases its power and efficiency. Without change in compressions, the fuel consumption in city service is approximately about the same for either drive. With higher compressions, as shown by recent tests reported by Mr. Froesch, assistant engineer of the Mack Company at an S.A.E. meeting on Nov. 14, the miles per gallon at five stops per mile or more actually are greater with the electric drive, despite its added weight. According to the same authority, even in purely interurban service there was a difference of only 10 per cent in gasoline consumption in favor of the mechanical drive.

The period of operation is too short, as yet, to make available any figures on relative maintenance. However, the Philadelphia Rural Transit Company and the Capitol District Transportation Company have doubled their inspection period with their new buses, and considerably reduced their garage expense.

In conclusion, all the experience to date bears out our claim that the use of electric drive on buses will enable faster schedules to be operated at reduced costs and will improve the comfort and safety of the passengers and of the drivers, and that these positive advantages far outweigh the relatively small increase in investment for buses so equipped.

*Abstract of paper presented at annual meeting of Electric Railway Association of Equipment Men, Southern Properties, held at Mobile, Ala., Feb. 24-26, 1926.

Great Lakes Cruise for C.E.R.A. Meeting

SAILING over the Great Lakes the Central Electric Railway Association will hold its midsummer meeting on board the steamer *South American* on June 28-July 2. The itinerary as adopted tentatively follows:

Monday, June 28:		
	Leave Buffalo	9:30 a.m.
	Arrive Cleveland	9:30 p.m.
	Leave Cleveland	11:00 p.m.
Tuesday, June 29:		
	Arrive Toledo	7:00 a.m.
	Leave Toledo	8:00 a.m.
	Arrive Detroit	1:00 p.m
	Leave Detroit	2:00 p.m.
	Pass Port Huron	7:00 p.m.
Wednesday, June 30:		
	Arrive Mackinac Island	12:00 noon
	Leave Mackinac Island	8:00 p.m.
Thursday, July 1:		
	Arrive Harbor Springs	7:00 a.m.
	Leave Harbor Springs	5:00 p.m.
Friday, July 2:		
	Arrive Benton Harbor	7:00 a.m.
	Leave Benton Harbor	9:00 a.m.
	Arrive Chicago	1:30 p.m.

Stopping at Mackinac Island Wednesday noon the entire afternoon will be available for golf or trips around the island. There are two golf courses, both available for members. The boat will reach Harbor Springs in time for breakfast Thursday. The Weguetonsing Golf Club has made available two 18-hole courses about five minutes from the dock. There is a third 18-hole course at Harbor Point. For those who do not care to play golf the steamer will proceed down Traverse Bay to Traverse City, stopping there about two hours and then returning to Harbor Springs for the golfers.

The *South American*, which has been used for similar meetings before, has been entirely rebuilt and improved. While berths are available for 500 passengers, it is the intention to limit the number on this cruise to 350. The total cost of the trip including stateroom and meals will be from $35 to $45, depending on the starting point. Children five to twelve years of age will be carried at half fare. Formal notice of the program will be sent out about April 15. This preliminary announcement will make it possible to make up parties for the cruise.

American Association News

Cleveland for 1926 Convention

CLEVELAND, OHIO, has been selected for the 45th annual convention of the American Electric Railway Association and affiliated bodies and the manufacturers' exhibit to be held in connection therewith. The dates will be Oct. 4 to 8, inclusive. The charge for space has been fixed at 75 cents per square foot. This was decided at a meeting, held on March 8 by the special sub-committee of the executive committee appointed to act on the recommendations of the committee on location. Those present were C. E. Morgan, chairman; C. R. Ellicott, E. P. Waller, J. H. Hanna, L. S. Storrs, J. W. Welsh and F. C. J. Dell.

The recommendation of the committee on location in favor of Cleveland was made after a careful survey of conditions in that city and Atlantic City, where the convention was held last year. Sub-committees visited both places and obtained first-hand information.

It was found that in the case of Atlantic City the primary difficulty was the lack of space on Young's Million Dollar Pier to take care of the total requirements for the exhibit. A second difficulty encountered this year was the refusal of the Million Dollar Pier management to permit heavy machinery or operating exhibits on the ballroom floor, even though a protecting temporary floor were installed.

To provide 20,000 sq.ft. additional space a temporary building was offered directly across the boardwalk from the pier. This would probably have had to be devoted to the bus exhibit and would therefore have encountered the same criticism as last year to the effect that the delegates would not visit it as extensively as the main exhibit, and that it partook of the nature of a side show. The rental for space on the pier charged by the management as well as the cost of the temporary building represented a substantial increase over last year.

In Cleveland the public auditorium provides an exhibit area of 52,000 sq.ft. net in a building designed with all the equipment and facilities required by exhibitors. In addition the Cleveland convention committee proposes erecting an annex to this building having a net area of 74,000 sq.ft. The plot on which the auditorium and annex are located also provides an open air space of 7,200 sq.ft. where 1,500 lineal ft. of car tracks can be placed to hold exhibits of cars, and other outside track tools and equipment can be exhibited in actual operation. The Cleveland Railway will install temporary tracks and connect them with its own system and also with the siding from the New York Central tracks immediately adjacent to the auditorium plot.

The auditorium and annex will give practically unlimited space for exhibitors with all facilities required and without restrictions as to size and weight. The open air space immediately adjacent to the auditorium will provide exceptional opportunity for a street car exhibit and for the demonstration of track tools, steam shovels, digging machines and other outside construction equipment. The cost of installing exhibits, particularly heavy machinery, track tools and street cars, will be far less than at Atlantic City since they can be brought directly into the exhibit space on their own power if necessary, over the Cleveland Railway or the connection to the New York Central siding.

The central location of Cleveland should result in lower transportation costs for most of the delegates, and the hotel rates are materially less than at Atlantic City. The cost for space has been fixed at 75 cents per square foot, which is the same charge the committee estimated would be necessary at Atlantic City this year, although it is 10 cents higher than the cost for space last year. This increase is necessary because of the cost of erecting the annex, but in the event that any appreciable surplus remains after paying the expense of the convention and exhibit a pro rata refund will be made to exhibitors.

The convention committee of the Cleveland Chamber of Commerce will provide between 2,700 and 3,000 rooms, of which 88 per cent will have baths, in the leading downtown hotels. These hotels are all within a few minutes walk of the auditorium, which is located in the heart of the city. The committee believes that through the intermediary of a local hotel committee adequate accommodations can be allotted to all delegates. The hotels have been instructed not to make reservations directly with delegates. Suitable blank forms will be sent out in the near future by the hotel committee, which will handle all reservations.

A local convention committee consisting of leading Cleveland citizens, including John J. Stanley, president of the Cleveland Railway; City Manager W. R. Hopkins and others, will stand sponsor for providing all of the facilities and equipment and the making of the necessary arrangements for the holding of the convention and exhibit.

Space applications and diagrams showing the exhibition layout of booths will be ready to go in the mail June 1. Thirty days will be allowed members in which to file requests for display space.

For information regarding exhibit space communicate with Fred C. J. Dell, director of exhibits American Electric Railway Association, 292 Madison Avenue, New York City.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 17-18—Central Electric Traffic Association, Portage Hotel, Akron, Ohio.

March 17-18—Illinois Electric Railways Association, Illinois State Electric Association and Illinois Gas Association, annual joint convention, Springfield, Ill.

March 23-25—National Conference on Street and Highway Safety, Washington, D. C.

March 25—New England Street Railway Club, 26th annual banquet, Copley Plaza Hotel, Boston, Mass.

March 29-31—National Conference on City Planning, St. Petersburg, Fla., April 1—West Palm Beach, Fla.

April 2—Metropolitan Section, American Electric Railway Association, Engineering Societies Building, 29 West 39th Street, New York City, 8:00 p.m.

April 13-16—Southwestern Public Service Association, Galveston, Tex.

June 2-4—Canadian Electric Railway Association, annual convention, Quebec, Canada.

June 9-16—American Railway Association, Mechanical Division, annual convention, Atlantic City, N. J.

June 28-July 2—Central Electric Railway Association, summer meeting, S. S. South American, Buffalo, N. Y., to Chicago, Ill.

Oct. 4-8—American Electric Railway Association, annual convention and exhibits, Public Auditorium, Cleveland, Ohio.

Subjects and Meetings

AT A MEETING of the committee on subjects and meetings of the American Electric Railway Association, held in Chicago on Feb. 25, tentative plans for the annual convention program were discussed. Members in attendance were J. P. Barnes, chairman; W. A. Draper, L. S. Storrs, J. W. Welsh, H. L. Brown, C. R. Ellicott, Thomas Fitzgerald, M. B. Lambert, C. L. Van Auken and Charles Gordon representing Morris Buck.

It was decided to follow the procedure adopted last year of sending out committee reports in advance and limiting the time taken on the convention floor to brief abstracts by committee chairman. In this way it is planned to concentrate the program on outstanding topics of major importance to the industry. Various subjects were considered and a tentative program was discussed. It is expected to have this in more complete form before the next meeting.

1925 Proceedings Distributed

PROCEEDINGS of the American Electric Railway Association and its affiliated associations for 1925 were distributed to members in February. All railway member companies should have received a complete set of these proceedings covering the American, Engineering, Transportation and Traffic, Accountants, and Claims Associations. Manufacturer member companies should have received copies of the American, Engineering and Transportation and Traffic Associations' proceedings. Executive Secretary J. W. Welsh states that any member company which has not

Digitized by Google

received these volumes should communicate immediately with association headquarters.

Heavy Electric Traction

PROGRESS reports were considered at the second meeting of the committee on heavy electric traction of the engineering association held at headquarters on March 4. Those present were: H. F. Brown, chairman; J. M. Bosenbury, vice-chairman; Morris Buck, secretary; L. S. Billan representing J. H. Davis, H. C. Griffith representing J. V. B. Duer, J. O. Madison, M. W. Manz, J. C. Davidson, J. T. Hamilton, Homer Cross representing L. S. Wells, and G. C. Hecker of association headquarters.

It was felt that standardization should be taken up with all the interested parties so that an agreement can be reached as to what material should be included. It was also the sense of the meeting that so far as possible assurance should be obtained from operating companies that they will adopt the standards.

The sub-committee on track and third rail bonds has held two meetings. It is reviewing standard bonding practice and preparing a tentative standard procedure for measurement of bond resistance. In the discussion which ensued Mr. Bosenbury suggested that a tabulation of the resistances of standard rail sections be included as part of the scope of this subject. The carrying capacity of the angle bars is of material importance depending upon their type, the number of bolts and the conditions. According to Mr. Manz, it is difficult to separate the current flowing through the bond and the angle plate in the ordinary methods of testing, making it next to impossible to determine accurately the resistance of the bond itself when in service. It was agreed that the subject of rail resistance be added to the assignment of this sub-committee.

Mr. Brown reported that the status of the bibliography of heavy electric traction is under consideration by the executive and policy committees of the American Association.

Chairman Armstrong was unable to be present, and no report of the sub-committee on branch line electrification and self-propelled cars was presented. It was pointed out, however, that the interest in gasoline, gas-electric and Diesel-electric cars and locomotives demands that full mention be made of them in the sub-committee report.

A report from Chairman Daus of the sub-committee on articulated trains was read. In it he stated that a letter had been sent to several equipment superintendents requesting information. It was felt that in view of the interest in the subject, all information possible should be made available in the report of the committee.

Data on locomotives, multiple-unit cars and electrified mileage is being revised, particularly to eliminate errors which were found in the tabulation last year, according to Mr. Buck, chairman of the sub-committee.

At the luncheon following the meeting, President Charles Rufus Harte of the Engineering Association spoke regarding the proposal to send letters on standardization to railways. He feels that the matter should be on a broader basis than that of a single committee only. He is going into the matter thoroughly in connection with the substitution of letter ballots for voting on the floor of the convention. This would include consideration of standards proposed by all committees. It is desirable to have greater support from the member companies in the use of standards, particularly if manufacturers are to be asked to produce material according to them.

Metropolitan Section Discusses Transportation Methods

"FURNISHING TRANSPORTATION" was the subject at the meeting of the Metropolitan Section of the A.E.R.A., held at the Engineering Societies Building, New York, on the evening of March 5.

The principal paper was by W. B. Wheeler, superintendent of transportation Third Avenue Railway System. Sketching the various forms of transportation, he showed that the street railway has a definite place and is not likely to be abandoned. He called the attention of his hearers particularly for the need of a man to keep interested in his work, as otherwise he cannot be wholly efficient. Good feeling between the various departments was also declared essential to the success of an organization.

Discussing this paper, S. S. Hamilton, assistant to superintendent of transportation Brooklyn City Railroad, said that in the metropolitan district the essentials to satisfactory service are sufficient cars to accommodate all desiring to use the service, regular intervals between cars, a type of car that is up to date and clean, and courteous employees who give a little thought to the comfort and wants of their passengers. Mr. Hamilton pointed out some of the difficulties of trolley car operation in the congestion of New York City.

M. J. O'Connor, superintendent of transportation New York Railways, also stressed the troubles from street congestion. The cost of living is increased for the average New Yorker some $44 due to this cause alone, according to the Sage Foundation, he said. The conditions are so bad that his company operates only about 90 per cent of its schedules.

Street Car Operation in Manhattan Difficult

Practically all of the surface cars in the Borough of Manhattan use the conduit system, said the speaker. With this system contact rails, cables, etc., are concealed under ground, and notwithstanding regular inspections made by trained men, trouble is experienced from short circuits due to nuts, bolts, skid chains, tire irons and numerous metal pieces that fall from passing vehicles which become lodged in the conduit, and at some time or other come in contact with the conductor rails, or, if they do not fall into the conduit, obstruct the slot.

The delay report for the month of October, 1925, represents what might be called normal conditions. This report is based on delays of five minutes duration or longer. Slot obstructions caused 31 delays, or a total of 601 minutes. Plows were charged with 86 delays, or a total of 871 minutes. The plow, which corresponds to the trolley pole on the overhead system, is quite a source of trouble. These failures are not due to material or workmanship, but solely to the conditions peculiar to conduit operation.

Accidents, car troubles (other than plows), carelessness, construction work, fires, parades and miscellaneous delays of minor nature caused 386 interruptions to service, or a total of 3,395 minutes.

Under the modest heading "Blocking by Vehicles," we have the staggering total of 1,300 delays or a total of 9,481 minutes, or expressed in another way, 73 per cent of the interruption to our service is caused not by broken-down trucks but by congestion of traffic, for the most part on lower Manhattan south of 59th Street. Delays in this classification are increasing from month to month and constitute a real danger, not alone to passenger carrying vehicles but to all forms of surface transportation as well.

The street railroads are also paying the freight. Our bill for overtime for platform men amounts to approximately $1,000 a month. This sum is paid, not for extra service to encourage more business, but for time lost in traffic holdups and is a total loss. From March 17, 1925, to Jan. 16, 1926, it has been estimated that 400,000 car-miles were lost owing to the low speed in getting through the congested parts of the city. Figure 65 miles to a car and you will get an idea of the service lost to the traveling public.

Many remedies have been suggested and some adopted, such as one-way streets, widening of thoroughfares, control of moving traffic by lights and others too numerous to mention. The relief, however, was only temporary, and the condition at present is worse than ever. What we want is immediate relief, and that can be obtained only by keeping the highways clear for moving vehicles. The parking of automobiles in congested areas should be stopped at once.

On a recent survey of the district from 59th to 14th Street from Lexington Avenue to Seventh Avenue 6,135 vehicles were found parked. This condition interfered with the passage of tens of thousands of other vehicles and hundreds of thousands of passengers. Our own checks show cars parked on Broadway and in 34th Street from two to six hours.

A north and south thoroughfare is needed in midtown; why not extend Park Avenue from 96th Street to the Madison Avenue Bridge? This can be accomplished by roofing over the New York Central tracks as far as 112th Street, thus providing easy and quick access to the east Bronx, thereby relieving Fifth and Madison Avenues of some of the overload.

A number of others discussed the general subject. It was the general opinion that the local situation is so serious that definite steps should be taken to rectify it.

Maintenance Notes

Wheel Hoist for Raised Pit

AN INGENIOUS form of wheel hoist is used in the shops of the Mobile Light & Railroad Company at Mobile, Ala. It is not new, having been installed some 20 years ago, but this fact alone makes it interesting, because it has given satisfaction for two decades. While it takes some room, it is easy to operate, and as the car is about 3 ft. above the floor when the truck is removed there is plenty of room for the workmen to move about in and there is plenty of light to let them see what they are doing.

The Mobile shops are equipped with both sunken and "raised" pits, and it is one of the latter which is equipped with the hoist. As shown in the illustrations, the hoist consists of a vertical piston operated by air and carrying at its upper end two short sections of track on a framework which is swiveled around the piston. When the car is run over the pit this section of track is in line with the pit rails and the piston is in its raised position. The rails are kept in alignment in this position by fishplates and bolts.

When the wheels come over the rails on the hoist the car is jacked up. The bolts and fishplates are then removed and the piston is lowered. When the wheels come to the level of the shop floor the framework supporting the wheels is swung around a quarter circle and the wheels are rolled out.

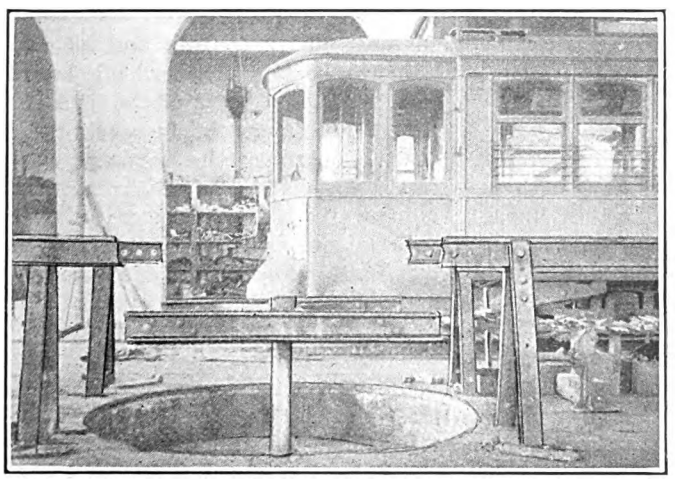
Car Sign Painting Methods Used in the Shop of the Department of Street Railways, Detroit, Mich., Greatly Reduce the Cost and the Time Consumed

Fast Work in Car Sign Painting

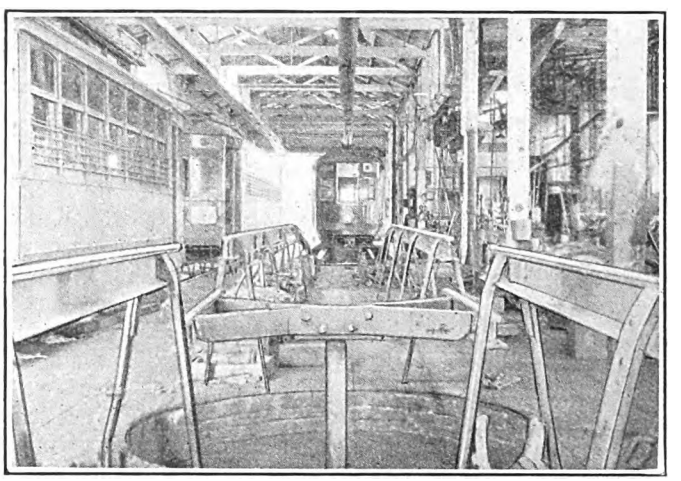
PAINTING car signs is but a moment's job as carried out in the car shop of Detroit's Department of Street Railways. The cloth used in the sign painting is first treated to a bath of fish oil and then hung up to dry, as shown in the view of the section used for sign painting. This treated cloth is then wound on rolls and hung on either end of the double sign painting table shown to the right in the illustration.

Letters forming the sign are cut from cardboard and pasted on the frames prepared in advance. These frames are of metal and wood construction and have silk bolting cloth stretched tightly in place. The letters forming the signs are then glued to the bolting cloth. The frames are hinged so that they may be attached to the table as shown. To the right of the table one of these frames is standing vertical just before being lowered over the cloth. One sweep of a rubber-edged wiper filled with a thick black sign paint forces the paint through the mesh of the cloth except in the space forming the letters. The frame is raised and the sign is painted. A few dabs of the brush complete the margins and an occasional spot that may be missed. The operator cuts the sign section in the manner shown on the left half of the table and hangs up the section to dry on the wire racks in the background.

After use the bolting cloth frames



Side View of Pneumatic Pit Hoist at Mobile



End View of Pneumatic Pit Hoist

Digitized by Google

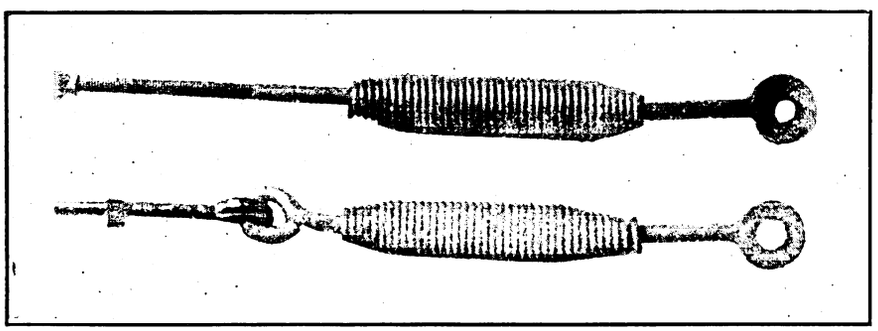
are thoroughly cleaned with gasoline in the tray table, shown slightly to the left of the cutting table. The workman is in the process of cleaning the frame just removed from the left end of the sign painting table. The frame is then stored away for future use in vertical racks, the edge of one just showing in the lower right-hand corner.

Most of the finished signs seen in the background are sections made to replace parts of rolls that were worn. When dry these are stitched in the roll sections of cars brought in for repairs.

The type of sign used in Detroit shows up well as it consists of white letters against a black background. At night the lamps placed back of the signs illuminate the letters silhouetted by the opaque background. Other colors can be used at will simply by using a different color paint. There is no comparison to the time formerly consumed by hand painting or by the use of double stencils that had to be carefully matched, one name at a time.

Double Rod Reduces Brake Release Failures

CONSIDERABLE trouble with broken rods for brake release springs was at one time experienced on the Richmond cars of the Virginia Electric & Power Company. The breaks did not occur in the springs themselves, but in the threaded shank. While not a serious matter, it was bothersome and so worth remedying.



Release Spring Connection on Brake Rod as Modified in Richmond

The most plausible theory advanced to account for the trouble was that the pull on the rod came sometimes from one angle and sometimes from another slightly different and that breakages could be avoided if the connection was not quite so rigid. This suggested the use of a rod in two parts joined together by two eyes. After this type of construction was installed the trouble disappeared, showing that the theory followed was correct.

In the accompanying illustration the upper view shows the spring rod as it was formerly used; the lower view shows the spring rod as changed in the shops under the direction of W. J. Hicks, master mechanic.

Emergency Valve Used with Straight Air Brake

USE has been made by an Eastern electric railway of the balancing feature of the triple valve to give added safety to cars equipped with straight air brakes. This company operates one-man cars in hilly districts and occasional difficulty has been experienced in stopping cars when the ordinary brake apparatus has been put out of order as the result of accident. Relief of air pressure on one side of the balancing valve is effected by a hand valve. The movement of the balancing valve then produces a direct connection between the air reservoir and the brake cylinder. This, of course, is sufficient to stop the car and hold it for some time, affording all the passengers an opportunity to alight if desired.

The release valve has been placed inside the front bulkhead, and an emergency pull cord runs the entire length of the car. The balancing valve has been installed under the longitudinal seat. Holes were cut in the back of a near-by heater to eliminate the possibility of moisture in the valve, causing it to freeze up. Above the holes in the heater a horizontal piece of transite has been placed to reflect the heat down against the valve and away from the rattan cushion. While the need for using this apparatus is infrequent the cost of installation is comparatively slight and the added safety provided by it is believed to be advantageous.

New Equipment Available

Oil-Tight Multi-Pole Circuit Breaker

SO AS to meet the demand for greater reliability and increased interrupting capacity, created by the modern tendency toward expanding concentrations of power and the demand for maintenance of uninterrupted service, the Westinghouse Electric & Manufacturing Company has developed a new type of oil-tight multiple-pole oil circuit breaker.

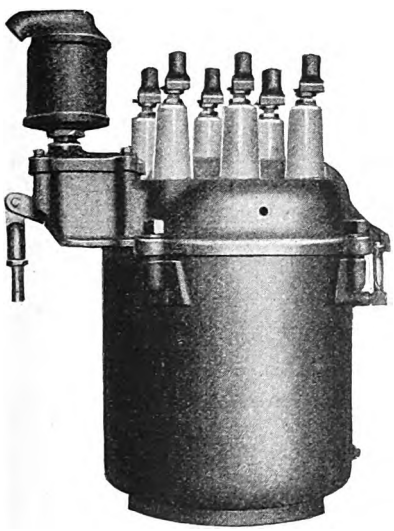
One of the novel features of this breaker is the inclosing of the three poles in a single round tank. This arrangement results in a type of breaker from which material advantages are gained in the form of increased interrupting ability; rugged, oil-tight construction, increased electrical clearances for terminal connections and a minimum of space requirements. The single circular tank with a rounded bottom and the dome-shaped frame form a breaker chamber cylindrical in shape with domed ends resembling boiler construction. This shape represents a maximum of strength for resistance to internal pressures with the most efficient use of material and the maximum volume of inclosed breaker chamber for a given installation space. The domed frame permits using space, heretofore inefficiently utilized, about the contact studs for additional volume of air expansion chamber above the oil, and also allows the system of operating levers to be inclosed within the breaker chamber, all without increasing the over-all height of the breaker.

A main shaft brought through the frame with a single operating lever outside, and well away from the live terminal connections, and the remainder of the levers within the breaker results in the removal of grounded moving parts from the vicinity of the bus connections. By this means the air insulating distances outside the breaker are increased and an oil-tight structure

Digitized by Google

obtained, neat and trim in appearance and easily kept clean. The single round tank for all poles provides for the most efficient use of the oil, the insulating properties of the entire volume of oil being available for each pole, and simplifies such maintenance features as renewal of oil, maintaining the oil level and the inspection of contacts.

The breaker is particularly well adapted to meet the requirements of heavier switching service in powerhouse and substation applications due



Type B-20 Multi-Pole Oil Circuit Breaker with Single Tank

to the increased interrupting capacity obtained by this form of construction. Adequate mechanical strength for resisting internal stresses; the large volume and head of oil; the ample air expansion chamber; large air insulating clearances outside the breaker chamber and the minimum of installation space required, together with its sturdy contact construction and a closing mechanism with sufficient power to close the contacts positively and accelerate them rapidly in opening, make the breaker dependable under severe operating conditions.

Light Electric Soldering Irons

LIGHT in construction and designed to heat up quickly, a new soldering iron is made by the General Electric Company in standard sizes ranging from ½ in. to 1¼ in. tip. The power ranges from 70 watts for the smaller iron for light and intermittent use to 350 watts for the larger size on heavy duty. The irons for heavy duty are provided with radiating stands for the purpose of maintaining the iron at the correct operating temperature when temporarily not in use. The rapid rate of initial heating is brought about by unusually good heat conduction between the heating element and the copper tip. Heat from the tip is prevented from reaching the handle by means of a special mechanical construction between the two, this being in the form of a spiral made from a steel rod. This also provides a rigid connection between the handle and tip.

Instead of mica, usually used for an electrical insulator in the heating unit of soldering irons of this type, the heating unit has an insulating powder so highly compressed that it becomes a good heat conductor and will withstand temperatures of more than 2,000 deg. F.

The iron is provided with a standard lead and connection plug. Its construction is simple, parts are few and all parts are easily replaceable.

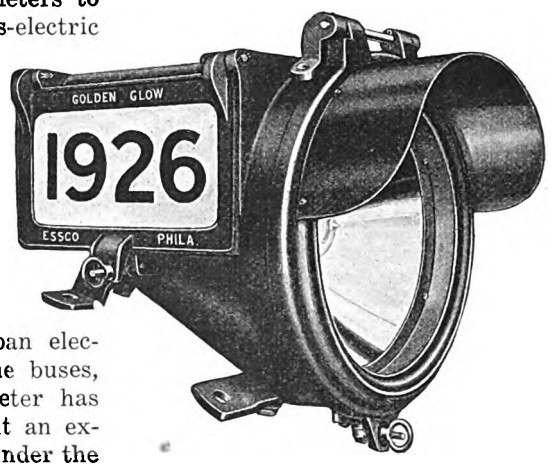
Meter Measures Bus Performance

FOR recording the performance of gas-electric buses, the Economy Electric Devices Company, Chicago, has recently placed on the market an Economy watt-hour meter with kilowatt-hour inspection dials. The Philadelphia Rural Transit Company has ordered 375 of these meters to be installed upon its gas-electric equipment. The order is the result of exhaustive tests which have been made by the Philadelphia company on watt-hour meters designed for this purpose. The meter itself resembles the standard railway type of Economy watt-hour meter used in street railway and interurban electric car work. Used on the buses, however, this particular meter has characteristics which give it an excellent accuracy curve even under the greatly varying voltage and current conditions typical of the gas-electric drive. It is connected to measure the output of the gas-engine-driven generator and will therefore afford definite means for comparing the relative efficiencies of the bus drivers and also for determining operating efficiencies of the individual gas-electric power plants.

In addition, the kilowatt-hour inspection dial feature of these meters will serve the shop maintenance department in determining the proper time for inspection and lubrication of equipment. The meter has three dials, each equipped with a moving and a stationary hand. The stationary hand is set at a point representing the amount of power which may be produced or consumed before inspection is necessary. When the moving indicator coincides with the stationary one, indication is given that inspection is due. After inspection is made, the moving hand is reset at zero and another cycle of operation is started. This feature eliminates all bookkeeping formerly necessary by the shop forces to keep account of mileage and to pull the bus into the shop at the end of 2,000 or 4,000 miles. The shop foreman or clerk, by a glance at the meter each night, may determine which particular bus is due for inspection and overhaul on the following day.

Tapered Body Feature of New Headlight

DESIGNED to fit the roofs of electric cars, a new headlight has just been placed on the market by the Electric Service Supplies Company, Philadelphia, Pa. This is an addition to the Golden Glow line and is specially designed for electric cars, self-propelled rail cars and the like, where installation on the roof is desirable. The body of the new



Headlight Arranged to Fit Curvature of Electric Car Roof

headlight is tapered and the seats are made so that they will conform to the curvature of electric car roofs. The main body of the new headlight is made in one integral cast aluminum shell. Front and side doors are also of aluminum and are gasketed to make them weatherproof. All fittings are of bronze. This new headlight has been designated type RA-128.

The News of the Industry

Trustees Favor Boston Control Bill

Interesting testimony about the Boston Elevated Railway, Boston, Mass., representing official points of view, was given recently before the Massachusetts legislative committees on metropolitan affairs and street railways, sitting jointly. H. Ware Barnum, general counsel for the Board of Public Trustees, said that he spoke for the majority of the board. He accepted, in general, the provisions of the bill. The extension of the public control for thirty years he approved. Such an extension he regarded as necessary to economic financing, as it gives an element of certainty to the investment. Uncertainty of termination of public control, and private management, is more injurious to the financing, he said, than a certainty of private ownership would be. At least $6,000,000 is needed in the next five years to keep the present service going.

Some people contend that the upkeep should come from earnings, so that if there is a proper depreciation account there is no need of new capital to maintain the service. The fact is that all the items going into the property cost twice as much today as when obtained, and under the law this excess in cost for replacement purposes must come out of new capital, and not out of earnings. That is a proper provision, as otherwise the road would be building up out of earnings.

When the report speaks of $6,000,000 it bases this on a minimum requirement, and Mr. Barnum estimated that the road really needs $2,500,000 a year of new capital. If it is allowed to sell preferred stock that improves its finances more than the actual amount of the new stock issue, because it follows that new bonds may be issued to the same amount as the stock, and with the new capital the company would be in a position to keep pace with the growth of population and the proper demands for expansion of the transportation facilities.

The proposed 30 years extension, Mr. Barnum thought, would give the necessary certainty and security to get low rates on the new money. The ten-year period which comes to an end in two years was not long enough for any comprehensive financial plan. In reality it has been only a six-year period, because the first four years were consumed in testing and determining the constitutionality of the law, and such proceedings do not encourage any long-term financing at favorable rates. It takes a much longer period to have any appreciable effect upon money rates.

Frederic E. Snow, counsel for the Elevated, said he did not believe that extension of public control 30 years, with a dividend rate of 5 per cent, would restore stock to par, and that consequently he "did not feel that the purpose of the Legislature would be accomplished by the proposed bill."

Although he said he was not authorized to speak for the common stock holders, Mr. Snow said he thought they are going to feel that they ought not to be asked to make the sacrifice involved in a cut in the dividend rate. "There is grave doubt about them accepting any proposition of this kind," said he.

Mr. Snow said that although the directors have passed no vote on the question of taking the road back, they are "ready to do it if the state decides to pass the road back." Asked by Senator Rice whether upon return of the road to private ownership the directors could finance it, give as good service at the same rate of fares as the public trustees, Mr. Snow said that it would take some time for the road to obtain new capital, and that the public would have to be content with the same service as at present.

Fact-Finding Study of New York Transit Problems

Causes of Congestion Outlined in a Report by the Regional Plan Committee—Traffic of Surface Cars, Buses, Elevated and Subway Lines and Steam Roads Is Analyzed

GROWTH of the port of New York and the industrial business and residential communities which now form one metropolitan region has led to congestion in places of business and recreation, delays in movement and in the transaction of business and increased costs of handling freight and passengers. This problem has been studied by the Committee on the Regional Plan of New York and its Environs and a report prepared by H. M. Lewis, executive engineer. The purpose of the study was to obtain the knowledge of facts needed to formulate a plan. Review of certain proposals made by public bodies does not carry with it any indorsement of specific projects and no definite suggestions are put forward on behalf of the committee. Progress has been made in the development of a plan, but the time is not yet opportune for publication.

Additional Facilities Needed on Vast Scale

Additional facilities of all types should be provided on a vast scale, the report states. While it is recognized that these cannot all be provided at once, the plans for them can be prepared, steps for carrying them out can be tentatively determined upon and available funds can then be applied to the progressive execution of a broad scale plan, which will provide for and direct the future growth of the region.

Experience in New York City has proved that population will follow transportation lines promptly and intensively. Their construction may lead either to increased congestion or to dispersion of business and industry in accordance with the amount of far-sightedness applied to the plan. The transit situation has grown so much more rapidly than the municipal authorities could estimate that the confusion is discouraging. In New York City more than 1,000 franchises exist giving transportation companies the right to operate upon public property. The periods vary for which these franchises were granted, but a large percentage of them are for long terms and many of them are perpetual. More than 200 operating companies hold these franchises.

2,000,000 Enter New York a Day

Of a total of more than 2,000,000 persons who enter Manhattan on a typical business day, 52.8 per cent come from Long Island, 29.8 per cent from the north, 15.6 per cent from New Jersey and 1.8 per cent from Staten Island. Almost two-thirds of the total number are carried by rapid transit facilities and less than 10 per cent by surface cars, while the trunk line railroads carry only 6.1 per cent into the city. In 1925 the mileage of rapid transit main running track in New York City was more than 590. Of this amount, about 100 miles was built in the period from 1904 to 1909 and more than 260 miles was added between 1914 and 1921. Since 1921 there has been no substantial increase in the mileage and the increase in traffic has heavily overloaded the existing facilities.

Concentration of buildings in the district below Fulton Street, Manhattan, an area of a little more than one-third of a square mile, is one important cause of congestion. The uptown business area is more scattered, but also presents a serious transit problem. More than 40 theaters, seating nearly 60,000, located within 1,000 ft. of the intersection of Broadway and 42d Street cause a concentration of passenger traffic which has placed a dangerous burden upon the rapid transit stations.

As congestion increases some form of decentralization will be forced, and this probably can best be guided by furnishing a system of belt line and

Digitized by Google

bypass routes which would encourage a more desirable distribution. It would be possible to add to the volume of traffic entering Manhattan south of 59th Street without constructing new transit lines by using to capacity all of the tracks and other facilities which are now only partially used. In the case of the lines from the north crossing 59th Street, increased capacity could be obtained only by lengthening the local platforms to accommodate longer trains or by constructing new lines. It would be desirable to supply as soon as possible such subway connections and facilities in Manhattan, Brooklyn and Queens as will make possible the full utilization of East River crossings. After the completion of various changes now under consideration, the total possible ultimate increase of capacity across the East River on the lines of the Interborough Rapid Transit Company would be only about 18 per cent, and on the Brooklyn-Manhattan Transit Corporation lines about 100 per cent. The capacity of Interborough north and south lines on Manhattan could be increased approximately 13 per cent.

In 1924 the total transit fares per inhabitant in New York City were about 450, having increased from 220 in 1890 and 320 in 1910. Surface car riding increased steadily during the years from 1860 to 1900, but there has been comparatively little increase since the latter date. The present riding habit on surface lines is about 180. Fares collected along subway routes outside of the central business district correspond to an annual riding habit based on the adjacent population of about 260 fares per inhabitant. Similar sections of elevated railway systems average 100 to 200 rides per inhabitant a year, varying with the type of development along the route.

Peak Noted During Spring Season

Rush-hour traffic in the morning on the rapid transit lines is from 380 to 584 per cent of the average hourly traffic, while the theater rush hour in the evening is from 112 to 156 per cent of the average hour. A study of seasonal variation of transit traffic indicates a peak during the spring months and a minimum in August. The elevated and surface lines both draw passengers from the subway lines during the summer months. Elevated lines show the least seasonal variation of these three groups of facilities.

Traffic on the surface lines has been practically stationary since 1914. It is believed, however, that this type of transit will continue to have its definite field.

Development of bus routes within the area has been mostly within the last ten years, and the growth of their business in many places has been rapid. During 1922 a complicated system of bus routes was proposed for New York City by the Department of Plant and Structures. More recently the Board of Transportation of New York City has developed proposals for bus routes.

An interesting point brought out in the report is that a large part of the traffic carried during rush hours by the Fifth Avenue Coach Company is long-haul traffic, averaging 5.1 miles. The average length of haul on Manhattan surface car lines is only 2.05 miles. Average speed of the buses is 7.9 m.p.h. and of the cars 7.3 m.p.h. More than five times as many buses were operated in the rush hours on Fifth Avenue as surface cars on Broadway or Madison Avenue. The buses, however, carried only 3½ to 4½ times as many passengers as did the cars.

Estimates of future traffic are also included in the report. By 1965 it is estimated that about 4,500,000 persons may enter Manhattan on a typical business day by all lines of transportation.

Passenger traffic and freight traffic problems of the existing steam railroad systems are considered in the report. Other sections deal with the use of waterways and with aviation. Airway transportation must be considered in planning for the future, but there is little chance of any serious competition in the near future with existing ground systems of transportation.

The danger of a network of rapid transit lines in the outlying parts of New York City and the metropolitan sections of New Jersey, such as will encourage intensive development in those areas, should be avoided. A homogeneous business district is advantageous, but residential areas should possess variety and provide for both open and close development.

$77,000,000 Valuation Fixed at Baltimore

Finding Handed Down in United Railways Case, Long Pending Before Public Service Commission—President Disappointed with Final Figure—No Fare Increase to Be Sought

PROPERTIES of the United Railways & Electric Company, Baltimore, Md., were valued at $77,000,000 as of Jan. 1, 1924, in an opinion handed down on March 9 by the Public Service Commission. The opinion brought to an end a case pending since Dec. 30, 1912.

An order was passed continuing the present rate schedules for two years, commencing at last midnight and ending at midnight April 30, 1928. This order, however, may be changed by the commission any time within the two-year period.

The commission expressed the opinion that "it would be unwise" to require the United "to embark on such an experiment" as the weekly pass.

The majority opinion of the commission made an allowance of $7,000,000 for easements (lands over which tracks are laid but not owned outright by the company) in the valuation figure. The United placed a value of approximately $18,000,000 on this item.

J. Frank Harper, member of the commission, wrote a dissenting opinion, in which he refused to concur with Harold E. West, chairman, and Ezra B. Whitman, the third member, in making any allowance for easements.

C. D. Emmons, president of the company, expressed disappointment at the low figure of the valuation. He pointed out that under the valuation the company was entitled to a higher rate of fare, but stated that the company expects to stand by its promise not to ask for any increase at present. The company has ten days in which to file with the commission a statement of agreement with the opinion or dissension from it. Mr. Emmons said.

> Our own valuation, after depreciation and all kinds of allowances, was $88,000,000, exclusive of easements, which I thought represented the actual cash value of the property, but people's counsel contended for $60,000,000, so it was quite evident at the trial that he didn't really expect so low a valuation.
>
> The commission allowed $70,000,000 for net value, exclusive of easements. In so doing they gave the people's counsel and the car rider the benefit of very doubt and discounted every possible uncertainty in the proof. I think this was lower than we were entitled to.
>
> Our total income with proper allowances ation of $70,000,000. According to all the rules of courts and commissions we would be entitled, even on present valuation, to a higher rate of fare, but we have said we hoped to avoid applying for an increase unless taxes or similar charges further make it necessary. By this statement we expect to stand.
>
> The opinion shows such painstaking care that it is difficult to get into a complaining mood.
>
> It is a satisfaction also that the three commissioners are unanimous as to the main point—a minimum value of $70,000,000, and that they differ only as to the $7,000,000 for easements. And it is a satisfaction also to find that the commission unanimously found our investment value, counting all doubtful questions against us, was over $71,000,000.
>
> Our total underlying divisional bonds, funding and other notes, amounted as of the valuation date, to between $49,000,000 and $50,000,000. The valuation is $77,000,000 and excluding easements the unanimous valuation is $70,000,000, so that these securities have an equity even under the worst conditions of 40 per cent, and including easements, of 55 per cent.
>
> Our securities are evidently selling below their proved asset value and I hope this prolonged investigation will finally set at rest the question of the value of our property and the reasonableness of our fare, and assure the security holders of the soundness of their investment.
>
> Whether we shall appeal I cannot at present decide. I am satisfied that a review of all the questions involved will result in a higher rather than a lower valuation, especially as to amounts allowed for easements. We will decide this after we have had a better opportunity to go over the opinion.

ELEMENTS TAKEN INTO CONSIDERATION IN EVALUATING UNITED'S PROPERTIES

The various elements taken into consideration by the Public Service Commission in determining the fair value of property owned by the United Railways are as follows:

Cost to Reproduce New, Undepreciated:	
Company (including easements)	$113,264,205
Company (excluding easements)	95,079,251
People's counsel (excluding easements)	72,975,688
Commission's finding (excluding easements)	78,541,895
Cost to Reproduce New, Less Depreciation:	
Company (including easements)	106,641,360
Company (excluding easements)	88,456,406
People's counsel (excluding easements)	60,488,392
Commission's finding (excluding easements)	70,100,645
Securities:	
Par value	85,827,200
Market value	56,629,818
Original Cost:	
Company	68,158,908
People's counsel	57,000,000
Original Cost in Present-Day Dollars:	
Company	100,087,000
Company (less superseded property)	86,810,000
People's counsel	83,730,000
People's counsel (less superseded property)	71,410,000

The commission allowed a total valuation of $77,000,000, including a $7,000,000 allowance for easements.

Special Limited Service Begun on Detroit Interurban

"Royal Blue" limited cars were put into operation on March 8 between Detroit and Royal Oak and Detroit and Pontiac, on the Pontiac Division of the Detroit United Railway. The limited cars run on schedule providing a car every hour on the hour from 7 a.m. to 5 p.m., leaving both Detroit and Pontiac terminals. Additional local interurban service varying from fifteen-minute to half-hour intervals between terminals, with a ten-minute rush-hour service in the morning between Birmingham and the Ford plant in Highland Park, has been announced by A. L. Drum, executive manager for the Security Trust Company, and W. C. Dunbar, receivers for the Detroit United system. All of the new equipment is not available to complete the improved service, but in the two or three weeks intervening the new schedules are to be in effect.

The limited cars which have already started in operation have bodies of royal blue and are decorated on the outside with pictures of the Indian chief Pontiac, "the Chief of the Ottawas." The new cars for local service are sand color. The all-steel de luxe chair car with observation platform has another color scheme, including the green band around the center of the body.

These changes are in accord with the improvements and economies planned for the Detroit United lines by the receivers. Other changes and improvements are planned for the coach lines now operated in connection with the D.U.R. system.

It has been announced that double-deck buses for rush-hour service will be put on the route between Royal Oak and the Ford factory, and in addition there will be another series of double-deck sightseeing buses for summer service on the Woodward super-highway between Detroit and Pontiac.

The receivers have been authorized by Judge Charles C. Simons to pay the city of Detroit $48,500 for rental of tracks and power for two years. The order is made contingent on the fact that the payment does not deplete the operating funds of the railway.

No Formal Wage Demand Yet in New York State

Employees of the New York State Railways in Rochester, Syracuse and Utica are beginning conferences preparatory to making demands for a revised wage and working agreement for the year that begins May 1. No formal program has been adopted, but a demand for an increase in wages, at least 5 cents an hour for all classes, was said to be assured.

Adoption of a definite program hinges on whether the Rochester union shall submit its demands separately from the workers in Syracuse and Utica.

Last September the Rochester men voted to ballot on contract proposals separately. This action followed the Rochester union being voted down by the preponderance of the Syracuse and Utica vote in the last poll on wage agreements.

In Rochester an 8-cent fare went into effect on Jan. 1. While the railway has asked for a similar fare increase (of 1 cent) in the two other New York State cities, the proposal is pending before the State Public Service Commission, with little likelihood of its beng adjusted before the time for voting on a yearly wage contract.

Rochester employees are likely to ask for power to bargain separately in the belief that the fare increase granted in their city will give them added ground for their request for higher pay.

Merchants Interviewed on Proposed Subway

Chicago merchants may pay a substantial part of the cost of the new subway which the city expects to build under the loop district in 1927 or 1928. Marshall Field & Company, owner of two of the seven blocks on State Street, have agreed to contribute.

The city, through a special committee headed by Alderman Albert, is interviewing the merchants who will derive the most benefit from a subway. The Field promise is believed to have set a precedent that makes the committee's work simple.

Owing to legal obstacles in the way of a collection of benefits for subway building, no official "negotiations" have been launched, but material is being collected to determine whether the response of the merchants will make it worth while to get special laws passed at the next Legislature to cover their contributions.

Albany Fare Hearing Deferred

No definite date has been set for a hearing on the application of the United Traction Company, Albany, N. Y., for an increase in fare from 7 cents to 10 cents cash or thirteen tokens for $1. The matter was held in abeyance by the Public Service Commission due to the death of Mayor Hackett of Albany. It is expected the commission will fix the date for some time in April.

John Boyd Thatcher, second, who has succeeded Mr. Hackett as Mayor, has announced that he will carry out the policies and program of his predecessor so far as possible. It is understood that the Corporation Counsel of the city of Albany is preparing to oppose the application for an increase in fare in so far as legal means may prevail.

Linked with the increase sought in the capital district is the application of the New York State Railways for increases in Utica and Syracuse.

Bridge Between Kentucky and Indiana Needed.—Prospects appear rather bright at this time for eventually securing an interstate bridge at Louisville, connecting Louisville with southern Indiana, for passenger, vehicular and street car use, to operate for approximately 25 years as a toll bridge, after which it would become a free bridge. At the present time there are three railroad bridges, two of which are used by interurban cars and one has roadways for automobile traffic. Bills have been introduced in Congress by Kentucky Representatives and Senators and enabling acts are now in the Kentucky Legislature. The proposed bridge would cost about $4,000,000.

Springfield Supports Rehabilitation Plan

Support has been extended by the City Council of Springfield, Mass., to the rehabilitation plans of the New Haven road in connection with the Springfield Street Railway system. Springfield will join with Worcester in asking for legislation to proceed with the proposed plans. The order of the City Council follows:

> Ordered, if the Common Council concur, that the Mayor be and is hereby authorized, in the name and on behalf of the city, to petition the General Court of Massachusetts that it take favorable action on the petition that the New York, New Haven & Hartford Railroad be authorized to acquire and hold the securities and properties of the New England Investment & Security Company; provided, however, before using such favorable action, the Mayor shall request the General Court to amend said bill by adding at the end thereof an additional section providing that so much of the bill as relates to the Springfield Street Railway, the Springfield Railways and the New England Investment & Security Company, controlling the operation of street cars in Springfield, shall take effect upon its acceptance by vote of the City Council of the city of Springfield.

The directors of the New Haven have met and officially approved the report for the rehabilitation of the Springfield system. The plans involve an expenditure of $1,500,000, which includes new rolling stock, additions to lines and new trackage. The proposed changes at Worcester in the Worcester Consolidated Street Railway were also approved. They involve an expenditure of $1,000,000. The proposed amendment to the petition by the City Council of Springfield was also approved as a reasonable request.

Vice-president E. G. Buckland of the New Haven does not approve of the wording of the order as constructed by the City Council, as it does not allow the New Haven to take over the New England Investment & Securities Company without the approval of the Council. This, however, will be rectified at the preliminary hearing in Boston.

The bill to the Legislature is divided into three parts. It grants the New Haven railroad the authority to take over the holdings of the New England Investment & Securities Company, makes its control over the Springfield Street Railway effective subject to the approval of the City Council of Springfield and makes its control of the Worcester Consolidated Street Railway subject to the approval of the City Council of Worcester.

In commenting on this line of action Mr. Buckland said:

> This will allow us to negotiate with the owners of stock when the enabling act is passed by the Legislature. We will not, however, be allowed to take over management and control of the trolley systems until the local City Councils have given their approval.
>
> I do not want any misunderstanding about the railroad's attitude. It has been said the railroad is insistent upon certain terms. In fact, we have been guided by the recommendations of the joint survey committee and approve its expert advice as to what improvements would modernize the Springfield system. The traffic expert of Springfield was a member of the committee and I understand that Mayor Parker is pleased with the contents of the report. Therefore our attitude is formed on the basis of the judgment of these experts.

The hearings on the matter before the Legislature at Boston are to start at once, and it is expected they will be completed by March 17.

110-Mile Electrification in Prospect

Electrification of the Springfield, Havana & Peoria Railroad, Springfield, Ill., is now under consideration, according to J. F. Gilchrist, a vice-president of the Commonwealth Edison Company, the new owner of this stretch of the old Chicago, Peoria & St. Louis Railway. Mr. Gilchrist is also president of the Chicago & Illinois Midland Railway, a 30-mile coal road which has acquired by lease the Springfield, Havana & Peoria. The new owners plan to expend a considerable sum in rebuilding the Springfield, Havana & Peoria, which extends from Springfield to Pekin, having 110 miles of trackage.

Milwaukee Authorized to Build Freight Line

Ruling that the Wisconsin Railroad Commission need not heed zoning or civic planning activities in granting certificates for rail lines, the Wisconsin Supreme Court denied the petition of the Milwaukee County Board and the County Park Commission for a rehearing on the order under which the Milwaukee Electric Railway & Light Company was granted authority to build and operate a freight line from its Lakeside power plant west through Tippecanoe and the town of Lake to connect with the main system of the Chicago, Milwaukee & St. Paul Railway.

This new decision finally ends the long controversy which the county waged against the building of this line. Objection was made to the line running through a proposed residential section when it could have been built further south in a district that is to be industrial in character. When the commission issued a certificate of convenience and necessity for the building of the line on Sept. 22, 1924, county and town authorities appealed to the Dane County Court. The court set aside the commission's order, but the commission reissued the certificate on May 30, 1925, without another hearing. Appeal was then taken to the Supreme Court, which upheld the findings of the commission. Motion was then made for a rehearing, which was denied, ending the fight.

New Parking Plan in Philadelphia Highly Beneficial

J. H. M. Andrews, assistant vice-president of the Philadelphia Rapid Transit Company, speaking before the Philadelphia alumni of the Massachusetts Institute of Technology at the Engineers' Club on March 3, made the following statements:

A recent check made by the Philadelphia Rapid Transit Company shows a very direct benefit to the car riders, who compose 90 per cent of the users of the downtown streets, brought about by the new parking regulation on Chestnut and Walnut Streets.

The result to the car rider under the new ordinance has been a 14 per cent increase in speed, which to the man boarding a car at Front and Walnut Streets means about four minutes saving in his ride to 20th and Walnut Streets.

A check has been made of the length of time required for a street car to operate eastbound from 20th and Chestnut Streets to Front Street, to Walnut Street and westbound to Nineteenth and Walnut Streets. The result showed that the average journey at the hour selected for the check was made in 33½ minutes. Checks made at the same hour and under similar conditions on Jan. 6 and on Jan. 20 showed that the same journey required from 38 to 40 minutes prior to adoption of the present "no parking" plan.

The total saving in time and money to the users of Chestnut and Walnut Streets, to the merchants and to the community generally is incalculable. Traffic congestion in American cities costs $1,500,000,000 a year, according to a special committee appointed by Secretary of Commerce Hoover.

Permissive Recapture Legislation for New York City Introduced

Mayor Walker of New York has sent to Albany and had introduced to the Legislature under bipartisan auspices a bill which would give power to the Board of Estimate to negotiate for the recapture of obsolete surface lines in the city. The bill is permissive in character. If, after a public hearing, it should be determined by the Board of Estimate that a line has outlived its usefulness, the board can decide that its tracks should be removed, and with the approval of the Mayor may enter into an agreement with the railroad or operators on terms of surrendering the property. With an agreement reached, the franchise would be voided and the tracks ripped up, the city paying with proceeds from serial bonds or short-time securities.

Accident Competition Renewed in Chicago

A one-year accident prevention contest was started in February among the many divisions of the Chicago Surface Lines, under the direction of Victor E. Noonan, supervisor of accident prevention. It is an amplification of an experimental contest conducted last year with great success, according to Surface Lines employees.

Meetings that are being conducted are well attended. Scores will be posted monthly, with divisions rated on ten classifications of accidents and figured in proportion to the car-miles of each division. The ten classifications are:

1. Fatal accidents to trainmen or other employees.
2. Fatal accidents to passenger and public.
3. Boarding or alighting accidents.
4. Collisions with vehicles.
5. Persons struck by cars.
6. Collisions of cars.
7. Brushed off steps (cars in motion).
8. Thrown in car by start or stop.
9. Employees injured on duty.
10. Blind cases.

A percentage of ten will be perfect in each classification. Prizes will be awarded to winning divisions.

Transportation Study at New Bedford

The New Bedford, Mass., City Planning Board has prepared a study, reproduced in the New Bedford *Sunday Standard* on March 7, on the position of the highways of today, how far they will be able to meet the needs of the people, and just what the big unsolved problem for the municipalities is today. The board's survey outlines aims sought and results of various methods tried. It discusses parking space versus travel lanes, loading space within buildings, store garages versus branch stores, staggered closings and other important problems in the traffic tangle. It is the opinion of the board that the greatest advance in the solution of the problem will be attained when each user of the streets considers the safety and convenience of others as well as his own.

Loss in Atlanta Freight Receipts

Permission to abandon freight and express service on all of its interurban lines has just been asked of the Georgia Public Service Commission by the Georgia Railway & Power Company, Atlanta. The two interurban lines affected are the Atlanta Northern, running between Atlanta and Marietta, Ga., and the Stone Mountain interurban, operating between Atlanta and Stone Mountain. The petition referred to the increasing use of automobile trucks as well as to the passenger automobile as the cause for the slump. Figures in the petition show a decrease in net freight and express revenue from $14,938 in 1919 to $4,543 in 1925. The net loss in 1919, the petition further states, was $8,647, increasing to $10,857 in 1925.

Business Men Will Help Preserve Indiana Line

To insure the continued operation of the Evansville Suburban & Newburgh Railway, Evansville, Ind., something must be done in the way of increased patronage. The company recently installed one-man cars on its lines with the hope of reducing expenses. The Business Men's Association of Boonville, Ind., has taken steps to lend assistance to the line. A committee will be appointed to call on the business men and ask them to patronize the railway. It was pointed out by this association that the bus lines and trucking associations operating between Evansville and Boonville have cut deeply into the business of the traction company. The company operates a line from Evansville to Newburgh, a distance of 10 miles, and from Evansville to Boonville, a distance of 18 miles. An improved state highway starting at Evansville runs through Boonville and on to French Lick.

Advertising Emblem Sought at Cincinnati

After trying unsuccessfully for three months to obtain an appropriate trademark from private artists, the Cincinnati Street Railway, Cincinnati, Ohio, has announced that it would give $50 for an acceptable drawing of such an emblem to be used for general advertising purposes. The contest is open to all school children and to the general public. If the winning emblem should be submitted by more than one person the prize will be divided proportionately. "We want a trademark that will stand the test of time and that will properly represent the safe, dependable all-day, all-night, all-the-year-round transportation service of the Cincinnati Street Railway," said Hudson Biery, director of public relations. He said that the design must be simple, that the trademark may include words or letters, may be symbolic or be purely a design.

Philadelphia May Run Subway

Mayor Kendrick of Philadelphia, Pa., in a recent statement threatened municipal operation of the Broad Street subway in the event of failure to reach an agreement with the Philadelphia Rapid Transit Company for its operation. The Mayor's statement protests against the ultimatum of the company in claiming back dividends for the company's stockholders under the 1907 city-transit contract and expresses the hope that negotiations for operation of the $100,000,000 investment may be entered into with a spirit of fair play.

News Notes

Wage Demands Made at Des Moines—Demands have been made by the employees of the Des Moines City Railway, Des Moines, Iowa, for a 5-cent wage increase with time and a half for all Sunday and holiday work. The present maximum is 60 cents an hour.

Prefer Street Car in Marinette.—Preference for the retention of street car service instead of replacement by bus service was the unanimous choice of the Marinette, Wis., City Council when it turned down the petition of the Menominee & Marinette Light & Traction Company asking permission to institute trial bus service on its unprofitable Pierce-Hall Avenue line.

Interurban Rates Increased.—Another change in interurban fares has been announced by the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind. The increase recently approved by the Indiana Public Service Commission brings the fares from 2 to 2½ cents a mile. The increase followed similar action on bus fares in that section. The company officials said they were unable to pay operating costs on the present income. The company has been going through a period of experimentation with reduced fares as a result of bus competition. Commutation rates by which travellers can buy $5 of transportation for $3.75 still hold good.

Fare Increase in Evansville.—A 1-cent fare increase in Evansville, Ind., has been ordered by the Indiana Public Service Commission following the request of the Southern Indiana Gas & Electric Company, owner and operator of the Evansville street car lines. Under the new rule, patrons will pay 7 cents for a single fare, and will receive only sixteen checks for $1, instead of a 6-cent fare or twenty checks for $1, as in the past. Increase in automobile traffic and consequent falling off in passenger traffic on its lines was given by the company as the chief reason for seeking an increased fare.

Mrs. Charles Henry Dies at Indianapolis.—Mrs. Charles Henry, 72 years old, wife of Charles L. Henry, president and receiver of the Indianapolis & Cincinnati Traction Company, pioneer traction man of Indiana, died recently at her home in Indianapolis, following an extended illness. She married Mr. Henry 51 years ago. Mrs. Henry is survived by her husband, four daughters and one son.

Recent Bus Developments

Application for Gas-Electric Operation in Buffalo Renewed

Ernest M. Howe, Detroit, has renewed his application before the City Council of Buffalo, N. Y., for a permit to operate 5-cent gas-electric buses over 71.5 miles of streets on thirteen routes in the city. Recently the Public Service Commission rejected Mr. Howe's application for a permit to operate in Buffalo when he failed to reveal plans for financing the project. It is now reported the company represented by Mr. Howe has been financed by New York interests.

Of the $1,600,000 necessary to start operations on the 5-cent bus lines in Buffalo, Mr. Melville informed the municipal authorities that $1,200,000 has been raised and Mr. Howe has sailed for England to secure the remaining $400,000 capital. The Tilling-Stevens gas-electric buses will be used by the Buffalo Omnibus Corporation, of which Charles P. Norcross, vice-president of O. J. Gude & Company, outdoor advertisers, is president.

Opposition to the Howe bus proposals was entered by the International Railway, Buffalo, and its subsidiary the International Bus Corporation.

Mayor Frank X. Schwab charged at the Council hearing on the bus proposals that the International Railway is a "confessed bankrupt" and is seeking to saddle its "$40,000,000 debt on a bus company, so that if the traction company becomes bankrupt in fact it could still operate as a bus company."

Bus Hearing in New York on April 8

The Board of Estimate of New York on March 11 postponed until April 8 the statutory hearings on 29 applications for bus franchises, presented by 24 companies. Mayor Walker informed the applicants that the board felt that the statutory hearings should not be held until they had completed an analysis of the offers. According to the Mayor the board will reach no conclusion until all the petitioners have been examined and their offers weighed in executive session.

John A. Ritchie, chairman of the board of directors of the Fifth Avenue Coach Company, declared that the company would be ready on a week's notice to supply full service on all eleven routes which it has proposed to operate in the Bronx.

Mayor Walker held his usual weekly transit conference with members of the Transit Commission and the Board of Transportation.

Service in Cincinnati on April 1

Service will be started on April 1 on two crosstown lines by the Cincinnati Street Railway, Cincinnati, Ohio, with the first bus consignment representing 23 buses. In the meantime this equipment will be held in storage at the plant of the Cincinnati Car Company in Winton Place. The two routes first to be operated intersect nineteen electric railway lines. The buses are of Mack make with Bender bodies, are orange colored with cream top, have aluminum bodies, a seating capacity of 29 passengers and are upholstered in leather. A feature is a vacuum booster brake, which is an added safety factor. The street railway has received a large number of applicants for the position of bus operators. Preference will be given to present employees where they are found to be fitted for the work.

City Lines in Indiana Under Commission Rule

Operation of bus lines wholly within the limits of a municipality under the terms of a municipal ordinance licensing the local bus lines does not exempt the lines from the jurisdiction of the Indiana Public Service Commission in its administration of the new motor bus law. This is the opinion rendered by Arthur L. Gilliom, Attorney-General, to the Indiana Public Service Commission. The question was whether such operation came within the classification of a contract which is exempted from the commission control by the bus law. The controversy arose at Connersville.

Joint Operation Over Camden Bridge Suggested

Joint operation of a bus line over the Delaware River bridge between Philadelphia, Pa., and Camden, N. J., by the Philadelphia Rapid Transit Company and the Public Service Railway of New Jersey was proposed on March 6 by the Philadelphia company. A new company, the stock of which would be owned equally by the two concerns, would be formed if the proposal is accepted by the bridge commission.

Trial Service Abandoned.—The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has abandoned the operation of bus service on Grand Avenue from Thirty-sixth Street to Hawley Road in Milwaukee, started on Dec. 28 as a trial line. Lack of patronage led to the suspension.

Seeks Increase in Bus Rates.—The Indianapolis & Cincinnati Traction Company filed with the Public Service Commission on March 4 a petition asking authority to increase its rates of fare for its bus line operating between Indianapolis and Shelbyville, Ind. The present rate is 2 cents a mile for straight fares and 1.49 cents a mile for commutation tickets. The company asks that a straight 3-cent fare be established, that tickets be interchangeable between the bus line and traction line, and that permission be granted for the baggage of bus passengers to be carried on the traction cars. Recently the company purchased the last of its bus competitors when it took over the Red Ball lines between Indianapolis and Shelbyville.

Digitized by Google

Keeping Pace with Needs.—The Wisconsin Gas & Electric Company, Kenosha, Wis., will improve its city bus service by the installation of three additional buses costing $9,000 each. A $70,000 garage and storeroom are under construction for the accommodation of the buses.

Buses Between Collinsville and East St. Louis.—The Illinois Commerce Commission on Feb. 24 granted the East St. Louis & Suburban Railway a certificate of convenience and necessity for the operation of buses in intrastate business between Collinsville, Ill., and East St. Louis, Ill. This line, operated by the Red Line Company, a subsidiary of the East St. Louis & Suburban, had been operating intrastate business between Collinsville and Greenville and continues into St. Louis.

Seeks Permission to Buy Bus Certificates.—Authority to buy bus certificates held by the Anderson Bus Corporation, Anderson, Ind., is asked in a petition filed with the Indiana Public Service Commission by Arthur W. Brady, receiver for the Union Traction Company. The bus corporation holds six certificates authorizing the operation of bus routes wholly within the city of Anderson.

New Bus Route Opened.—The new Lemay Ferry Road bus route of the St. Louis Bus Company, subsidiary of the United Railways, St. Louis, Mo., went into service on March 3. It extends from Broadway and Koeln Street, St. Louis, to Point Breeze, on the Lemay Ferry Road in St. Louis County. A fare of 7 cents for adults and 3 cents for children is charged, but no transfers to the lines of the United Railways are furnished. The buses connect with the Broadway and Bellefontaine divisions of the railway.

Opposes Intrastate Business.—The Eastern Massachusetts Street Railway in a petition to the United States District Court has sought an injunction to restrain the Abbott Motor Coach Company from carrying on an intrastate business between Brockton, Mass., and Providence, R. I. The injunction was granted March 8 by Judge Brewster. The bus line will be allowed, however, to continue its interstate business between these two points.

New Schedules Planned.—Buses will replace trolley cars, beginning March 15, on the Hartford & Springfield Street Railway, East Side line, between Warehouse Point and the Connecticut state line, and also on the Somers division, where a limited schedule has been maintained for trolley cars for several months. An exception will be made on Saturdays, however, when the present schedule will be maintained, and on other weekdays school and workmen's extras will be run. The existing car service will be maintained from Warehouse Point south to connect with the Connecticut company's system. In place of the trolleys on the northern end, buses will be run every half hour between Thompsonville, Conn., and Springfield, Mass., and hourly bus service will be given on the Somers division and also south of Warehouse Point, where buses are used to supplement the trolleys.

Financial and Corporate

Net in Duluth Much Higher

Earnings of 100-Mile System in Pacific Northwest Cities Show Marked Progress in 1925

The net income transferred to profit and loss of the Duluth-Superior Traction Company, Duluth, Minn., for 1925, showed an increase of $41,857 compared with the year previous. The increase in operating expenses and taxes indicated in the accompanying table is due to vacation allowances to employees, an increase in personal property taxes in the city of Duluth and the cost of bus operation. The sum of $59,286 was expended for renewals and charged against the depreciation reserve. For additions to property during the year $216,237 was spent.

In his annual report to the stockholders, A. M. Robertson, president, referred to the steps taken to develop the bus transportation business. He tells the history of the Duluth Coach Company, which later changed its name to the Duluth-Superior Coach Company. The outstanding stock of this company, $61,600, is all owned by the Duluth-Superior Traction Company.

In July the Duluth Street Railway, a subsidiary of the Duluth-Superior Traction Company, purchased the local jitney bus business in Superior, thus eliminating all remaining bus competition in both Duluth and Superior. No extensions of railway lines were made during the year in Duluth or Superior.

The Duluth Street Railway amended its articles of incorporation to provide for an issue of 7 per cent preferred stock and offered $500,000, par value, for sale in limited quantities through its own employees. The offering was made on March 16, 1925, and at the end of 22 days the amount was fully subscribed. The stock was sold to employees at 96 and to the local public at 98. At the close of business on Dec. 31, 1925, these 5,000 shares were distributed among 1,653 holders in Duluth, Superior and immediate vicinity, 337 employees of the company being the owners of from one to seventeen shares of this preferred stock.

The report goes into detail on the fare controversy waged by the Duluth Street Railway, the subsequent court hearing and a decision of the Supreme Court of Minnesota sustaining the lower court, which "will remove the last legal obstacle delaying a hearing by the commission on the company's application for an increased fare."

Some statistics on the railway operation only are included in the accompanying tables.

CONSOLIDATED INCOME STATEMENT OF THE DULUTH-SUPERIOR TRACTION COMPANY

	1925	1924
Operating revenues:		
Revenue from transportation	$1,928,624	$1,774,763

$539,914 Carried to Surplus by Midland Utilities

Rapid development of the Midland Utilities Company, Chicago, an investment company which owns or controls public utility companies in northern Indiana and western Ohio, is shown by the first annual report prepared to cover the calendar year 1925. The Midland Utilities began business on June 22, 1923, but its securities were not offered to the public until March, 1925.

The annual report shows the total income of the company in 1925 was $2,985,781.60, compared with $2,118,716 in 1924. Net income for the last year was $2,287,912, compared with $1,517,104 in 1924. After the payment of dividends on the prior lien and preferred stocks and $219,048 paid on the common stock, $539,914 was carried to the surplus account, which on Dec. 31 aggregated $1,115,607.

The Midland subsidiaries at the close of 1925 were furnishing electric, gas or transportation service to 194 communities, as compared with 118 communities served on Dec. 31, 1924. The estimated population served increased from 600,000 in 1924 to 850,000 at the close of 1925.

The principal operating subsidiaries in the Midland group are the Northern Indiana Gas & Electric Company, Northern Indiana Public Service Company, formerly called the Calumet Gas & Electric Company; Indiana Service Corporation, Gary Railways, Chicago, South Shore & South Bend Railroad and West Ohio Gas Company.

Philadelphia-New Jersey Merger Not Yet Accomplished

No definite plan of merger has been accomplished by the Trenton, Bristol & Philadelphia Street Railway, the Pennsylvania-New Jersey Railway and the Frankford, Tacony & Holmesburg Street Railway. It was said in the spring of last year that plans were under way for a consolidation of three electric railways through which there would be a direct route from Bridge Street and Frankford Avenue, Philadelphia, to Trenton, N. J. The Trenton, Bristol & Philadelphia Street Railway and the Pennsylvania-New Jersey Railway are controlled by the same interests, which also have a minority interest in the Frankford, Tacony & Holmesburg Street Railway.

Status of Connecticut Line Explained

Action pending to foreclose the two mortgages on what was originally the Groton & Stonington Street Railway, now underlying mortgages on the property of the Groton & Stonington Traction Company, Groton, Conn., is intended to clear the title to these properties and create one unified property all owned by the traction company. So far as the Groton & Stonington Street Railway is concerned it is non-existent. It was liquidated in 1916. The trackage became the Groton and Stonington Division of the Shore Line Electric Railway. On Jan. 1, 1923, the receiver of the Shore Line Electric Railway sold this division, subject to the underlying mortgages, to a new company incorporated as the Groton & Stonington Traction Company in order to expedite liquidation of the receivership estate. All the securities of the traction company are now owned by the Shore Line receivership estate, so that the Groton & Stonington Traction Company is a going concern with no suggestion of receivership, either present or future. It is in excellent financial condition. The traction company is the owner in fee of the trackage from Groton into New London and owns the equity in the main line.

Cincinnati & Dayton Traction Sold—Reorganization Arranged

Eighty-six-Mile Road Soon to Come Out of Receivership—Debt to Be Cut from $4,900,000 to $1,300,000—$4,000,000 Equity Represented by 20,500 Shares Holding Company Stock

PROPERTIES of the Cincinnati & Dayton Traction Company, offered for sale on March 9 by George P. Sohngen, receiver, in the suit of the Citizens Savings & Trust Company, Cleveland, Ohio, against the company, brought a total of $519,400 for constituent properties. The College Hill division was sold for $89,000; the Dayton division, extending from Hamilton to Dayton, $208,500; Hamilton City lines, $201,000; power house at Lindenwald, $19,000. and miscellaneous, $1,900.

The purchasers were Thomas E. Conway, Philadelphia, and Warren S. Havens and Livingston Jones, Cleveland, forming the bondholders' reorganization committee. This committee represents 95 per cent of the bondholders of the Cincinnati & Dayton and the underlying companies holding securities valued at approximately $2,000,000.

The sale is subject to approval of the Court of Appeals, which ordered it and fixed the knockdown price for the various divisions of the company's lines.

The plan and agreement for the reorganization of the Cincinnati & Dayton Traction Company have been adopted by the protective committee representing the holders of the first and consolidated mortgage bonds of the Southern Ohio Traction Company and by the committee representing holders of the Cincinnati & Hamilton bonds. As both of these committees were faced with the fact that the security holders they represent will become the owners of the railway, their problem was to try to set up a financial structure which will adequately care for the future as well as for present capital requirements. Accordingly provision has been made for the incorporation of an operating company to take title to the entire property subject to a small divisional first lien upon 11 miles of interurban between Dayton and Miamisburg, under which $250,000 par value of bonds are now outstanding.

The successor company will execute a new $200,000 closed first mortgage upon the Hamilton city lines to replace the Hamilton & Lindenwald mortgage to be foreclosed. The operating company will also create a modern open-end mortgage as a lien upon the entire property, subject only to the two divisional liens previously mentioned. To provide new capital $850,000 of first and refunding series A 6 per cent gold bonds will be issued. The balance of the equity in the property—substantially upward of $4,000,000—will be represented by common stock, all of which, with the exception of the directors' qualifying shares, will be owned by the holding company.

The holding company will issue the following securities:

$2,125,000 par value of 6 per cent prior lien debenture gold bonds, dated Jan. 2, 1926, due Jan. 1, 1976.

$875,000 par value, 6 per cent, adjustment income gold bonds, dated Jan. 2, 1926, due Jan. 1, 1976.

20,500 shares of common stock, no par value.

Incidentally arrangements have been made for the extension of the $250,000 of Dayton traction bonds for a period of five years. On the other hand, it was impossible to effect an extension of the Hamilton & Lindenwald bonds in the hands of the present holders. In consequence, it has been necessary to provide for refinancing this issue in connection with the reorganization. The reorganization managers have arranged for the distribution of a substantial part of the proposed issue of new Hamilton & Lindenwald bonds in lieu of cash, in payment of fees and expenses fixed under order of the court or otherwise. The plan contemplates that the balance will be subscribed for and issued to holders of the Cincinnati & Hamilton and of Southern Ohio bonds.

It is explained that the prolonged efforts of the Cincinnati & Hamilton and Southern Ohio protective committees to formulate a plan of reorganization under which the Cincinnati, Dayton & Toledo committee would agree to accept securities for the property and equities owned by it, free and clear of the liens of the Cincinnati & Hamilton and the Southern Ohio mortgages, proved fruitless. As a result, the Southern Ohio committee, with the approval of the Cincinnati & Hamilton committee, has taken an option on the so-called Cincinnati & Northwestern division, consisting of the section of the interurban line from the Cincinnati terminal to College Hill and of the freight line from College Hill to Mount Healthy. With this exception, no provision is made in the reorganization plan for the stockholders of the Cincinnati & Dayton Traction Company.

In order to meet the immediate financial needs Southern Ohio bondholders, as well as the holders of Cincinnati & Hamilton bonds, are asked to subscribe to part of an issue of $200,000 par value of new Hamilton & Lindenwald bonds and to part of an issue of $850,000 par value of bonds to be issued under the new first and refunding mortgage

Digitized by Google

There will be no assessment for expenses upon depositing bondholders who assent to the plan, as it is felt that the funds which will come into the hands of the committee from operation and from other sources will be sufficient to enable the committee to function.

As for the new money which depositing bondholders are asked to provide, the entire contribution represents new capital, the proceeds of which will be expended in the reorganization and rehabilitation of the property. It will be represented by an equivalent par value of new securities, upon which the committee believes a regular return will be enjoyed by the holders. In this connection, it is interesting to contrast the initial bonded indebtedness of $1,300,000 of the operating company with the fact that from 1906 to 1917 the same property was subject to mortgages aggregating $4,900,000.

The property included under the plan of reorganization consists of:

(a) An interurban line, 53½ miles in length, a large part of which is of double-track construction, located almost entirely upon private right-of-way, running from the center of the city of Dayton to the outskirts of the city of Cincinnati.

(b) A branch line from College Hill to Mount Healthy, 3 miles in length, over which only freight service is now rendered.

(c) Local street railway lines serving the city of Hamilton.

(d) Two local railway lines furnishing service to a rapidly growing section of Dayton, Ohio.

The total population of the territory served, including the cities of Dayton and Cincinnati, was 733,030 in 1920. The total track mileage of the property is 86.2 miles.

At the time of the appointment of the receiver in 1920 the property was badly run down. More than $300,000 in net earnings from operation have been returned to the property in rehabilitation, improvements and betterments.

There is no bus competition between Hamilton and Dayton, but the railway is still subject to competition between Hamilton and Cincinnati. There also is competition with the local railway lines in Hamilton.

The city lines in Hamilton have been upon a paying basis for some time. Present net revenues are upward of $71,000 a year. This good showing is attributed to efficient operation and the modernization of the property, including the thorough rehabilitation of the tracks and the introduction of modern light-weight one-man cars. It has been impossible during the receivership similarly to modernize the interurban lines and the Dayton City lines. The new financing in connection with the reorganization is intended to provide funds for these purposes.

The net earnings during the twelve months ended Oct. 31, 1924, and 1925 respectively, are as follows:

	Year Ended Oct. 31, 1924	Year Ended Oct. 31, 1925
Gross earnings from operation	$968,606	$972,255
Operating expenses, including maintenance, rentals and taxes	861,940	852,638
Balance	$106,665	$119,616

The interest charges on $250,000 on Dayton Traction sixes, $200,000 new Hamilton & Lindenwald bonds and $850,000 first and refunding series A 6 per cent bonds aggregate $78,000 per annum. The net earnings available for the payment of fixed charges in the twelve months ended Oct. 31, 1925, were $119,616, or more than 1½ times the interest charges upon these securities.

Announcement is made that, conditioned upon the prompt acceptance of the reorganization plan and the provision of the new capital, an arrangement has been effected with Thomas Conway, Jr., and his associates to become the executive officers of the new companies. Based on the assumption that the reorganization will become effective early this year, that the Cincinnati subway will be opened in 1928 and that the necessary additional investment will be made from time to time for the purpose of handling the anticipated growth in the company's business, Mr. Conway has furnished the accompanying estimate of the probable results of operation of the railway in the five years 1926 to 1930.

The annual interest charges on the prior lien debenture gold bonds contemplated in the plan are $127,500. Estimates indicate that this interest will be earned by the operating company beginning in 1928.

The annual interest charges on the adjustment income gold bonds aggregate $52,500. Estimates indicate that the interest on these bonds will be earned by the operating company beginning in 1929, after providing for interest upon the prior lien debenture gold bonds.

Upon surrender of his certificate of deposit issued under the bondholders' protective agreement of May 15, 1918, each depositor will be entitled, for each $1,000 bond deposited, to receive interim certificates calling for $500 face value adjustment income gold bonds of the holding company and two shares of common stock without par value of the holding company. Each depositor will also be entitled, for each $1,000 bond deposited, to purchase for $250 the following securities:

$50 face value of new Hamilton & Lindenwald bonds.

$200 face value of first and refunding mortgage series A 6 per cent gold bonds of the operating company.

$500 face value of prior lien debenture gold bonds of the holding company.

Four shares of common stock without par value of the holding company.

The committee recommends that each of the depositing bondholders purchase his proportion of the new securities and thus protect his present investment.

ESTIMATE OF PROBABLE EARNINGS OF THE CINCINNATI & DAYTON TRACTION UNDER REORGANIZATION

	1926	1927	1928	1929	1930
Gross revenues from operation	$1,030,000	$1,162,500	$1,426,000	$1,532,000	$1,642,000
Operating expenses including maintenance, rentals and taxes (exclusive of federal income tax	903,606	905,490	1,108,110	1,157,510	1,212,185
Balance	$126,394	$257,010	$317,890	$374,490	$429,815
Interest on bonds of "operating company" chargeable to operation	50,000	78,000	108,000	126,000	144,000
Balance	$76,394	$179,010	$209,890	$248,490	$285,815
Depreciation accrual	40,000	55,000	57,500	60,000	62,500
Balance available for dividends to "holding company," federal income tax, and surplus	$36,394	$124,010	$152,390	$188,490	$223,315

$2,000,000 British Columbia Issue

Sales Campaign to Be Conducted by Canadian Company to Place Stock with Local Public

A customer-ownership campaign to sell $2,000,000 of stock in Vancouver and Victoria will be opened on March 20 by the British Columbia Electric Railway. Of the total, $500,000 will be sold through employees of the company and the ramainder through bond dealers in the two cities.

The issue will consist of 6 per cent cumulative preference shares in the British Columbia Electric Power & Gas Company, a subsidiary of the British Columbia Electric Railway, incorporated in the province of British Columbia for the purpose of permitting customer ownership to be realized. It will take over the capital stock of several power and a few gas companies, amounting in value to more than $15,000,000, which has been held in the past by the railway.

The British Columbia Electric Railway is an English company and as such its capital is in pounds sterling and its dividends are subject to English income tax. It has never been feasible to sell the stock or shares of this company to local people in British Columbia for these reasons.

The railway will continue to operate the properties of the power and gas company and will guarantee the dividends. These shares will be sold at the price of 99. The guarantee of the railway places the new shares ahead of all other stock issues, amounting to $21,000,000. There are unencumbered assets behind the new issue totaling $20,000,000, or $1,000 for every $100 share. While only $2,000,000 of these shares will be issued at present, a total issue of $5,000,000 is authorized.

Of the present issue $1,000,000 has been underwritten by a syndicate which has an option on a further $500,000. The employees of the company have been allotted $500,000 to sell and to subscribe. The employees' campaign has been placed in the hands of a committee consisting of W. Saville, general secretary; E. H. Adams, comptroller, and J. Lightbody, publicity manager. The two sales will be carried on simultaneously.

The subscription limit has been placed at $5,000. The company will accept no applications from persons resident outside the province of British Columbia.

The proceeds of the issue will be used on construction work during 1926. The year's program calls for a total expenditure of nearly $5,000,000. Any

Digitized by Google

further financing that is necessary will be done, as in the past, in England.

The directors and officers of the new company will be identical with those of the railway.

Dividend on Common Stock Increased by Twin City

The Twin City Rapid Transit Company, Minneapolis, Minn., has declared a quarterly dividend of $1.25 on the common and the regular quarterly dividend of $1.75 on the preferred, both payable April 1 to stock of record March 15. The previous common dividend was 4 per cent yearly. It was paid semi-annually.

January Revenue in Boston Lower

In January, 1926, the revenue of the Boston Elevated Railway, Boston, Mass., exceeded the cost of service by $223,302, against $269,649 for January, 1925. Details of January operation are given in the following table:

General Financial Data:	1926	1925
Revenue exceeded cost of service	$223,301.90	$269,649.08
Operating revenue per car-hour (A.E.R.A. std.)	$6.15	$6.25
Operating revenue per car-mile operated, cents	64.09	65.27
Average fare per revenue passenger, cents	9.231	9.186
Ratio operating expense to operating revenue, per cent	67.17	65.83
Passengers Carried:		
Revenue passengers	33,144,528	33,305,311
Per cent 5-cent and 6-cent passengers, per cent	18.63	19.49
Revenue passengers per car-mile operated	6.804	6.973
Operating Facts:		
Trips operated	635,193	606,938
Car-miles operated:		
Rapid-transit lines	1,258,980	1,290,266
Surface, two-man	2,100,618	2,261,585
Surface, one-man	1,193,843	1,090,984
Express, newspaper and sprinkler cars	6,513	6,875
Motor bus	311,407	126,571
Total miles operated	4,871,361	4,776,281
Accident Data:		
Accidents per 10,000 car-miles	2.28	2.30
Accidents per 10,000 bus-miles	5.96	5.06
Revenue passengers carried per accident	27,078	29,340
Average number of witnesses per accident	3.28	3.26
Complaints and Defects:		
Complaints in regard to car service	26	28
Employees complained of by car riders	118	136
Car defects reported per 10,000 car-miles	5.5	8.9

Permission Sought to Acquire Tennessee Line.—The Tennessee Eastern Electric Company, Johnson City, Tenn., recently applied to the State Railroad and Public Utilities Commission for permission to acquire the Johnson City Traction Corporation, operating 6 miles of line. The electric company already owns a majority of the traction stock.

San Juan Company Enjoined from Discontinuing.—The Public Service Commission of San Juan, Porto Rico, on Feb. 27, 1926, enjoined the Porto Rico Railway Light & Power Company, of which the Porto Rico Railways, Ltd., is a subsidiary, from discontinuing its trolley service in San Juan. The Porto Rico Railways, Ltd., on Feb. 24, 1926, announced that the trolley company would surrender its franchise and discontinue service on Feb. 28, 1926.

Railway Sold.—The St. Francois County Railroad, Bonne Terre, Mo., has been taken over by a group of Farmington, Mo., business men. They will continue the passenger and freight service between Farmington and DeLassus. This is the third time that local citizens have owned this electric road. The St. Francois line operates 12.9 miles of line.

Surplus of $221.—The Greenfield-Montague Transportation Company, operating an independent railway line between Greenfield and Montague, Mass., reports a net profit of $1,796 in 1925. Each town received a dividend and $1,450 was paid into the treasury for emergencies, leaving a surplus of $221. The total passenger revenue for the year was $72,024. The line operates under special permissive legislation from the State of Massachusetts.

St. Louis Certificates Called for Payment.—Pursuant to the order of the United States District Court Receiver Rolla Wells of the United Railways, St. Louis, Mo., has called for payment at 100.5 and accrued interest on April 1 all of the present outstanding issue of series B receiver's certificates. Funds for payment of the certificates and interest will be deposited with the First National Bank of St. Louis and the Guaranty Trust Company of New York. The certificates outstanding total $4,200,000.

Railway Rights May Go to Bus Company.—Negotiations have been opened for the purchase of the Hudson River & Eastern Traction Company, which owns the railway lines in Ossining, N. Y., by the owners of a bus company. If the project is successful it will lead to the abandonment of the railway. Officers of the railway are said to have admitted that the village authorities had indicated a preference for bus lines to street cars and that the negotiations had been opened. It is reported that the Westchester Coach Company, in which E. W. Niver of Briarcliff is interested, is seeking control of the railway.

Abandonment Petition Denied.—The Missouri Public Service Commission recently denied the application of the Southwest Missouri Railroad to abandon service between Joplin and Duenweg, a distance of about 6 miles. Duenweg has lost heavily in population since work in the mines adjacent to it fell off. Service over the railway to Duenweg has been reduced to one car a day, but the company desires to supplement the service by operating buses.

Seeks Abandonment of Unprofitable Lines.—A representative of the Northern States Power Company recently appeared before the City Council of Chippewa Falls, Wis., to determine whether public objection would be voiced against the proposal of the company to discontinue city service in Chippewa Falls and interurban service between Eau Claire and Chippewa Falls. The operation of these systems, it is declared, has proved a losing proposition due to the popularity of the bus and private automobile as well as objections from the city in connection with the use of city streets by the company. There was no personal objection voiced by members of the City Council to the proposal. It is expected that the next step will be a formal application to the commission.

Key System Issue Offered.—A syndicate headed by E. H. Rollins & Sons, New York, is offering at 97½ and interest to yield 5.78 per cent $2,500,000 of first mortgage 5½ per cent gold bonds, series C, of the Key System Transit Company, Oakland, Cal. The bonds are dated Oct. 1, 1925, and are due July 1, 1938. The proceeds will be used to reimburse the company's treasury for capital expenditures heretofore made and will provide funds for additional improvements.

New Financing in Portland Planned.—Stockholders of the Portland Electric Power Company, Portland, Ore., on March 24 will consider the issuing of common stock of no par value for common stock of $100 par value and plans for financing through the sale of common stock instead of bonds or prior preferred stock. This announcement was made recently by Franklin T. Griffith, president. A statement pointed out that the company will need $6,450,000 to meet its obligations, provide sinking funds and revenues for the construction program.

Capital Stock Increased.—At a special meeting of the board of directors of the Madison Railways, Madison, Wis., an increase of $300,000 in its capital stock was authorized, raising it to $1,000,000. By the sale of this additional stock the company hopes to secure sufficient money to carry on its 1926 program of improvements and extensions. The first improvement to be made this year will be the paving and double tracking of Breese Terrace and the improvement of six other streets used by the company.

Conditions in St. Johns.—The present actual cost of operating the line in St. Johns, Newfoundland, by the Newfoundland Light & Power Company is 10 cents a passenger exclusive of overhead cost, while the passenger receipts average 4.6 cents, as six tickets are sold for 25 cents. The deficit on the railway has to be met from the profits of the lighting system. J. W. Morris, superintendent of the line, is reported to have said that there had been an appreciable increase in traffic since the road was rehabilitated and new cars installed.

Grand Junction Utilities Bought.—Henry L. Doherty & Company, New York City, have purchased all the public utilities of Grand Junction, Col. Gas, light, transportation and ice plants are included. The owners of the Grand River Valley Railway and the Grand Junction Electric & Gas companies' properties, which are involved in the deal, are the estate of the late Charles M. MacNeill, Charles L. Tutt, A. E. and L. G. Carlton, Joseph Stewart and Spencer Penrose. The consideration is said to be $150,000. The properties will be formally transferred on May 1. The railway, comprising 27 miles, operates between Grand Junction and Fruita.

Legal Notes

ALABAMA—*Time to Sound Gong.*

In an action for injuries resulting from a collision between an automobile and a street car, the company's counsel requested an instruction that the duty of the motorman did not require him to sound his gong until he realized, or by the exercise of reasonable care should have realized, that the automobile driver was not aware of his approach. The court held, however, that this might have deprived the alarm of its utility, and the proper time at which the gong should have been sounded, in the circumstances, should be determined by the jury. [Mobile L. & R. Co. vs. Logan, 106 Southern Rep., 147.]

MAINE—*Public Welfare as Well as Public Convenience and Necessity Required for Certificates.*

The Maine laws require automobile common carriers to secure permission from the Public Utilities Commission before beginning operation, and the commission has jurisdiction over the routes, schedules, rates of fare, etc., of such motor vehicles. A bus company to which a certificate was refused by the commission applied for a writ of mandamus to compel the issue of a certificate on the ground that it is a ministerial act and no discretion was permitted to the commission in the issuing of such certificate. The court held that the Legislature has vested in the commission a broad discretion, having in view not only the necessity and convenience of the public but also its general welfare, and its authority, if it desires, to prohibit the use of public ways to heavy high-powered motor buses cannot be doubted. In this case, no abuse of discretion appeared on the part of the commission. [Maine Motor Coaches, Inc., vs. Public Utilities Commission, 130 Atlantic Rep., 866.]

MASSACHUSETTS—*State Trustees of Electric Railway Must Secure Local Licenses to Operate Motor Buses.*

Under the authority of the Legislature, trustees were appointed to operate the Eastern Massachusetts Street Railway system and were empowered with authority over rates and other matters. This authority was held not to include that of operating motor buses without first securing licenses for such bus operation from the local authorities concerned. [Eastern Mass. St. Ry. vs. Trustees of Eastern Mass. St. Ry., 149 Northeast Rep., 628.]

MICHIGAN — *Contributory Negligence and Assumption of Risk as Defenses Under Employers' Liability Act.*

In the case of a section hand who was injured and brought suit under the federal employers' liability act, the court held that while contributory negligence was not a defense under the act it might be considered by the jury in diminishing the plaintiff's damages. Assumption of the risk by the employee, however, is a distinct defense that would bar recovery. [Safranski vs. Detroit G.H. & M. Ry., 250 Northwest Rep. 485.]

NEW JERSEY—*Duty of Automobile Guest.*

A man riding as a guest on a motor truck was injured in a collision between the truck and a trolley car. He admitted that he had observed the car as it was approaching but had said nothing to warn the driver. His negligence, in such circumstances, was held to be a question of fact to be determined by the jury and not a matter of law to be disposed of by the trial court. [Baus vs. Trenton & Mercer County T. Co., 131 Atlantic Rep., 92.]

NEW YORK—*Liability for Collision with Unlawful Bus.*

A bus, which was being operated without lawful authority to use the public streets, was injured by a trolley car. The railway company claimed the presence of the bus on the streets to be a trespass and a public nuisance, so that it was not liable. The court held that the trespass was not the proximate cause of the accident, so that the railway was not relieved of its duty to exercise reasonable care to avoid a collision. [Audubon Transportation Co. vs. Yonkers Railway, 212 N. Y. Sup., 684.]

OHIO—*Conditions for Issue of Interstate and Intrastate Certificates of Convenience and Necessity.*

An applicant for a certificate of convenience and necessity for a motor bus line in Ohio to a point outside the state was asked if he desired a certificate to operate an exclusively interstate motor service and said he did not. He could not then complain at not receiving either an interstate or intrastate certificate, where the Public Utility Commission decided that the public convenience and necessity did not require intrastate service. [Eager vs. Public Utilities Commission of Ohio, 149 Northeast Rep., 865.]

PENNSYLVANIA—*Supervision over Infant Passengers.*

A boy 8½ years old, riding on an electric car with his sister 14 years old, left his seat and stood on the steps of the rear platform. He was seen in this position by the conductor who warned him of his dangerous position, but immediately afterward he fell or was thrown from the step and injured. A judgment in the trial court for the plaintiff was reversed. [Trippett vs. Monongahela W. P. P. S. Co., 130 Southeast Rep., 483.]

Book Reviews

Guiding Principles of Public Service Regulation

By Henry C. Spurr, editor of Public Utility Reports. Public Utility Reports, Inc., Munsey Building, Washington, D. C., 750 pages. $7.50.

This is Vol. II of the new work on utility regulation. It is based upon findings by public bodies. There are full references, and complete index. The table of cases covers 56 pages. For convenience the table of contents has been divided into 25 chapters, carrying over from Vol. I and including the subjects: Pavement over Mains, Land and Buildings, Property Not Used or Useful, Abandoned and Superseded Property, Standby Equipment, Property Acquired for Future Needs, Property Not Owned by Utility Company, Donated Property and Services, Property Paid for Out of Earnings, Miscellaneous Charges to or Deductions from Capital, Working Capital: Function and Amount Necessary, Basis for Estimating Working Capital, Nature and Kind of Depreciation, Necessity of Providing for Depreciation, the Depreciation Fund or Reserve, Prevailing Treatment of Accrued Depreciation, Proper Treatment of Accrued Depreciation, the Annual Depreciation Charge, Rates of Depreciation, the Return and Its Ascertainment, Treatment of Expenditures for Betterments, Replacements and Repairs, Treatment of Other Expenditures, Amortization of Expenses and Losses, Reasonableness of Operating Expenses in General, Reasonableness of Payments to Other Companies for Service or Commodity and Estimates of Operating Expenses.

The text is a running account of the position taken by the public regulatory bodies on the subjects cited. It is not overstating the case to say that the book is essential to the proper conduct of all work that has to do with the problems of regulation.

Signal Wiring

By Terrell Croft, consulting engineer. Published by McGraw-Hill Book Company, Inc., New York. 1926. 350 pages. $3.

This book on signal wiring consists principally of circuit diagrams. Of these there are more than 460 in the volume. The book is planned for the man who installs signals and who is interested in wiring diagrams. Currents involved with signal equipment are very small and voltages usually are very low. The diagrams have been selected from a mass of available material as those most useful to the average man. The subject matter is divided into 16 divisions. It includes such headings as, Bells and Annunciators, Burglar Alarms, Hospital and Hotel Signals, Time and Program Clock Circuits, Auto Call Signaling Circuits, Telephone Circuits, Fire Alarm Circuits, Watchman and Police Call Circuits, Power Station Signaling, Water Flow and Pressure Alarms, Elevator Signaling, Mine Signals, Railroad Signaling, Miscellaneous Signal Circuits, Batteries, Transformers and Signal Devices, Signal Wiring Methods.

Personal Items

J. H. McClure to Rehabilitate Another Property

J. H. McClure, vice-president and general manager of the Chicago, Aurora & Elgin Railroad, Aurora, Ill., has been made vice-president and general manager of the Cincinnati & Dayton Traction Company. As noted elsewhere in this issue the Ohio line has been purchased by an Eastern syndicate headed by Thomas Conway, Jr. This property, in which Mr. McClure will be financially interested, is one of a dozen or more similar properties taken over, rehabilitated and sold by these interests. The Cincinnati & Dayton Traction Company operates electric trains between Cincinnati and Dayton, about 50 miles.

Mr. McClure will have direct charge of operation of the reorganized property as vice-president and general manager. Since 1910 he has in turn been in charge of various public utility properties in Pennsylvania, Ohio and Illinois. He was general manager of the Citizens' Traction Company and the Citizens' Light & Power Company of Oil City and Franklin, Pa., from 1912 to 1920. During the latter part of this period he filled the position of vice-president in charge of operation of the Youngstown Suburban Railway, Youngstown, Ohio, and Salem Light Company, Salem, Ohio.

In April, 1920, Mr. McClure went to Lima, Ohio, as vice-president in charge of operation of the Ohio Electric Railway, and in connection with the financial readjustment of the affairs of that company has served as receiver of the Indiana, Columbus & Eastern Traction Company, and as operating manager for the receiver of the Columbus, Newark & Zanesville Electric Railway, with headquarters at Springfield, Ohio. He resigned from this position to take charge of the Chicago, Aurora & Elgin road.

Mr. McClure is at the present time receiver for the Indiana, Columbus & Eastern Traction Company, operating 200 miles of high-speed electric railway in the heart of Ohio.

Earl G. Hines with Brown Boveri

Earl G. Hines has been appointed general sales manager for the American Brown Boveri Electric Corporation in charge of subsidiary company organization and general sales policies of the Brown Boveri Corporation. He is also vice-president of Wilder Electric Trusts, which founded the American Brown Boveri Electric Corporation.

Since 1915, with the exception of eighteen months in 1919 and 1920, Mr. Hines has been with the McGraw-Hill Publishing Company, Inc., as Eastern manager of the *Electrical World* and the *Industrial Engineer*. Previous to this he was with the organization of Harrison Williams, engaged in public utility management and finance, and still earlier in his career he was sales manager for Conger interests in central New York. The American Brown Boveri Electric Corporation has been recently organized with main works at Camden, N. J., and with several American subsidiary companies.

Pierre See President Central Body

Superintendent of Equipment at Akron Made President of Master Mechanics Association

Pierre V. C. See, elected president of the Central Electric Railway Master Mechanics Association at the annual meeting held in Akron last month, is superintendent of equipment of the Northern Ohio Traction & Light Company, Akron, Ohio. To Mr. See his job, like that of the modern physician, is a preventive one. His first aim is to anticipate defects in equipment, and where they do occur to correct them as soon as possible. He keeps his work well organized, but he does not permit detailed reports and statistics to overwhelm him.

P. V. C. See

He grew up from the ranks and has an uncanny faculty of taking in at a glance a shop situation both with respect to men and equipment. Many of his orders are given on the run to his subordinates, but he himself follows up the work, making personal inspections of all activities of the company for which he is responsible wherever he deems them to be desirable.

Not only in the maintenance of electric railway cars but in the maintenance of buses has he made a name for himself. The Northern Ohio Traction & Light Company was one of the first roads in the country to use the bus on an extended scale. In caring for these vehicles Mr. See had to hew out his own path. Here again, as in the railway field, he sought to establish practices that would prevent troubles and defects rather than resort to measures to correct troubles after they had occurred.

As a result of his able handling of the fleet of buses on this property in city, suburban and interurban service, he has won for himself a reputation as one of the foremost bus maintenance men in the United States.

His experience in the railway field covers all types of electric operation. Before he went to Akron Mr. See was superintendent of car equipment for the Hudson & Manhattan Railroad, Jersey City, operating high-speed lines in heavy service. Before that he was general foreman of the Decatur shops of the Illinois Traction System. Previous to that he was general foreman of the shops of the Twin City Rapid Transit Company in Minneapolis and St. Paul. Mr. See's first work in the electric railway field was with the Metropolitan West Side Railroad, Chicago, as foreman and car-builder inspector in the Throop Street shops. He went to this job after he had been graduated from the Armour Institute, Chicago, in 1904 from the electrical engineering department. He was born in New Brunswick, N. J.

For the last two years Mr. See has been chairman of the equipment committee of the American Electric Railway Engineering Association. Previous to that he did considerable committee work, particularly on equipment subjects.

F. T. Hulswit Out of United Light & Power Company

Frank T. Hulswit has resigned from the presidency of the United Light & Power Company, Grand Rapids, Mich., formerly the United Light & Railways Company.

In recent years Mr. Hulswit has been very active as a financier in the utility industry with widespread holdings. He was not only the president and prime mover in the United Light & Power Company but also an organizer and director of the American Super-Power Corporation.

Mr. Hulswit was born in Grand Rapids, Mich., on Sept. 10, 1875. He was the eldest of a family of four boys. He apprenticed himself to a watchmaker at the age of fifteen, but quickly determined that there was no future for him in that line. Civil service in the conduct of the post office offered an opportunity to secure a clerkship in government service. He soon grew restive of the chances for advancement which government service held forth and, opportunity offering in the shape of a job as messenger in the Michigan Trust Company, he quit the post office at a sacrifice of salary and entered what was to be his life work.

The experience gained in the service of the Michigan Trust Company was utilized in 1904 when the firm of Child, Hulswit & Company was formed, to do a general bond brokerage business. The firm dealt largely in the bonds of public service companies, and as the business grew he, as a banker, entered actively into the affairs of the utilities that were being financed through this firm. The organization was enlarged by the addition of experts in gas engineering and in management.

Joseph C. McCune to Occupy New Post

Joseph C. McCune, connected with the Westinghouse Air Brake Company in various engineering capacities since 1913, has been appointed assistant director of engineering with the air brake organization. Mr. McCune's first employment with the Westinghouse organization was as assistant to the chief engineer. Previous to this connection, he was affiliated with the Cutler-Hammer Company, Milwaukee, and the Pittsburgh Railways.

From 1915 to 1917 Mr. McCune served as mechanical expert for the Westinghouse company in the eastern district, with headquarters in New York. He then spent several years in military service, first on the Mexican border and later in the World War. At the conclusion of the latter, he was made special engineer of the engineering department at Wilmerding, in which capacity he remained for several months. He was then transferred to the eastern district, where he served first as assistant to the district engineer and then as district engineer. He held this position until his recent appointment, which will again bring him to the home office of the air brake company at Wilmerding. Mr. McCune is a graduate of Cornell with the class of 1911. While there he won the first Sibley prize for scholarship and received the degree of mechanical engineer. He is widely known in electric railway, steam railroad and engineering circles.

Richard Schaddelee President of United Light & Power

Richard Schaddelee, Chicago, senior vice-president of the United Light & Power Company, Grand Rapids, Mich., has been elected president of the company to succeed F. T. Hulswit. New directors added to the board are H. B. Rust, president of the Koppers Company; J. S. Brookes, secretary and general counsel of the Koppers Company, and Richard Ingliss of Otis & Company.

M. M. Nash has resigned as superintendent of the Terre Haute division of the Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute, Ind. He had given 24 years of continuous service to the company. His plans for the future have not been announced.

A. M. Farrell, who has been connected with the Wisconsin Power & Light Company as district manager of the Oshkosh branch and general superintendent of the railway and bus systems since January, 1923, has resigned to become sales manager in the states of Ohio, Pennsylvania and West Virginia of the Puncture Proof Compound Company, Milwaukee. Prior to his work at Oshkosh Mr. Farrell was traffic manager of the traction company at Joliet, Ill.

J. I. Beals has been appointed superintendent of the Terre Haute, Ind., division of the Terre Haute, Indianapolis & Eastern Traction Company to succeed M. M. Nash, recently resigned. In the fall of 1925 Mr. Beals resigned as general superintendent of the Monongahela-West Penn Public Service Company, Clarksburg, W. Va., after a service with the company of eight years.

C. D. Porter remains with the Newport News & Hampton Railway Gas & Electric Company, Newport News, Va., as general manager for the General Engineering & Management Corporation. The Newport News property was recently taken over by the Fitkin utility group.

Obituary

Waldo G. Paine

Waldo G. Paine, vice-president and general manager of the Spokane & Eastern Railway & Power Company and the "Inland" system, operating interurban lines out of Spokane, Wash., died suddenly at his home in Seattle on Feb. 20 after a brief illness. He had recently gone to Chicago, but was forced to return home before he had completed the work of his mission to that city. Mr. Paine had been suffering only a short time from heart disease.

Mr. Paine was associated with F. A. Blackwell in the construction of the Spokane & Cœur d'Alene Railway, the first interurban line at Spokane. Since 1903 he had been an executive with that line and allied properties out of Spokane, serving for years as traffic manager. He succeeded as manager F. E. Connors, who died three years ago. Since that time he had been the directing head of the "Inland" lines. Mr. Paine was also a director of the Spokane United Railways, operating the city lines in Spokane.

Waldo Paine was one of the best known operating men in the electric railway field on the Pacific Coast. He was a native of Minnesota, but had been identified with interests in Spokane since 1889. After a period in the real estate business, and a subsequent connection with a mercantile company, he became one of the incorporators of the Spokane & Cœur d'Alene Railway. This company, with others, was later consolidated as the Spokane & Inland Empire Railroad, and Mr. Paine was made general freight and passenger agent. He was appointed vice-president and traffic manager in 1910, following a reorganization of the company.

Calvin H. Allen, 66 years old, real estate and tax agent for the Union Traction Company of Indiana for more than fifteen years, died at his home in Anderson, Ind., recently. At one time he was county auditor at Anderson.

Joseph M. Nougues, superintendent of the Sutro Division of the Market Street Railway, San Francisco, Cal., died on Feb. 20, 1926. He entered the service of the Market Street Railway as a conductor on March 29, 1904, and was transferred as a clerk in the employment bureau a few months later. In 1907 he was appointed superintendent of the Ferry Terminals and two years later, in May, 1909, he became superintendent of the Sutro Division. Mr. Nougues was born in St. Louis, Mo. on March 4, 1873. He was the son of Joseph M. Nougues, for many years city attorney of San Francisco, who died several years before the fire of 1906.

Sterling P. Anderson, auditor of the Tennessee Public Utilities Commission for the past five years and former state auditor, died recently. He was an important figure in the civic life of Jackson, Tenn., for many years.

Henry M. Ballard, for 20 years an executive of the old West End Street Railway, Boston, Mass., and at one time its electrical engineer, died recently. For several years he was with the Thomson-Houston Company in Lynn.

Edmund J. B. Huntoon, for many years asociated with Stone & Webster, Inc., Boston, Mass., died at Milton, Mass., March 8. He was born in Canton, Mass., in 1868, and was graduated from the Massachusetts Institute of Technology in 1889. He was active in the earlier electric railway construction of Stone & Webster, and at the time of his death was identified with the securities department of that organization.

Frank Andrew, who had been president of the Electric Railway Equipment Company, Cincinnati, Ohio, died on March 5, at Fort Myers, Fla., where he was spending the winter. Mr. Andrew went to Florida two months ago, in an effort to improve his health. He was one of the founders of the company, a Mason and a member of the Cincinnati Chamber of Commerce. Mr. Andrew was 80 years old.

Herbert E. Bradford, a pioneer electric railway man in New England, and at one time president of the New England Street Railway Club, died at Providence, R. I., on March 6 at the age of 67. He was a native of Claremont, N. H., and during his career was superintendent of the Marlboro Street Railway, the Worcester Consolidated Street Railway and of the Bay State lines in Newport, R. I. Mr. Bradford was in the automobile business at Providence at the time of his death.

Murray Carleton, during recent years vice-president and director of the United Railways, St. Louis, Mo., died in that city on March 2. For many years he had been a leading figure in the commercial activities of St. Louis. He was never active in the railway on its operating side.

Charles E. Hubbard, formerly well known as an electric railway official, died at Hartford, Conn., on Feb. 19. Mr. Hubbard was born in Essex, Conn., in 1868. He went to work for the Farmington Street Railway, one of the first lines that was built at Hartford, Conn., in 1898, was purchasing agent for the company and later became secretary and general manager. In 1910, when the company was taken over by the Connecticut Company, he became purchasing agent for the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, where he remained until 1914. He then returned to Hartford and went into the building supply business, with which he was connected at the time of his death. Mr. Hubbard was interested in politics and was a member of the Common Council of Hartford in 1917 and 1918. Later he became police commissioner

for Discussion of Manufacturing and Sales Matters

Good Will Fostered by Advertisements

Westinghouse Company Has Prepared Collection of Boosters to Assist Railway Industry

In an effort to secure better public understanding of the economic service rendered by the electric railways, the Westinghouse Electric & Manufacturing Company has for the last eight years been conducting a series of good-will advertisements in the leading national popular magazines. The company believes that there is today, on the part of the general public, a commendable increase in knowledge and appreciation of the tremendous importance of adequate transportation facilities, especially those facilities as represented by the service furnished by electric street and interurban railways.

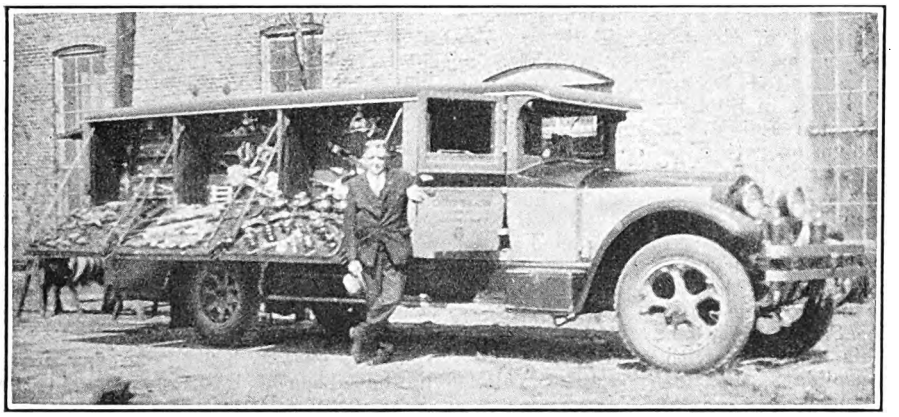
The Westinghouse company has endeavored further to strengthen public understanding of the electric railway industry, which represents an investment at the present time of $6,000,000,000, with securities held by 1,300,000 people and operating 105,000 cars on 50,000 miles of track in the transportation of more than 16,000,000,000 passengers annually. Facts such as these have been stressed in the consistent program of advertising which has been conducted in the *Literary Digest, Scientific American, Forbes, Collier's,* the *Nation's Business, Saturday Evening Post* and many financial papers in recent years.

The most important of these good-will advertisements are reproduced in special publication 1751, entitled "Electric Railways—the Keystone of Progress." This has just been issued by the Westinghouse company and is available to any who desire copies. The advertisements reproduced in this book represent a combined circulation of 26,324,000, or, in reality, that number of individual messages delivered in behalf of the electric railway industry.

An important feature in connection with this publication is that the Westinghouse company announces its desire of sending to any railway company free of charge either mats or electrotypes—for either newspaper or magazine reproduction—of any of the advertisements included in the publication. Copies of the booklet may be obtained from the nearest Westinghouse office or direct from the department of publicity at East Pittsburgh.

A Traveling Exhibit

A feature of the recent meeting in Mobile of the Electric Railway Association of Equipment Men of Southern Properties was the presence of one of the exhibit trucks of the Ohio Brass Company. These trucks, of which there are two, are fitted with racks for the display of the latest type of insulators, overhead line material and other equipment, light in weight, manufactured by the Mansfield concern. This material is attached to the sides of the truck so that when the sides are dropped down the exhibit can be seen to very good advantage. The trucks can be driven from city to city to show the material as occasion requires.



Ohio Brass "Drops In" at Mobile Meeting

The accompanying illustration is reproduced from a photograph taken in front of the repair shops of the Mobile Street Railway at the time the delegates to the Mobile meeting visited these shops. Fred W. Roth of the car equipment division of the Ohio Brass Company was in charge of the truck. He is shown in the picture standing in front of the truck.

G. E. Cullinan Promoted by Graybar

George E. Cullinan has been elected vice-president in charge of sales and a director of the Graybar Electric Company. He has had 24 years service with the Western Electric Company, during which time he has risen from a clerical position to the post of general sales manager of the supply department. Mr. Cullinan's first important position was that of chief storekeeper at the New York distributing house. He held that position until 1907 and was then transferred to the St. Louis branch, where he continued to advance rapidly, becoming Western district manager in 1908 and later central district manager in Chicago. When the supply department became a distinct organization of the Western Electric Company in 1923 Mr. Cullinan returned to New York as general sales manager, a post which he has held until his latest promotion.

Detroit Wants Tires on a Mileage Basis

Proposals for rental and maintenance of tire equipment on 125 gas-electric double-deck motor buses are being requested by the Detroit Department of Street Railways. The option of adding one to 300 additional buses during the life of the contract will be included. Bids will be opened on March 22, the same date as the opening of bids for furnishing the department with the double-deck buses on which the tires will be used. The contract is to cover the period expiring Dec. 31, 1926. Mileage will be computed from the records of the Department of Street Railways.

Each bus specified is to be equipped with six 38-in. x 8-in. pneumatic tires. The successful bidder shall carry in each of the garages of the D. S. R. a number of spare tires equal to 10 per cent of the total number of tires on buses being operated from that garage.

The contract is to include all repairs on all tire failures in operation and daily inspection by the successful bidder. Coaches will be equipped with tires of the manufacture of the successful bidder.

The basis of prices of bidders is the bus mileage, each bus to be operated approximately 100 miles a day. The D. S. R. reserves the right to purchase the tire equipment at the expiration of the rental period if it so desires, less the amount paid as rental on such tires as may at that time constitute such equipment, or to use such tires until unfit for further service, paying for them at the contract rental price.

Metal, Coal and Material Prices

Metals—New York	March 9, 1926
Copper, electrolytic, cents per lb	14.175
Copper, wire base, cents per lb	16.00
Lead, cents per lb	8.575
Zinc, cents per lb	7.75
Tin, Straits, cents per lb	64.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.475
Somerset mine run, Boosn, net tons	2.075
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.675
Central, Ill., screenings, Chicago, net tons	1.425
Kansas screenings, Kansas City, net tons	2.425
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.25
Weatherproof wire base, N. Y., cents per lb	18.00
Cement, Chicago, net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb	10.7
White lead in oil (100-lb. keg), N. Y., cents per lb	15.50
Turpentine (bbl. lots), N. Y., per gal.	$1.00

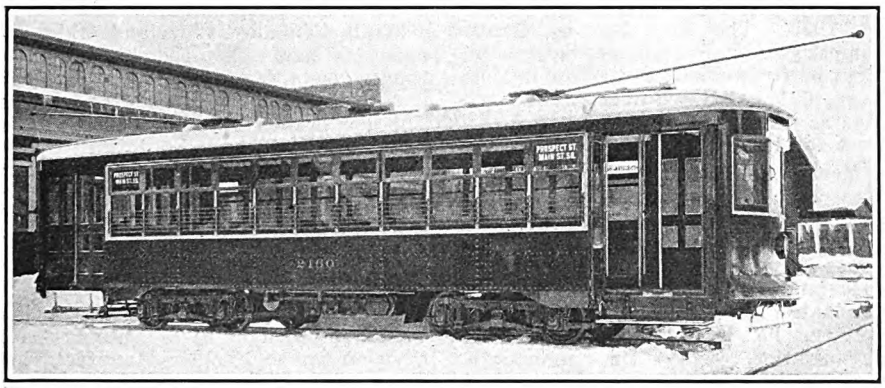
Car Lighting to Be Improved by Standardized Lamps

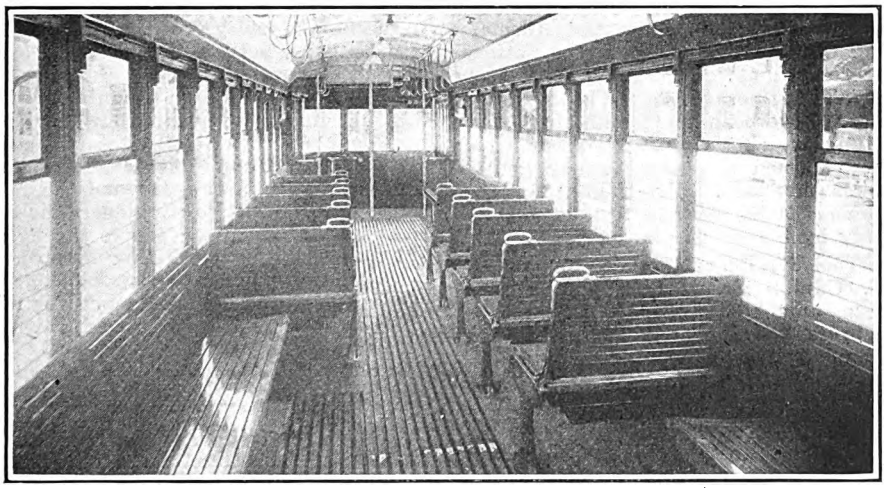
Standardization of the equipment used in the construction and maintenance of street cars has been acknowledged as one of the greatest boons attainable by the industry. Perhaps the latest definite step in this direction was the announcement made last month of the completion of the new standard line of "Mazda" lamps. The first of these lamps, a new 25-watt inside-frosted type, was placed on the market last July. The second lamp of this new line, the 100-watt inside-frosted type, became available on Nov. 1. Also three intervening sizes of 60, 50 and 40 watts respectively, all of the inside-frosted type, are now available.

For years the lamp industry has been directing its efforts to the simplification and standardization both of its line of lamps and its processes and equipment used in making them. While lamp voltages and lamp bases had been reduced in variety, there still remained considerable room for the advancement of a more complete standardization program. The present program affects the assortment of lamps of 100 watts and smaller, which are particularly applicable to car lighting service.

Careful study of requirements to be met in service has shown that the 45 different lamps of several sizes, types and finishes (not counting the three usual voltages of 110, 115, and 120) which existed in the field can be replaced by a single series of but one uniform type of finish.

Data on 25 Cars for United Electric Railways





Good Visibility Provided in New Cars for United Electric Railways of Providence, R. I.

Delivery of 25 type DJ one-man, two-man cars to the United Electric Railways, Providence, R. I., which were ordered from the Wason Manufacturing Company last September, was begun in January. The cars will seat 44 passengers. Specifications follow:

Weights:	
Car body	15,800 lb.
Trucks	15,200 lb.
Total	31,000 lb.
Length over all	41 ft. 0 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 1 in.
Height, rail to trolley base	10 ft. 11⅛ in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	⅛-in. Agasote
Roof	Arch
Air brakes	Safety Car Devices Co.
Armature bearings	Plain
Axles	4½-in. gear fit, 4-in. diameter
Bumpers	Channel iron
Car signal system	Consolidated electric buzzer
Car trimmings	J. L. Howard Co. statuary bronze
Compressors	DH-16
Conduits and junction boxes	Special
Control	Two K-35
Couplers	Bar
Curtain fixtures	Curtain Supply No. 89, pinch handle
Curtain material	Pantasote, double-faced
Destination signs	Hunter illuminated
Door-operating mechanism	National Pneumatic
Fenders	H-B lifeguard
Finish	Pratt & Lambert enamel
Gears and pinions	G.E. solid
Hand brakes	Peacock type G-14; 34
Heater equipment	Gold 500-watt single coil panel and 250-watt cross seat
Headlights	Crouse-Hinds ZL 28540 incandescent
Journal bearings	Plain
Journal boxes	Brill standard
Lightning arresters	General Electric MD-3
Motors	Four GE-265 A, inside hung
Sanders	Ohio Brass
Sash fixtures	Howard sash lock and anti-rattlers
Seats	Brill "Waylo"
Seating material	Wood slat
Slack adjuster	Brill automatic
Springs	Brill
Step treads	Mason
Trolley catchers	Wilson type "T"
Trolley base	Two GE
Trolley wheels	General Electric
Trucks	Brill 177-EX
Ventilators	Brill exhaust
Wheels	Steel, 27-in.

New Detroit Buses Will Have Inclosed Decks

In many respects the 150 new buses for which bids have been asked by the Department of Street Railways, Detroit, Mich., will be similar to those of the double-deck type now in operation in that city. However, the specifications call for completely roofed and inclosed upper decks, able to pass unladen under 13-ft. viaducts. They are to have a low center of gravity, to be easy riding and to be arranged for either one-man or two-man operation. Sixty passengers are to be seated, 27 on the lower deck and 33 on the upper.

The door from the rear platform into the body will be of the jack-knife type, air-operated and opening outward. Treadle control will lock the brakes while the door is open. The front door will be of the double jack-knife type, opening outward.

Some of the principal specifications follow:

Weight, maximum	19,000 lb.
Length over bumpers, approx.	30 ft.
Length over body, approx.	27 ft. 3 in.
Width over all, maximum	96 in.
Height over all, maximum	12 ft. 10¾ in.
Wheel base, minimum	230 in.
Headroom inside body:	
Lower deck at rear	6 ft. 2 in.
Lower deck at front	6 ft. 4 in.
Upper deck	71 in.
Front and rear entrances	69 in.
Floor, height from ground	22⅝ in.
Framework	Second growth seasoned ash
Roof:	
Upper	Haskelite, ⅛ in.
Lower	Monitor, steel construction
Headlining	Aluminum
Inside finish	White enamel
Sash	Curtain Supply Co.
Interior finish:	
Lower deck	Corrugated aluminum matting
Upper deck	Pyramid aluminum matting
Seats	De luxe
Seat spacing	29 in.
Heating	Exhaust through steel tubing around sides of body
Lighting	Keystone
Bumpers:	
Front	Spring type—extra heavy
Rear	Two 3-in. channels
Signs	Hunter illuminated
Engine	six-cylinder
Steering gear	Ross cam and lever type
Generator	GE-1098, 125 volts, 200 amp. at 1,200 r.p.m.
Motors	Two GE-1079—126 volts, 85 amp. at 1,640 r.p.m.
Brakes	Air, manual and electric regenerative
Wheels	Budd pressed steel disk, dual rear

Large Order for Rails for Hanshin Railway

An order for 32 miles of 91-lb. rail has recently been placed with United States rail manufacturers through the medium of Mitsui & Company. These rails are for the Hanshin Electric Railway in Japan and were awarded through Mitsui & Company on the basis of furnishing American open-hearth steel rails. The contract was let in spite of sharp European competition and efforts to discredit American steel products in Japan.

Rolling Stock

New York Rapid Transit Corporation, New York, N. Y., has had its award of contracts for the purchase of 201 steel subway cars approved by the Transit Commission.

Union Traction Company of Indiana, Anderson, Ind., has been granted the petition recently made by Arthur W. Brady, receiver for the company, for authority to buy bus equipment of the Hoosier State Lines at a price of approximately $135,000. The petition was granted by the judge of the Circuit Court at Anderson, where receivership proceedings had originally been brought. There are at present sixteen buses on the Hoosier Lines and it is expected that additional equipment will be purchased from Mack Trucks, Inc. Mr. Brady stated that leases on bus stations used by the Hoosier Stage will be sought, and that several other details will require attention before the final transfer of the bus equipment is made.

Track and Line

Wisconsin Gas & Electric Company, Kenosha, Wis., plans to lay double tracks on Sheridan Road between South and Elizabeth Streets and contemplates double tracking on Milwaukee Avenue as far as the Bronson Street siding. This is part of the 1926 program of improvements.

Georgia Railway & Power Company, Atlanta, Ga., spent approximately $700,000 for trackwork, paving and miscellaneous improvements during 1925. Of this sum more than $303,000 was spent in building additional track facilities and in rebuilding tracks necessitated by city paving projects. The annual report of the roadway department shows an expenditure of $100,000 for paving work ordered by the city.

Arkansas Central Power Company, Little Rock, Ark. will extend its Fifteenth Street car line a distance of seven blocks, if the Public Utilities Commission grants the petition requesting the city to act toward obtaining this extension.

Los Angeles Railway, Los Angeles, Cal., will spend approximately $75,000 in the reconstruction of the car tracks on East Seventh between San Pedro and Alameda Streets in the near future. The job will include the laying of 6,000 single track feet of heavy girder rail, and the repaving of the surface of 64,200 sq.ft. at a cost of more than $15,000.

United Railways, St. Louis, Mo., has applied to the St. Louis Board of Public Service for a permit to construct a new loop for the Wellston division cars extending north from Easton Avenue on Theodosia and thence westward to the present terminus of the line. The company also asked the Public Service Board to authorize the abandonment of a single track of the Bellefontaine line on portions of North Ninth, North Tenth and Hebert Streets. If permission is given the company will have a double track on north Eleventh Street. This arrangement will straighten out several bad curves and also give North St. Louis two important non-street car thoroughfares in that section. North Ninth and North Tenth Streets are to be repaved this year.

Trade Notes

Root Spring Scraper Company, Kalamazoo, Mich., manufacturer of spring scrapers and steel life guards for electric railways, states that it is now manufacturing the snow scrapers for the new Grand Rapids cars, ordered from the St. Louis Car Company. Details of these cars appeared in the ELECTRIC RAILWAY JOURNAL for Dec. 26, 1925. The Root Spring Scraper Company further announces the appointment of Grayson Railway Supply Company, 601 LaSalle Building, St. Louis, Mo., as its representative in the Southwest for the sale of snow scrapers.

Herman Steinkraus has recently assumed the representation of Bridgeport Brass products in the Cleveland territory in charge of sales and its warehouse service. He has resided in Cleveland for a number of years. A graduate of Western Reserve University, he has handled sales and organization work in managerial capacities for the Cleveland Automatic Machine Company, the Cleveland Chamber of Commerce, the Advertising Club of that city and the national secretary's office of the National Young Men's Business Clubs. The last eight years have been spent with the Osborn Manufacturing Company, from which he resigned not long ago as general sales manager. Mr. Steinkraus' continuous sales service was interrupted only by his service in the World War.

Tool Equipment Sales Company, 18 S. Clinton Street, Chicago, Ill., has been appointed the exclusive factory representative of the Bicknell-Thomas Company, Greenfield, Mass., manufacturer of tapping equipment. A complete stock of this company's product will be maintained.

Ludlum Steel Company, Watervliet, N. Y., announces that T. Holland Nelson, internationally known rustless steel expert, has become associated with the company in a consulting capacity in connection with the production of rust and corrosion-resisting iron and steel. Mr. Nelson is also vice-president of the William T. Bate & Son Company, Conshohocken, Pa. He is well known as a lecturer on problems of rust and corrosion, and has been intimately connected with the development of rustless steel both in this country and in England.

Fageol Company, Kent, Ohio, delivered fifteen motor coaches to the Miami Beach Railway, Miami, Fla., during the period from Jan. 15 to Jan. 31. These were six-cylinder gas-electric buses with the electrical equipment supplied by General Electric Company. The coaches are fitted with Westinghouse air brakes.

Railway Materials Corporation, Toledo, Ohio, has purchased and taken over the business and good will of the Railway Materials Company of Ohio. There has been a complete reorganization, and the following officers were elected: President, E. C. Folsom; vice-president, B. J. Farnham, secretary and treasurer, James P. Schrider.

Dale P. Cartwright, who sailed in January, 1925, on a year's tour throughout Europe and to the Orient in the interests of the North East Electric Company and North East Service, Inc., has just returned to the home office in Rochester, N. Y. In addition to calling upon dealers handling buses equipped with North East products. Mr. Cartwright visited North East foreign service stations in order to build up closer relations with them. In a number of countries he established new NorthEast service stations.

White Company, Cleveland, Ohio, has opened a new direct factory branch in Omaha, Neb., for the selling and servicing of White motor trucks and buses. The new branch sales offices and service department will be located at 1310-1316 Jackson Street. Dean M. Gillespie, former Denver salesman, has been appointed branch manager and A. F. Burgdorf, former St. Louis shop superintendent, becomes service superintendent at Omaha.

Mark A. Smith has been made assistant sales manager of the Motor Coach Division for the Yellow Manufacturing Sales Corporation. He was formerly district representative in Philadelphia. In his new capacity, Mr. Smith will supervise sales activities of the various district representatives. Before he joined the Yellow Coach organization in the fall of 1924, Mr. Smith was vice-president of the Royal Motor Coach Company. Through his long association with the bus industry and the Society of Automotive Engineers he is well known to railway people throughout the country. The Yellow Manufacturing Sales Corporation was recently organized as the selling agency for all Yellow truck and coach products with the exception of G.M.C. truck. It is headed by T. L. Emerson as president.

Advertising Literature

Alexander Milburn Company, Baltimore, Md., has issued a catalog describing various types of Milburn cutting and welding torches. A special type of torch is provided for various applications and differing maintenance requirements.

Fageol Motors Company, Oakland, Cal., has issued a booklet describing the various features of its gas-electric buses. Technical data on the electrical units supplied by the General Electric Company are included, as well as speed time curves showing the acceleration of the Fageol gas-electric unit with a weight of 16,500 lb., a competitive gas-electric unit with a weight of 17,620 lb. and a mechanical unit, manufactured by the same competitor, with a weight of 14,120 lb.

Smith & Gregory, Inc., New York, N. Y., has issued a novel folder calling attention to the Gruss air spring manufactured by the Cleveland Pneumatic Tool Company, Cleveland, Ohio. These air springs may be applied to trucks, buses and passenger cars.

Maintenance Men Have an Important Part in Merchandising Transportation

TO THE maintenance man the subject of merchandising transportation has sometimes seemed outside of his immediate interest. He has been inclined to consider merchandising problems as of immediate interest only to the transportation department and the management. Too often the same viewpoint has been taken by the management relative to the maintenance man's relation to merchandising problems. Economy has been the keynote in considering the activities of the men responsible for the equipment, track and line.

There are some notable exceptions to this condition. In the case of one Southern property, maintenance men were asked to join with the transportation men in submitting slogans to be used in attracting new riders. That mechanical men will react to the spirit of the selling idea was demonstrated by the fact that these men brought in slogans that were easily the equal of those submitted by other members of the staff.

But it is not in writing slogans that mechanical men have their greatest opportunity for helping to sell rides. On them rests the responsibility for the physical condition of the property with which the service must be rendered. And if the service is not up in quality, no amount of merchandising activity can hope to be permanently effective. The proof of the salesman's promises lies in the character of the commodity offered. If the goods are not up to standard, the salesman is an unwelcome visitor, and advertising becomes ridiculous.

Thus the maintenance man supports the entire merchandising structure. Unless this is realized both by them and by the management, sales effort is foredoomed to failure. Dirty cars, rough track and interruptions to service due to equipment defects or broken trolley wire are comparable in transportation service to a dingy store, unreliable delivery or faulty merchandise in a mercantile business. No amount of sales effort or publicity will permanently avail under these conditions.

There is a strong tendency, particularly when receipts are falling off, to screw down on maintenance expenditures to the utmost. The result, if this policy is continued, is to aggravate conditions. More infrequently, perhaps, maintenance men have been tempted to make a showing of efficiency and economy by themselves taking the initiative in deferring necessary work at the expense of the condition of the physical property.

In either case the best interests of the property are not being served. Proper facilities, tools and machinery are essential to efficient work and ultimate economy. The merchandising viewpoint is as important in making out the maintenance budget as in the case of advertising. In fact, when funds are limited it may be wise to hold the latter to a minimum until the physical property has been brought up to first-class condition.

Progressive maintenance men are today looking at their work from a merchandising perspective. This is shown by the articles in this issue. Whether the immediate interest is maintenance of equipment, track or overhead line, the opportunities for helping to sell rides are present on every hand. In proportion as he accepts this modern viewpoint and puts it into practice will the maintenance executive rise to his present opportunity.

Paint Is the Cheapest Publicity for any Transportation Company

"PAINT, Publicity and Politeness" is the slogan with which one progressive railway manager carried his road to prosperity not so many years ago despite adverse conditions. While it was in the days when painting had to be done entirely by hand and hence was expensive, he realized that it was the cheapest form of publicity in which the company could invest. Attractively painted cars, with appropriate striping and lettering, were the mute evidence that his road was ready to give its patrons good value for their money. With that background politeness of the men was all the easier to obtain.

Today, when costs have mounted in nearly every department, modern methods have made it possible to reduce sharply the cost of car painting. Furthermore, they can be made to do a better job than that to which the public has become accustomed in recent years. New paints and lacquers have been developed that cut the time a car must be out of service for painting from two or three weeks to as many days. The use of the spray brush makes it possible to get coverage and protection of the surfaces in inaccessible places more effectively than the hand brush ever could do, unless perhaps in the hands of experts. Stencils and cutouts facilitate the lettering and striping, and masks make the use of two-tone or three-tone effects but little more expensive than a single color.

The most successful companies have made it a practice to keep their equipment so well painted that it is hard to tell which are the new cars and which the old. A few new cars, brightly painted, accentuate the difference and show the public that really the remainder of the rolling stock is in deplorable shape. So when a program of modernization of rolling stock is under way, care should be taken to keep up the appearance of the remainder, and the public will feel that the standard of the entire road has been lifted to a new level.

Referring back to the slogan, "Paint, Publicity and Politeness," it is easy to see that the two first items are so closely allied that the one begets the other. In creating favorable public sentiment and in attracting riders to its vehicles, there is nothing which will bring greater returns than a liberal use of paint.

This is the issue in March that is devoted essentially to maintenance subjects

Labor-Saving Equipment Gives Reduced Maintenance Cost

CARS are too valuable and their earning capacity is too great to justify holding them in shops for long periods of time. A modern repair shop may be small, but it should be provided with the last word in labor-saving equipment in order to keep the cars on the road. Modern cars cost in the neighborhood of $15,000 each. In order to keep the investment working as nearly full time as possible, a considerable investment in modern shop equipment is justified. One of the principal factors in rapid repair of car equipment is to provide cranes, telphers, hoists and like equipment for handling and transporting parts to the particular locations at which they are to be repaired. Work in overhauling cars starts with the removal of the trucks from the car body and continues through different dismantling processes where the various equipment parts are removed and transported to repair sections or to the particular machine tools on which the work is done. It is better to put money into the best means of doing a job in a shop rather than to invest a smaller sum in a slower, less efficient substitute which may delay the return of the car to service.

Cranes, hoists and telphers are but a part of the equipment required for equipment handling. The use now made of truck tractors by electric railways is small, but these can be employed to great advantage and with a material reduction in labor cost. Several of the larger electric railway systems are using them and find that many parts can be handled by one man in less time than was taken by several laborers previously. The type with elevating platform is particularly convenient for removing equipment from cars and depositing it upon the repair bench and after repairs are made for reinstalling the equipment under the car body.

The value of any labor-saving device must be judged by its ability to perform a greater quantity of work of the same or a better quality than is possible with hand labor; in other words, by its ability to decrease labor costs without sacrificing quality. That it is possible to do a larger amount of work with the same number of men is no recommendation for the use of a tool if the work performed will not stand up as well as work done by hand, and if the cost over a period of time will equal that of hand labor. Nor is its purchase justified if the first cost and the maintenance expense over its normal term of usefulness are greater than when the work is performed by hand labor.

It Is Important to Know When to Stop Maintaining Old Cars

MUCH has been said about the low maintenance costs that result from new cars, and there are many examples of roads on the brink of disaster which have been made to pay good returns as a result of new cars and better service. The proportional decrease in maintenance expense where new cars have been substituted for old has been given as varying from 35 to more than 50 per cent. Differences in maintenance costs result from many factors apart from the cars themselves, such as the tracks over which they operate, the service conditions, weather conditions, and the extent to which the equipment is subjected to overload.

All railways are anxious to take advantage of the reduced maintenance cost which results from new cars, and those managements that have secured new equipment should devote their efforts toward continuing the low maintenance cost. Even though the cars be new they still require careful maintenance, or soon the low costs will disappear.

In addition to an adequate degree of maintenance for all cars, both new and old, a sound policy of retirement for the old equipment must be adhered to, so that equipment owned may be reasonably modern and capable of meeting the different requirements without needing constant attention. There is a rather well-defined line of demarkation beyond which it is more economical to retire equipment and replace with modern units rather than to repair and modernize with betterments. The dividing line, of course, varies with market and labor conditions and is affected by financial considerations. Obsolescence is not a constant, but is affected by the introduction of inventions and by the demands of passengers for improved service.

New equipment produces marked reductions in maintenance expense, which is essential in producing ultimate economies. With the added investment resulting from the purchase of new equipment comes also an obligation on the part of maintenance departments to develop the shops, tools and organization needed for keeping cars in proper condition. Close supervision and a specialized organization can effect material economies and at the same time keep the equipment in the high state of repair that is essential.

Co-ordinating Car and Bus Maintenance Avoids Wasteful Duplication

FEASIBILITY of co-ordinating maintenance on electric railway cars and buses depends largely on the size of the particular property under consideration. For small companies, it is obvious that it would not be economical to have separate facilities and separate organizations for the two kinds of work. Where the number of vehicles of each type runs into the hundreds, on the other hand, there is so much work to be done that it is possible to specialize it to a great extent. Between these two extremes is a wide middle ground where the manager must use his own discretion to decide the question. Prevailing opinion, however, appears to favor co-ordinating the work as far as possible to avoid duplication.

Certain kinds of maintenance work are similar for both cars and buses. For example, painters, carpenters, fare box and register repairmen, blacksmiths, and to some extent even machinists, can ply their trades equally well for either type of vehicle. More efficient use of the men's time, as well as greater flexibility in the operation of the shop, is secured by having them work indiscriminately on cars or buses as occasion demands.

Separate maintenance personnel will be required for certain other types of work, however. Electric motors, gears, brakes, wheels and trucks of railway cars must be handled by specialists, as must the gasoline engines, transmissions, differentials, carburetors, tires, etc., of the buses. One way to meet this need on larger properties is to have a man of this type for each specialty traveling constantly among all the shops, carhouses or garages on the entire system.

In general, it is probable that there will be enough

Digitized by Google

regular inspection work to be done, even on a small railway property, to justify separate inspection personnel for cars and buses. Cleaners might well be kept separate also, as there is a considerable amount of this work to be done, and it must be performed somewhat differently on the two types of vehicles.

Regardless of how far it may be advisable to go in the use of the same men and the same facilities for these two kinds of work, there are certain advantages in the employment of experienced electric railway men for bus maintenance. They have the transportation viewpoint concerning readiness for service, which it would take a long while for an outsider to acquire. They know the kinds of defects to watch for, the necessity of having all the equipment ready for use in rush hours, and many other little tricks of the trade. Of course care must be exercised in the selection of men with the right kind of experience. Track greasers should not be employed on automotive engine work, or other unskilled labor on delicate jobs. Selection of the proper men, however, will produce close co-operation on account of the feeling of mutual understanding resulting from having a common basis of past experience.

Track Crossings that Reduce Noise Are Desirable from Many Viewpoints

WITH renewed confidence in electric railways comes a desire to improve their operation. Many things are needed. While much has been accomplished in noise reduction, the next few years will undoubtedly see great progress along these lines. One of the worst offenders has been the noisy crossing. Any well-made crossing is good until it breaks, and then it ordinarily remains in use for many months before it is replaced, but the noise is accentuated at once, to say nothing of the damaging effect on the equipment passing over it.

Much expense goes into repairs of broken special work, though they oftentimes are successful only to a limited degree. It is not easy to weld alloy steel successfully and get a permanent job. The alloy in the original case is made, cast and tempered under the supervision of a metallurgist. It is impossible to duplicate this in practical welding processes.

Elsewhere in this issue is the story of Cleveland's attempt to eliminate noise by adopting a crossing type heretofore largely used by the steam railroads. Its popularity with the steam roads has been largely because it wears out before it breaks. This very feature, aside from the economy it produces, is the essence of the noise reduction feature. After adopting this design developed by usage on the steam roads, two important features were incorporated to improve the product for use in paved streets. The principle of flange running was adopted so that the wheel rolls on the flange over the entire crossing. Also by use of the flange block the wheel tread does not come in contact with the rail head at the joint with the crossing leg, thus avoiding a battered rail end.

In this way noise is reduced, first, through a design that permits flange running and, second, by eliminating breakage of the crossing elements. To be sure, a crossing of this type costs slightly more initially than the solid manganese type, and either costs about twice as much as the bolted type built up of rail and guard sections. The ultimate answer, however, is in the service obtained. The more expensive type through longer life may be the cheaper in the long run. Cleveland's answer is in ordering more crossings of this type after a four-year test, with as yet no failures despite the density of service on Euclid Avenue and at the other points where they are used.

When Maternity Cases Overrun the Operating Ward

MAINTENANCE shops, as their name implies, might be likened to an operating ward in a hospital. There the victims of disease and accident are brought, their condition ranging from acute to mildly serious, to have the broken parts mended, the infected parts removed, and perhaps new organs and features grafted. But alas for the inhumanities of the *genus homo!* How frequently have railway officials been wont to ignore the plaintive cries of the sick, the halt and the hurt and have hung the "maternity ward" sign on the door of a perfectly good maintenance shop. Building new cars instead of repairing old ones, making new parts for the repairs instead of purchasing them—burying the true cost of the process under a mass of complicated bookkeeping, so that when the infant finally sees the light of day no one can say how far the proud papa—the railway company—has had to dig down in his jeans—no wonder the accounting departments have petitioned for a psychopathic ward for the personal use of their staffs.

When a patient of long standing comes knocking at the door he is all too apt to be informed that accommodations are lacking—unless his is a case of life and death, when perhaps he may be grudgingly admitted for a brief treatment—and he perforce goes back for another 20,000 miles of "grin and bear it." Perhaps this is a far-drawn analogy. Nevertheless it is true that the practice of building new cars and parts in railway maintenance shops, originally undertaken to make use of shop equipment standing idle in off hours of maintenance work, has sometimes grown to a monster which has all but destroyed its creator.

It is not a question of the right of railway companies to enter into direct competition with car builders or equipment manufacturers. As Thomas Elliott recently said, their justifiable activities in this direction are determined entirely by their abilities to build better cars than they can buy. But the activities of a railway in the operating field alone are manifold. Its reputation is built upon the service it gives, not upon the cars it manufactures. If it unconsciously neglects that service in developing and expanding its activities to other lines, such as that of manufacturing, it will be the one that must ultimately pay the piper.

Maintenance is one of the most important features of proper railway service. If a hard and fast line could be drawn and maintained between maintenance activities and manufacturing activities, the problem would not present the difficulties which it does. It seems, however, that efforts made in this direction have not met with entire success. To keep the bookkeeping straight, so that items properly chargeable to manufacturing are not foisted upon the already overburdened maintenance account, requires much ingenuity. It would seem better, in this day of specialization, for the operator to concentrate on operating details and to leave production details in the competent hands of the car and equipment manufacturers. Certainly he would be able to toss a large bundle of grief overboard were he to do this.

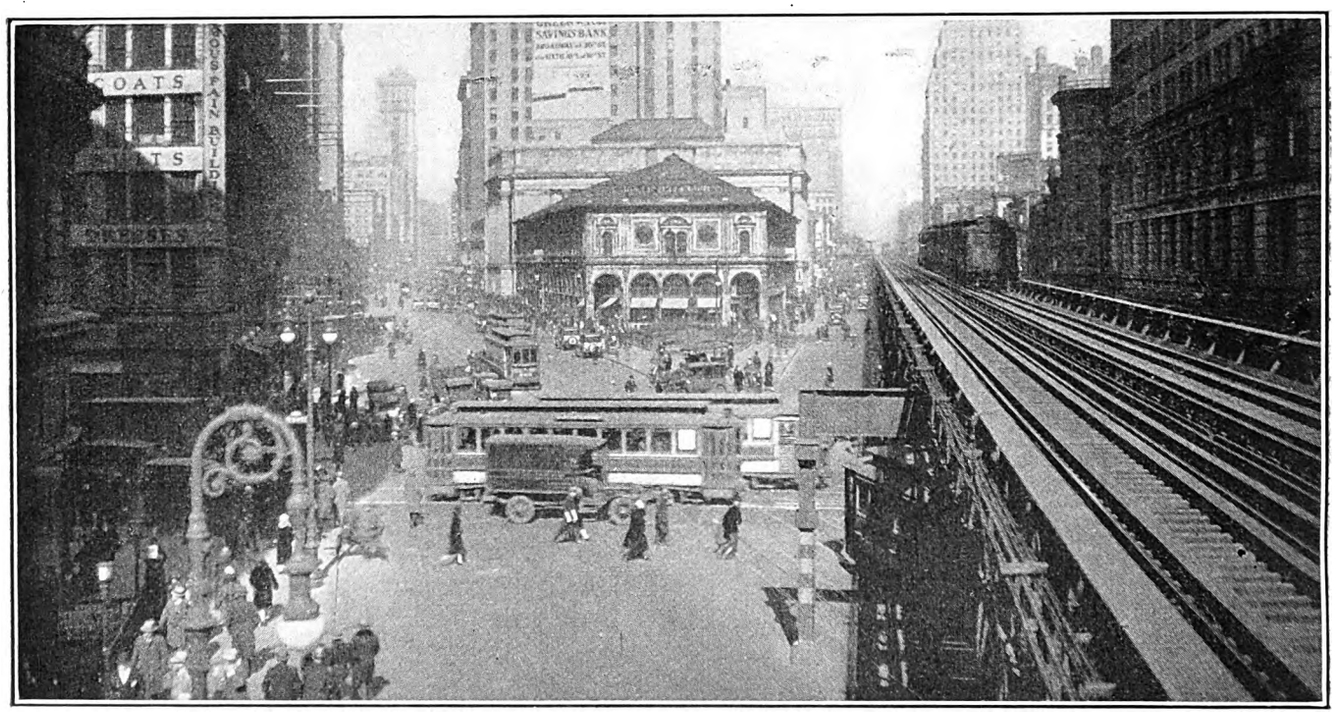
Car Noises from Inadequate Maintenance Demand Attention

Closer Limits for Wheel Wear—Less Side Play—Gearing Properly Centered—Closer Bearing Fits—Oiling of Springs and Close Attention to Brake Rigging Are Some Things that Will Increase Attractiveness of Electric Car Riding by Reducing Noise

By H. S. Williams
Assistant Superintendent of Equipment,
Department of Street Railways, Detroit, Mich.



The Noisiest Corner in New York City. Elevated, Subway and Surface Cars, Combined with Congested Street Traffic, Make the Junction of Broadway, Sixth Avenue and 34th Street Disagreeable

A SUBSTANTIAL reduction of noise in car operation is possible by proper maintenance, but it is a formidable contract for the equipment man, and yet it is absolutely necessary that it be done. The various points to be considered and the work to be done can be carried along gradually in the course of routine car overhauling.

To plunge directly into the subject, let us start at the source where we find two principal things operating to produce noise, i.e., metal wheels rolling on metal track, and motors with their gearing. In order to get the least possible sound from wheel and track it is necessary first that each be in as perfect condition as possible. It is hardly necessary to point out that the track must be smooth, in good alignment, free from low joints and corrugation, all of which spells high standard of maintenance. The next thing is the car wheel, and this has many noise producing possibilities. To start with, the wheel must be true—that is, it must be perfectly round, accurately centered and with smooth tread. With steel wheels there is little probability of starting out otherwise; but with chilled iron wheels it is different, and it may be necessary to grind them to produce accuracy and smooth finish. These points are self-evident and require no further argument.

It has been thought by many equipment engineers that improvement can be effected by pressing wheels on the axles to a wider gage; the idea being that with less side play there will be less tendency toward nosing and oscillation, with a resulting reduction of wear and noise. In this connection it is worthy of note that the standard A.E.R.A. wheel gage is now made 4 ft. 8⅛ in., instead of 4 ft. 8¼ in. It appears that the present practice of condemning steel wheels for flange wear according to the standard "Limit of Wear Gage" is too tolerant in that it allows too great side play. An extreme case which is possible with the use of the gage but is exceptionally rare in practice is, if a pair of wheels with 1⅛-in. flanges were both worn to the limit indicated by the gage or to a thickness of 1⅛ in., this would allow each flange to wear off ½ in., or a total of 1 in., which is too much. Such wear would undoubtedly cause noise, and should be avoided by increasing the thickness of the flange at its condemnation point.

Again, the thickness of the flange is a noise sinner,

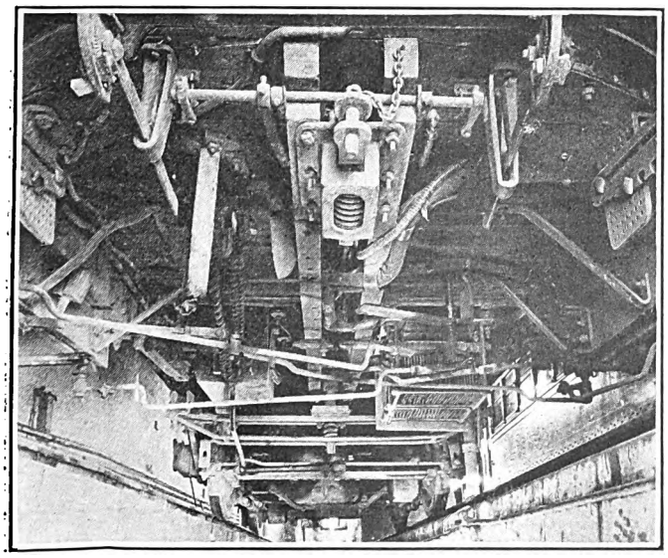
Digitized by Google

in that it governs the width of slot necessary in special work; so the narrower the initial wheel flange, the narrower the rail groove can be made, and thus the pounding of wheel passing over special work will be less objectionable.

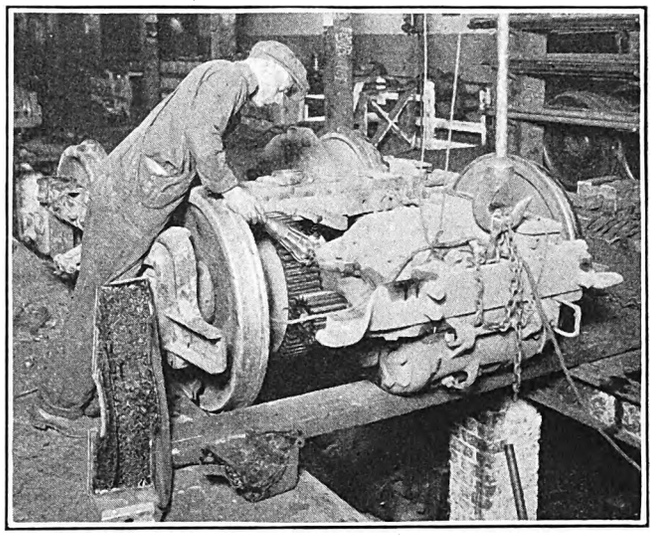
Another phase of noise production by wheels is the ringing, bell-like sound which is set up whenever they are in motion. This is particularly true of steel wheels, and its cure is extremely easy. If the wheels are purchased with four holes drilled through the web, the simple expedient of bolting four pairs of wood, rubber or similar cushioning element blocks to the wheel will effectively kill the ringing sound. This is easily demonstrated in the shop by equipping one wheel as directed, then by striking this wheel a hammer blow and comparing the sound with that produced on another wheel without the silencing pads. Of course, one must not run into the error of thinking that this treatment will kill all wheel noise, for it will not.

The weight of wheel and axle has a bearing on noise, as this is all unsprung weight and, of course, all of the impact sounds due to roughness or imperfections of wheel or track are proportional to the weight. While this might be considered a construction problem rather than maintenance, it is to be noted that wheels and axles are continually being replaced in the routine of maintenance. To cut down this weight it is probable that the Twin City lines of Minneapolis and St. Paul have made the greatest progress, as they have used hollow axles and cut large holes in the web of the wheels.

Motor gearing is another prolific source of noise which can be greatly reduced by proper maintenance. Probably the most important feature of this is to maintain correct gear centers. With gears the proper distance apart, bearings tight in their housings and gear teeth well lubricated the noise due to them will be at its minimum, and will not be objectionable. While this discussion pertains to noise, yet the subject of wear as its component is inescapable, for wear means noise and noise means ultimate destruction. So it is to be noted that the minimum wear takes place when the pitch lines of the two gears coincide. As soon as spreading of centers is allowed, cutting action between the teeth takes place and wear sets in at an accelerated rate. This allows hammer blows between teeth and consequently disagreeable sounds. Spreading of gear centers



The Underbody of Most Cars with Many Joints, Connections and Levers Is a Fertile Place for Sloppy Fits



Careful Attention to Gearing, with Ample Lubrication, Will Do Much to Reduce Noise. The Maximum Amount that Gearing Can Spread Should Be Determined at Each Inspection

is due to worn bearings or housings, or both; so to keep the resultant noise within bounds it will be necessary to fix limits of wear. It is impossible at this writing to prove what the limits should be. As a tentative recommendation I suggest that armature bearings be renewed when worn $\frac{1}{16}$ in., and axle bearings be renewed when worn $\frac{3}{32}$ in. When the bearing becomes loose in its housing it should be replaced, as any looseness means rapid wear and noise.

The customary initial bearing fits are considered too tolerant. Successful operation can be obtained by boring bearings 0.002 in. per inch of diameter larger than the shaft. This applies to axle bearings as well as to armature. Axle bearings should have individual fitting and not be bored to a set of standard sizes. To follow this practice successfully it is necessary that the shafts be trued and kept free from taper. It is also important that the bearings be protected from dust and grit. By paying careful attention to accurate bearing fits much greater life may be expected from them, which will compensate for a reduction in the amount of wear allowed at the condemnation point. It has also proved good practice to make the outside diameter of replacement for axle bearings 0.004 in. oversize to insure tight fitting.

Shimming between bearings and housings is indefensible as a standard practice, as the wear at this point is such as to produce an elliptical form; consequently a shim will not offer uniform support to the bearing. The result is a distorted bearing or a fit that will soon become loose and then—more noise. The best practice is to bore the housing to a standard oversize, or weld it and rebore to the original size.

Gears are also subject to high pitched ringing sounds similar to those previously discussed under the subject of car wheels. This ringing can be muffled in a manner similar to that suggested for wheels, by bolting pads of cushioning material to the web.

Noise emanating from trucks is probably of next importance, and the standard of maintenance has an important bearing on whether these are obnoxious or not. The truck sounds are usually due to loose parts, so the problem here is to set up maintenance practices which will keep the parts tight from one overhaul period to the other. Bolted parts that have a tendency to loosen may be held much better if the bolts are made

With Wheels Pressed on Accurately and to the Widest Gage Practical, One Source of Noise Is Reduced

of a better grade of material, such, for example, as S.A.E. specification 1035 screw stock, and if a fine thread be used in place of the coarse form. In other cases, if a strip of canvas dipped in a good grade of paint be placed between the parts to be bolted together this will form a cushion that will help reduce transmission of noise and will keep the parts absolutely tight. This method has been most effective where brake heads are bolted to a brake beam, also between gib plates and the pedestal.

Journal box covers are subject to much wear and rattle. On most boxes new covers may be used which may be bolted tightly in place. This will not only cut out their noise but furnish better protection against dirt. On some roads wooden journal box covers have been used successfully.

As mentioned previously, noise is largely due to wear; consequently, if such parts as gib plates, bolster guides, etc., are made of higher grade material or are case-hardened they will wear much longer, and the noisy conditions will be prevented between overhaul periods. Regular and systematic overhaul is absolutely essential in any campaign looking toward noise reduction. In respect to case-hardening, this means hardening by the pack process to insure depth of the hard surface. A thin surface hardening such as cyaniding is not sufficient, although it helps.

Truck noises and vibrations may be transmitted to the body through the medium of the truck springs. Little can be done to prevent this, as the inherent design of the truck is largely responsible. However, if the elliptic springs can be made a little more sensitive some good will be accomplished. This is possible by applying lubricant regularly to the springs. Common car oil can be used, but to secure better penetration it is advisable to cut it with kerosene and swab it on the outside of the spring with a brush or similar tool. Such a practice will also improve the riding qualities of the car. Experiments have been made of wrapping the springs with felt to hold the oil, but the resulting action is no better than the swabbing when consistently followed out.

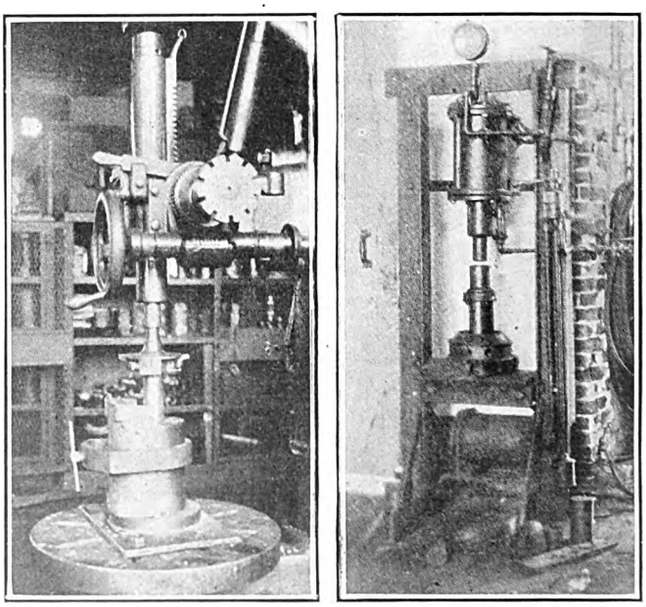
Brakes are not guiltless in the noise inquest. The rigging is never a mechanically perfect job. Sloppy fits are the rule. While this may be justifiable, yet it courts noise. The problem, then, from the maintenance end is how to better existing conditions when overhauling. Hardened pins and bushings should be used, and clearances between pin and bushing should be kept as low as 0.010 in. Clearance between clevis jaws and levers should be taken up by means of flat springs which would prevent rattle. Where long brake rods require support this may be given by allowing them to ride over wooden strips which will thoroughly absorb any noise. Brake shoes are noisy items. While this is a problem of design, rather than maintenance, yet thought should be given to its solution. Shoes have been used successfully which are bolted to a brake beam, thus eliminating the brake head, but their adoption has not spread to any appreciable extent. Surely the present method of attaching brake shoes is entirely unsatisfactory as a noise preventive.

Squealing Brake Shoes Are Annoying

A word might be added as to the composition of brake shoes. This should be so regulated as to prevent squealing. If the shoe is too hard it will be most obnoxious; so a combination of hard and soft metal can be used which will give the life wanted and yet prevent noise.

Of body noises there are many, yet there is little that can be done in the way of maintenance to reduce them except as a car is rebuilt. Perhaps one of the most common sources of body noise as well as a most irritating one to the passenger is loose glass and sash. This can be cured by proper attention. One cause for loose glass is the use of poor putty in setting the glass and using it too freely, with the result that it pulverizes, shakes out and leaves loose glass. Felt or rubber setting is not as susceptible to such trouble. The sounds from track, wheels, trucks, etc., can be minimized by the use of a deadening felt or similar sound-insulating material between the layers of a double floor. Also, the use of a linoleum, rubber tile or equivalent type of semi-soft floor will help muffle these noises.

From the foregoing it is seen that car noise is a complex problem, that no one remedy can be applied to its reduction, but rather the solution of the problem means the study and adoption of higher standards of maintenance and finally keeping everlastingly at it.



Bearings Should Be Bored Accurately, Fitted Individually and Pressed into Housings Carefully in Order to Reduce Noise in Operation

Efficient Trolley Maintenance Helps Sell Rides

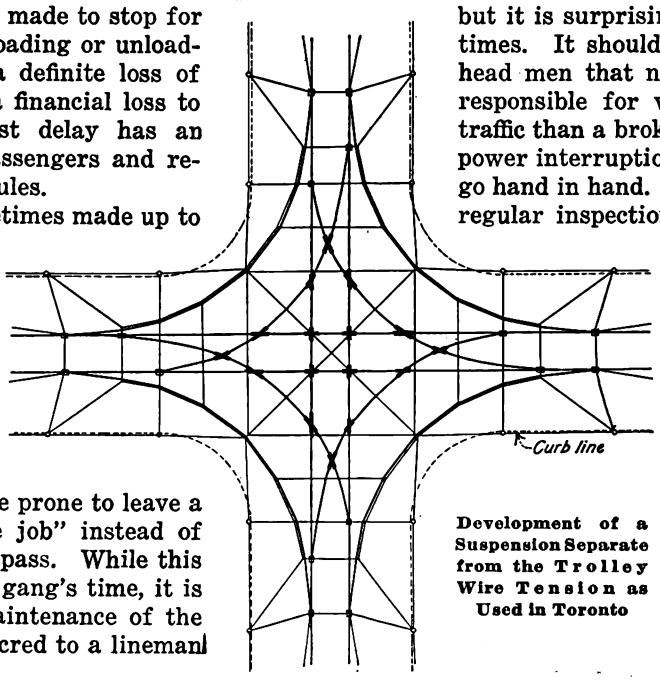
Improved Overhead Construction Maintenance Will Help Materially to Make Electric Car Transportation Popular—Delays to Service Aggravate Passengers—Keeping Cars on Schedule Should Be a Sacred Duty of Linemen

By J. F. Neild
Electrical Engineer Toronto Transportation Commission, Toronto, Canada

CAN an overhead man sell transportation service? Perhaps not; he is not in that end of the business; but it is up to him to help in the production of a service, which the traffic department of the electric railway will find worth selling. How can this be done, and in what particular manner can the line gangs help? It should be impressed upon every line gang foreman; in fact, upon every railway employee, that each time a street car is made to stop for any other purpose than the loading or unloading of passengers there is a definite loss of prestige to the system and a financial loss to the investors. The slightest delay has an irritating effect upon the passengers and results in disturbing the schedules.

The traffic schedule is sometimes made up to operate on a time margin as closely as one-half minute, and it requires the united effort of the whole traffic staff to maintain that schedule against what might be called foreign obstructions, without any associated department contributing a few extra ones. Line foremen are prone to leave a gang at work "to finish the job" instead of pulling out to allow a car to pass. While this way saves a little of the line gang's time, it is wrong in principle. The maintenance of the schedule should be just as sacred to a lineman as it is to a traffic man. Care should also be taken to see that line gangs are not sent to busy sections of the city during hours of congested traffic, for while the crew may not delay a street car directly, it may so obstruct the street as to cause the traffic stream to divert to the car tracks, thus causing delays.

That the work should be so well done as to safeguard against breakdowns one would take for granted, but it is surprising what chances are taken at times. It should be impressed upon all overhead men that no part of the system can be responsible for wider spread disturbance of traffic than a broken trolley wire, unless it be a power interruption, and these twin devils often go hand in hand. All lines should have careful, regular inspection at comparatively short intervals. In Toronto the practice is to cover the entire system every three months; all repairs that are found necessary by the inspecting gang should be made by the gang when found. When repairs are listed for future attention usually a certain percentage are neglected and a breakdown may result.



Development of a Suspension Separate from the Trolley Wire Tension as Used in Toronto

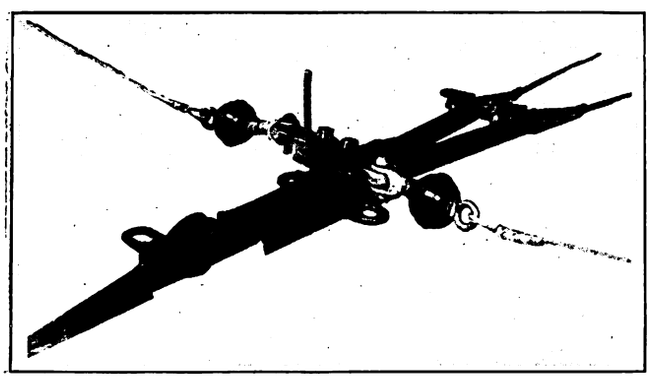
Investigation into many types of intersection construction shows that while

Digitized by Google

they are apparently well built and have a neat appearance, they have the possibilities that a broken trolley wire will cause a sag sufficient to obstruct traffic. Having this in mind, the electrical department of the Toronto Transportation Commission is working with the idea that the suspension of an intersection should be entirely independent of the trolley wire tension. The suspension is erected first and the wire is run in afterward. With this type of construction, the possibilities of an intersection sagging sufficiently to obstruct car traffic are reduced to a minimum. This also permits the renewal of curves without losing the alignment.

An accompanying illustration shows a plan of the present stage of the evolution of this construction as applied to a grand union. Constructive criticism will probably bring further developments, but the results of two years experience with this construction indicate that the extra cost, if any, is justified, as the main object is not how cheaply curves can be erected, but how securely they can be put up at a reasonable cost. Extreme low cost of construction is not as important as continuity of service.

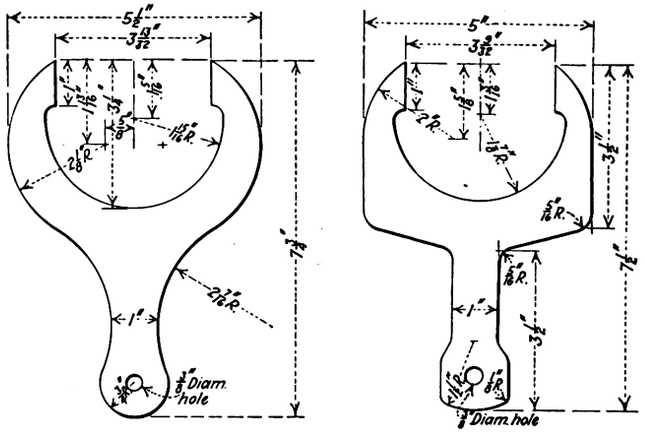
In order to speed up the changing of worn frog



New Type of Frog Suspension Clamp Used by Toronto Transportation Commission

pans, a new type of frog suspension has been developed. This is shown in another illustration. This device is a clamp, which is supported by the span wires and which holds the trolley wires. The frog pan is placed up against the underside of the clamp and is held in place by the cam tips. In order to change a pan, all that is required is to strip off the cam tips, replace the pan and put on new cam tips, a matter of two minutes. This device accurately retains the frog location, which is a very important feature for some locations. After an experience of one year with approximately one hundred installations no weakness has developed in the device.

A close examination of the wear of trolley ears has shown that no matter how careful a man is in putting on the ears ridges are left on the lips of the ear by the hammer. These ridges become worse gradually and are responsible for a great deal of the rumbling in a car when the trolley wheel is passing over an ear. After considerable investigating, we found that by using a 15-in. ear on the tangent line, clamping it on 3 in. at each end and leaving the remainder of the lip as a smooth-running surface, there is a considerable reduction in noise. The continued running of the trolley wheels rolls the ear around the wire, as shown by two accompanying illustrations, one showing a newly installed ear and the other an ear after six months running. At first it was thought that the ear installed in this way would not hold the wire securely, but after

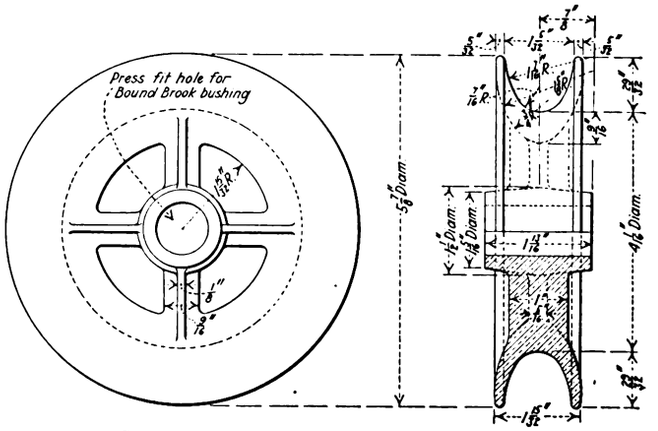


Gages for Trolley Wheels. At Left, Shop Gage for Re-dressed Wheels and Minimum Wear Gage for Further Service. At Right, Inspection Gage to Show When Wheels Should Be Removed

two years experience this thought has been dismissed, as no case of an ear "letting go" has been found, and during 1925 there were only 26 emergency calls for ears on the entire system.

Greasing the trolley wire is another factor which has contributed to quieter operation. The primary object in greasing the wire in Toronto was to prevent the formation of ice, but the results have proved very satisfactory from a regular operating standpoint. A smooth, hard skin appears to form on the wire with greasing, which reduces the rolling friction of the wheel or slider to a minimum and gives a very quiet operation, particularly around curves or loops. From the experience in Toronto, I believe the greasing of the trolley wire is well worth following up.

No matter how much attention is paid to the overhead lines, it can be offset very easily by the failure to maintain the trolley collector, either wheel or slider, with its auxiliary equipment, in first class condition. In Toronto the trolley poles, stands, etc., on cars are inspected every 1,000 miles in the case of some cars and 1,500 miles for others. At this inspection the trolley wheel is examined, and if there is no undue play at the bushing and no flat spots, side grooves or other defects necessitating removal, the wheel is gaged, using special gages for this purpose. There are two of these gages, one of which is also used in the shops as a "minimum allowable diameter" gage for further service of re-dressed wheels. If, when checking on the car, the wheel will not pass through this gage, it is considered fit to run till the next inspection without further attention. The second gage is a scrap limit gage, and all wheels which pass through



Standard Trolley Wheel Used in Toronto

Digitized by Google

this are removed from service. If a wheel will pass through the first gage, but not the second, the car number is recorded and the wheel checked at intervals of three or four days. These two gages and details of the wheel are shown in accompanying illustrations.

The trolley wheels used in Toronto are 5⅞ in. diameter and have a "U"-shaped groove. Our experience has proved that this diameter is best suited to our needs and that the "U" groove is more satisfactory than the "V" shape, affording a longer life and more uniform wear. These wheels are fitted with a special bronze bushing with graphite inserts. A ½-in. diameter cold rolled steel axle is used. The average life of a wheel has been found to be 14,000 miles and one wheel will wear out two bushings.

The pressure of the wheel against the wire is checked by means of a 25-lb. weight which the inspector hooks on to the trolley rope. The upward pressure of the springs should balance the pole at any elevation, and, if necessary, the spring pressure is adjusted to obtain this condition. The wheel axle is not oiled, the graphite taking care of the lubrication at this point, but a few drops of oil are put between the contact springs and the wheel.

The rolling stock department, which is responsible for the trolley wheels, and the electrical department, which is responsible for the trolley wire, work together in the closest co-operation and thus smooth out any rough spots in the overhead system.

Can the present transportation sold by electric railways throughout the country be improved by the overhead department? It can and it will be, in many small ways which in themselves may seem trifles, but in the aggregate are important, just as soon as all overhead men, and in fact all street railway men, realize that no matter in what department they are, their business is to carry passengers, not only safely but with a regularity of service that will command attention.

The Electrical Department Can Help Reduce Noise

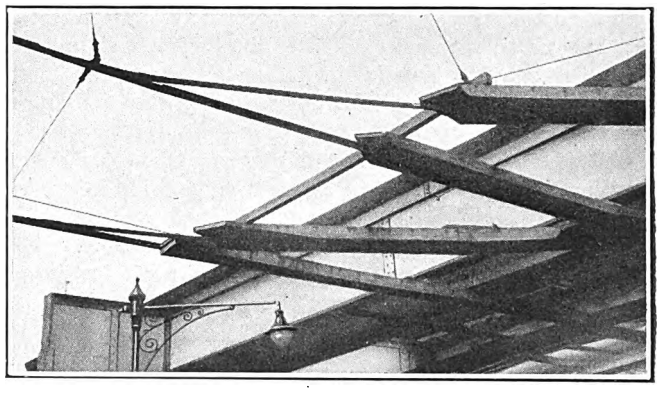
In the Overhead Short, Heavy Ears Cause Pounding—Section Insulators and Frogs Require Long, Smooth Approaches—Bar Construction Is a Particular Offender—Third Rail Approaches Should Be Long

By G. H. McKelway
Engineer of Distribution Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

VERY few men in the line department of electric railways realize that there will be any difference in the amount of travel in electric cars if the amount of noise is reduced. One of the first things necessary to effect a reduction of noise is to sell the fact to the employees that the railway company will be helped if there is less noise and also that at present there is more noise than is necessary. Many of the lesser noises which are not given consideration can be reduced and probably done away with entirely. Many old timers may consider it a joke, but the fact still remains that line departments of electric railways can assist materially in reducing noise in operation through better maintenance and so can help to merchandise electric railway transportation.

The trolley wire itself, especially when supported by span construction, presents a smooth path along which the wheel can run or the shoe can slide with a minimum of noise. There may be trouble at the ears due to pounding, but with a well-designed ear, that gives a smooth under-run, there should be no trouble. Occasionally, however, one finds a home-made design which is short and heavy, with thick lips. This is sure to pound and make noise. The same trouble will be experienced with section insulators or frogs. Much can be done here by carefully designing the approaches and by renewal of the approaches or castings when they begin to wear. Fiber runners of circuit breakers become burned away and these should be replaced in order to give smooth running.

A piece of copper tubing used to protect the wire at frogs and similar locations which becomes broken away



Iron Bar Construction, While Strong and Durable, and of Particular Benefit Where Operation Is Under Bridges or Culverts, Is a Great Producer of Noise

from the rest of the sleeve and is allowed to hang loosely around the wire is another and generally very annoying noise producer. This will rattle when the wheel is passing and also continue to rattle for some time after while the wire is vibrating. The remedy, of course, is to remove the broken piece and make repairs as soon as it is noticed. While such noises are considered very slight when the wire is under span construction, the pounding and consequent noise is increased by more rigid support, as when the hanger is attached to a bracket arm without a short piece of span wire.

When trolley wire is run under a trough construction the noise is much more noticeable, particularly with the most common construction, which consists of attaching the wire directly to the trough by means of barn hang-

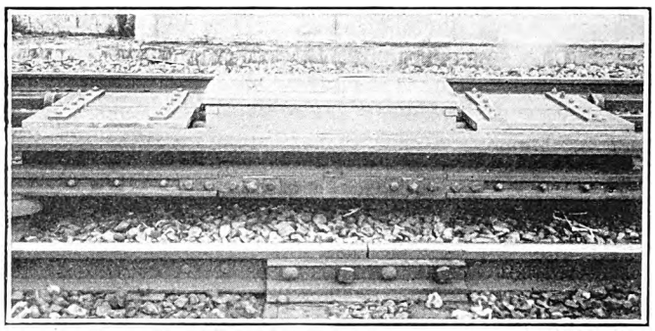
Instead of Allowing a Gap in the Third Rail for Expansion and Contraction, Expansion Joints May Be Used Which Will Not Lift the Shoe and Will Produce Quiet Operation



A Type of Construction Used at Feeder Sections Which Eliminates Gaps Consists of an Insulated Joint Between the Ends of the Third Rail

ers. Not only is the pounding increased with this construction but the trough acts as a sounding board to throw the sound down and outward, where it can be heard more readily. On very hot days the trolley wire will sometimes expand to such an extent that there will be considerable slack between the ears and so cause considerable pounding. This may be so bad that even the flanges of trolley wheels will strike the bottom board of the trough. This condition occurs much more frequently with trolley hangers spaced far apart than with deep ones set close together.

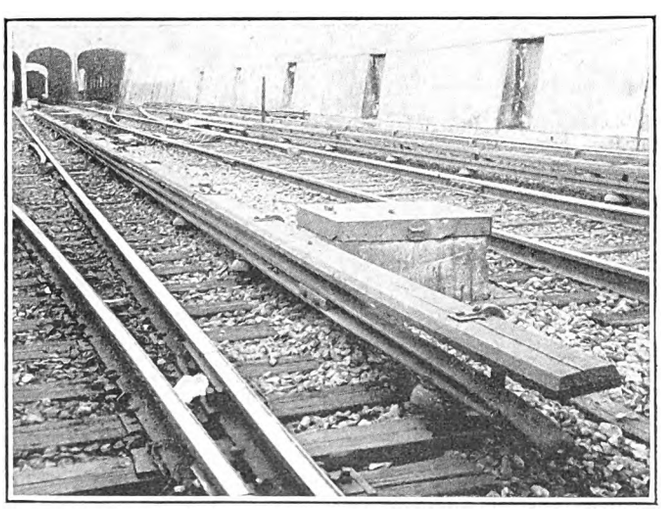
The worst noisemaker among all kinds of overhead construction is the iron bar. This is a pity, for there is no stronger and more durable construction than this. Attempts have been made to lessen the noise by using copper instead of iron bars. This makes a quieter but weaker and a much more costly type of construction. On account of its great strength and freedom from breaking, iron bar construction would be used much more under trough were it not for the noise made by cars when operating under it. Possibly in time some method of spring suspension may be worked out which will admit of this type of construction being used without the noise which is now considered so detrimental. Now the construction is limited generally to that over special trackwork or where operation is under bridges, culverts or elevated construction or into carhouses.

All of the noise that is blamed on the distribution system is not confined to those roads using overhead trolleys. Operation of third rail collectors used by many interurban roads often produces more noise than trolley wire collectors. This is very annoying, not only to persons riding in the cars, but to those living near the lines as well. One of the greatest troubles is due to shoes leaving the rail and then striking it again with a bang; also when operating across gaps with power on there is flashing from opening the circuit and considerable noise. The obvious remedy is to keep shoes in contact with the rail as much as possible. This can be done on unbroken sections by keeping the ends of abutting rails together and in line, so as to prevent pounding and arcing at these points.

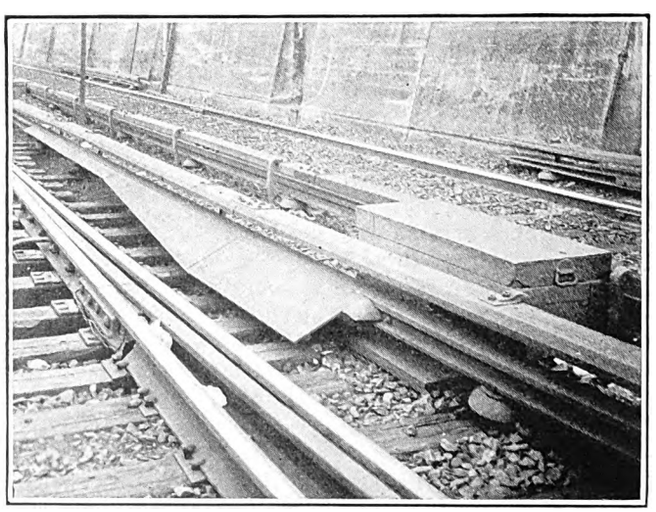
The worst places for noise are at the end approaches or nosings, as they are frequently termed. One way of reducing noise at these points is to eliminate as many of these as possible. Some of these are necessary, however, and where used, noise can be reduced to a great degree by careful design so that long, easy approaches are provided.

These approaches often are installed at intervals of 1,000 ft., so as to allow for the expansion and contraction of the rails due to changes in temperature. This method of construction, however, is unnecessary, as the same results usually can be obtained through the use of expansion joints which will not lift the shoe from the rail and therefore will cause quiet operation. An accompanying illustration shows a type of construction which is proving satisfactory.

Another point where nosings were once used but where their use has now been decreased considerably is at the ends of feeder sections where gaps were formerly left in the third rail so as to separate the sections from each other. Now it is considered better practice, especially where only a short break is required, to use an insulated joint between the ends of the rails or a section of rail with insulated joints at both ends.



Noise Can Be Reduced Where Third Rail Is Broken by Having These Long Approaches



At Crossovers Where Side Approaches Are Used Sharp Angles of Contact Should Be Avoided

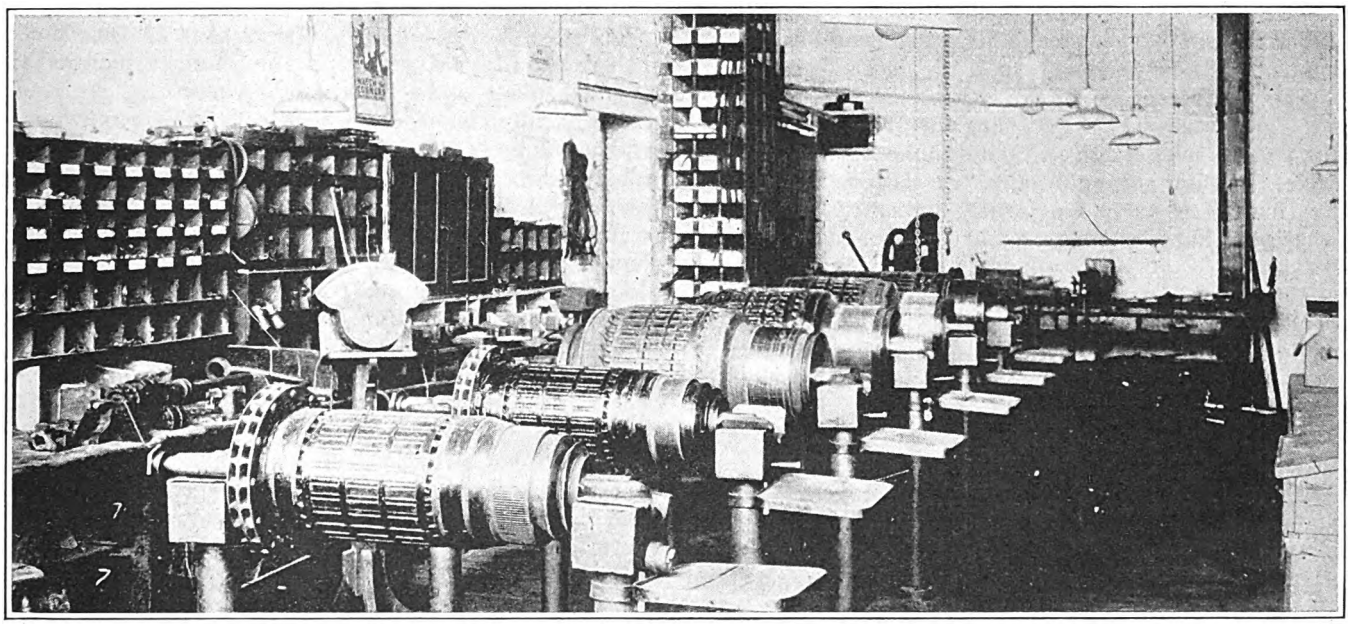
Reliable Rolling Stock Must Have Well-Directed Maintenance

Continuous, Uninterrupted Operation of Cars Requires Constant Attention to Electrical Equipment—Defects Should Be Prevented Rather than Remedied—Careful Adjustments and Tests Are Necessary to Keep Equipment in Its Highest State of Usefulness

By C. R. McMahon
Superintendent of Equipment Des Moines City Railway, Des Moines, Iowa



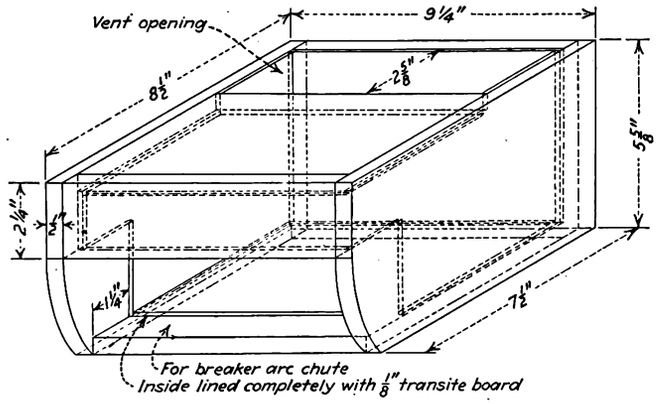
Armatures Are Supported on Stands During Repairs. The Meter Used for Testing Can Be Attached to Any Stand

PROPER maintenance of the electrical car equipment of any railway requires much more than ability to make repairs skillfully and quickly. The aim of men in the maintenance organization should be to prevent troubles rather than to remedy them; to prevent accidents, shock or irritation to passengers from improper operation of the equipment rather than to locate trouble after the damage is done; to furnish better and more attractive service by reducing detentions caused by equipment failures, and to bring the equipment to its highest efficiency. The maintenance department must co-operate with the stores department to keep essential renewal parts on hand and to keep the stock of repair parts as small as possible. It must co-operate with the track department by keeping wheels to gage, trucks free and true and sharp wheel flanges off the road and with the line department by not allowing trolley wheels to become worn excessively, by keeping trolley bases well lubricated and the tension just right. The management of the road must be kept informed as to costs of maintenance and the need for new and better equipment. All this requires a knowledge of operating conditions, a well-balanced organization and a definite program for careful and systematic inspection.

In Des Moines we have found that by having a careful record system and by studying the results we can look into the future and see where improvements will produce still better results and reduce failures. We keep a careful record of the number of gears and pinions used and the number of armature, axle and journal bearings used by types and divided between new and reconditioned material. Records of gear cases, trolley equipment, air compressors, compressor armatures and fields, railway motor armatures and fields, armature coils and other like equipment give a comparison by types as well as a record of their service. Detail records of car failures from electrical causes are classified into the different pieces of apparatus and are kept separate for city and interurban service. Such records give information for reducing the number of car defects, for reducing overtime due to fewer breakdowns on the road and for keeping maintenance costs down. The improved equipment creates better public relations and furnishes better service.

Some of these records are shown in the accompanying tables. Those for new gears and pinions used as indicated by storeroom requisitions are tabulated for the past eight years and are listed by the various types of motors that are in service. The reduction in the number of armature bearings, axle bearings and axle collars used indicates how effective our system of lubrication has been. We endeavor to keep our oiling cost as low as possible, but we believe that oil is cheaper than bearings, gearing and armature repairs. Our oil cost

Digitized by Google



Box Construction to Shield Circuit Breaker Arcing

for the past three years has averaged about 25 cents per 1,000 car-miles. This includes all oil for armature and axle bearings, journals, air compressors and gears, but not for new packing waste.

The number of new gear cases used was reduced to two for the year 1924 and none for 1925. Requisitions for trolley poles, slides and shoes are shown in another table. The low consumption of wheels for 1919 is due to the fact that we had a large number of second-hand wheels on hand which were turned up and returned to service.

Maintenance records and costs must necessarily depend to a large extent on service conditions and the equipment operated. In order that those unfamiliar with the Des Moines property may get a birdseye view of our service and equipment a summary of equipment and yearly mileage for city and interurban cars is given in two tables.

The equipment operated by the Des Moines City Railway and the Des Moines & Central Iowa Railroad consists of 156 city passenger cars, ten interurban passenger cars, eight electric locomotives, two express cars, eleven work, line and service cars and ten miscellaneous snow plows and sweepers. The motor equipment is shown in Table I.

On account of service conditions, 95 city passenger cars which originally had G.E. 57, 67 and 258 motors were replaced with four G.E. 247-I motors during the years 1922 and 1923. In addition, ten new cars with G.E. 247-I motors were purchased early in 1924. Service conditions in the city of Des Moines are rather severe for a city of its size. This is due particularly to the small area covered by the business district, which necessarily causes much congestion and results in delays to operation through the loop section. There are also numerous grades in the city, some of which are quite severe. The total residence district for the city covers an area of approximately 54 square miles. Weather conditions result in a wide variation in temperature, varying from 100 deg. F. in the summer to 20 deg. below zero in the winter. The rainfall in Des Moines is often quite heavy during the summer months and there is much snow in winter. Therefore, our equipment is called upon to meet quite variable conditions.

The repair facilities of the railway consist of one main shop, where all heavy repairs, such as changing armatures and wheels and repairing cars damaged in collisions, are taken care of, together with general overhauling and painting. In addition there are two city operating carhouses and one interurban operating carhouse, where inspection, oiling, light repairs and car washing are done.

All cars are inspected on a 1,000-mile basis at the operating carhouses. Trolley wheels are examined for wear and arcing, but are not oiled, as we use an oilless wheel. Poles are checked for bends and alignment, bases for easy action and tightness of trolley cables, and car roofs are checked for leaking. All car seats, destination signs, window glass, guards, grab handles, fare registers, steps, doors and other car body parts

are examined thoroughly and any light repairs needed are made.

Controllers are examined carefully for worn fingers and segments. Cable connections are examined and all working parts are lubricated. Circuit breakers and line switches are looked over and repairs are made if needed. All air brake equipment is inspected, valves are oiled, governor contacts and their action are checked, compressor motors are examined, brushes are renewed if needed, brush-holders and field connections are inspected, the oil level is checked and any air leaks in the piping are repaired. All motor leads, cables and resistors are examined and repairs are made if needed. Motor brushes, commutators, armature clearance and the general condition of the motors are examined, both from the top cover plate and bottom inspection plate.

Trucks, wheels, brakes, fenders, sanders, drawbars and all parts underneath the car are gone over thoroughly. All armature and axle bearings are oiled on the same 1,000-mile basis. The car journals and gears are lubricated on a 4,000-mile basis.

At overhauling periods air governors are removed from cars and are thoroughly inspected. Worn parts are replaced and tested for adjustment and air compressors are removed, armatures taken out, cleaned, tested, painted and commutators are turned. Compressor bearings are adjusted, pistons and rings are examined and renewed if necessary and gearing is inspected for wear. The compressor is then reassembled and tested for quietness and efficiency.

Cars are overhauled and are painted on a 100,000-mile basis, or approximately every two years, at which time everything is thoroughly inspected and repaired from the trolley wheel to the wheels underneath the car, and all parts are put in as nearly new condition as possible. The car is then taken to the paint shop and is thoroughly cleaned, varnished inside and enameled outside with a coat of varnish over the enamel, which is allowed to dry seven days before the car is returned to service.

The beneficial results of more rigid inspection are shown in the tabulation of car failures from electrical causes, as shown in Table IX, which is for the past seven years. Reduction in armature, brush-holder and field failures for the past three years is due partly to the purchase of some new motor equipment, but the reduction of other electrical failures is due to more rigid inspection.

The types and number of air compressors which we have in service are shown in Table XII and the number of air compressor armatures in the shop yearly for rewinding and repairs is shown in Table XIII. Table XIV gives the fields for air compressors which are repaired yearly. These are divided into the various types of compressors which are in service. New field coils for traction motors drawn from the storeroom yearly are shown in Table XV and those repaired in Table XVI. Table XVII gives the sets of armature coils used and Table XVIII the number of armatures except rewinds which are in the shops for repairs yearly. The repair list of armatures also includes those which were in the shops only for testing and painting without additional repairs being made.

Some of the improvements which have been made and methods which have been adopted have resulted in a material reduction of troubles which can be classed as annoying to passengers or producing conditions which detract from the service. At one time we had many circuit breaker failures caused by the arc gradually burning a hole in the inside between the contact tips and the arc chute. This has been eliminated by lining the chute with transite. An accompanying illustration shows the construction used for the MR 12-D circuit breaker. Whenever holes burn in the transite it is now replaced by new pieces which are kept to standard size.

We have been very successful in eliminating the noise

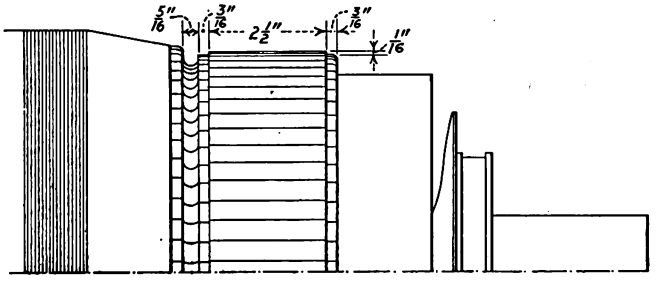
and flashing caused by circuit breakers on account of grounds or excessively fast feeding of the control. Another illustration shows the construction which we have used for placing a box over the arc chute of circuit breakers. When this construction was first installed we rather expected some circuit breaker trouble on account of the choking effect that might result on the arc, but we have had no failures from that cause. The elimination of the flash and danger from the car has been very pleasing to our claim department. While this box construction takes care of the arc from breakers which are located inside the car, it is our experience that the line switch or circuit breaker located underneath the car is much to be preferred, particularly on account of its operating more accurately on overload, and as a result of the circuit being broken underneath the car and not in the controller less trouble is experienced at the controller from burning of the contacts.

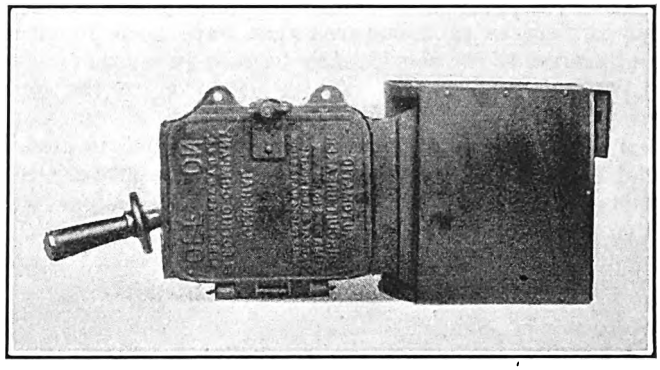
We also take particular precautions to make certain that circuit breakers work properly and that they will open the circuit uniformly at their maximum overload setting. All circuit breakers are tested at overhauling periods and at other times when we have cause to suspect that they may be out of adjustment. Our circuit breaker testing outfits consist of a water rheostat and ammeter, breaker bracket, main switch and fuse, all mounted on a panelboard. The water rheostat consists of a barrel partly filled with salt water. A movable plate moving up and down in the water forms one electrode, while the lower plate, fastened to the bottom of the barrel, forms the other electrode. A pulley at the top is fastened on a cross beam with a rope which connects the ballast weight with the movable plate, which is thus balanced so as to stay in any position where it is stopped. The panelboard is fastened on two timbers which extend into the barrel and act as guides for the movable plate. A long cable is also provided of sufficient length to reach to any car in the shop and tests the circuit breaker in position without removing it from the car. An accompanying illustration shows the circuit breaker testing outfit as located at a central point in the shop. The switch and breaker bracket on the panelboard is used to test repaired breakers before they are sent out to the carhouse as extras.



Commutators Are Turned Down 1/16 In. at the Ends so that the Contact Surface Is the Exact Width of the Brushes

Another piece of electrical testing equipment which has resulted in material reduction of detentions in service caused by electrical failures is a panel with instruments for making various tests of electrical equipment. This panel has connections for both a.c. and d.c. current, and its construction is shown in another illustration. The circuit breaker at the top of the panel is connected directly to the positive feeder. The circuit then passes to the main single pole switch through the main resistance, which is variable, and then to a double socket used for small current tests. There is also a larger double socket which is used for heavy currents. The circuit is grounded on the other side of the sockets so that a plug with two wires can be used to reach to any part of the shop for making tests.

In the illustration six double sockets will be seen distributed along the right side of the panel. The top one of these is connected to the ground return of a single lamp circuit and is used for ordinary ground tests. The second one has three circuits, which are



Circuit Breaker Type G.E. MR 12-D with Box Attached to Shield Arcing

used for testing various lamps. The third is the double socket just referred to, which is used for currents of small value, and the fourth is for testing headlights and also for heating small armatures in the electric oven. This is controlled by the round switch just under the breaker, which has a resistance located behind the panel. The fifth socket is provided with 110-volt a.c. and is used for field testing and for connection to a high-voltage transformer. It is controlled by the double-pole switch on the front of the panel. The sixth socket is for providing heavy d.c. current used to test motors and where heavy current is needed. The square switch and resistance near the bottom of the panel is used for testing Peter Smith stove motors.

As an additional means of reducing failures in service and annoyance from wrong operation of electrical equipment we follow the new features which are brought out and incorporated in late types of equipment, with the idea that some of these constructions may be used to advantage while repairing equipment so as to bring it to a higher state of usefulness. An example of this is the armature coils used with our G.E. 212-B armatures. We now use a one-piece coil with a removable back head. These are purchased from the General Electric Company. With the old type of construction we had considerable trouble due to open circuits and burnouts. These were caused by the two-piece coil becoming unsoldered at junction points. The use of the one-piece coil has entirely eliminated this trouble.

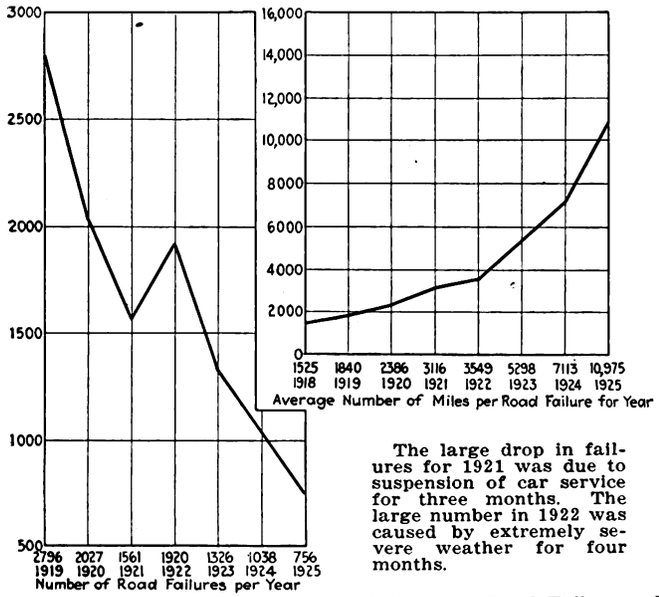
We also rewind National A-4 compressor armatures somewhat differently than they were originally wound and find that better results are secured. Instead of laying the first leads as the coils are put in, we bring these up between the coils and then put them in the commutator after all coils are in place. With this type of construction there are no loose leads to vibrate and break off.

Some of the accompanying illustrations show views in our armature repair department. The stands used for supporting armatures while being repaired or rewound have a shelf at one end for holding various tools and material used in the rewinding operation.

Digitized by Google

The large millivoltmeter on a pedestal which can be seen in the view for these armature racks is for testing bar to bar of commutators. This is so arranged that it can be moved from one rack to another to be convenient for the test. All armatures which come into the shop for any cause are cleaned, tested and given a coat of varnish and the commutators are turned if necessary. Other views in our armature repair department show the lathe used for banding armatures and another winding lathe for field coils. The rack used for storing extra armatures that have been repaired and are ready for service may be seen in another view.

We have found that careful attention to the grid resistors on cars reduces many complaints from sudden jerks during acceleration and also prevents abnormal currents which cause damage to current-carrying parts of other equipment. Ordinarily, resistors will give little trouble if properly designed for the particular equipment on which they are installed, but careful attention must be given to keeping the grids tight in the frame, and we have also found that the location of resistors underneath the cars is a very important point. On 40 of our low-floor single-end cars which were purchased in 1916 the resistance was located underneath the rear end of the car. We experienced considerable trouble with the resistors on these cars becoming grounded. It was almost impossible to keep the No. 4 pair of wheels from throwing water and snow up onto the resistors, although we tried to protect them by shielding. The result was that with almost every rain or snow there were several failures. About three years ago we moved the resistance to the center part of the car and also improved the installation by using insulators with a transite board over the resistors. The front and rear ends were shielded against water and snow by sheet iron shields attached to the car floor. This has effectively prevented troubles previously experienced.



Graphs Showing Average Number of Miles per Road Failure and Number of Road Failures per Year for Mechanical and Electrical Defects

The proper maintenance of lightning arresters is another thing that produces beneficial results by reducing car failures. We are using the liquid type of lightning arresters and have had very good results. These arresters are placed under the car seats and are inspected on a 1,000-mile basis along with the other equipment. Although we use outside storage for our cars, we find it unnecessary to remove the arresters during the winter time. We give them a thorough inspection yearly during the month of April so as to be sure they are ready for the first storms.

We have been very successful in eliminating many car failures which occurred during the cold weather due to frozen air pipes. This has been accomplished by the installation of an anti-freeze device in the compressor intake pipe. This device requires no other attention than replenishing the supply of alcohol.

We pay particular attention to our brush-holders, carbon brushes and commutators. The brush tension used is 8 lb. Careful tests, however, have proved that there is very little difference in brush wear with tension between 5 and 8 lb., but we have less trouble from motors flashing with the higher tension. An accompanying line drawing shows the method we use in turning commutators on G.E. 247-I armatures. This consists in turning down the ends to a slightly smaller diameter. We find this much more satisfactory than the old way, because the brush then covers the full width of the commutator and does not leave a ridge or high place at the end from wear. Previously, the formation of ridges at the ends made it necessary to turn commutators which otherwise would be unnecessary, as the riding of the brushes upon the ridges at the end raised them out of contact for the major portion of their length.

The installation and suspension of motor leads is another point that is given considerable attention on our property. Motor leads are brought out from the car body in a standard manner, so that all cars are alike as to the location of the leads. Wooden blocks are used to support the leads and knuckle joint connectors are used between the leads from the motor and those attached to the car body. Pieces of circular loom are placed over the connections and the ends are taped securely so as to keep out water.

In order that the fuses for air compressors, lights and other car circuits may be handy for the car operator we have installed fuse holders on all cars, also a receptacle for burnt-out fuses. These are located in a standard position on all cars, although we have several different types. This reduces the time of delay which might be otherwise serious from blown fuses. In connection with the location of the equipment, we are making this as uniform as possible on the different types, as a uniform arrangement has proved of considerable advantage.

In connection with Table III, which shows the average time to rewind armatures, we compiled this data for each type after a careful check of the work in our armature room. This time includes the tearing out of the old coils, any core or commutator work which may be necessary, the putting in of new coils, soldering of leads, banding, testing and painting, and otherwise preparing the armatures for service.

In addition to the tabulations of car failures for mechanical and electrical troubles, two graphs show the manner in which these have decreased during the past seven years. One of these is for car failures for mechanical and electrical troubles and the other gives the average miles operated per pull-in from mechanical and electrical troubles. Car failures are checked daily, and where they show evidence of having been due to faulty inspection, attention of the particular employee who is responsible is called to this, and if improvement is not shown, other measures are taken.

More Riders

Through Better Maintenance

The illustrations in this PICTORIAL SECTION show how each department can do its part in selling the service

Relaying Track Without Inconveniencing Riders

NIGHT WORK is not uncommon with electric railway maintenance employees, as they must continually make repairs and replacements or install new construction without interfering seriously with car service. Ingenious methods must be devised and work planned carefully to the minutest detail so that car riders will not be inconvenienced. The above illustration shows how track on Euclid Avenue in the downtown section of Cleveland was relaid at night. Floodlights installed in the overhead produced the illumination. New rail was laid on an old concrete base using International steel ties constructed with flat bars instead of channel connections between bearing plates.

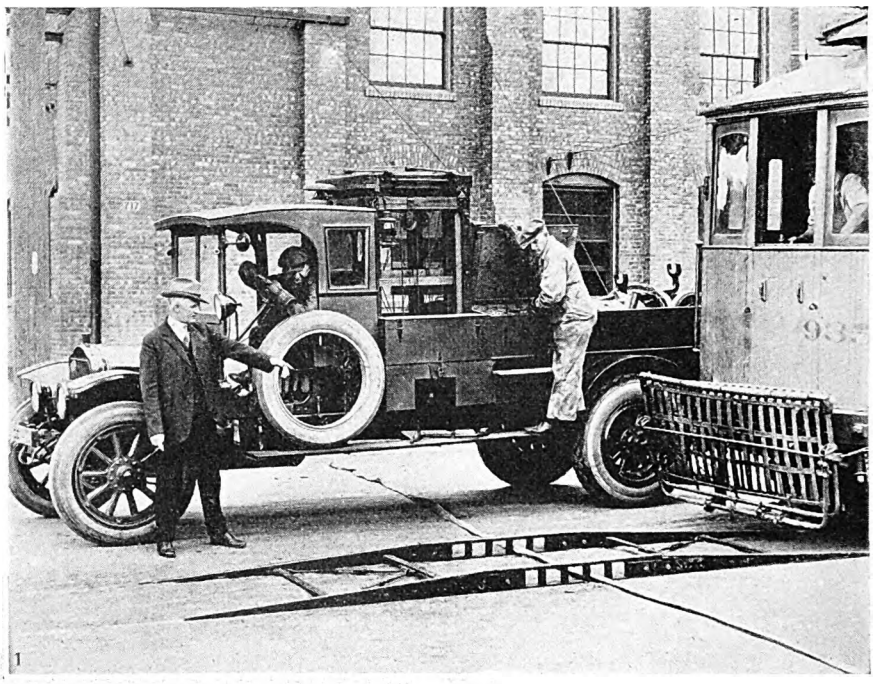
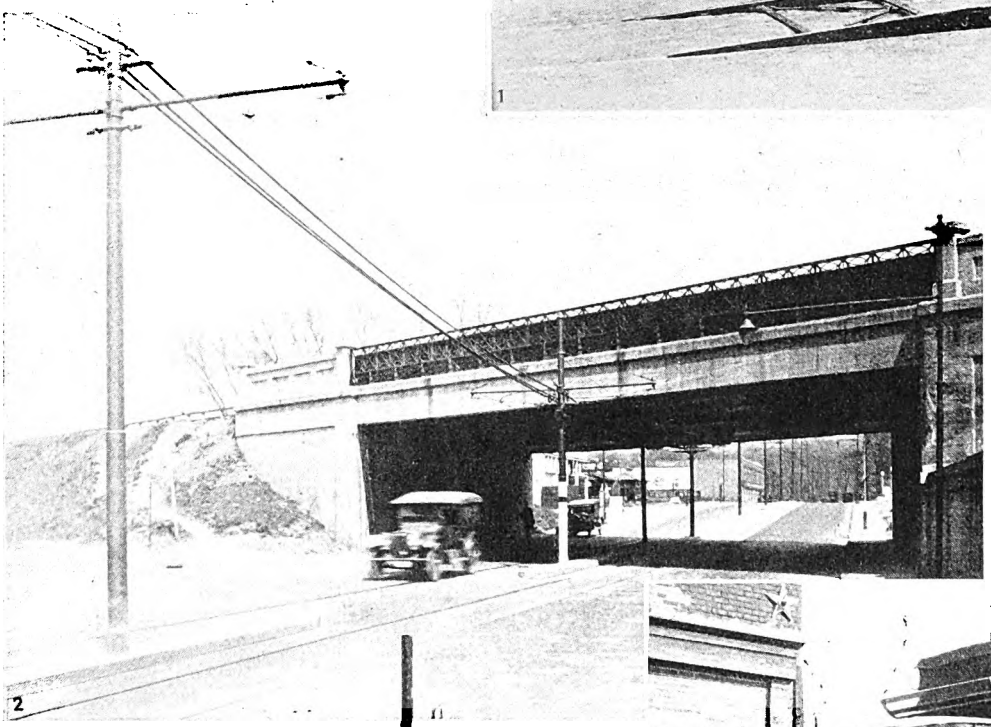
Line Maintenance

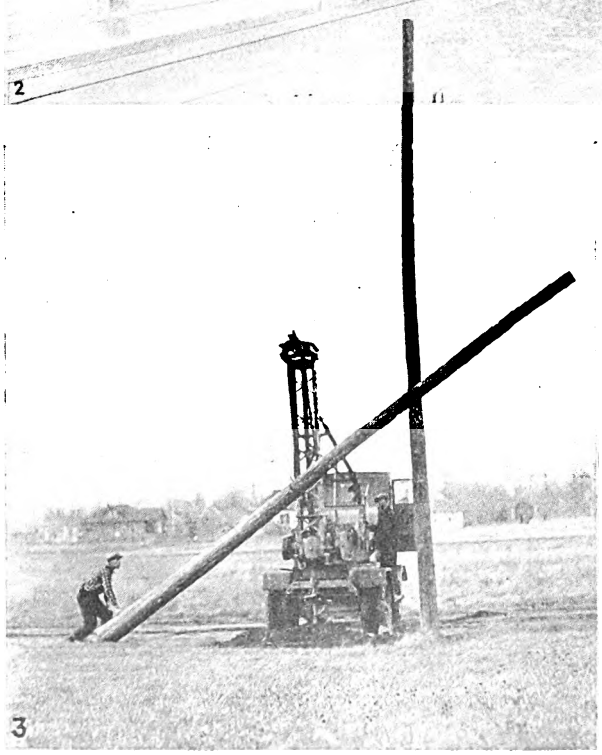
Should Be Directed to Prevent Annoying Delays

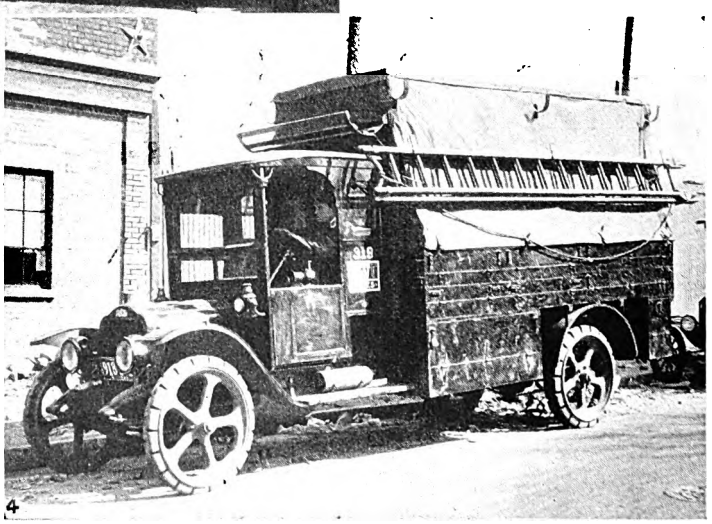




MOTORIZED line repair wagons are rapidly replacing old type tower cars for line maintenance. Trucks can get to the job quicker and can pull out of the way so as not to interfere with car schedules.

Trucks with cranes and mechanical hole-digging equipment speed up pole replacement.





1. In Los Angeles emergency trucks with hose bridges answer fire calls so that car service will not be interfered with.

2. The problem of insufficient space at the side of street for setting poles was solved in Cleveland by constructing a curb in the center of the street and erecting steel trolley poles in this space.

3. Trucks arranged with pole-setting equipment are increasing in use by electric railways.

4. Several new line department trucks of this type have just been placed in service by the Brooklyn-Manhattan Transit Corporation.

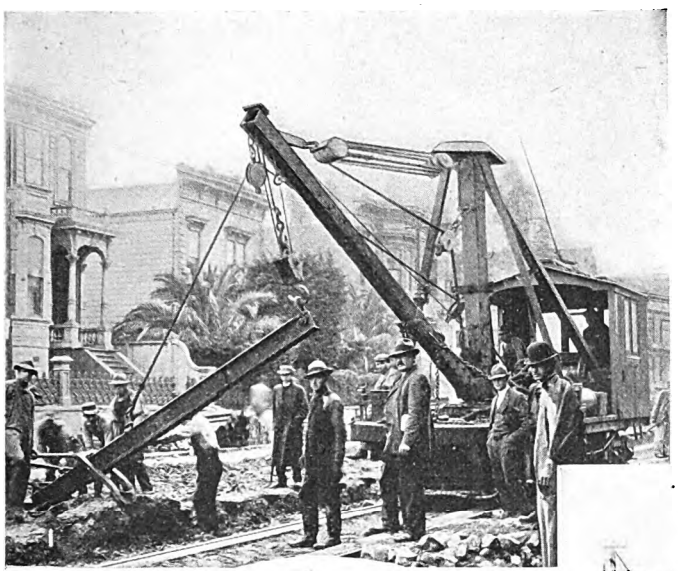
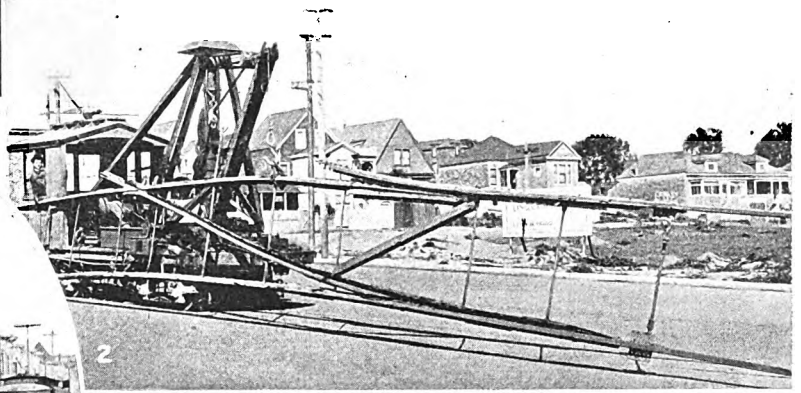
Labor-Saving Equipment Has Many Uses in Track Reconstruction

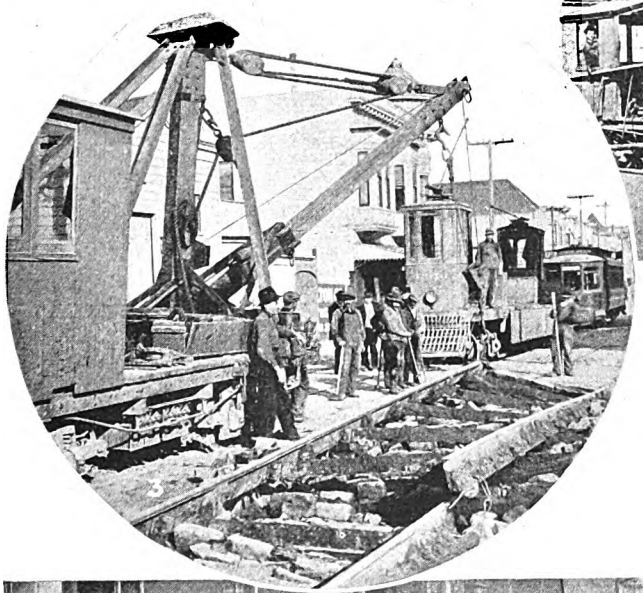


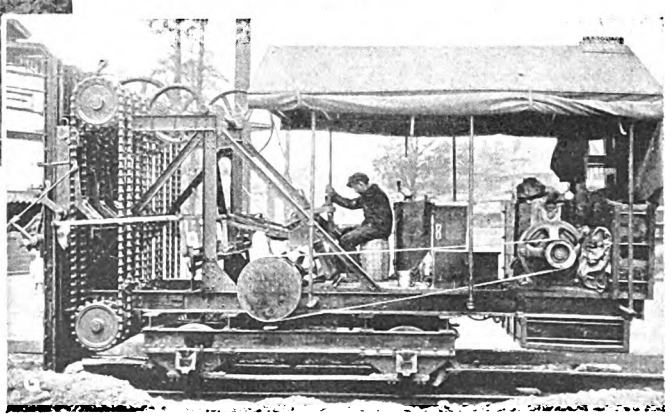
1. A length of rail with a loose link provides additional leverage for the derrick used in San Francisco to pull up an old cable yoke set in concrete.

2. Portable T-rail crossovers are pulled in place by a derrick during reconstruction of double track.

3. Rail ties, concrete and paving are loosened in one operation.







4. A 3,000-lb. hammer with 10-ft. drop is used for breaking up concrete. The hammer is raised by the derrick motor and dropped by release of drum.

5. For reconstruction work in San Francisco, a plow is hauled by a derrick and is returned to the starting point on a small car that runs on the adjacent track.

6. In Cleveland an elaborate type of concrete breaker has proved a great time saver for track reconstruction work.

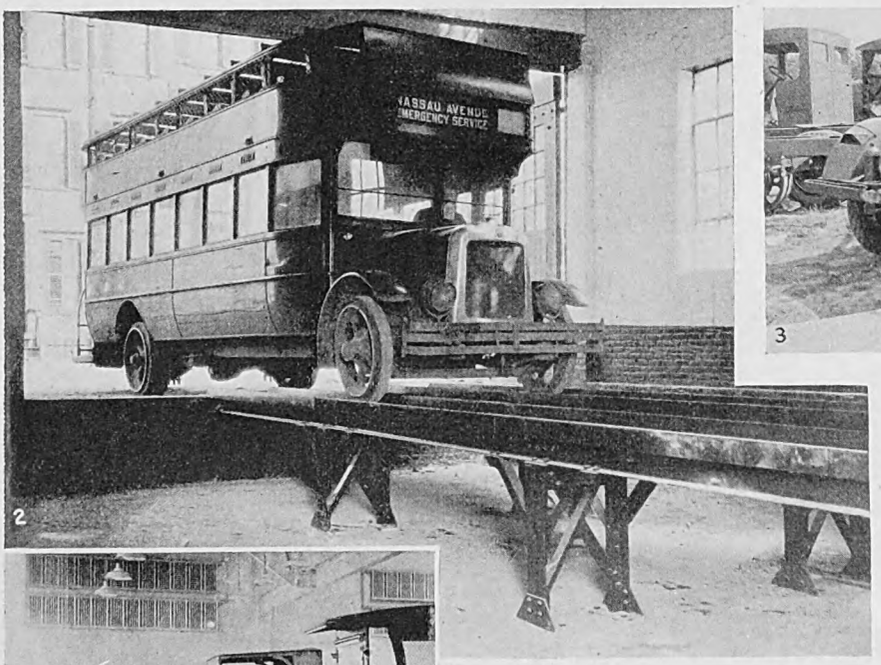
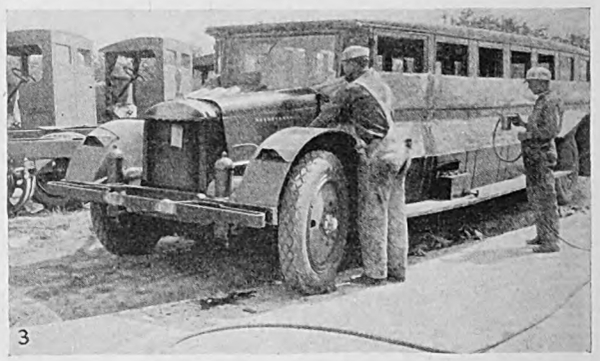
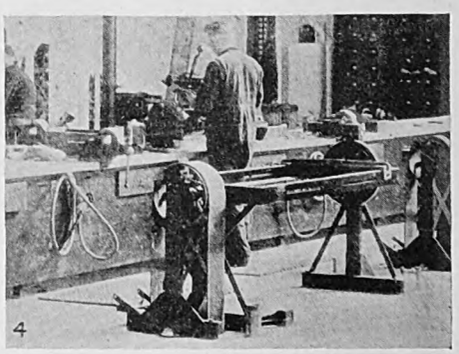
Bus Maintenance

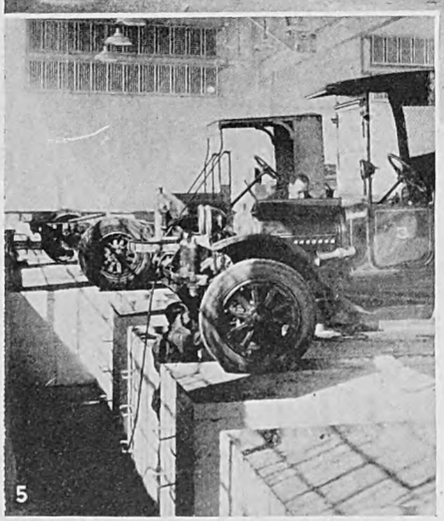
Is an Additional Problem That Electric Railways Are Now Solving

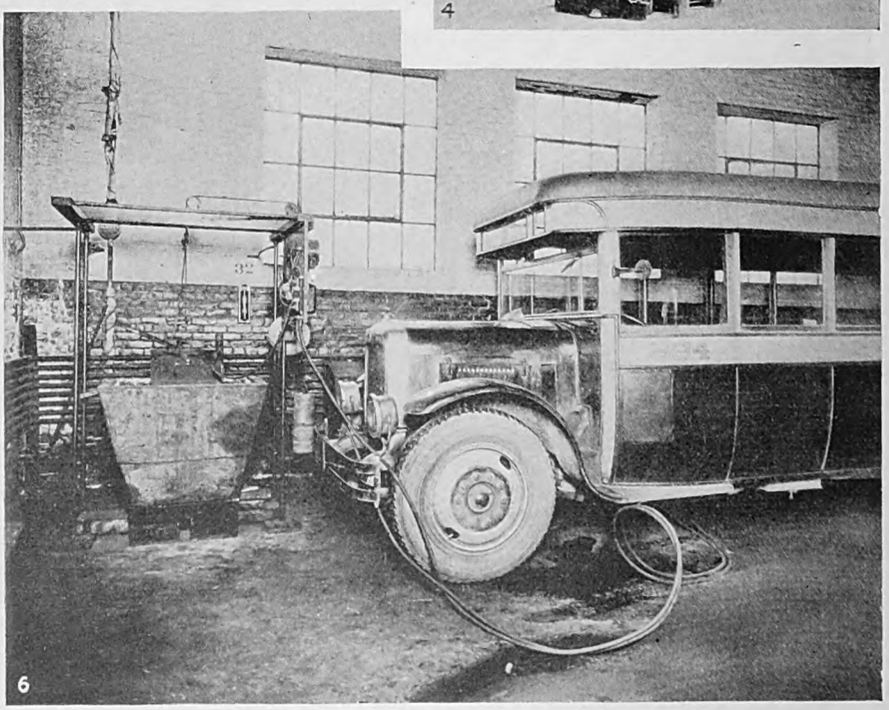
1. Corner of the Kenwood Shop, Akron, Ohio, where transmissions are overhauled.
2. The bus runway in the 24th Street garage of the Brooklyn-Manhattan Transit Corporation is on a level with the street and buses can be run directly into position.
3. When spray painting the stripes on bus bodies, it has been found convenient to use paper strips held in place by adhesive tape.











4. A run-in stand located conveniently to the repair bench facilitates the work of bus maintenance and assembly.
5. Open-end pit construction has many advantages in bus maintenance. Good light may be obtained from windows at ends.
6. In Philadelphia the generators, engines and connections of gas-electric buses are tested under load without removing engine from chassis. The generator is connected to water rheostat and readings of amperes and volts taken for various speeds as shown by tachometer. By burning a definite quantity of fuel the kilowatt output at definite speed per gallon of fuel is obtained.

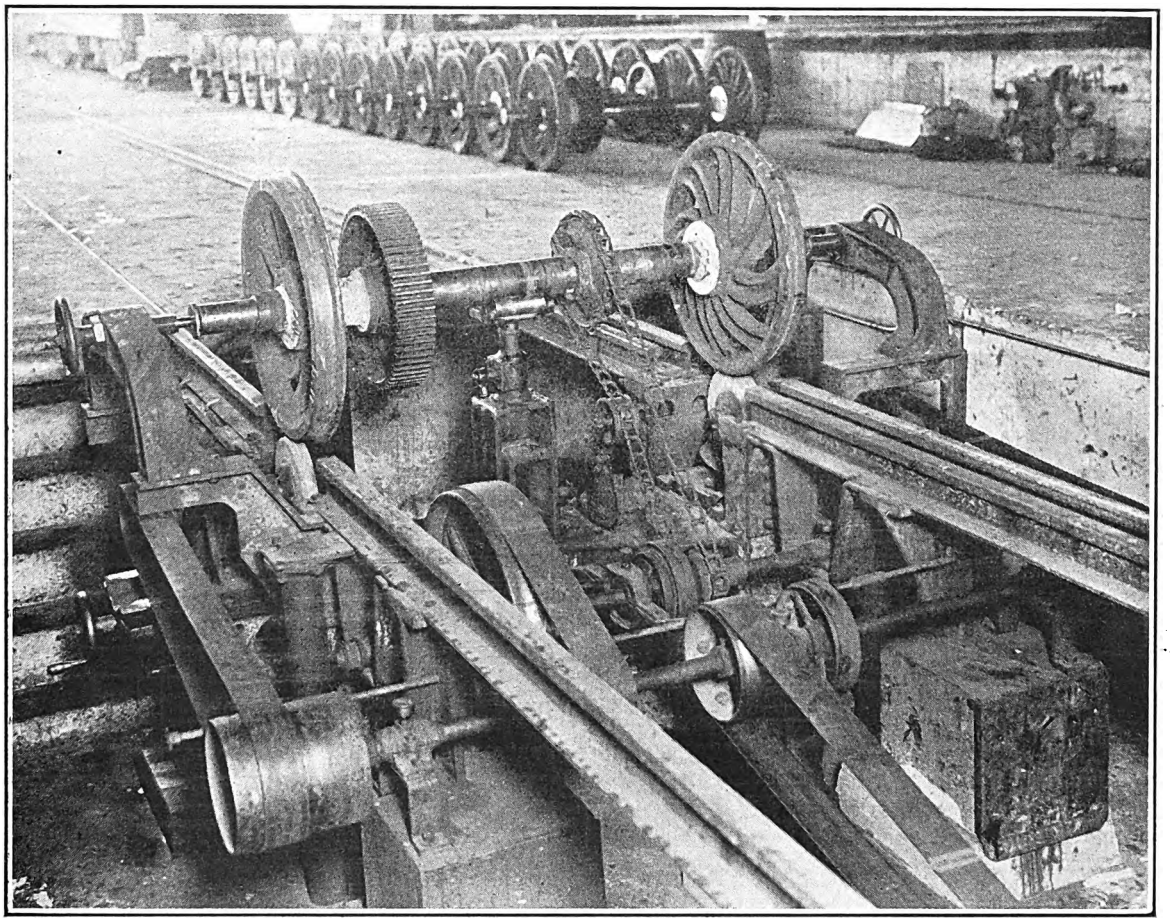
Organizing an Equipment Engineering Department

Engineers Connected with a Railway Property Are in Best Position to Know Where Special Improved Features of Car Construction Will Overcome Troubles, Reduce Maintenance Costs or Give Increased Life

By A. B. Paterson
Vice-President New Orleans Public Service, Inc., New Orleans, La.



Wheel Grinders of This Type Are Assisting in Rapid and Efficient Maintenance in the New Orleans Shops

IN 1921 the New Orleans Public Service, then the New Orleans Railway & Light Company, began the organization of an engineering department under the superintendent of rolling stock and shops. The company has for a number of years made a practice of sending its master mechanics and leading inspectors on inspection trips to various parts of the country. No one property does all things in the best way and practically all properties have certain maintenance "kinks" which possess considerable merit. These trips resulted in the adoption of many improved practices.

It was believed that a separate engineering organization reporting to the superintendent would result in a more systematic procedure in the modernization of all shop practices. Another object of the organization was the development of a system of inspecting and checking shop practices and a system of records which would facilitate analyzing equipment performance. In connection with old equipment it was desired to develop a system of inspection and renewals and replacements with a view to standardization. Another object was the education of operating and maintenance employees by personal contact and instruction books.

During the last four years a large number of new cars have been purchased. A competent engineering organization was essential for the design of these cars and the selection of the proper electrical and auxiliary equipment. With cars purchased from various car builders it is necessary to have fairly rigid specifications in order to obtain a uniform product. The engineers' study of cars operating on the property acquaints them with detail troubles encountered and with the

Digitized by Google

desirable features which should be continued. They are thus in a better position than the car builder to design cars which will have a long life and low maintenance under the particular conditions of operation.

In the application of motors the engineers study operating conditions and by calculation are able to select, in the same manner as the manufacturers of electrical equipment, the proper motor for any service. But the local engineers' observations go farther than this. The nature of their other duties is such that they have unequaled opportunity for forming conclusions regarding the performance of existing equipment and are thus better able to select the proper equipment for new cars. Having technical training, they are more likely to look at matters of this kind broadly and not to be unduly influenced by only one factor which for some reason may have received a great deal of attention.

When reviewing the accomplishments of the engineering department it must not be assumed that in the absence of this organization none of the work would have been done. Many of these things were contemplated for some time and were even partially in effect. The engineering department provided the superintendent with a new tool for working out the details and carrying the plans through to a definite conclusion.

As is the case on many railways, the records of old equipment were incomplete and not arranged in convenient form. Drawings, specifications and tabulated records have been made complete in all details. These records have been systematized and made readily available. Drawings and specifications have been provided for shop procedure. As a result the work in all shops is done in a systematized manner.

A standard new car design including all auxiliary equipment has been established. The desirability of this practice has been discussed. Drawings have been made covering the remodeling of old equipment. The principal work of this character has consisted of inclosing car platforms and rebuilding a number of trailers. The property has standardized on two sizes of railway motors which meet all of the present demands and greatly simplify maintenance and lower maintenance

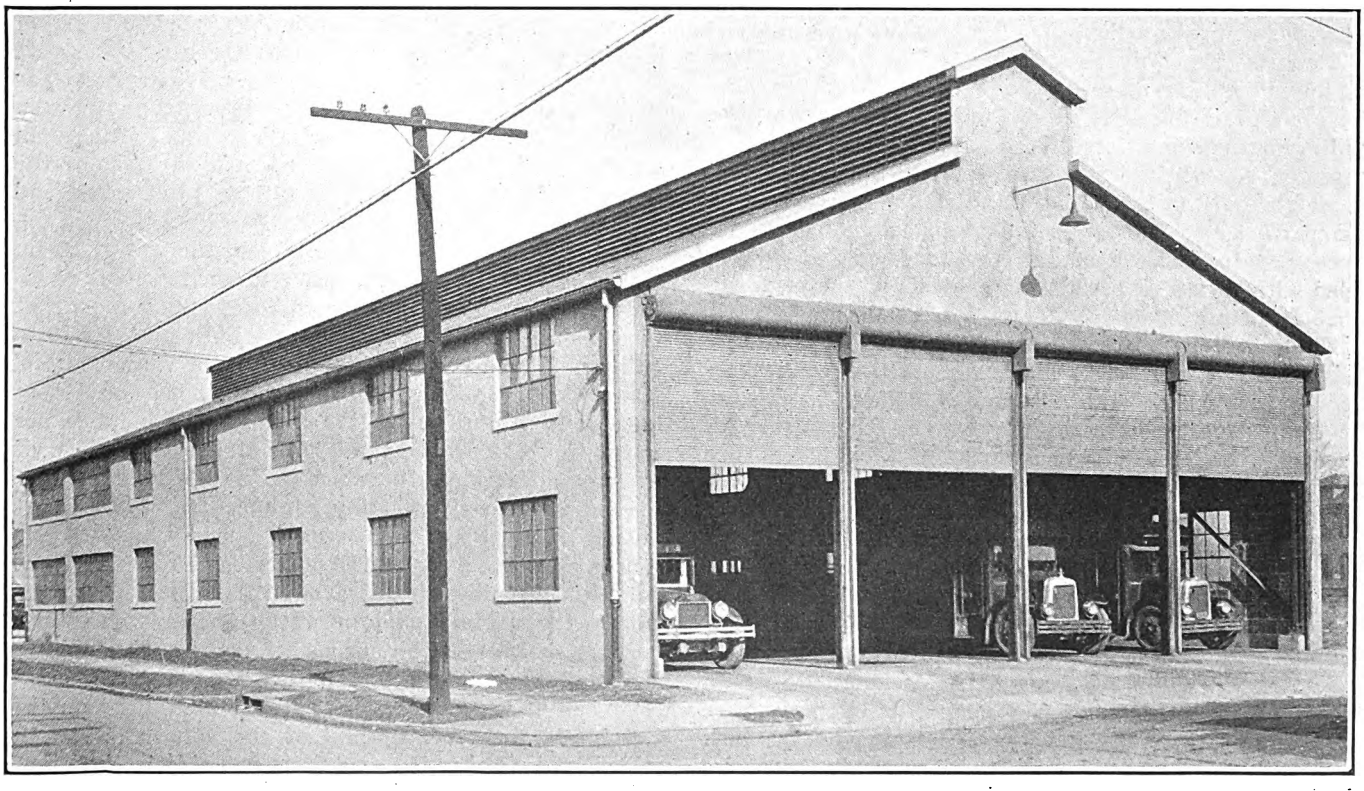
Pit Arrangement of New Garage Constructed for Buses of the New Orleans Public Service, Inc.

cost. However, it is not proposed to follow this standardization blindly and thus stifle progress. When material developments are made the standards will be changed, but progress will be made by orderly steps.

The old shop equipment has been rearranged so as to reduce lost motion and facilitate production. New tools, modern cranes and modern electric car hoists have been installed in shops and stations. The object is to substitute mechanical power for human labor wherever possible. The car hoists especially speed up the changing of trucks.

Wheel grinders of an improved type have been installed in all stations. This special type of grinder was developed after watching the operation of standard grinders. The wheels run freely between lathe centers, while a jack, fitted with rollers, partially supports the weight. By means of a sprocket and chain drive the "idle" and pony wheels, as well as the driving wheels, are ground. A special steel tape is used for measuring the wheels accurately. The wheel grinder is shown in an accompanying illustration. It has two special attachments of particular value. One permits the grind-



New Garage Designed by Engineering Department

Digitized by Google

ing of wheels on trucks of different gages. The other is a centering device for the axle so that the wheels will be ground true.

The engineering department designed and put into operation a modern motor repair shop with facilities for testing, dipping and baking, renewing bearings and general overhauling of the motors. Armature open circuits, loose leads and short circuits are located by means of a millivoltmeter. Motors are also given a high voltage test. An electrically heated baking oven and special dipping tanks and steel armature wagons have been designed and built. The dipping tanks are so arranged that the armature is placed in the empty tank, commutator end up, and the varnish is allowed to rise in the tank to the proper height. The heat for tinning and melting babbitt metal is controlled by two pyrometers.

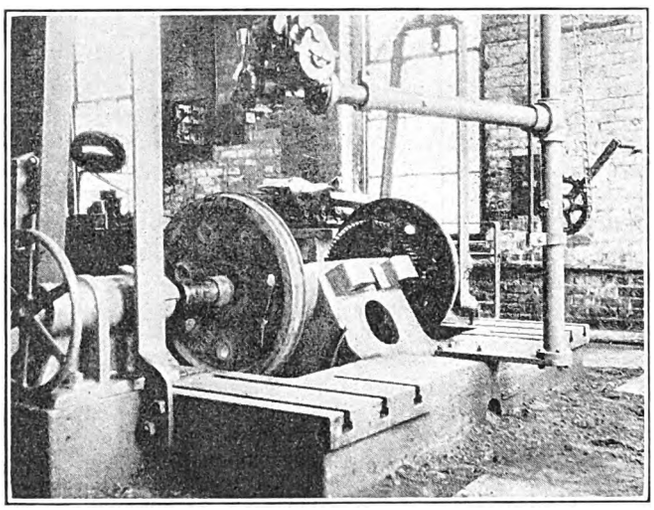
A standard service test has been devised for all cars leaving the shops. When a failure of any part of the equipment brings a car to the shop before its regular inspection period it is given the standard test. Cars are inspected and overhauled on a mileage basis. A standardized procedure and system of records for this work were developed. The form of motor inspection report used is shown.

Instruction manuals for distribution to maintenance employees have been prepared. Such items as wiring diagrams, controller connections, motor connections, brake rigging and bearings are covered. Separate instruction books on trucks, control and resistance, armature and axle bearings and other car parts are available.

Recently the operation of buses has been started. The engineers have designed a modern bus garage providing for modern automotive maintenance practice. The maintenance of the buses has been standardized in the same general way as the car maintenance. No generally adopted scheme of cost records being available, it was necessary to devise a new system, and this was developed with a view of permitting analysis of bus performance in detail.

These activities are, of course, not the limit of usefulness of the engineers. They are continually endeavoring to improve the performance and reduce the expense of their department and their efforts have met with success. As new problems arise the engineers are available to assist in finding a solution and as a result of their training are adept in analysis.

One should not think that to form a successful engineering department it is necessary only to employ a number of technical school graduates. One of the first requisites is to have a progressive man at the head of rolling stock and shops who will support his engineering force in their recommendations. In addition to technical skill the engineers should be possessed of considerable tact. Even with official support the task is a difficult one and much can be accomplished by the hearty co-operation of the shop organization.



Home-Made Equipment for Building Up Sharp Flanges on Steel Wheels, Richmond

Rolling Stock Improvements in Richmond

IN RICHMOND, VA., about half the rolling stock is arranged to be operated by two men and half by one man. A considerable number of the one-man cars are of the Birney type, but the doors open inward instead of outward. This was done to reduce damage to doors from passing automobiles and also because the tracks in the carhouses are quite close together. In the latest car designs inward opening is retained for the entrance doors, but the rear-exit treadle doors obviously have to open outward.

Although the company is buying new cars for one-man, two-man operation it is also rebuilding in its shops for trial two former two-man cars for one-man operation. There will be exit and entrance in front with a second exit in the rear operated with a treadle and fitted with a Bennett air signal. Pneumatic operation is used for doors, fare box and register, being employed for the latter to avoid a register rod through the car. The seats will be green plush. The principal structural work required in the reconstruction of these cars was to lengthen the front platform, and in this change the opportunity was utilized to encase all the dash equipment and provide a "spit hole" in the floor for the operator. The exterior finish of the cars will be green for the roof, orange enamel for the body and cream trimmed with maroon for the vestibule from the dash up. The lettering and striping is black.

The company believes strongly in the traffic-winning possibilities of modern rolling stock. It scrapped 40 cars last year and hopes to do the same with some other cars when fifteen new cars which it has on order with the American Car Company are received. These new cars are of the Birney double-truck type and will have plush seats and linoleum floor covering.

The company is going generally to the use of 26-in. steel wheels for all its city cars and an ingenious welding frame has been constructed for welding a pair of wheels while their sharp flanges are built up by electric welding. The basis of this frame is a former wheel lathe which is fitted with an overhead hoist for lifting the wheels in and out of the lathe. This hoist is not shown in the view. At the side of the base plate of the lathe and midway between the wheels is an adjustable support for the welding equipment. This support consists of a vertical pipe support carrying a telescopic horizontal arm on the end of which is the welding outfit. This arm is swiveled around the vertical support and can be raised and lowered by a crank, gear and sprocket chain. As the horizontal arm is adjustable to any height and length it can be set so that any sized wheel can be welded. As the support is midway on the base block, the second wheel of the pair can then be welded by swinging the arm from one side to the other without any further adjustment.

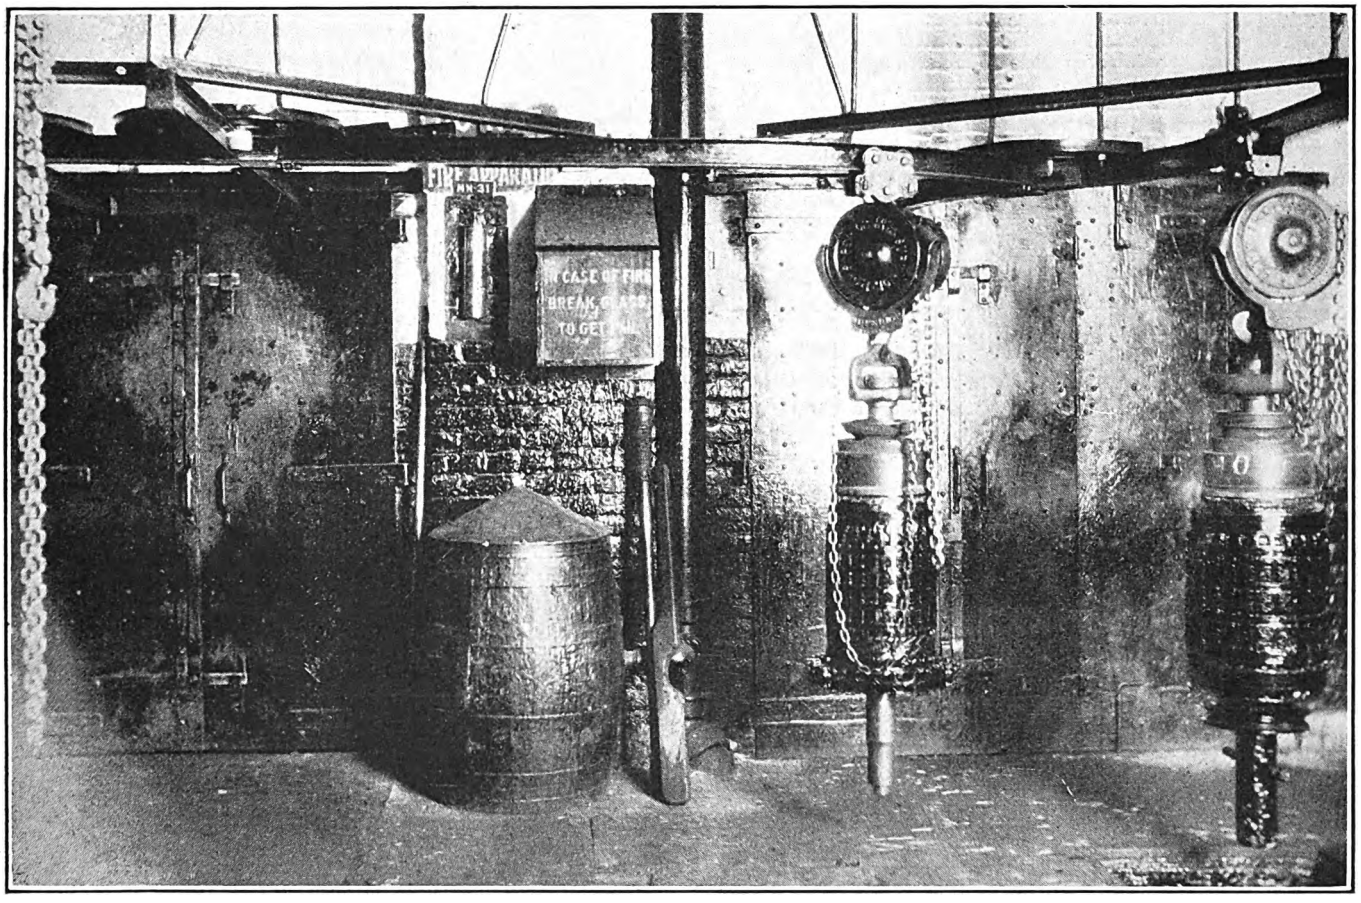
Capacity of Three Baking Ovens Increased 62 per Cent

By an Efficient Arrangement of Racks and Specially Designed Armature Wagons Armatures Are Set on End for Baking—A New Overhead Conveying System Saves Space Needed for Effective Handling

*By O. H. Jorgensen**
General Mechanical Engineering Department,
Pullman Car & Manufacturing Corporation, Chicago, Ill.



The Turntable Arrangement of Overhead Trolleys Provides an Efficient Means for Handling Armatures at the Front of the Oven

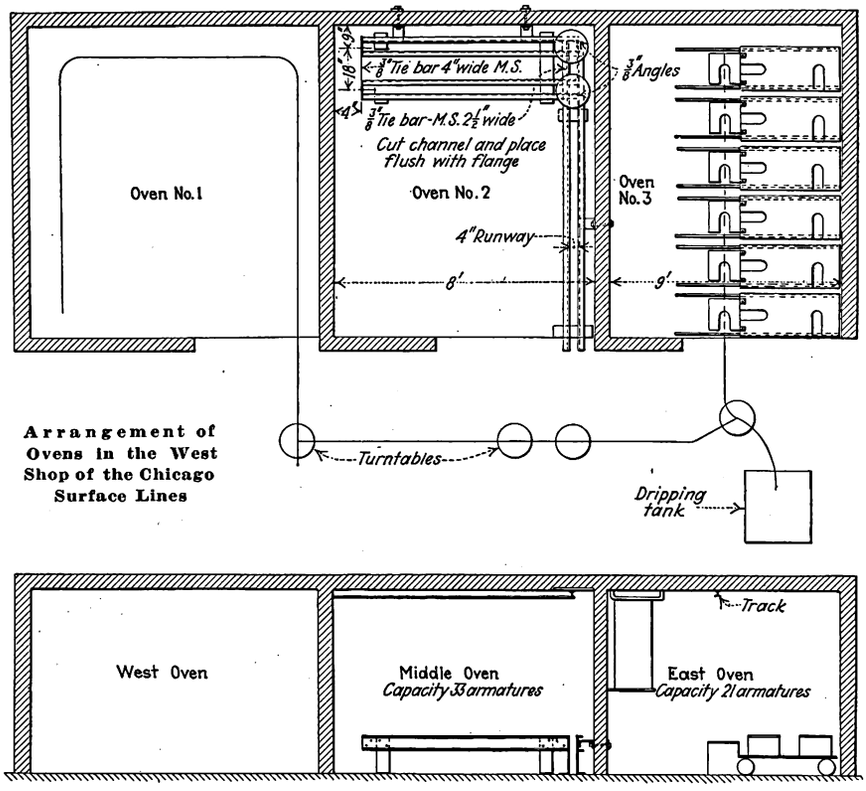
INCREASING the capacity of present baking facilities without enlarging the ovens was a problem recently solved by the shop and equipment department at the West shops of the Chicago Surface Lines. The space available for ovens was limited due to the layout of the shop, and when the equipment department was confronted with the need for greater capacity, only one effective way for obtaining it was presented. This was by rearranging the storage of armatures in the oven and providing more effective methods for handling the armatures themselves. Previous to the changes which were made, the total combined capacity of the three baking ovens was 42 armatures. The present capacity is 68 armatures, or an increase in capacity of 62 per cent. This shows what can be accomplished sometimes by an effective study and where added facilities cannot be obtained.

The layout of the three ovens is shown in an accompanying illustration. Oven No. 1 is equipped with low transite covered steel platforms and is used for drying out newly wound armatures, coils and miscellaneous supplies. The No. 2 oven is used for heating armatures and oven No. 3 is used for baking armatures and field coils after they have been dipped. In studying arrangements of armatures in the oven, which would permit of more armatures being placed in them at one time, it was found that armatures placed on end provided the most efficient arrangement of space. It was accordingly decided to provide facilities so that armatures could be handled and be placed in position for baking by setting them on their pinion ends.

A rack placed along one side and across the end of

*Formerly chief draftsman equipment department, Chicago Surface Lines.

Digitized by Google



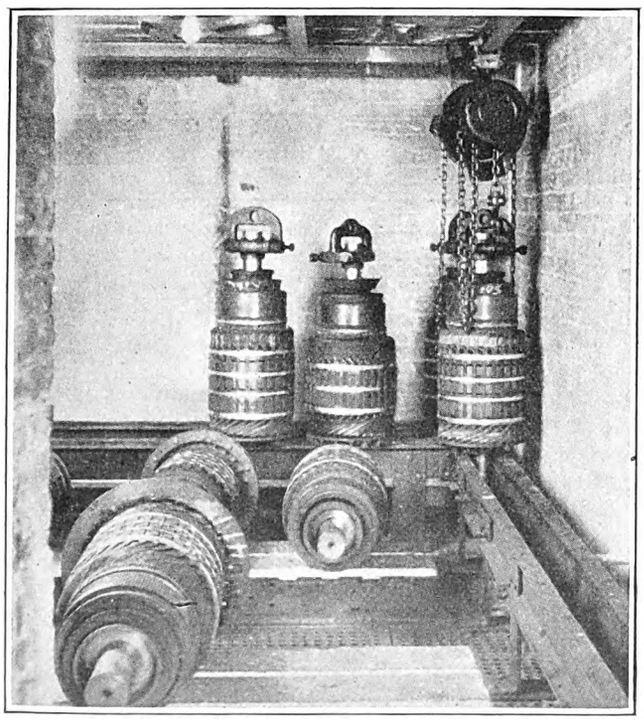
Arrangement of Ovens in the West Shop of the Chicago Surface Lines

oven No. 2, in addition to the old style steel platform previously used, increased the capacity of this oven from fourteen to 33 armatures. An accompanying illustration shows the construction of the rack and the arrangement of overhead track for serving the ovens inside. Standard channel sections are used as the principal members in the rack. Two of these are placed side by side with sufficient space between them to allow the largest armature shaft to fit in easily. The top flanges serve as a support for the armatures, so that the end bell of the pinion end rests directly on these.

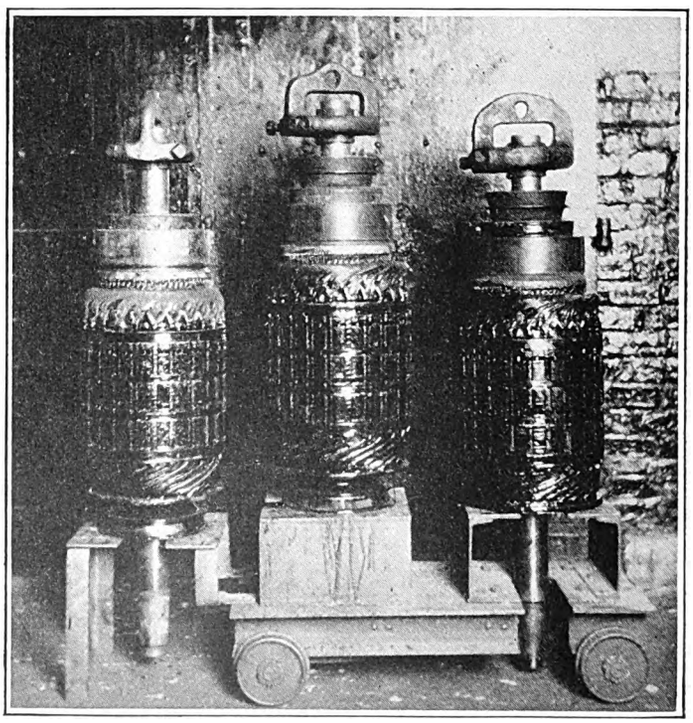
A standard form of overhead track was installed on which a chain hoist operates to place the armatures in position. For holding the armatures while being handled, a specially designed dog with two set screws is used. This dog clamps over the commutator end of the armature shaft and to prevent damage to the shaft a special protection is provided which consists of a spring steel band lined with brake lining material. Accompanying illustrations show several of these clamps in position on armature shafts.

In order further to increase the capacity of the oven, seven small wagons of a design shown in another illustration have been specially designed and built to hold armatures in a vertical position after they are dipped. These wagons are used in oven No. 3 by operating them on tracks which are provided. Each wagon is arranged to hold three armatures supported on their pinion ends. A channel iron framework is used to support the wheels and the top platform is arranged with three stands. Two of these are over the body construction of the truck and the third hangs over one end. This latter stand is arranged so that it can be separated from the main frame. These stands were necessary in order to raise the armatures so that the ends of the shafts will be free from the floor. These wagons permit the maximum utilization of floor space for storing the armatures and in conjunction with the overhead track provide a simple and efficient handling system. This installation increased the capacity of the oven so that 21 armatures can be handled at one time in addition to the field coils.

In order to use the armature wagons and rack most



A Rack for Placing Armatures on Ends Is Installed Along the Side and Across the End of Oven No. 2



Specially Constructed Utility Wagons Are Used for Running the Armatures Into and out of the Oven

Digitized by Google

efficiently, a new system for conveying the armatures in and out of the oven was constructed. This consists of a specially designed overhead track, as is shown in another illustration. This provides an efficient method of transferring armatures from the shop overhead track system to the oven system. The height of the ceiling in the oven was but 6 ft. 6 in. This low height, together with the narrow clearances available, necessitated the construction of a special turntable, which, together with all the other mechanical equipment for the oven, was designed and built at the West shops. This turntable has proved very satisfactory and is much smaller than any found on the market. The illustration showing its construction gives an idea of its method of support and shows how armatures are handled on the various tracks without interference.

Both steam and electric heat is used in the oven. Steam heat is supplied from the shop heating system and electric heaters of 1,000-watt capacity are installed in the ovens. These are placed under the oven floors and are connected in banks of four, six and eight heaters. In two of the ovens the temperature is controlled by commercial thermostats, but in the third oven a shop-constructed thermostat is proving very effective. This consists of a No. 000 trolley wire placed under the ceiling of the oven. The wire is 11 ft. long and has an extension through the oven wall to a switch, which in turn is connected to a regulator in the control box. Variation in temperature causes this trolley wire to expand or contract and so regulates the closing or opening of the switch. It is adjustable and operates within a 10-deg. range. A control box at the rear houses the heat regulator, fuses, switches and an ammeter. The four-heater banks in an oven are controlled by one switch. The six and eight-heater banks are cut in by another switch and are subject to thermostatic control.

Quiet Track Gives Low Maintenance Cost

More Attractive Electric Car Service for Patrons Is Essential—Better Relations with the Public Will Result from a Smoother, Quieter and More Attractive Ride

BY H. E. BEAN
Engineer Way and Structures New York State Railways, Syracuse, N. Y.

NOISE in connection with street railway operation has been given but scant attention by the industry until recently. It seems to have been considered one of the unavoidable factors accompanying such operation. Engineers awake to the possibilities of public approbation and appreciation of efforts to effect the most desirable service are attempting to work out the problem in the best and most economical manner. Complaints of noises emanating from street cars show that guests in hotels, worshipers in churches and people congregated for other purposes demanding quiet are the ones most likely to be affected. Unusual noise in any location will immediately bring inquiries and protests from local residents. Trolley patrons seem less critical, but surely are worthy of the greatest consideration.

On every property there is some avoidable noise. The desirability of noise reduction is growing rapidly, but only slight progress can be made without the expenditure of money. Fortunately the accomplishment is subject to any degree of expenditure, but not in direct proportion. A comparatively small amount added to maintenance allotments will eliminate a large proportion of the most disagreeable noises if properly expended.

Noises emanating from track conditions may be divided into the two general classes of (1) noises resulting from the degree of maintenance and (2) noises due to the type of track and pavement construction.

The first is of major interest at this time because it is the cause of the greater portion of noisy operation and also the easier and more economical point of attack. If these noise-making causes be analyzed the five following conditions cover substantially all of those connected with this classification.

1. Special trackwork.
2. Imperfect rail joints.
3. Corrugated rail.
4. Squealing of car wheels in curves.
5. Foreign matter in rail grooves.

Special trackwork will always cause noise, but such disturbance can be minimized by a reasonable attention to the flange bearings and avoidance of loose hard centers. Under conditions of extremely high percentage of operation in one direction grooves may be welded flush, thus providing jump frogs on the occasionally used track. Low track joints or cupped rails should be repaired for economical reasons alone. Blows resulting from these causes are destructive in the extreme and will soon necessitate a much larger expense for repairs.

Corrugation develops very rapidly after the initial waves are formed. When allowed to become aggravated it is destructive of track foundation, pavement and rolling stock. The greasing of curves may, in general, be omitted if the expense is deemed to exceed the cost of extra wear. Under traffic of different wheel flanges, and especially in short radius curves, squealing generally demands application of grease or heavy oil.

These conditions are all noise makers and engineers are familiar with the proper remedies. It seems obvious that the reduction of noise will be accomplished by expenditures which are bound to show good returns through lessened costs by making timely repairs. Unnecessary noise and destruction are synonymous for track structures; lessen one and the reduction of the other follows.

Manufacturers have developed welding and grinding outfits, quick-setting cements, speltering outfits, air tools and many other devices which make for speed and economy in repairing defects at a minimum cost. On new work the difference in noise intensity in the various types of track and pavement construction are slight compared with the above causes. It seems desirable for engineers to investigate local conditions and make such application of cushioning as is merited, but the results accomplished will not be comparable on most properties with those attendant upon higher maintenance.

To summarize, the accomplishments of reduced noise from track conditions might be stated as follows:

1. Ultimate lessened expense due to less destructive blows affecting both track and rolling stock.

2. Better relations with public living adjacent to lines or coming in contact with avoidable noises in home, business, entertainment or church.

3. More desirable service to patrons, providing not only a more quiet but also a smoother and more attractive ride.

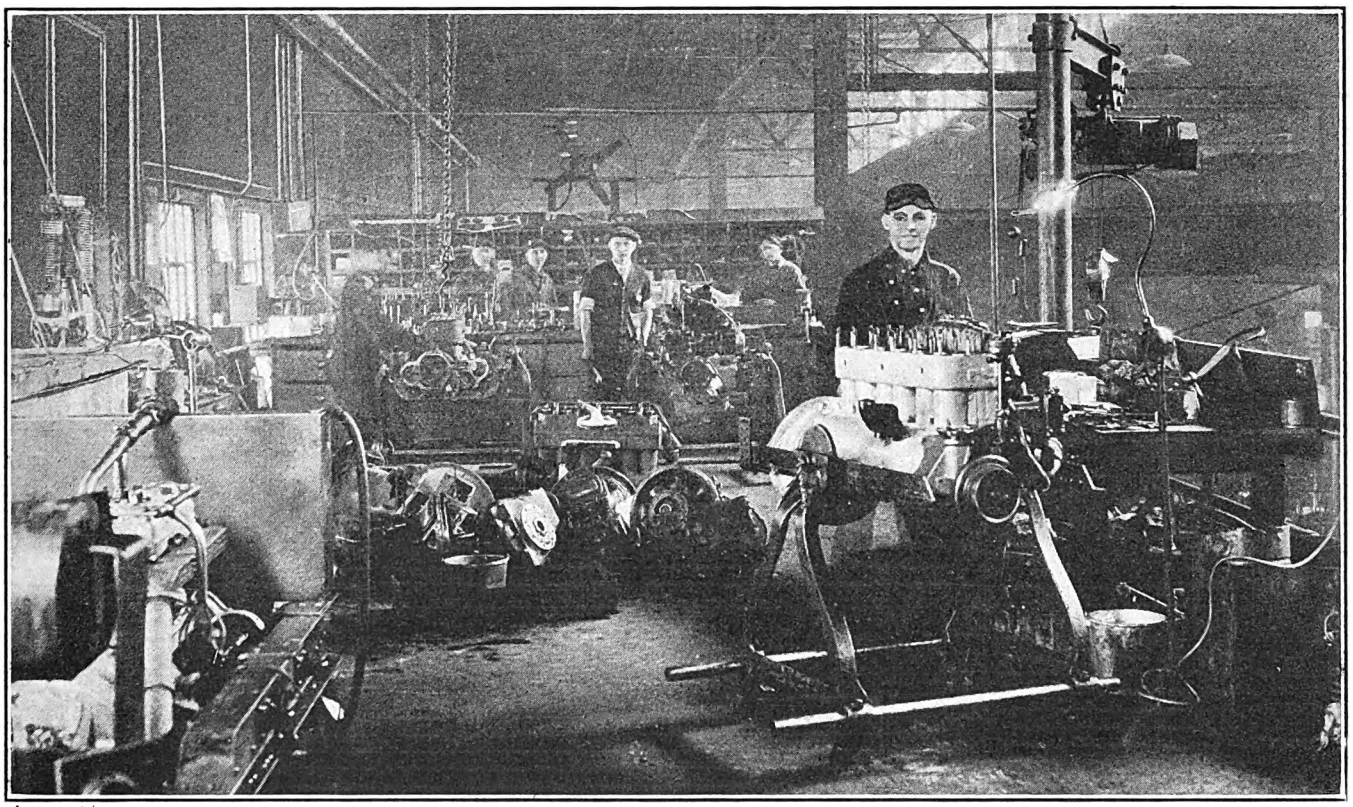
Co-ordinating Bus and Electric Railway Car Maintenance

Men Familiar with Electric Car Maintenance Fit Admirably Into a Bus Maintenance Organization—Bus Overhauling Lends Itself Particularly to Joint Use of Equipment and Men Needed for Electric Car Work

By Pierre V. C. See
Superintendent of Equipment Northern Ohio Traction & Light Company, Akron, Ohio



Bus Motor Overhauling and Testing Department of Northern Ohio Traction & Light Company

EXPERIENCE of electric railway executives in providing an efficient maintenance organization for electric cars will prove a valuable asset when the problem of reorganizing forces to care for bus maintenance has to be wrestled with. The inspection and repair of buses is not essentially different from the inspection and repair of electric cars, and just as the inspection system on cars has to be varied for different types of equipment and service, so the system for maintenance of buses must likewise be varied to suit the service and type of equipment used.

The first thing to do in organizing bus repair forces is to decide on the inspection system. This can be arranged at first along lines found satisfactory for electric car maintenance, or if information is available as to systems used on other properties, the inspection system can be modeled along lines which have been found satisfactory on some other properties which are operating buses. Many alterations, however, will no doubt be found desirable, in order to meet changed operating conditions and different equipment. It will be found that with some types of buses the inspection periods can be lengthened, but if the loads to be carried are heavy and the grades which must be negotiated are severe, it may be necessary to shorten the inspection periods. Local conditions and the type of equipment operated will be found to govern the inspection basis finally adopted.

After the inspection system is once laid out, probably the first alteration will come from the necessity to provide more frequent inspection of parts that are giving trouble and to increase the inspection periods for parts that are not so essential. The experience of the electric railway man will here prove valuable, as he can judge the parts which must receive most frequent attention.

If a considerable number of buses are being maintained, a system of inspection and repair similar to that used for electric cars should be worked out with a section provided for inspection of buses, so that a definite inspection of the body and chassis similar to that used for car bodies and trucks can be inaugurated.

Oil changing, valve grinding and minor repairs can also be taken care of on an inspection basis. An independent department should be established for the overhauling. This should take care of the painting, carpenter work, engine overhauling, transmission and differential repairs and work on other parts of the chassis.

If a very few buses are to be maintained, it will prove advisable more closely to co-ordinate the work of the maintenance forces. Car inspectors may inspect buses and overhauling crews may do certain parts of the overhauling work. There is nothing essentially different or more complicated about a gas engine than there is about the equipment of an electric car. The ignition system or even the latest voltage regulating system is far less complicated than the various circuit wiring for either the type PC or the HL control system. Such control circuits are very familiar to the average carhouse electrician, and the engine and carburetor will be easily understood by men familiar with air compressor and triple valve maintenance. Most electric railway properties start with a few buses, but as the number of units increases it soon becomes necessary to use men exclusively on bus maintenance work.

The work of bus overhauling lends itself more readily to the joint use of men and equipment than does bus inspection. A carpenter familiar with car maintenance makes the finest kind of a bus carpenter, and as practically all electric railways now have some steel bodied cars, carpenters who have been doing railway maintenance work for the last ten years have become very familiar with work in sheet metal and with the composite construction where this type of equipment is used. The woodworking machinery of present electric railway carpenter shops adapts itself easily to the repairing of broken posts, sash and doors that occur frequently on the buses. Bus painting can easily be carried out in the paint shop, and if the truck shop and machine shop are large enough the overhauling work on buses can be most easily handled at these points. The blacksmith shop, electric welding department and the acetylene torch department may all be used to advantage.

As the number of buses increases the addition of grinding machinery becomes more essential. An inside grinder, however, is very useful in the repairs of car air compressors, since it is far more economical to grind a compressor and fit in new pistons than to bore out the cylinders and press in a sleeve as has been the practice in the average electric car shop. When it comes to purchasing new grinding machines, it will be found that the same machine can be used for both classes of work. If the car shop has a turret lathe in its equipment it can be used to very good advantage for making studs, bushings and pins. In bus maintenance there is such a large variety of these small parts that if an attempt is made to carry a stock of all of them the spares would soon reach enormous proportions. Making these as they are required will probably be found more economical at the start. Practically all the machinery of the electric car shop can be utilized in the bus maintenance work. In fact, it is very essential, if any great number and variety of buses are to be maintained, to have good shop facilities available, since it is often impossible to secure bus parts immediately, and it is therefore necessary to weld, forge, machine

and often to have parts cast in order to make emergency repairs. By this means the number of spare buses can be kept at a minimum, and on most properties the service requires that a large part of the equipment be available at all times.

The unit system of maintenance should be followed as far as possible. The engine should be overhauled carefully with the idea of getting at least 50,000 miles of operation before it comes back to the shop. This is more than a year's run. With this in view, each part should be inspected and tested before it is returned to the engine. If the parts are not in condition to make this mileage they should be discarded. The engine block should be bored out, the pistons should be weighed up to insure correct balance and the engine carefully assembled. After all parts are in place, the engine should be run in, preferably on a dynamometer, as described in the ELECTRIC RAILWAY JOURNAL for Feb. 9, 1924, page 224. The unit is then ready to be assembled in an overhauled bus. The transmission and differential should receive like treatment. Generators, starters and voltage regulators can be taken care of to advantage in the armature room. These units, after repair, should be used to put in overhauled buses, and the lighter units can be installed in the inspection shop.

Where buses are maintained at different points, some sort of supply service is essential. Thus, on the Northern Ohio Traction & Light Company's system, the Canton shops are 25 miles from the Kenmore shops in Akron, where overhauling is done. We often find it advantageous to send a complete engine by the supply car to the Canton shops rather than to drag a bus over that distance.

The supply of additional facilities necessary to take care of bus maintenance often can be taken care of by remodeling some of the present buildings of the railway

Bus Inspection Schedule

No. 1—750-Mile Inspection on Buses—Five Days

MOTOR

Clean screens in carburetor and all gas lines.
Inspect all gas lines for leaks and also the tank.
Clean spark plugs and check points.
Oil and clean magneto and inspect points and ignition wiring.
Inspect fan bracket and fan and oil same.
Check water pump for leaks and grease pump.
Check vacuum tank for loose fittings and lines, also vacuum tube.
Inspect windshield cleaner and connections.
Check oil level in motor and also oil pressure gage and lines.
Check radiator for leaks, hose and hose connections and supports.
Oil all working parts on the gas and spark control.
Check all quadrants and gears on steering and oil same.
Check generator brushes, tension and charging rate.
Inspect battery, lights, bells, horn and wiring.

CHASSIS

Check grease level in transmission and differential.
Check clutch throw-out, clutch adjustments and pedal.
Check gear shifting and levers.
Check foot and hand service brakes and lining.
Grease propeller shaft bearing and drive shaft complete.
Check front and rear springs for weak and broken springs, also loose spring clip bolts and loose body braces.
Check front axle and steering column and front wheels for loose bearings and dust retaining nut, steering pins and bushings.
Check front wheel alignment.
Tighten all wheel bolts and wheel flanges.
Check rear axle for loose axle nuts.

BODY

Inspect driver's seat, cushions and see that driver's seat is fastened down tight.
Check all cushions and seats and see that they are in first-class shape.
Inspect sash and doors for cracked glass.
Adjust doors and oil all working parts.
Check windshields for thumb screws and rubbers.
Inspect hood fasteners.

No. 2—3,000-Mile Inspection on Buses—Twenty Days

MOTOR

Check valve tappet clearance—0.008 to 0.010 in.
Remove carburetor, clean screens, jets and butterfly.
Clean spark plugs and check points.
Clean and oil magneto and check points —0.15 in.
Check fan bracket, belt and oil.
Check water pump for leaks grease, pump.
Check radiator hose, connections and supports.
Check vacuum tank, gas lines and vacuum lines and fittings.
Check windshield cleaner and connections.
Change motor oil and inspect oil pressure and lines.
Oil all small working parts and inspect quadrant, control levers and gears.
Check generator for high mica on commutator, brushes and brush tension and oil generator.
Check starter wiring, switches and brushes and oil starter.
Inspect all lights, horn, bells, stop and tail light wiring and ignition wiring and conduits for shorts.
Test compression, grind valves if necessary.
Check water in battery and also check terminals and wiring to battery.
Check exhaust pipe and manifold gaskets, exhaust pipe and muffler for gas leaks.

CHASSIS

Check grease level in transmission and differential.
Grease chassis complete.
Check clutch and clutch throw-out bearings, clutch pedals, pins and levers.
Check foot and hand service brake, rods, pedals, levers and pins and oil same.
Check transmission and gear shifting lever.
Check for worn universal joints, fabrics and loose flanges.
Check for worn brake drums, linings, thin and worn out.
Check front and rear springs for weak and broken springs, clip bolts and worn shackles.
Check radius rods for stripped and loose.
Check rebound straps on rear end.
Check gas lines for worn or loose places and gas tanks for leaks and see that gas tank is tight.
Check steering column, bushings and pins and front wheel dust collars and worn and broken bearings.
Check front wheel alignment.
Tighten all wheel bolts and axle nuts and axle flanges.
Check differential for grease leaks and grease on brakes.
Check body braces, exhaust pipe and heater pipe.

BODY

Inspect driver's seat and see that same is fastened tight to the floor.
Inspect all seats and seat cushions for holes and broken springs.
Inspect floor and safety tread in step.
Inspect signs.
Inspect front body braces and dash for loose and broken braces.
Inspect front fenders for loose and broken braces and see that rear wheel housings are not worn through.
Inspect all doors, sash and emergency door.
Inspect for broken and cracked glass in doors and windows.
Inspect windshield for loose glass, cracked and rubber strips and thumb screws.
Oil and inspect all door rigging.

No. 3—10,000-Mile Inspection on Buses—Sixty Days

This inspection will be the same as 3,000-mile with the following additions:

MOTOR

Remove cylinder head, clean carbon and grind valves.
Remove carburetor, clean jets and screens and clean coke and butterfly and on buses that have stew pots, remove carbon.
Remove magneto and check points and replace if worn.
Remove generator and replace with O.K. unit.
Remove starter and replace with O.K. unit.
Remove voltage regulator and replace with another regulator.
Inspect magnetic switch and all terminals and connections for lights, horns, bells, starter, tail and stop lights.
Vacuum tank top to be removed and inspect valve and springs and float assembly. Clean tank and inspect for leaks.
Use new gaskets in replacing top.
Water in the radiator to be changed, inspect radiator for loose core or hood rest broken or cushion for hood missing. Replace if found in bad order.

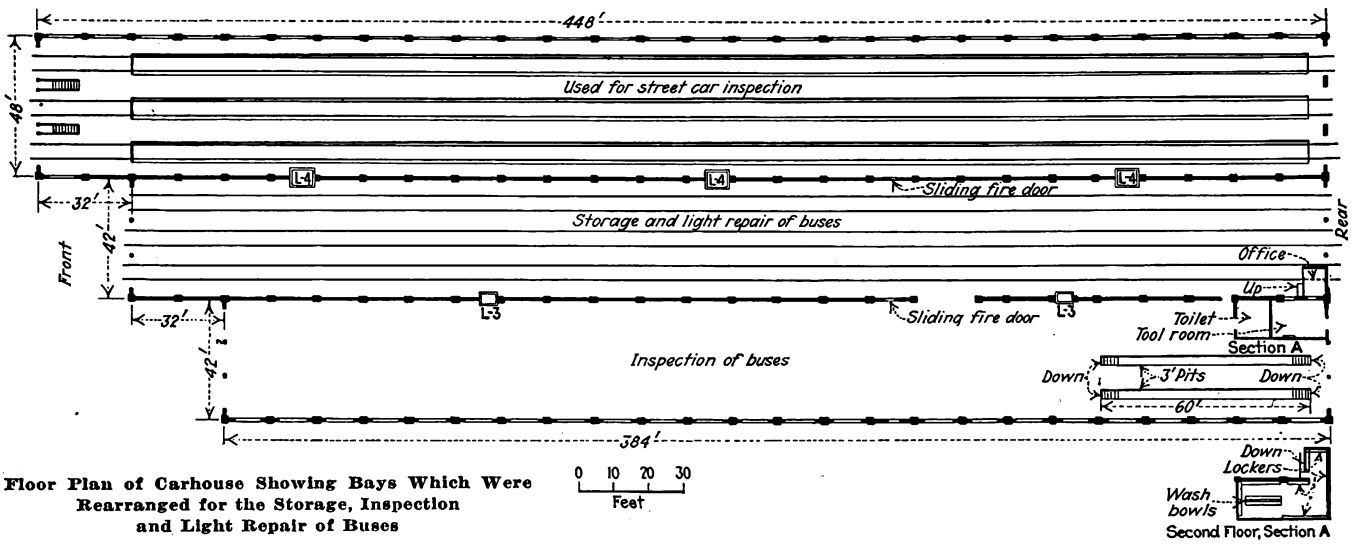
CHASSIS

Drain transmission and differential; grease, remove plates and check for worn gears and bearings and adjustments. If found worn, replace units. Use same grease unless grit or dirt is found in it.
Inspect all shackle bolts, bushings and replace if worn.
Inspect drive shaft and drive shaft bearings. See that drive shaft is not bent or bearings loose or broken. See that brake drums are not worn or loose.
Inspect front end complete, see that front axle is straight and look at wheel bearings.
Remove rear wheels at axles and inspect bearings and retaining felts.
Inspect all brake rods, levers and bushings. Inspect brake bands and linings.

BODY

Inspect all seats and seat cushions, driver's seat and seat box.
Inspect for bad floors, wheel housings, fenders, front dash braces and supports, safety treads, step.
Check for loose glass in sash.
Inspect grab handles and rails and see that they are tight and not broken.
Inspect fare box railing and fare box for cracked glass and dirt.
Inspect roof inside and outside, also ventilators.
Remove dents in body and fenders, wheels and fenders to be painted.
Inspect front fenders for loose and broken braces and see that rear wheel housings are not worn through.
Inspect all doors, sash and emergency door.
Inspect for broken and cracked glass in doors and windows.
Inspect windshield for loose glass, cracked and rubber strips and thumb screws.
Oil and inspect all door rigging.

Digitized by Google



Floor Plan of Carhouse Showing Bays Which Were Rearranged for the Storage, Inspection and Light Repair of Buses

to take care of the bus work. Electric railway properties often have buildings that are not being used that can be converted into very practical garages. As an illustration of such a conversion, accompanying illustrations show a power house from which the old engine and 25-cycle generators were removed to take care of bus storage and inspection. The holes in the floor for the flywheels and accessories were boarded over and a cinder incline was made up to the doorway. The entrance was enlarged to provide space so that buses would go through readily. Twenty buses can be stored in this building. The expenditure necessary to prepare for this use was very small.

An accompanying plan shows the bus inspection facilities at the Kenmore shops, Akron, Ohio, where a covered storage for electric cars was used. The electric cars are now stored in the yards and two large storage bays have been converted into a garage. By cutting a large doorway through the fire wall, buses can be routed so as to go in one bay, through the door and out the other bay, thus saving any backing.

Cement pits have been provided in one end of one of the bays and locker and toilet rooms have been installed. The construction of the pits is shown in an accompanying illustration. In the other bay the tracks were left in and a cement coating was put on top of the ties to the level of the head of the rail. In the bay in which the new pits were installed the tracks were entirely removed, so that proper drainage could be obtained. By running buses four abreast 120 will go into this building.

As the Kenmore shops have a steam railroad siding, gasoline is purchased in carload lots on government specifications. Each car is tapped and a sample is drawn off. This is given the A. S. T. M. standard distillation test. The car is then either rejected, if the test is unsatisfactory, or, if satisfactory, the gasoline is dumped into storage tanks which have a capacity of 28,000 gal. Purchasing gasoline in this way has not only resulted in a big saving but a more uniform grade is secured.

Lubricating oil tanks have also been installed under

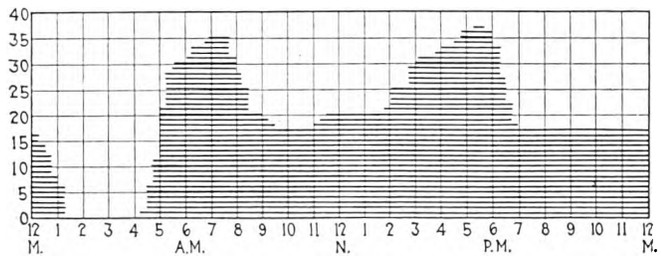
The Exterior of an Old Power House Which Was Arranged with an Incline at the Entrance to Permit Its Use as a Garage

Digitized by Google

the floor of the garage and lubricating oil is purchased in carload lots under specifications. Illustrations on page 504 show the testing apparatus for both gasoline and oil.

In order to care for the very large number of buses that come into the garage between the hours of 1 and 3 a.m. and leave between 4 and 6 a.m. it is necessary to work out a very careful plan of movement. Each bus as it comes in passes a fare box house, where the magazine is pulled and another is installed. The bus then goes into the garage, where it is turned over to the mechanics, who first fill the 50-gal. gasoline tank. This large quantity of gasoline is needed for the long all-day runs. In fact, it is hardly large enough under winter conditions of snow and when chains are used or where heavy grades are being negotiated. Each bus is then washed on the outside and the amount of oil in the engine is checked. The man checking this oil has a list of the buses which are to have their oil changed. These buses do not receive any oil. The bus is then spotted in the proper place for going out in the morning.

Before leaving the garage the driver is required to make out a written report as to the condition of the bus. Any defects reported by him are taken care of by the night mechanics, but it is desirable to do as little mechanical work as possible during the night. As the



Buses Operated from Central Garage, Akron, Dec. 15, 1925

time that the buses are available for maintenance repairs is short any work must of necessity be rushed. It is also hard to get good mechanics to work on a night shift. For this reason the greater part of the maintenance work should be carried on through a regular system of inspection under a predetermined mileage or time basis, as is done on most electric car systems. An accompanying schedule shows the inspection system which we have developed for our service.

In order to lay out a definite program for each day's work of bus inspection and overhauling, we have found it a great help to have charts showing the hours that buses are needed for the schedule. Two of these charts for service operated Dec. 15, 1925, are shown above. It will be seen from these that more than 50 per cent of our buses are in service continuously except during the hours between 1 and 5 in the morning.

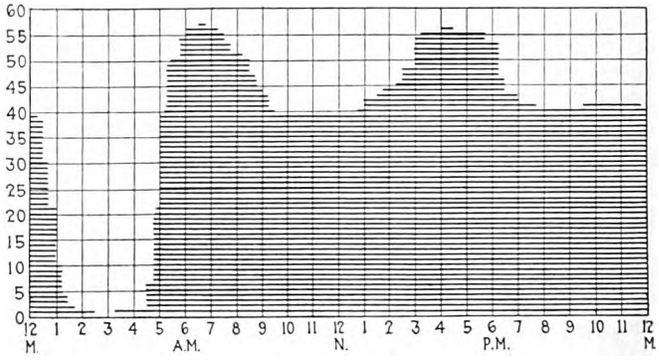
Various forms have been arranged for the keeping of bus maintenance figures and records. The larger the system becomes the more numerous and comprehensive these forms should be made, so as to get the information summarized into such shape that will give executives the necessary information. Samples of some of the forms used by the N. O. T. & L. are shown.

An "Operators Daily Defect Card" is required of every driver regardless of the condition of the bus, so that in case of an accident the claim department is well supplied with information as to the past condition of the bus. The spaces left for the purchase of oil and gasoline on the road have been used very extensively on our system when new lines were bought and on some long interurban runs and sightseeing trips.

The "Inspection" form is used to cover the lighter inspection and all operations are initialed by the man doing the work for the benefit of the claim department. A "Service Recorder" chart is put on each bus every night. This shows automatically when the bus is moving and when it is standing still. This is very useful in checking up drivers and also complaints as to delays in the service.

The "Engine Report" card is put in a celluloid front container and is hung on the engine when it is removed from the bus. Notations are put on, including the maximum horsepower reading. The card is not removed from the engine until it has been replaced in another bus. The card is then entered in the bus overhauling book so that the record of its life may be traced back. An average life of at least 50,000 miles is expected and usually secured; in fact, some engines have gone more than 70,000 miles.

The keeping of tire records becomes very heavy and burdensome when a large number of buses are being



Buses Operated from Kenmore Garage, Dec. 15, 1925

operated, as the changes are made in the streets and under the worst of weather and speed conditions. The system therefore for the tire man must be made as easy as possible. With this in view, the "Tire Change Card" has been made a small pasteboard card which will fit in the roadman's pocket. The tires are all branded and he has only to get the numbers of his tires off and on and also the date, time, bus number and wheel location.

Additional forms are necessary to keep track of the tires mounted on the wheels in the garage and also records as to the cost of each make of tire. Unless every detail of this is followed closely and persistently errors of tire numbers and mileage will creep in and make the records valueless. Unless it is desired to secure some comparative data, tire records of this nature are hardly worth the cost and effort necessary for their maintenance.

The "General Inspection and Cleaning Sheets" are used for keeping monthly check-ups. These are mounted in home-made aluminum folders and are used not only for the checking of buses but also for work on cars. The frequency of any inspection or cleaning operation can be seen at a glance.

So many electric railway companies have gone into bus transportation to a greater or less extent that it is a very opportune time to consider what resources in personnel, equipment and buildings can be combined for the maintenance of both cars and buses.

Track Crossings in Cleveland Reduce Noise

Nearly Four Years Experience with Three Crossings of the Balkwill Type Indicates Success in the Elimination of Breakage and Much Noise—A Fourth Is Now Being Constructed

FOLLOWING the success of the first three crossings of the Balkwill type, the Cleveland Railway is about to install a fourth at the intersection of Euclid Avenue and East 30th Street. While long life is the principal claim by the makers of this type of crossing, it can also be constructed to eliminate much noise common in special work. The first three installations in Cleveland have been in service for nearly four years and have required practically no maintenance. An inspection in February of this year showed no sign of breakage and only normal wear.

Steam roads have used nearly $2,000,000 worth of crossings of this type, with the result that many have standardized on it when specifying manganese crossings. Because of the high speeds and absence of the necessity for noise reduction, crossings designed for steam roads are not of the flange-bearing type. Electric roads operating in paved streets find it desirable to specify the flange-bearing type to reduce the noise as well as to obtain longer life.

Two views are shown of one of the crossings before installation at Euclid Avenue and 105th Street in 1922. Another view of a model illustrates the principle on which the crossing is constructed. Essentially this single-track crossing consists of twelve pieces as shown in the partially exploded view of the model. All are constructed of 12½ per cent manganese steel. Extra heavy heat-treated alloy steel bolts hold the pieces together.

Two reasons are given for the success of this type of construction. First a solid cast crossing tends to break essentially along the lines forming the natural joints of this newer type, so that when bolted together the strains do not tend to create new breaks, but are relieved ever so slightly by the natural give of the bolts. Due to the tapered machine fits these strains do not subject the bolts to a shearing stress, but place them practically in tension, the natural stress the bolt can best resist. The second reason is that in quenching the component parts the points subjected to greatest wear in the final crossing are quenched first and are necessarily more dense. The softer metal, or that under greatest internal strains due to the tempering process, is away from the greatest wear points. Great masses of metal are avoided as compared with the solid cast type, so that the internal strains should be relatively less. Even these are removed from the points that receive the hammer blows caused by operation.

Flare blocks, first used in the Cleveland installation, lift the wheel on the flanges over the joints of the crossing legs with the rolled steel running rails. The

Construction Details of Track Crossings Used in Cleveland

Digitized by Google

wheels are thus picked up and gradually let down away from the ends of the rails, thus avoiding hammered ends, so often a source of trouble. These flare blocks, also made of manganese steel, can be seen in the partially exploded views.

Complaints of excessive noise from nearby apartment houses, common before the installation of these crossings, have been practically eliminated. The crossing at 105th Street and Euclid Avenue was installed over night by a crew of the railway. While it was impossible to obtain a high grade concrete base with so short a time for setting, the crossing has operated satisfactorily without breaks and without maintenance for nearly four years. It shows no sign of failure, and only normal wear. It is estimated that this type will outlast four bolted rolled steel types or at least two of the solid cast type, and instead of breaking toward the end of its life will wear out from normal wheel passage. This insures relatively less noise, not only while new but also toward the end of the normal life, since a broken crossing is particularly noisy and hard on the equipment passing over it.

In building the crossing care is required to obtain accurately machined fits between its legs and the standard running rails that must be joined on to them after installation. Apart from this the job is fitted and adjusted accurately in the factory before shipment. The latest crossing for the Cleveland Railway is being constructed by the Pettibone-Milliken Company of Chicago, Ill. An early description of this type of crossing appeared in ELECTRIC RAILWAY JOURNAL for Jan. 26, 1918.

Claims Work Reviewed by Safety Council

SEVENTY per cent of the electric railways paid less than 3 per cent of their gross earnings for claims during 1925, says a bulletin issued by the National Safety Council, whose membership includes more than 150 corporations in this industry. Although the 1926 Safety Congress is still several months distant, the electric railway section already is making plans for its sessions and the subject of claims will be one of the most important topics on the program. How member companies manage to keep their claims down to a minimum will be told by various safety engineers.

At a recent meeting of the electric railway section of the National Safety Council encouraging reports were made by the various committee chairmen. John J. Connors of the Nashville Railway & Light Company stated that his company paid only 2.8 per cent for claims during 1925, against 6.8 per cent paid in 1921 before joining the council.

The committee on recommendations of the section, composed of E. K. Eastham, chairman; Samuel H. Reid and Victor T. Noonan, has developed a program for standardization of street railway accident statistics, which will be carried out in conjunction with the claim section of the A. E. R. A.

Marked interest is being shown in the monthly news letter which is being issued by Secretary Eastham of the electric railway section.

It is the hope of Chairman J. J. Connors of the membership committee that during 1926 a larger number of electric railways will participate in the activities of the section. At the present time Mr. Connors is issuing a series of letters outlining the advantages of membership. He feels that a great many electric railways are not familiar with the work that is being done by the National Safety Council, which is a co-operative, non-profit-making institution supported by community safety councils, corporations and public-spirited citizens interested in preventing accidents on the streets, at home and throughout industry.

The Readers' Forum

Are Your Small Tools Efficient?

MORSE TWIST DRILL & MACHINE COMPANY
NEW BEDFORD, MASS., Feb. 23, 1826.

To the Editor:

In looking over numerous articles relating to new machines and machine tools, it appears that increased capacity has been stressed, particularly in new designs. The various improvements provide for increased production, freedom from trouble and more uniform and accurate work. It seems to the writer that very often the fact is lost sight of that even with this new equipment the quality of work turned out is dependent very largely upon the small tools used in the machine. While much thought, time and attention are given to the selection of the machine tools themselves, there appears to be, except in very large production shops, very little real investigation as to the actual results obtained from small tools. Of course, the cost of these in proportion to the cost of the machine installation is small, but if an adequate return is to be had from the large investment in machinery, it is absolutely necessary that time and thought be given to the selection of the small tools. These should be bought on a quality basis rather than on the basis of first cost, as many times the slight difference in cost on the original purchase will return large dividends in the matter of increased production, freedom from trouble, more uniform and accurate work.

W. T. READ,
Vice-President and Treasurer.

Good Maintenance Reduces Costs

UNITED RAILWAYS & ELECTRIC COMPANY
OF BALTIMORE
BALTIMORE, MD., Feb. 27, 1926.

To the Editor:

The criticism contained in article "Footing the Bill for Car Improvements," dated Jan. 20, 1926, appearing over the name of "Master Mechanic" is evidently made through a mistaken idea of the principles which guided the committee in taking up this very important subject. Without an ideal no object can be attained, and to attain this ideal means that much effort and money must be expended. But who will say that if cars were kept and maintained in first-class condition and free of all unusual noises, and therefore more attractive and efficient, the costs would not be worth while? It is due entirely to the fact that most companies have allowed their standards of maintenance to fall to low levels that cars go rattling along on poorly maintained tracks. It is up to those interested each year to spend more effort and money on bettering the conditions of cars and tracks. These results will soon repay all moneys wisely spent.

A. T. CLARK,
Superintendent Rolling Stock and Shops.

Dick Prescott Rides to Work

And Visits with a Passenger

DICK PRESCOTT, engineer of equipment of the Consolidated Railway & Light Company, rode to work regularly on the Greenhill line of his company. Although several of his neighbors frequently tendered Dick a lift in their automobiles, he preferred to ride the cars because of the suggestions he frequently picked up through his experiences as a passenger.

The new management of the Consolidated continued to inject enthusiasm into the organization. The subject of selling transportation was frequently discussed in meetings and bulletins were sent out by the general manager. Stress was laid on the fact that railway employees are the actual salesmen of the company, as they meet their passengers each morning and night on the cars.

In all of this discussion Dick had felt that the mechanical department was on the side lines. He rather envied the fellows in the transportation department who were more directly taking part in this new and interesting activity of trying to create satisfied riders.

These thoughts stood out in Dick's mind one morning as he watched the operator of his car making friends for the company by the newborn courtesy and attention that was beginning to be quite noticeable among the platform men. Absorbed in his thought, he was a little startled when the passenger at his side, noticing Dick's interest in the operator, was moved to comment on the service.

"That motorman is certainly a fine fellow," said Dick's seat companion.

"Yes, I have just been noticing him," replied Dick courteously, "he makes riding on his car a real pleasure."

"That's a fact. This company has been making some marked improvements recently. I've ridden this line on and off for fifteen years and it's only during the last few months, since they put on those nameplates, that I've known the names of some of these men."

"It makes the service more human, doesn't it?" commented Dick.

"Noticeably so," replied the passenger. "They seem to have done many other things that help out also. I think these cars ride much better than formerly, and they certainly make less noise."

"They do ride better," agreed Dick. "The springs were recently replaced with new ones that are better designed for the loads imposed."

"Oh, is that so? I didn't know that, but I did notice the difference in the riding of the cars. Does that also account for the reduction in noise?"

"It probably helps, but in addition to that all the maintenance work on the trucks is being watched more carefully than formerly."

"That accounts for it then. Are you connected with the street car company? You seem to be well acquainted with the construction of the cars."

"Yes," answered Dick. "I am in the mechanical department at the shops."

"That must be interesting work."

"It is very interesting, indeed. When you consider that each of these cars makes about 35,000 miles every year, you can readily understand that the maintenance work becomes of major importance."

"My, that's certainly a lot of mileage! I had only 30,000 miles on my last automobile when I turned it in."

"It takes quite an organization and very careful work to prevent service failures."

"Well, you seem to have improved there too, because we formerly had frequent delays on this line. But the service is much better now. At one time I drove my car to the office every day because I got tired of getting down late. Recently, however, the people in our block have been leaving their cars at home. I decided to give the service another try and have been riding regularly since."

"That's going to help the company to improve the service still further," said Dick, "because the added revenue will make that possible."

"I had never thought of that. Maybe that's why they started fixing up the track on this line."

"That probably explains it in part, but you see it's a cumulative process. Better service increases revenue, and the increased revenue in turn makes possible still more improvement in service."

"Well, that's very interesting. Thank you very much. This is my corner. I'll have to leave."

Dick started his work with a new enthusiasm that morning. "Why, it's just like any other business," he thought, "and these fellows in the shop determine whether or not the salesman has a satisfactory product to offer."

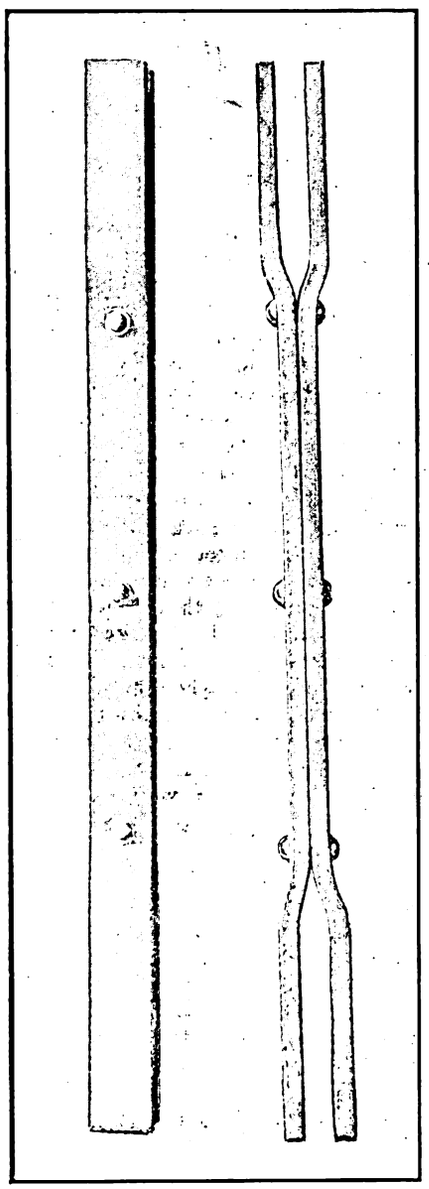
Maintenance Notes

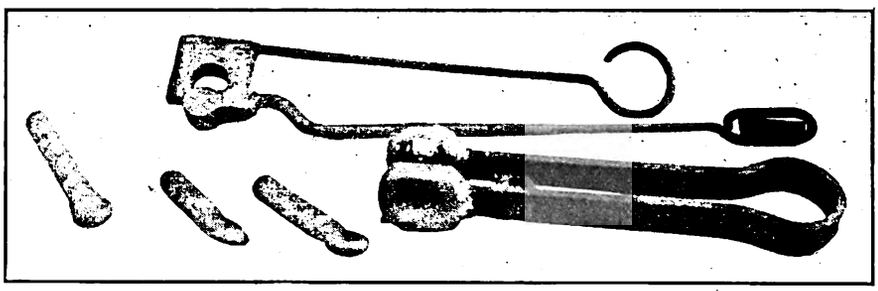
Built-Up Brake Tie Rods

USUALLY tie rods for foundation brake rigging are made by forging the jaws separately and then welding these to round rods. Where welding is not done carefully the rods fail at this point. The Northern Ohio Traction & Light Company has had several broken brake rods due to defects in the material where it is welded. With the hilly conditions under which cars operate in Akron, Ohio, a break is very serious.



This Built-Up Type of Tie Rod Effectively Prevents Breakage

A built-up type of tie rod has been designed by Pierre V. C. See, superintendent of equipment. This is shown in the accompanying illustration. It is somewhat heavier than the type of brake rod which it supersedes, but its sturdy construction is of benefit in preventing breaks, as no difficulty from this source has arisen with this type. The tie rod is formed of two pieces of steel of $\frac{5}{8}$-in. x $2\frac{1}{2}$-in. cross-section. These are formed to the desired shape in a bulldozer and are then riveted together by three large rivets. This type of rod is easy to construct and maintain.



Dies Used for Forming and Finishing Step-Adjuster Bolts

At the left in the foreground are shown the three stages of forming. The die used to form the end of the bolt is in the right foreground and the tools in the background are for clipping off the burrs which are left from the forming operations.

Convenient Tools for Forming Step-Adjuster Bolts

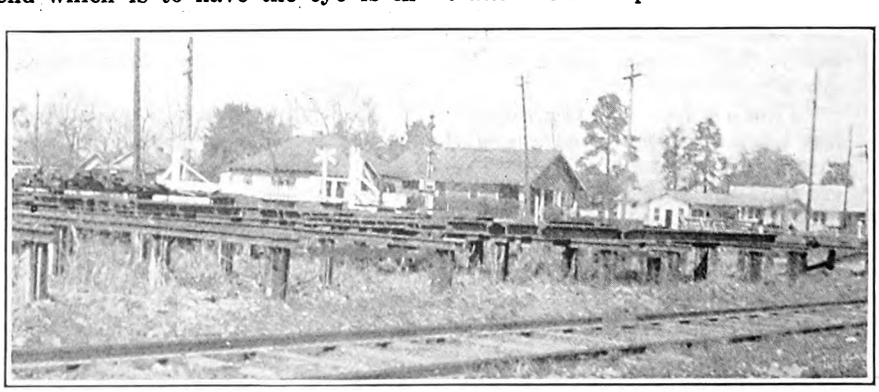
BOLTS used to connect folding steps to the operating lever on cars of the Eighth Avenue Railroad, New York City, consist of a threaded length of about 8 in. with an eye formed at one end. These require replacement for worn threads and for wear in the hole at the end. In forming new bolts a few simple dies have been found of particular benefit.

The stock used for forming these adjuster bolts is $\frac{7}{8}$ in. diameter. The end which is to have the eye is increased in diameter by heating and up-ending. It is then placed in the forming tool shown in an accompanying illustration. A blow from the hammer forms the end and leaves a countersunk portion for the drilling of the hole. The next operation is to remove the burrs from around the edge. This is done by a die through which the adjuster bolt is forced so as to clip off the burrs. The remaining operations are those of drilling the eye and cutting the threads.

Racks for Rail and Pole Storage

USUALLY rails, poles, special work and other bulky track and overhead material are stored in the open. No serious amount of depreciation follows from this practice, provided the material is kept off the ground where it does not lie in water or on damp soil.

In Mobile, Ala., the practice is followed of using old rail for making the horizontal pieces for these racks. The vertical members are stout posts. The accompanying view shows a rack made in this way for storing track rail and special work.



In Mobile Racks for Outside Storage Are Made from Old Rail

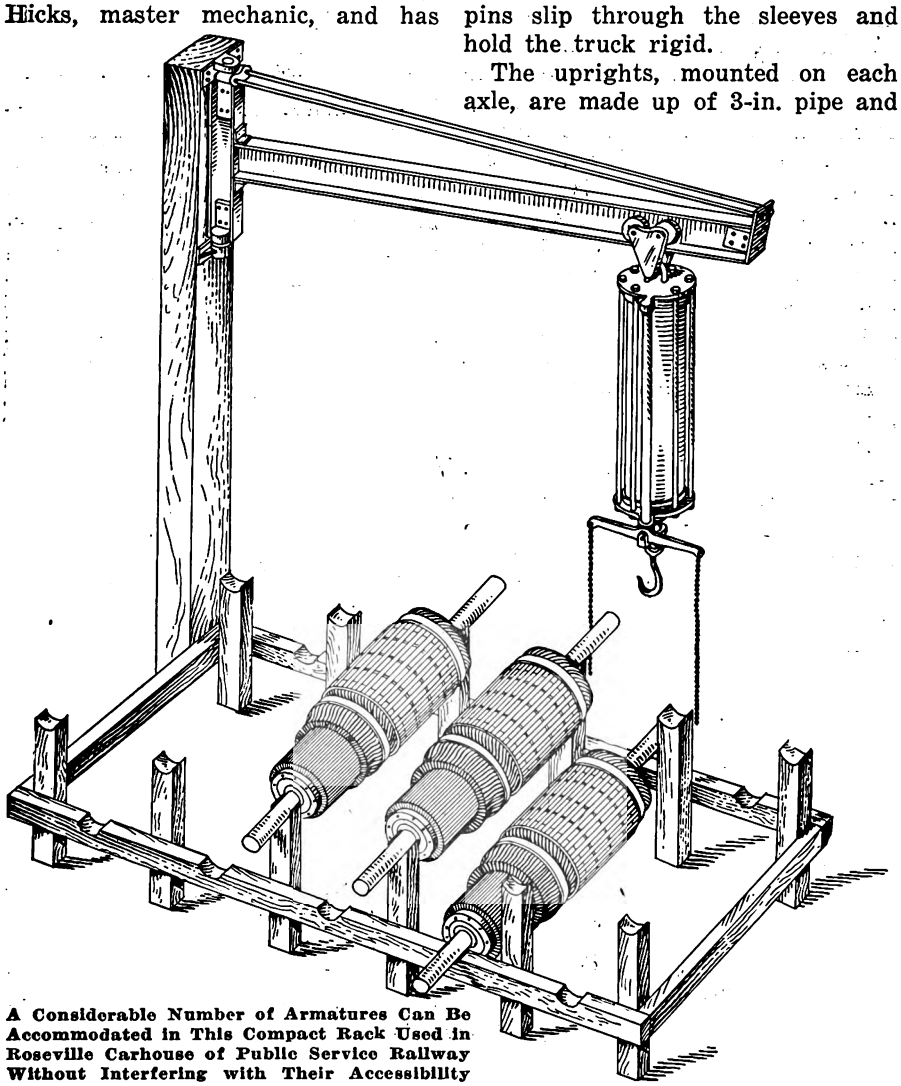
Adjustable Armature Carrier in Richmond

Adjustable Armature Carrier

CARRIERS for armatures in a variety of forms are common in electric railway repair shops, but the type used in the Richmond shops of the Virginia Railway & Power Company has a number of novel features. It was designed by W. J. Hicks, master mechanic, and has been found very convenient in transporting armatures in the shops from one point to another.

A feature of the carrier is that its length is adjustable. The side pieces are short sections of 2-in. pipe which are attached to the front two-wheel truck but slide in sleeves attached to the rear two-wheel truck to provide the adjustable feature. Dowel pins slip through the sleeves and hold the truck rigid.

The uprights, mounted on each axle, are made up of 3-in. pipe and the rests are ball bearings, which make the removal of the armature very easy.



A Considerable Number of Armatures Can Be Accommodated in This Compact Rack Used in Roseville Carhouse of Public Service Railway Without Interfering with Their Accessibility

Compact Armature Rack Serves Big Carhouse

FOR the storage of spare armatures at the Roseville carhouse of the Public Service Railway, Newark, N. J., a compact and convenient rack has been devised by Ben Singleton, shop foreman. From this carhouse 126 cars are operated, including six different types. These cars are equipped with motors of various makes, and consequently a considerable number of spare armatures must be kept on hand. A double-deck rack has been built in such a manner that a minimum of space in the shop is required, yet any armature can be taken out easily and quickly.

The rack consists of a rectangular wood frame and a number of 4-in. square posts. These posts extend about 6 in. below the frame, thus raising it from the floor, and extend about 2 ft. above the frame. Grooves have been cut in the tops of the posts to form seats for the armature shafts. Similar grooves have been cut in the sides of the frame midway between each two pairs of posts. Armatures are supported by the ends of the shafts which rest in pairs of grooves on opposite sides of the rack. The general arrangement of this device is shown in an accompanying illustration.

To the rear of the rack at one end is a jib crane equipped with a traveling air hoist. The crane arm extends over the entire length of the armature rack, and the traveling feature of the pneumatic hoist makes it easy to lift any armature and transfer it to a hand cart for transportation to the car where it is to be installed. The space between two armatures resting on the tops of adjacent pairs of posts is not sufficient to permit raising an armature directly upward from the frame below. In lifting armatures it is therefore necessary to carry the armature slightly forward until the core is clear of the two cores above. The armature can then be raised straight up as there is sufficient clearance for the shaft between the upper cores.

Should it ever be desired to increase the capacity of the rack, a new section could be built similar to the one now in use. By placing this in the same relative position on the opposite side of the crane, the air hoist would serve it as it does the first section.

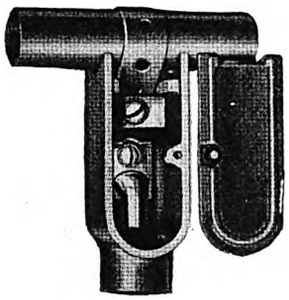
New Equipment Available

Condulet for Ground Wires

IMPORTANCE of a well-grounded system with wire thoroughly protected from mechanical injury is appreciated by the men responsible for electric car maintenance. To provide a condulet with necessary connections so that this can be installed readily, the Crouse-Hinds Company, Syracuse, N. Y., has just brought



New Condulet with Cover Removed to Show Strap and Lug

out its type GC condulet. This is provided with necessary tinned-copper grounding straps and lugs of ample size. The clamping means provided effect a rigid, mechanical and electrical connection between the condulet and the piece which serves as a ground. After the connections have been made, a cover incloses and protects the connections, but may be opened for inspection at any time without disturbing them. These condulets are furnished in three sizes, depending upon the size of ground wire used. These are GC 1 for ground wires No. 10 to No. 6; GC 2 for No. 4 to No. 1 wire, and GC 3 for No. 0 to No. 000 wire.

Copper Tungsten Electrode for Welding

COPPER-TUNGSTEN electrode, a development which is expected to prove of great value in the welding of metals, is now available. This announcement is made by the General Electric Company, Schenectady, N. Y., which evolved the new electrode.

One of the limiting features in many resistance or spot welding operations has always been the copper electrode used, the pure copper not being hard enough when used under the high pressures at high currents common to this type of welding. Usually, after a few welds are made, the surface of the copper electrode in contact with the weld becomes hot enough to anneal the copper, thus making it very soft. As a result, the copper tip rolls and mushrooms over the edges, giving a large spot weld which changes the current density and, consequently, the quality of the weld.

Copper-tungsten, as its name indicates, is a mixture of two metals, one a good electrical conductor and the other very hard. The alloy has a hardness of 225 (Brinell), as compared with 82 for hard copper and 30 for soft copper. The compressive strength of the copper-tungsten is 208,000 lb. per square inch, as against 58,000 lb. per square inch for hard copper. The tensile strength is 56,350 lb. per square inch, compared with 30,000 lb. for soft copper and 50,000 to 70,000 lb. for hard-drawn copper.

Copper-tungsten does not anneal at red heat. Thus there is no soft surface metal to roll or mushroom over when used in resistance welding. It has not been found necessary to form the entire electrode point or die of copper-tungsten, but rather to use inserts of this alloy by any one of a number of methods, such as forcing an oversize piece in a hole in the die, brazing a block in the wearing surface or placing pieces in a mold and casting the die around them. The remainder of the die is made of copper as before.

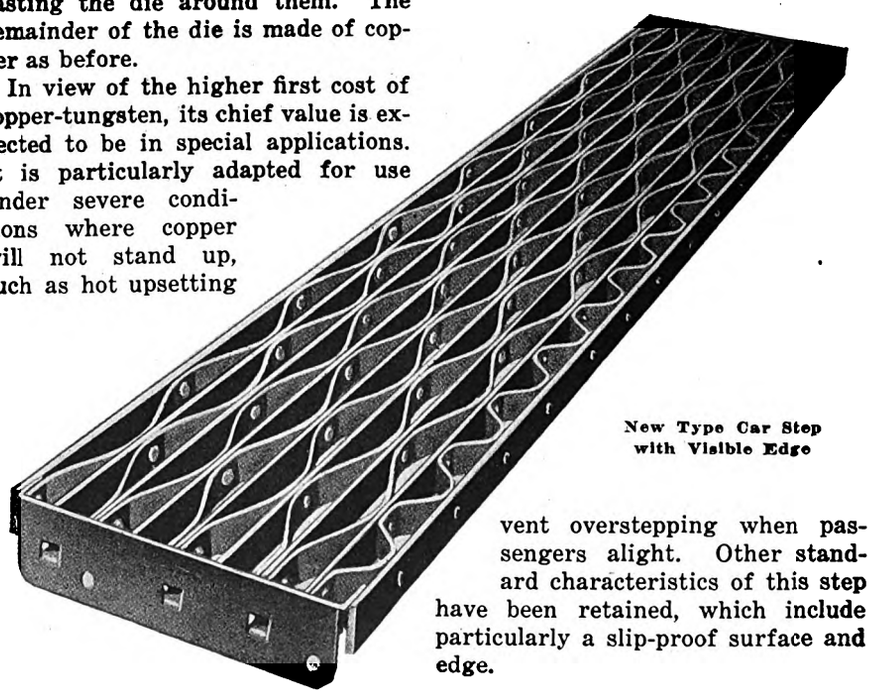
In view of the higher first cost of copper-tungsten, its chief value is expected to be in special applications. It is particularly adapted for use under severe conditions where copper will not stand up, such as hot upsetting rivets electrically, and in facings for clamps for rod welding, split dies for welding steel spokes to both rim and hub of steel wheels and in many other applications where copper cannot be used because of its softness. In such instances, without the use of resistance welding which is now made feasible, it would be necessary to adopt other and more expensive methods of fabrication.

The durability of the new alloy is shown by a recent test, where the number of welds made with one dressing of a copper die averaged ten, while the first test using copper-tungsten inserts gave more than 1,000 welds, with the die still in good condition at the end of the test. Other tests showed better results. It is therefore expected that the cost of changing the old copper electrodes and redressing them will more than pay for the larger first expenditure for copper-tungsten.

The material has been given the trade name Elkonite and will be manufactured and sold exclusively by the Elkon Works, Inc., Weehawken, N. J., of P. R. Mallory & Company.

Visible Edge on Car Steps

IN ORDER to make the outside edge of "Safesteps" more pronounced, the Irving Iron Works Company, Long Island City, N. Y., has brought out a new design in which the first bar next to the nosing has twice as many crimps as the other bars on the step. This has been added as a safety precaution to prevent overstepping when passengers alight. Other standard characteristics of this step have been retained, which include particularly a slip-proof surface and edge.



New Type Car Step with Visible Edge

Association News & Discussions

Pennsylvania Street Railway Association Holds Valuable Meeting in Pittsburgh

Proposed Policy Discussed in Bus Application of Reading Railroad—Traffic Questions Treated in a Paper by the Traffic Engineer of Pittsburgh—A. W. Robertson Points Out Many Opportunities for Public Relations

ONE of the most fruitful meetings of the year was held in Pittsburgh on March 12 representing the annual convention of the Pennsylvania Street Railway Association. A. W. Robertson, vice-president of the Philadelphia Company, gave an inspiring talk on the opportunities in public relations, saying that such opportunities not only do not knock but once at our doors but almost hammer their way to our attention every few minutes. Every time a passenger drops a fare in the box such an opportunity exists. When an extra amount is dropped in accidentally the conductor of a Pittsburgh Railways car is permitted to make a cash refund, simply asking the passenger to sign a receipt for the amount returned.

Opportunities without number were cited by Mr. Robertson; the acceptance of many of such on the part of the railway he represents was responsible in no small part for the great progress made in recent years that culminated last October in the award of the Coffin Prize to the Pittsburgh Railways. Mr. Robertson, a lawyer by profession, is a public servant at heart.

Following President F. R. Phillips' address of welcome and the annual reports of the association officers the reports of the standing committees on legislation, policy and overhead lines were read by the respective chairmen, A. W. Robertson, C. L. S. Tingley and M. W. Cooke. Mr. Tingley discussed at length the memorandum proposed for submission on the part of the association before the Public Service Commission of Pennsylvania relative to the blanket application of the Reading Railway for bus operating permits in certain eastern Pennsylvania territory jointly occupied by the steam carrier and certain electric railways. The memorandum argues that the granting of such permits to the steam carrier would greatly deplete the revenues of the electric carrier and render it unable to perform its charter duties, inevitably ending in bankruptcy. Such a procedure would be tantamount to confiscation. "On the other hand," the memorandum asks, "would the refusal of such certificate so adversely affect the revenues of the steam carrier as seriously to impair its earning capacity? If the general contention of the steam carriers is true, as we believe it is, that passenger traffic on many branch lines is not only unremunerative but is actually conducted at a loss, the curtailment or even entire abandonment of passenger service on such lines should have a beneficial effect upon their net earnings, though somewhat reducing their gross.

The memorandum concludes with several principles that are offered as a basis for consideration of such permits; arguments were presented from the floor relative to the inclusion of the last principle and this was held open for later consideration on the part of the member companies:

Unnecessary duplication of transportation service is an economic waste to be avoided.

The service zone or territory of each established common carrier and earnings derived therefrom should be respected and protected, and no attempt made to duplicate existing service in any given territory or service zone where such carriers stand ready to furnish adequate service.

Transportation facilities in any given territory or service zone should be co-ordinated so as to give the public the best practicable transportation service without duplication.

Established rail carriers or their affiliated carriers should be given preference within their respective territory or service zones as to the use of public highways for motor coach routes where necessity for same exists.

In territory common to two or more steam rail carriers, priority of occupation and extent of traffic diversion should largely determine the order of highway preference as to the several steam rail carriers.

In territory common to steam rail and electric railway carriers, the electric carriers being entirely dependent upon local passenger traffic for their revenue should have prior right to the use of highways for motor coach service operated through their affiliated motor coach companies, for the motor coach is highly competitive with the entire business of electric carriers and is a similar transportation agency which should be utilized for the extension of electric carriers' routes and service and operated as a part of electric carriers' co-ordinated railway and motor coach systems.

In territory common to two or more electric rail carriers priority of occupation and extent of traffic diversion should largely determine the order of the highway preference as to the several electric rail carriers.

During the luncheon intermission a playlet was presented by employees of the Duquesne Light Company entitled "Investigation of a Fatal Accident."

P. H. Gadsden, vice-president United Gas Improvement Company, responded to the request of the chairman to give a short talk on the value of public utility service, saying in part that such a service must eventually win out because of the superior value of the service rendered to the public. It must perform and it must be frank with the public in telling its story.

Burton W. Marsh, traffic engineer for the city of Pittsburgh, told of the co-operation he had received in helping to solve the traffic problems of that city. More than 50,000 people are now transported daily in and out of the triangular downtown district on the cars of Pittsburgh Railways and are practically on time, whereas before the rerouting of such lines cars were generally from ten to fifteen minutes late. This has been accomplished despite the 50 per cent increase in motor vehicle registration in six years and despite the fact that traffic has increased lately 2.24 times as fast as the population. Intelligent parking regulation has helped in this accomplishment. Traffic fatalities have also been reduced from 154 in 1924 to 134 in 1925. Pittsburgh is one of the few cities of its size to have effected such a reduction.

Few traffic lights are used in Pittsburgh, as the officials are not agreed that an improvement could be made by adopting systems that have been developed so far.

Digitized by Google

cussing Mr. Marsh's paper, described the system of traffic control of Chicago's 49 intersections in the loop. He said that observations during the first month of their operation indicated a greatly increased speed of cars and vehicles and a consequent reduction of congestion. The system on which the light signals were operated was not synchronous but co-ordinated, the time relationship being calculated from innumerable time studies of car and vehicle movements made by engineers of the Chicago Surface Lines.

A paper by R. H. Horton, president Philadelphia Rural Transit Company, was read in which Mr. Horton discussed the co-ordination of bus operation with present transportation facilities. This paper will be abstracted in an early issue of ELECTRIC RAILWAY JOURNAL. A reel of motion pictures illustrating Philadelphia's bus operation was shown following the reading of the paper.

Walter Jackson, in discussion, described early European bus operation and its development in certain European cities, stating in part that the gas-electric bus was an early feature in some of these installations.

Following the association dinner Hon. Richard W. Martin, newly appointed member of the Pennsylvania Public Service Commission, discussed the Pittsburgh contract under which the Pittsburgh Railways emerged from receivership two years ago. Following Mr. Martin, Thomas Fitzgerald, vice-president of this company, delivered an address, carrying his hearers through the six years of operation by the court, during which time only 150 new cars were purchased. Without the Pittsburgh contract and the partnership provisions it contained it would not have been possible to borrow the $5,000,000 necessary for rehabilitation at the time of the receiver's discharge.

Never was a street railway more liberally treated and never was there such co-operation exhibited than since the start of operations under this agreement. Since the receivership 328 new cars have been purchased, 50 miles of tracks have been rehabilitated, new signals have been installed and trainmen's quarters in ten stations have been opened.

The weekly pass has made possible greater service to the people of Pittsburgh, if not greatly increased revenues. Lessened gross revenues last year were not caused by the use of the pass, according to Mr. Fitzgerald, but were the result of industrial conditions. He stated, however, that there was not complete unison of opinion regarding this point by all officials, but that it was certain the increased usefulness to frequent short-rider patrons was a distinct asset to the company.

The same officers were re-elected, adding J. L. Adams, president and general manager Philadelphia & Western Railway, as second vice-president of the association. J. J. Coleman, general manager Scranton Railway, was elected to the executive committee to fill the position of Mr. Adams. The new officers for the coming year are: President, F. R. Phillips, Pittsburgh Railways; vice-president, W. S. Bell, Wilkes-Barre Railways; secretary, Harold A. Buch; treasurer, C. F. Crane, Harrisburg Railways. The new executive committee consists of C. L. S. Tingley, American Electric Power Company; Thomas Cooper, Westinghouse Electric & Manufacturing Company; C. F. Crane, Harrisburg Railways; J. J. Coleman, Scranton Railways; H. L. Mitchell, West Penn Railways; J. E. Wayne, York Railways, and W. A. Woolford, General Electric Company.

There were 148 registered at the meeting and 174 attended the dinner.

Attendance at A.R.E.A. Convention Shatters Previous Records

Committee Reports at Chicago Bring Out Many Points of Interest—Meetings of Signal Section and of National Railway Appliance Association Are Also Held—Many Exhibitors in Coliseum

ONCE again the American Railway Engineering Association broke all previous records for attendance at its annual convention held in Chicago March 9 to 11. Final registration figures for this 26th annual meeting showed a total of 831 members and 199 guests, or a combined total of 1,030. Sessions were held morning and afternoon of each day, the time being largely devoted to the hearing of committee reports and to limited discussion of the same. Due to the extensive nature of these reports, the committees were requested to abstract them as much as possible, in order that more time might be available for discussion. There is considerable feeling prevalent in the association that some means must be found for providing additional convention time, possibly through the addition of a fourth day to the convention period.

The annual dinner was held on Wednesday evening, at which time E. W. Beatty, president of the Canadian Pacific, presented a very interesting talk on "The Engineer." A number of other important addresses were also given. So great was the interest shown in the banquet that the total possible reservations were exhausted, and several people had to be turned away.

It was considered advisable to shift the time for holding the meetings of the Signal Section, A.R.A., to the day before and the first day of the American Railway Engineering Association convention rather than scheduling them for the day following the close of the convention proper. This was because the two bodies had so much in common that it was felt advisable so to arrange convention dates that a maximum amount of joint attendance would be possible.

The National Railway Appliance Association held its eighteenth annual exhibition in the Coliseum on Monday, March 8. The exhibitors this year totaled 188, compared with 176 last year. Displays of railway materials and devices were more elaborate than ever before.

PRESIDENT FAIRBAIRN OUTLINES SCOPE OF THE ASSOCIATION

Believing that a more uniform effort should be made to encourage membership in the American Railway Engineering Association, in order to equalize to some degree the corporate and geographical distribution of the membership, J. M. R. Fairbairn, chief engineer Canadian Pacific Railway, pointed out in his presidential address the manifold activity carried on by the association and the very real advantages to be derived from membership therein. Speaking of the work done by the 23 standing committees of the association and those special committees dealing with special assignments, he explained that the various subjects assigned to each committee are pertinent to the particular field which that committee covered and are selected carefully by the outline of work committee and the board of direction, after fullest co-operation with the committee chairman in each case. It is intended to cover in any one year only those subjects which are most urgently in need of analysis and solution by the railways.

At the Wednesday afternoon session C. F. W. Felt, chief engineer Santa Fé system, was elected president of the association for the ensuing year. He was installed on Thursday afternoon at the conclusion of the presentation of the committee reports. At this time J. L. Campbell, past-president, presented Mr. Fairbairn with a silver loving cup in behalf of the association in appreciation of his services to the organization.

W. B. Murray, vice-president of the Murray Train Control Corporation, became president of the National Railway Appliances Association for the ensuing year. A. H. McKeen, signal engineer Union Pacific System, was elected chairman of the Signal Section, A.R.A.

Some of the more important points covered in committee reports which may be of interest to electric railway men are given here:

ECONOMICS OF RAILWAY LOCATION

Economics of railway location is affected by the introduction of electric locomotives, according to the report of this committee. The principal economy to be effected by the introduction of the electric locomotive for a projected railway line lies in the modification of the ruling grade, it being possible to follow more closely the natural topography of the country. Unless the country were level in character less linear curvature would be possible, shortening the total mileage of the system accordingly.

Characteristics of Electric Locomotives—Maximum tractive effort which may be exerted by an electric locomotive is dependent upon the weight on drivers and may be maintained from zero speed up to some speed determined by the motor characteristics. The tractive effort is uniform at any given speed, decreasing as the speed increases, and always has a definite relation to speed, depending upon the characteristics of the motors used.

Digitized by Google

Availability of Motive Power—It has been demonstrated by the electrified railroads of this country that electric locomotives can be operated at greater distances from repair shops and for longer periods between shopping for inspection or overhaul than steam locomotives, due to the lesser necessity and the greater ease of making renewals to electric locomotives. This feature of the electric locomotive should affect the economics of railway location in that terminal facilities for turning of locomotives, inspection and repair can be located at the most economic point and raw supplies and labor more readily and cheaply obtained.

The committee wishes to draw attention to the consideration being given at the present time to the internal combustion engine in the form of a prime mover for locomotives, which, in combination with electric drives, makes an independent unit with some of the desirable characteristics of the electric locomotive and without the attendant disadvantages of transmission, distribution and conversion equipment. The introduction of this type of electric locomotive will affect railway location and these locomotives can carry sufficient fuel and other supplies for a six to seven-day run.

Iron and Steel Structures

The committee recommended that report on instructions for maintenance inspection of superstructures of steel bridges be approved for publication in the Manual. These instructions are for the guidance of inspectors in the maintenance inspection of steel railway bridges. Inspectors will be held responsible for the performance of their duties in accordance with these instructions. They shall make a complete detailed inspection of every bridge and shall report indications of overload or failure in any part of the bridge. They shall observe the behavior of the bridge during the passing of live load if practicable, noting excessive vibrations, deflection, and side sway.

Shops and Locomotive Terminals

With regard to storehouses for shops and locomotive terminals, the committee reported that the primary consideration is the economical handling of material. The arrangement should be such as to insure ample natural light and the convenient handling, checking and inventorying of materials and ease of supervision. Racks should be so located that the handling of materials will be reduced to a minimum, so there will be no dark pockets for the accumulation of rubbish, etc.

The most general process is to place a rack transverse to the house, thus permitting natural light from side windows to illuminate the aisles and racks. Some railroads place the racks longitudinal to the house to permit freer observation of the force. On the other hand, this requires more artificial lighting and more floor space.

Track facilities should be provided for the receipt of incoming materials, for the loading out of materials, for distribution to other points in the shipment of scrap. Paved roadways should connect the storehouse to a public highway and all parts of the shops and terminals served by the storehouse. These roadways not only serve in the distribution of materials but also provide easy access for fire apparatus.

Electricity—Specifications for Track and Third Rail Bonds

The work of the sub-committee this year has been confined largely to securing and tabulating data covering the latest bonding practices being used in steam railroad electrifications in the United States and Canada. It will be noted that track rail bonding as well as third rail bonding practice varies widely even where conditions that affect the selection of bonds are similar. Reliable data covering the relative merits and performance of the different types of bonds are lacking.

Track Rail Bonding

There are two general classifications of bonds in use, (a) mechanically applied bonds to web of rail and (b) heat applied bonds to head of rail. The advantages and disadvantages of a mechanically applied type of bond may be summed up as follows: *Advantages*—Ease of installing. Wide range in choice of length of bonds and flexibility of designs to suit rail joints. Low labor costs of application and replacements. Small and inexpensive installation tools. *Disadvantages*—High first cost. Necessity of being designed to suit the rail joints, the length being fixed by splice bar and bolt hole safety. Larger capacity than otherwise necessary when long lengths are used. Uncertainty of securing and maintaining uniform and low contact resistance unless special care is taken to insure proper application and maintenance.

Advantages and disadvantages of the welded type of bond may be summed up as follows: *Advantages*—Low first cost to install. Low resistance due to short lengths and character of contact. The use of small capacity bonds, all being of 250,000 circ.mil or less. Easily inspected. Uniformity in design. Permanency of contact and consequently permanency of contact resistance provided the weld holds. *Disadvantages*—Skilled operators required for installation. Special tool equipment which is more or less cumbersome. Exposed to mechanical injury of several kinds. Exposed to theft. Limited resistance to fatigue stresses on account of short lengths. Expensive to replace, particularly when only a few applications are to be made. Limited to rail head applications. Possibility of starting detail fractures in rail due to heat necessary in application.

Third Rail Bonding

Due to the different kinds and shapes of third rail in use, the third rail bond must necessarily be of more or less special type and the design must be adapted to the type of rail with which it is used. There are eight installations comprising four mechanically applied types of bonds and four heat applied. Of the mechanically applied, three are of the compressed terminal type and one the pin expanded terminal type. Of the heat applied bonds, two are gas welded and one electrically welded and one of the standard type. Comparatively little opportunity is offered at present for standardization of third rail bonding practice because of the widely differing types of third rail construction.

With respect to thermit welding, practically nothing has been done in the steam railroad field with the exception of an experimental installation in third rail work, although this type of welded joint is widely used in the street railway field for running track.

Signals and Interlocking

Arguments for and against the location of warning signals in the center of the road rather than on the right side of the road are listed. Uniformity is needed, not only of signals but of their location, but in the committee's opinion this cannot be secured. Each location should be given special study. With the highway curving sharply to the right, in some cases in spite of interference of lights from opposing automobiles and even the cars themselves, it will be best located on the left side. If the roadway and surroundings are well illuminated as in city streets, and especially if the city traffic signs are in the center of the street and people are accustomed to look there for them, the center of the street is the place for crossing signals also.

In the open country where power is not available to furnish extraneous lighting, as is the case in the majority of country roads and even on state highways, and where drivers are accustomed to look to the right side of the road for information, signals should be located on the right of the highway so as to be seen by those who seek them there.

Perhaps as good a rule as any to advocate would be to locate the signal in the center of the street if the street is wide enough so that this can be done without great expense when assured that the local people will not require floodlighting or illuminating it to give a Christmas tree effect; otherwise it would be best to locate the signal on the side of the road. Second, uniformity in the matter of painting, both as to color and the form it should take, might be attainable. Third, it certainly should be possible to present a united front on the desirability of eliminating advertising signs in the vicinity of railroad crossings, especially within the zone limited by the approach signs at 300 ft. or 400 ft. beyond the crossing. Also, against the use of fixed red color lights under signals located in the highway.

Ballast — Revised Rules Pertaining Thereto

Rule 790—The object of ballast is to secure a solid and uniform bearing for the ties, distribute the applied load over a large surface, hold ties firmly in position, give elasticity to the track, and allow the water to pass off freely.

Rule 791—Before distributing ballast, the roadbed should be carefully prepared with embankments and cuts widened to conform to the standard plan. Track must be kept in good line and surface while ballasting and stakes should be set for this purpose. The ballast program should be so arranged and the supply so regulated as to leave the least possible open track during the progress of the work, with no open track when the season closes.

Rule 792—Where directed by the

Digitized by Google

division engineer, preparatory to the distribution of new ballast, all the old ballast and unsuitable material must be removed to the bottom of the ties for the full width of the roadbed, the old ballast cleaned and the material unsuitable for ballast used for widening embankments or other purposes. At the same time all ties requiring renewal should be replaced and the ties properly spaced.

Rule 795—In gravel or broken stone ballast the ties should be tamped solid from 15 in. inside the rail out to the ends. The space under the rail should be tamped well. The center of the tie should not be tamped.

Rule 796—Where the track is electrically bonded, the ballast must be kept at least 1 in. below the base of rail. At road crossings and platforms where this is not practicable, the rails should be insulated by painting them with an asphaltum or tar product, and good clean stone mixed with the same material should be used for at least 1 ft. each side of the rail.

Economics of Ties

In preparation of service tests, it is necessary, first, to determine the object of the test and then the test practice can be devised. Considerations of the elements of testing tie life or service led to selecting the following subjects which should be considered in formulating test practices and records: (1) Relative advantages of the different sizes of ties. (2) Results with different intensities of traffic, other variables being the same. (3) Relative advantages of different kinds of preservative treatment. (4) Advantages of pre-boring and pre-adzing ties for treatment. (5) Relative economies of large and small-sized tie plates. (6) Determination of density of traffic which makes use of tie plates economical. (7) Relative economy of crossties 8 ft. long compared with ties 8 ft. 6 in. long, under different traffic and ballast-conditions. (8) Relative values of different kinds of wood. Recommendation of the committee that the report be accepted as information was accepted by the convention.

Wood Preservation

Among the outstanding problems concerning wood preservers has been the treatment of Douglas fir, the extent of its use making it an appropriate subject for attention on the one hand and its resistance to treatment presenting a real obstacle on the other. The committee has made some very complete investigations on this subject and felt justified in presenting specifications for the treatment of this type of timber. The committee also undertook the carrying on of marine piling investigations. Being restricted by lack of available funds for research and being under the necessity of working entirely with contributed services, the committee found itself unable to continue the extremely valuable biological work which had been previously carried on by the National Research Council.

Wooden Bridges and Trestles

This committee's report took the form of four appendices. Appendix A comprised a brief statement concerning changes in the Manual, none being offered. Appendix B embraced a large amount of material relative to the simplification of grading rules and classification of timber and lumber in railway uses. Appendix C contained a report on the value of treated timber in wooden bridges and trestles. Appendix D constituted the results of a study in the classification of the uses of timber and lumber on the railroad, and took the form of tables giving the recommended grades of lumber to be used in various types of wooden bridges, buildings, tanks, fences, culverts, etc.

Economics of Railway Labor

Of particular interest was the report on standard methods for performing maintenance of way work and the establishment of units of measure of work performed; the extent to which it is practicable to stabilize employment in the maintenance of way department in the interests of efficiency; economy in the use of labor-saving devices; and education and training of maintenance of way employees. It was the conclusion of the committee, in connection with the investigations of standard methods of performing maintenance of way work, that it is not possible to determine a fixed unit of cost of maintenance of way and structures account for any unit of property, such as the equated mile, or for any unit of use, such as 1,000 car-miles. It stated the conclusion that it will be impossible to determine upon such unit of cost at any future time unless all railroads were to adopt the use of standard materials and standard practices, and even then there would exist differences reflecting the differences in location, climatic conditions and physical construction.

Signs, Fences and Crossings

The committee reported concerning proposed revisions of the Manual, methods of apportioning the costs of highway improvements adjacent and parallel to railroad rights-of-way; the elimination of highway grade crossings and the use of natural rock asphalt as the substitute for planking in road crossings. The revisions of the Manual included a revision of the highway crossing sign and of the present bridge sign, various minor corrections and revisions intended to cut down the amount of space devoted to tables and illustrations and revision of the specifications of bituminous crossings.

Rails

The committee presented a recommended design for track bolts, including corresponding joint bar hole. This design accords with the recommended design presented last year as a progress report, with the exception of revised dimensions and radii of the shoulder of the elliptical track bolt. As now presented, the design shows optional properties for contour of shoulders, type of thread and periphery of nuts. The committee believes that this design meets conditions existing on the majority of American tracks for renewals and may be adopted generally for new construction. Manufacturers of track bolts have approved the design.

Statistics and data on rail failures, transverse fissures, relation of bolt tension to mechanical strength of joint, rail battering, the welding of traction and signal bonds, rail canting and specifications for spring washers and for girder rails were presented. On the latter point, the committee stated that while the girder rail is used only by steam railway lines in pavements through city streets and will probably never aggregate more than 100 miles, still it has seemed wise to co-operate with the American Electric Railway Engineering Association in revising its standard to conform as closely as possible with the steam T-rail standard in metallurgy and mechanical requirements. The specification has been ratified by the American Electric Railway Engineering Association, and adoption of it by the American Railway Association sets a common standard.

Track

Among the subjects covered by the committee in its report were detail plans of switches, frogs, crossings, including plans of self-guarded frogs; methods of determining recommendations for rail renewals; cause and prevention of rail battering; principles of rail joint construction; use of nut locks for rail joints with special reference to heat-treated bolts of large diameter; plans for tie plates. The sub-committee on detail plans of switches, frogs and crossings offered Plan No. 778 of manganese steel insert crossings, steam railroad over electric railway, angle below 45 deg. to 40 deg. inclusive, for adoption as recommended practice. This plan is to complete the series of plans of crossings of steam railroads over electric railways. Solid manganese construction for steam railroad over electric railway crossings is recommended for angles 90 to 45 deg. as per plans No. 776 and No. 777, adopted in March, 1924. Manganese insert construction is recommended for angles below 40 or 45 deg. to 30 deg. as detailed on plan No. 778 now offered. For bolted rail crossings, steam railroad over electric railway, there are plans No. 716 and No. 717 for angles 90 to 30 deg. adopted in March, 1925. The committee recommends that crossings, steam railroad over electric railway, below 30 deg., particularly for narrow tread and shallow flange electric railway car equipment, be avoided.

In addition, in collaboration with the M.T.S. standardization committee, this plan was prepared in consultation with a number of the members of the committee on way matters of the American Electric Railway Engineering Association and that committee will offer it to the American Electric Railway Association.

Records and Accounts

The committee presented a report covering the following assigned subjects: (a) Methods and Forms for Gathering Recording Data for Keeping Up to Date the Physical and Valuation Records of the Property of Railways; (b) Feasibility of Reducing the Number of Forms Used in the Engineering and Maintenance of Way Department, Combining Forms and Simplifying Those Retained; (c) Comparison of Daily and Monthly Time and Material Reports.

The News of the Industry

Management Contract Under Fire in Indiana

A contract existing between an operating railway in Indiana and a holding company domiciled in New York is criticised by the Indiana Public Service Commission in an order granting an increase in fares to the railway. The contract under fire is one by which the local company pays a percentage of gross earnings and expenditures for extensions and betterments of service to the New York company.

Clyde H. Jones, commissioner, denounced the contract as "a process for milking the patrons of the utility and directly obtaining an enhanced return on its investment." The order of the commission said in part:

> This contract is similar in its terms to certain license contracts which other foreign holding corporations have imposed on local operating utilities, but it goes much farther than any to which our attention has yet been called. Sooner or later patrons who are subjected to such contracts will become aroused and it will provide a splendid argument for those who insist on government and municipally owned utilities.

Tentative Franchise for St. Louis Nearly Ready

Mayor Victor J. Miller of St. Louis, Mo., discussed the new blanket franchise for the United Railways in an address before the St. Louis Chamber of Commerce. He stated that the draft of the franchise ordinance would be ready for publication soon. The Mayor says the new grant is to be a very inclusive document, designed primarily to see that the citizens receive the best possible service at a minimum cost. He believes it would be an excellent thing for the city to be in a position to lend its credit to the railway in the construction of subways. The city should retain absolute control of the character of service. There should be provision for a director of transportation.

Municipal Operation a Fizzle Again

New York City Loses $717,508 on Staten Island Operation—Since 1921 Loss on Trackless Trolley Has Been $346,232 on Five-Cent Fare—New Administration Wants Roads Privately Operated

TRACKLESS trolley operation by the city of New York on Staten Island has cost the city $346,232, that having been the loss from Oct. 13, 1921, to Dec. 31, 1925. Municipal operation of the lines of the Staten Island Midland Railway has cost the city $371,276, that being the deficit on a 5-cent fare from Jan. 1, 1921, to Dec. 31, 1925. This is a total loss to the city of $717,508 on the two operations.

As a result of the studies made abandonment by the new city administration of municipal operation of the trackless trolleys and Midland Railway surface lines on Staten Island and of the surface line across Williamsburg Bridge are foreshadowed.

The Williamsburg Bridge operation has never been profitable to the city and a return to operation of the cars by the B.-M. T. and the Brooklyn City Railroad was advocated during the closing days of the Hylan administration.

That the city, in addition to its loss of $717,508 on the operation of trackless trolleys and surface lines on Staten Island, faces an additional loss on damage suits was disclosed by Comptroller Berry, who said that claims aggregating $120,000 had been filed against the city and that a reserve of only $3,056 had been established.

Examinations previously made of the affairs of the trackless trolley system have been continued under Mr. Berry's direction and show the following situation to exist:

An operating deficit for the entire period of more than $300,000; that the cost of transporting each paying passenger was 12.19 cents and that this cost was about 10.42 cents with a charge for depreciation excluded. To this must be added the amount that must be ultimately recovered for damages, claims having been filed for approximately $120,000, of which a judgment has already been entered and paid amounting to $11,334.35. A reserve of only $3,056.72 has been set up during the entire period to offset these claims for damages.

In a previous report on the conditions of the trackless trolley system on Staten Island covering the period from Oct. 14, 1921, to March 14, 1923, it was estimated that the cost of transporting each passenger was 10.27 cents. The increase in cost from 10.27 cents per passenger to 12.19 cents for the entire period covered by the present report is due in part to the increase of operating expenses, those for 1925 being approximately $5,000 a month in excess of preceding year.

For various years from Jan. 1, 1923, the cost of transporting each passenger was as follows: 1923, $0.1251; 1924, $0.1213; eight months of 1925, $0.1218.

Operating revenues for the entire period were $210,399.54 as against operating expenses of $512,639.91, leaving a net deficit of $302,240.37.

The examination conducted by the Department of Finance shows a total of 4,228,987 paying passengers carried for the entire period, this total being divided between 5-cent fares for adults and 3-cent tickets for school children. There was free transportation for 10,950 employees, making a grand total of passengers carried of 4,239,937.

On the occasion of the publication of a previous report by the Department of Finance the contention was raised in some quarters that admitting there was a loss in operating the trackless trolleys the transportation facilities afforded by the city had resulted in opening up a large undeveloped territory to home sites; that the increased assessed valuations of real property in the territory affected and the consequent increase in the city's revenues from taxation would ultimately offset the losses. Of this Mr. Berry said:

> This contention has not been borne out, nor is there any likelihood that the increase in population in the territory affected ever will be such as to put the present transportation system on a self-supporting basis.

The Board of Estimate appropriated $83,000 for the purchase of trackless trolley cars and the installation of overhead equipment on April 1, 1921, and operation of two lines was begun Oct. 13, 1921. On Nov. 18, 1921, the board appropriated $10,000 to serve as a "revolving" fund for operation, and on Dec. 8, 1922, a second $10,000 for the same purpose. In the meantime, on Dec. 16, 1921, the board appropriated $192,700 for the establishment of a trackless trolley line from Richmond, the terminus of the Richmond line of the Midland Railway, to Tottenville. On Oct. 5, 1923, the board added $30,000 to the revolving found.

In the fall of 1923 the board decided to include in the tax levy budget the funds considered necessary for the operation and maintenance of the trackless trolley lines and provided $128,678 for this purpose in the 1924 budget. It pursued the same policy for the succeeding years and put $118,551 in the 1925 budget and $107,930 in the budget for 1926.

An estimate of the cost of operation follows:

Expenses to Dec. 31, 1923, includes special revenue bonds—receipts for passengers, etc., from books of Department of Plant and Structures	$153,821.26
General fund	60,924.16
From tax levy budget funds, 1924.	128,677.71
From tax levy budget funds, 1925.	112,344.53
Claims paid by Finance Department on account of accident	11,334.35
Reserve for claims, accident and damages estimated	10,000.00
Interest on corporate stock, 1923, 1924, 1925	41,365.21
Interest on corporate stock to Dec. 31, 1922, estimated	10,000.00
	$528,067.22
Less materials on hand	38,699.55
Total estimated cost of operation and maintenance, exclusive of depreciation	$489,367.67

Records of the Plant and Structures Department give the cost of equipment and construction for the trackless trolley lines as $275,224. In their

Digitized by Google

report to Commissioner Goldman his engineers have estimated depreciation at 33⅓ per cent, or $91,740. This added to $480,367, the estimated cost of operation and maintenance exclusive of depreciation, would make the total cost of operation and maintenance $581,107.

After the bankruptcy of the Staten Island Midland Railway Company the city, through the Department of Plant and Structures, began operation of its six lines with a total mileage of 41 on Dec. 1, 1920.

The balance sheet of the municipal operation of the Midland surface lines, from Dec. 1, 1920, to Dec. 31, 1925, follows:

Special revenue bonds (revolving fund)	$160,000.00
Receipts — Passengers, advertising, etc.	2,171,907.79
General fund	145,924.02
Taxes—Payable by Department of Finance (estimated)	86,627.63
Interest corporate stock, Department of Finance (estimated)	76,592.45
Accidents and damages, Department of Finance (estimated)	50,000.00
Paving by Borough President of Richmond	117,797.21
	$2,808,848.10
Bills payable (no funds available)	120,073.69
	$2,928,921.79
Credit—Cash, materials, supplies, etc.	42,989.75
Total (not including cost of cars)	$2,885,932.04

The deficits in operation of the surface lines, as reported by the engineers, amounted to $3,316.55 for the six months ended June 30, 1921; $49,191.31 for the year ended June 30, 1922; $35,099.27 for the year ended June 30, 1923; $84,848.53 for the year ended June 30, 1924; $103,595.71 for the year ended June 30, 1925, and $104,690.07 for the six months ended Dec. 31, 1925. Deducting $9,464.98 received from the sale of old material, the total deficit on the operation of the lines up to Dec. 31 last was reported to have been $371,276.76.

BUS LINES SUGGESTED

Discontinuance of city operation of the lines and the establishment of bus routes have been recommended by Edward A. Byrne, chief engineer of the Department of Plant and Structures. He said:

The receipt for the nine months ended Dec. 31, 1925, were only sufficient to pay salaries and wages, and the city owed on Dec. 31, 1925, about $110,000 for power, materials, supplies, hire of cars, etc. The city-owned cars are in such poor operating condition that this department found it necessary to hire cars from the Richmond Light & Railroad Company to operate during rush hours, and bills unpaid to Dec. 31, 1925, for this service amount to $14,460.

If the city decides to continue the operation as a permanent enterprise it will be necessary for the city to appropriate funds to an amount of from $1,500,000 to $1,750,000 to purchase new cars, install new track for part of the system, purchase a substation and a carhouse site, reconstruct the carhouse and acquire any rights that the railroad company may have. If this be done a rate of fare must be fixed taking into consideration all the above stated facts.

As a business proposition purely, putting aside the service that the people of Staten Island expect who have purchased property and live in the territory served by the city operated cars, the writer would recommend that this department cease operation of this road and the Board of Estimate and Apportionment grant franchises for the operation of buses along the routes now operated by this department.

Facts on New York Buses Disseminated

Railway Managements and Director Storrs Spread the True Story—Newspaper Co-operation Being Secured—Some Hints on How Others Have Done It

NEWSPAPER editors throughout the country are learning first-hand from their electric railway managements that the surface car in New York is not going to be supplanted generally by buses. Not only has the ELECTRIC RAILWAY JOURNAL discussed the matter at length, but armed with an authorized statement, prepared under the direction of Managing Director Storrs of the American Electric Railway Association, explaining the situation, the managements are getting in direct contact with their editors and rapidly correcting the original misleading story.

The statement, released through the association, follows:

Submission recently of a plan to substitute buses, at an increased fare, for 200 street cars in New York, which have been unprofitable under a 5-cent fare, has led to erroneous conclusions. The chief of these is that "this proposal marks the beginning of the end of surface lines in New York City."

The facts do not warrant this assumption or anything like it. What has happened is simply this:

For some years the New York railways has been operating street cars on the 25 miles of track involved at a loss under the 5-cent fare. Recently it arranged with the Fifth Avenue Coach Company to propose to the city that buses be substituted, under a 5 and a 10-cent fare arrangement, for street cars on the present unprofitable 5-cent lines. The short cross-town rides would be 5 cents, but the longer up and down town rides 10 cents.

Compared with the city's total riders, the number affected by the proposed change would be small. Passengers carried on the 200 cars in 1925 represent about 4 per cent of the city's surface lines total of 1,035,977,724 revenue riders. This is 36 per cent of all electric railway pasengers. Subway and elevated lines carried 62 per cent, or 1,680,800,254 passengers.

Various individuals and groups have hailed this proposal as marking the obsolescence of the trolley. It is nothing of the kind. This suggestion is simply another move to carry out the definite policy of the American Electric Railway Association and the local transportation industry generally.

That policy is to render service either by electric railways or buses, and particularly to supplant non-paying lines with buses at a rate of fare which will insure fair earnings. There have been similar replacements proportionally as great elsewhere in the past, but invariably the electric railway has remained the backbone of the system.

Incidentally, it should be remembered that in New York subways provide the backbone of service and all other means of transportation are necessarily of a supplemental character. In most cities the local electric railway is the main artery of transportation, as in the subway in New York. To talk of doing away with surface lines in most cities is equivalent to talking abandonment of subways in New York. And that isn't being done.

Attempts made in London to substitute buses for street car service have failed. When the point was reached where buses were carrying 40 per cent of local downtown traffic the congestion became so great that it was necessary to eliminate many of the buses.

The New York *Times* summarizes the situation so far as it affects Manhattan Island very clearly in an editorial which says in part:

"There is danger of the opinion establishing itself that the surface car in Manhattan is an obsolescent institution of little practical value, the sooner got rid of the better. In 1925 the surface cars in Manhattan carried 354,000,000 passengers. This was 2,000,000 more than traveled on the elevated lines and nearly half the number carried on the Interborough subway lines. Obviously the surface car is a problem of considerable dimensions.

"From that point of view the question of fares becomes of outstanding significance. The new plan calls for a 10-cent fare on the longitudinal routes. That same fare, it must be assumed, will be asked whenever the extension of the bus routes to the entire city is effected, if ever. If such a fare is justified, it would be a virtual admission that the bus is much more expensive than the trolley car. This would confirm the general deduction from the fact that gasoline power threatens to become more and more costly with time, while electric power tends to develop in the opposite direction. In any case the establishment of a 10-cent fare is not a matter to be lightly disposed of in a community which has fought historic battles over the 5-cent fare in the subways."

Predictions that the trolley is doomed to pass have appeared many times in the past and doubtless will appear in the future. Yet these salient facts stand out:

Bus rides cannot be provided as cheaply as electric railway rides.

Every attempt in this country to motorize a city of more than 50,000 persons has failed.

Informed transportation minds everywhere agree that the best local transportation service is provided by electric rail service supplemented by buses.

In addition to supplying all companies, both operating and manufacturing, with this authorized statement, the association prepared it in leaflet form and it is now being widely distributed. Among others who have received the statement are all newspapers in the country, all financial editors, investment bankers, state committees, libraries, universities and schools, state and city officials.

One of the first railways to use this material to advantage was the Montreal Tramways. Both English and French papers published stories exposing the weaknesses of the claim that cars were to be supplanted.

The Chicago *Daily News*, in an editorial, pointed out clearly the impossibility of buses supplanting the surface lines.

The Philadelphia *Public Ledger* and the New York *Evening Post* took cognizance of the situation in their financial pages.

Walter A. Draper, president of the Cincinnati Street Railway, and Hudson Biery, commercial manager, were quick to sense the timeliness of the topic. Mr. Biery delivered a talk to a local club and later the Cincinnati papers published more than half a column about his remarks.

These are only a few specific instances of getting the correct story before the public through executive co-operation. There have been and will be many others.

Managing Director Storrs paid particular attention to the situation in a speech at Providence, R. I., and another at Springfield, Ill. The Providence speech was productive of much local publicity. The Springfield address was delivered before the combined utility associations of Illinois. It was carried in advance by large press associations and newspapers.

The statement recently sent out is available through the association in leaflet form, but there also is much more than that available. The association, the ELECTRIC RAILWAY JOURNAL, other trade publications, speakers and others have discussed the subject thoroughly during the last five years.

Seven-Cent Fare in Chicago Stands

Chicago's 7-cent fare, in effect on the surface railways as a temporary compromise since June, 1922, has been approved by C. B. Morrison, federal master in chancery. The 6-cent fare ordered by the Illinois Commerce Commission in 1922 would be confiscatory, the master reported by implication. He said also that the 8-cent fare previously effective was too high. His report recommended continuance of the 7-cent compromise. In ordering the fare reduced to 6 cents the Illinois Commerce Commission attempted to force the Chicago Surface Lines to reduce the wages paid to trainmen and the salaries paid to officials, the master said. The commission failed to prove that wages or salaries are excessive. The report will make worthless the hundreds of thousands of transfers car riders have been saving since 1922 under a court ruling that made transfers legal fare receipts. Had the 6-cent fare been upheld the transfers would have been redeemable for 1 cent each. It is expected that Federal Judge Wilkerson will approve the finding.

Valuation Finding at Baltimore Attacked by People's Counsel

Clarence W. Miles, people's counsel, has appealed to the Circuit Court at Baltimore from the recent decision of the Maryland Public Service Commission placing a valuation of $77,000,000 on the property of the United Railways & Electric Company, Baltimore, which amount includes an allowance of $7,000,000 for easements. He asks that the opinion and order passed by the commission be vacated, annulled and set aside. During the hearings Mr. Miles opposed including the easements in the valuation. Two of the three members of the commission, however, after receiving an opinion from the Attorney-General of the state, included the easements. The third member, J. Frank Harper, agreed with Mr. Miles and filed a minority opinion in the case. Mr. Miles said the so-called easements constitute a mere right in common to use the streets and are in no sense property or such an interest in land or property as to permit their capitalization or evaluation for rate-making purposes. The court issued an order requiring an answer by April 7.

New Franchise Need in Louisville Explained

James P. Barnes, president of the Louisville Railway, Louisville, Ky., and its subsidiary, the Kentucky Carriers, Inc., went before the Board of Works on March 11 and outlined expansion plans over the next ten years. He argued for a new franchise contract with the city, based on a broader term, enabling the company to secure earnings which would make it possible to interest capital and provide funds for necessary expansion. Mr. Barnes discussed plans calling for about 45 miles more of track, about 70 cars, additional buses, and equipment to a total of $8,500.000.

In 1930 the company must refinance a first mortgage of $6,000,000; and in 1932 a second mortgage of $2,000,000, and it may be necessary to pay interest for this money higher than is now paid, due to the present ordinance, limiting earnings to a point where investment would not appear attractive. Extensions costing about $350,000 are needed now in the suburban section.

The company is now collecting a straight 7-cent fare under a sliding or barometer scale arrangement.

Charles L. Craig Holds Option on Certain New York Lines

Charles L. Craig, former comptroller of New York City, now holds an option on the franchise and trolley tracks of the Fourth and Madison Avenue lines running from the old Post Office at City Hall Park to the Harlem River. The option was obtained six days before the so-called "mystery" bill was introduced in the Legislature at Albany to give New York City the power to acquire any surface car line and remove its tracks from the streets. Mr. Craig said that he felt the city should have the chance to acquire the property but that he and his associates were prepared to modernize the trolley lines and continue operation at a 5-cent fare. The Craig bill was criticised in Albany on the ground that it might be considered a "grab."

Relief Sought in Sioux Falls

In accordance with present plans the fate of the Sioux Falls Traction System, Sioux Falls, S. D., will be decided upon by the voters at the city election on April 20. A chamber of commerce committee recently appeared before the City Commission seeking relief for the street car system. The committee stated that the street car system was of vital importance in the development of Sioux Falls, but unless some relief were offered the company would cease operations. The survey shows that the street car company is steadily losing patronage and that its expenses are steadily increasing. Each year shows the company to be operated at a greater loss. The loss is shown in both the bus and street car departments. Relief is sought in several ways. It has been proposed to increase the fares to 10 cents and to sell fifteen rides for $1; to relieve the company of having to pay for the paving between its rails and a foot on each side; to change track construction and reduce the taxes on the property.

Extension of Public Control of "L" Favored

At the first voting the bill to extend the public control of the Boston Elevated Railway, Boston, Mass., for a period of 30 years scored a victory in the Massachusetts Legislature. The committee on metropolitan affairs and committee on street railways, sitting jointly, voted in favor of the bill, fourteen to ten, with three members reserving their rights and three not voting. The bill, as approved, is reported in the House.

News Notes

Changed Fare Approved.—The Public Service Commission has approved by special permission an amended tariff of the Kingston Consolidated Railroad providing for a sale of ten school tickets good in the city of Kingston, N. Y., and suburbs for 50 cents, effective March 1.

Increased Fare in Effect.—The East St. Louis Railway, effective March 11, raised the cash fare over the Eads Bridge from St. Louis to points in East St. Louis, Ill., from 13 cents to 15 cents. Persons who use tokens, which are purchased five for 40 cents, can make the trip for a token and 5 cents. A federal injunction recently secured at Danville, Ill., restrained the Illinois Commerce Commission and state, county and East St. Louis city legal officers from interfering with a raise in the basic city fare in East St. Louis from 8 cents to 10 cents and tokens from two for 15 cents to five for 40 cents.

Wage Negotiations in Scranton.—Wage conferences are being held with the officials of the Scranton Railway, Scranton, Pa., and the carmen's union looking to a new contract to replace the old one expiring on March 31. The railway employees' union is demanding an increase of 11 cents an hour for motormen and conductors and a boost of 16 cents an hour for track men and 17 cents for carhouse men. The company has been asked to make the hourly rate of pay for operators of one-man cars $1 an hour instead of 72 cents. Under the present one-year contract the men receive 58, 61 and 64 cents.

Transfer Plan Extended.—The Memphis Street Railway, Memphis, Tenn., has started a new plan of allowing several transfers to its patrons for the one fare. Conductors are instructed to punch transfers twice or three times providing the patron is bound for a destination that is in one general direction. Prior to the latest transfer innovation the crosstown line was the only one permitting two transfers for one fare.

Line Between Marietta and Beverly May Continue.—Officials of the Monongahela West Penn Public Service Company are willing to continue the Muskingum Valley line between Marietta, Ohio, and Beverly if a plan can be worked out by which the company will receive enough to meet actual operating expenses. The directors of the local Chamber of Commerce will co-operate with officials of the company in an effort to work out some method by which the company may operate.

Honor Long Service.—Officials and employees of the Indianapolis Street Railway, Indianapolis, Ind., on March 12 honored William F. Milholland, assistant secretary-treasurer, with a surprise party in the counting room of the company's offices. The event was in celebration of the completion of his 42d year of service with the company. As a token of esteem from the employees Mr. and Mrs. Milholland received a table lamp.

Recent Bus Developments

Reorganized Property to Run Buses

Unified transportation service, consisting of interurban cars and buses, between Cincinnati and Dayton, Ohio, is planned by the bondholders' reorganization committee of the Cincinnati & Dayton Traction Company, which acquired the property at the receiver's sale on March 8. Plans of the new owners to rehabilitate the system contemplate bus routes wherever needed in the Miami Valley from Dayton to Cincinnati. This may mean the installation of buses not only on the main line but on the city lines in Hamilton, which have earned money under the four years of receivership at a 5-cent rate of fare. Buses will be run in parts of that city now inadequately served by the electric railway. Nothing definite will be attempted until the sale of the railway under foreclosure is approved by the court.

Bus Franchise Sought to Replace New York & Long Island

Service on the New York & Long Island Traction Company lines will end in April. The lines extend from Mineola to Freeport, from Jamaica to Mineola and from Jamaica to Hempstead, in Long Island. The transit property, including franchises, was sold recently under foreclosure.

The receivers have organized the Queens-Nassau Transit Company, Inc., and application for bus franchises to cover the routes now served by the trolley cars has been made by the Board of Supervisors. Edward A. Roberts, general manager of the receivers, is head of the new corporation. The plans of the new company, Mr. Roberts said, insure improved service for the present patrons of the trolley lines. The rate of fare would remain on the present basis of 5 cents between villages.

No Suspension in Rockford Until Bus Is Assured

No attempt to abandon the interurban lines to Freeport and Janesville will be made until the protection of patrons of these lines is assured by the establishment of adequate bus transportation. This statement was recently made by Adam Gschwindt, receiver for the Rockford, Ill., interurban lines. From the time the receivership was declared it has been obvious that one of the principal steps in the rehabilitation of the Rockford City Traction Company would be to shake the city lines free from the two interurban lines, which have been a constant drain upon the company's finances, the receiver said. The question of financing the company's rehabilitation program is of first importance, the receiver says. He has suggested the underwriting of a $600,000 bond issue for rehabilitation of the traction lines. He proposed to issue receiver's certificates for that amount which would be first lien upon the property. Cost of new tracks under the rebuilding plan will be about $300,000, including incidental paving costs, and the remainder will be expended for new equipment and replacements.

Interurban and Stage Terminal for Seattle

A magnificent interurban and stage terminal and a big service building are to be constructed this year in Seattle by the Puget Sound Power & Light Company. The new terminal, to be two stories high, will be built of reinforced concrete faced with brick and stone in such a manner that it may be increased to eight stories and used for office purposes. The estimated cost of the building is $400,000. It will be used as the Seattle terminal of the Everett interurban line and at the same time will form headquarters for all stage lines operating in and out of the city. The site has not yet been decided upon.

The service building will occupy an area of 35,000 sq.ft. It will be of reinforced concrete, one story high. This building will also be so designed as to support additional stories should occasion arise. It will be used for linemen's headquarters, housing automobiles, meter department and various other purposes. Its cost is estimated at $175,000. Several sites are now under consideration.

Hearing on Reading Railway Bus Grant

Five electric railways and a borough opposed the application by the Reading Railway for permission to operate bus service from Pottstown to Pine Ford and Barto, Pa. The hearing was held recently in City Hall at Philadelphia before Russel Wolfe, an examiner for the Public Service Commission. The basis for the protest was that the proposed bus lines would parallel services already in operation. E. D. Osterhout of the Reading Railway testified that the decision to establish bus lines was taken as the result of a survey which showed that passenger traffic had fallen off in recent years as a result of the increased use of automobiles.

Hearing on Interstate Bus Bill on March 22 and 23

Representatives of fifteen bus operators' associations were scheduled to meet in Washington on March 19 to perfect through the American Automobile Association a permanent national organization. The body will be known as the Bus Division of the A.A.A. and is expected to merge the bus men of the country for closer co-operation.

Delegates to the meeting March 19 expect to be on hand to attend Senate committee hearings set for March 22 and 23 on the Cummins bill, which provides for regulation of bus lines in interstate commerce.

Operation Sought Between Rochester and Irondequoit.—The Rochester Railways Co-ordinated Bus Lines, Inc., has applied to the Public Service Commission for a certificate for operation of a bus line between Rochester and the town of Irondequoit. An hourly service is planned over the route from 6:15 a.m. to 11 p.m.

Certificates for Massachusetts Operation Extended.—Temporary bus certificates in Massachusetts, which would have expired on Dec. 5, 1925, but were extended by the Public Utilities Department until March 31, have been extended again until May 21. The reason for this extension is that the Public Utilities Department is still working on the rules and regulations for the control of bus operations in Massachusetts.

Buses to Supplant 2-Mile Railway.—W. H. Ward of Ward & Ward, Houston, Tex., has been granted a franchise by the City Commission to operate buses in Brownsville. At the same meeting an ordinance was passed, effective at once, canceling the franchise of the Brownsville Street & Interurban Railroad. The railway operated 2 miles of line. Mr. Ward proposes to start service with two buses and increase the number as conditions require. The franchise to Mr. Ward is not exclusive.

Bus Route Questions Involved.—The Citizens Transit Company, a subsidiary of the Citizens' Traction Company, Oil City, Pa., has asked permission to give up the bus franchise between Hydetown and Pleasantville. V. A. Redfield, general manager of the Citizens' Traction Company, said there had been no action toward relinquishing the Titusville bus route but that matters were considerably involved at the present time. In any event bus service as far as Rouseville would be maintained.

Route Between Frankfort and Delphi Sought.—The Indiana Motor Transit Company, a subsidiary of the Terre Haute, Indianapolis & Eastern Traction Company of Indianapolis, has applied to the Indiana Public Service Commission for a bus route between Frankfort and Delphi, setting forth that the Monon Railroad, the only other carrier connecting the cities, does not supply local service to intermediate points. It is planned to provide Delphi people with quick transportation to Indianapolis, connecting with the traction line at Frankfort. The operating schedule calls for five round trips a day and a 75-cent fare between the cities.

Gary-Lafayette Route Authorized.—The Indiana Public Service Commission has authorized the operation of the Gary-Lafayette bus route by the Gary Street Railways, Gary, Ind. Service between the two points will begin shortly. Included in the grant to the company will be authorization to operate between Gary and Crown Point. The route will provide a continuous bus line from Gary to Indianapolis.

Bus Replacement Under Consideration.—The Manhattan & Queens Traction Company has under consideration a proposal to replace the trolleys on Queens Boulevard, L. I., between Jamaica and New York, with buses.

Financial and Corporate

New York Surface Line Does Better

Directors of the Third Avenue Railway, New York, have declared a semi-annual payment of 1¼ per cent on the 5 per cent adjustment bonds of the company payable on April 1. The last payment on this account was also of 1¼ per cent. It was made Oct. 1 to cover the six months ended June 30, 1925. Accumulated interest on the bonds, including the interest payment of Oct. 1, was 22½ per cent on July 1, 1925.

The net deficit in January was $16,128, against $72,016 in January, 1925. Total operating revenue in January was $1,210,308 against $1,444,635. Gross income after operating expenses, taxes and addition of interest revenue was $205,854, against $152,879. Interest charges of $221,982, against $224,896, resulted in the deficit.

Operations in the six months ended Jan. 31 resulted in a net income of $51,939, against a net deficit of $114,494 in the same period a year before. Total operating revenue was $8,598,132, against $8,479,812. Gross income after operating expenses and taxes and the addition of interest revenue was $1,626,898, against $1,461,912. The net income figures for the period are after interest charges of $1,574,958, against $1,576,407 reported by the company in the previous period.

Bonds Called in Accordance with Ruling

Rolla Wells, receiver for the United Railways, St. Louis, Mo., has called for payment on April 1, 1926, the Lindell Railway first mortgage gold bonds, Cass Avenue & Fair Grounds Railway first mortgage gold bonds and Compton Heights, Union Depot & Merchants Terminal Railroad first mortgage gold bonds, extended to Oct. 1, 1923, including principal and accrued interest at 8 per cent per annum from Oct. 1, 1923, to April 1, 1926. No interest will be paid on the bonds after April 1. The call for payment of these bonds is in accordance with a recent order of the United States District Court.

Another Brooklyn-Manhattan Transit Common Dividend

Directors of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., announced on March 15 the second quarterly dividend of $1 to be declared on the corporation's common stock. Although nothing official to the effect was stated, the action was considered in financial and banking circles as another step toward placing the stock on a $4 annual basis.

Dividends on the common stock were announced on Dec. 21 for the first time since reorganization of the company, May 24, 1923. Directors then declared a dividend of $2 applicable to the period from organization to Sept. 30 last and another dividend of $1 for the period from Oct. 1 to Dec. 31, both payable Jan. 20 to stock of record Jan. 5.

Gross revenue of the company in January was $3,678,316, against $3,613,674 in January, 1925, and surplus after charges $383,533, against $339,615 in the preceding January. Gross revenue in every month for the last seven months has been greater than in the corresponding month a year previous, and, with the exception of December, the same has been true of surplus after charges.

Interurban Issues Called for Payment

The Chicago, Aurora & Elgin Railroad, Aurora, Ill., is calling all outstanding two-year 6½ per cent secured gold notes dated Dec. 1, 1924, and all series A refunding and improvement mortgage 7 per cent gold bonds, dated April 1, 1922. The former will be paid March 27 at par and accrued interest at the office of the Wilmington Trust Company, Wilmington, Del., and the latter April 1 at 101 per cent and accrued interest at the office of the Girard Trust Company, Philadelphia, Pa.

As part of this plan the company recently placed with the public $5,000,000 of first and refunding mortgage 6 per cent bonds at 96 and interest, yielding 6.30 per cent, as noted in the ELECTRIC RAILWAY JOURNAL for Jan. 30, page 215.

Public Service Railway Reports Gain

New Jersey Company Goes Ahead with Its Co-ordination Plan—Slight Decrease in Trolley Passengers—Bus Business Has Grown from 1,952,059 Passengers in 1923 to 146,053,237 in 1925

MORE records were broken by the Public Service Corporation of New Jersey, Newark, N. J., for the year ended Dec. 31, 1925. Operating revenues of subsidiary companies totaled $94,715,525. Before any dividend payments there was a net of $9,995,325. Preferred dividends to the amount of $3,223,728 were paid and common dividends to the amount of $4,781,557. In 1924 common dividends totaled $2,959,329. The net increase in surplus for 1925 was $1,990,039.

It is impossible here to go into all the operations of the company as a whole. To street railway men the main interest in the operation of the company lies in the results secured in the so-called transportation group. Much of that story is told in the income account of the Public Service Railway and other affiliated companies reproduced in the accompanying statement.

The problem presented to the management in connection with the Public Service transportation system is largely one of economical and at the same time efficient operation. As the company sees it, that part of the task of solution which depends upon the company is being worked out. But the problem goes deeper than that. It is believed that if car and bus service be further co-ordinated, better traffic regulation be enforced and the railway relieved of charges resulting from paving obligations imposed in the days of the horse car and no longer fair or just the position of transportation companies can be much improved.

The use of one-man cars was further extended, so that all cars in the system

INCOME ACCOUNT OF PUBLIC SERVICE RAILWAY AND OTHER COMPANIES IN TRANSPORTATION GROUP FOR THE TWELVE MONTHS ENDED DEC. 31, 1925

	Public Service Railway	Public Service Railroad	Public Service Transportation Company	Other Affiliated Companies	Total
Operating revenues	$21,035,933	$283,610	$7,608,504	$1,589,869	$30,517,918

*1925	40,016,174	24,181,431	30,517,918	94,715,525

* Change in classification of accounts effective Jan. 1.

are now so operated; the 5-cent fare plan was extended to cover all lines; wherever possible, both on lines where Public Service controls all service and on those on which independent bus operation is still in vogue, operating schedules were established to the satisfaction of both the public and the municipal officials, while in some instances it was possible to discontinue duplicate service and run cars and buses as supplements to each other.

A change in form of company organization, affecting both the railway and the transportation companies, noted previously in the ELECTRIC RAILWAY JOURNAL, was made with the idea of centralizing authority and responsibility in operating heads of the six divisions. A manager and an assistant manager were appointed for each division, who report direct to the vice-president in charge of operation and to whom report the division officers in charge of transportation, way, overhead and shops.

The conversion during the year of 333 closed and 197 open cars for one-man operation brought the total number of converted cars up to 1,789. In connection with this work pneumatic door mechanism and folding steps were placed on 428 cars and electric fare boxes and registers installed in 718.

Some 960 cars were completely overhauled, major repairs made to 800 others and 1,442 pasenger and 22 service cars repainted.

During the year 22.5 miles of track was reconstructed with new rails. More than 7.5 miles was reconstructed with the same rail, and 3.8 miles of track extension made, largely in connection with outdoor car storage at carhouses used in part as garages. Track was carefully maintained and is in satisfactory operating condition.

The policy of utilizing, wherever desirable, carhouses and other railway service buildings for garage purposes was continued. A combined carhouse and garage, having capacity for 70 buses, and indoor and outdoor storage for 44 cars, was erected at Sanford Street and Commercial Avenue, New Brunswick. This permitted the closing of the Milltown carhouse.

Through an arrangement with the United States government, in connection with the relocation of track in West Deptford, the former Washington Park carhouse was relocated in the yard adjoining the Newton Avenue, Camden, carhouse, where it is available as a garage.

On Dec. 6, under an arrangement with the Morris County Traction Company, cars of that company began operation over tracks of the Public Service Railway in and out of the Public Service terminal at Newark. The operation has so far proved mutually satisfactory and affords a decided accommodation to the public.

STATEMENT OF MILEAGE OF THE PUBLIC SERVICE RAILWAY AS OF DEC. 31, 1925

	Miles
First main track	523.285
Second main track and turnouts	295.097
Connections, crossovers, wyes and loops	11.983
Carhouse and yard tracks	46.253
Total	876.618
Total number of passenger cars available for operation: Closed 1,876 Open 339	
Number of new passenger cars since 1903: Closed 1,493 Open 327	
Track reconstructed with new rail during 1925	22.532
Track reconstructed with same rail during 1925	7.556

PUBLIC SERVICE TRANSPORTATION COMPANY

Very considerable progress was made during the year in bringing about an improvement in conditions surrounding the operation of buses by the company. An organization fitted for the complex task of handling the large number of vehicles required for service in the territory is, as a result, taking permanent form; garage and shop facilities were extended; efficiency of methods was bettered, and operating experience acquired, all in anticipation of further co-ordination of car and bus service that will give to the people of the territory served one of the largest and best local transportation systems.

The year's activities culminated in the placing, in December, of an order for 333 gas-electric buses of a type which it is believed will provide the maximum of convenience and accommodation for the public, and at the same time materially reduce the expense of maintenance, which, owing to the character of equipment purchased from independent operators, has been abnormally high.

Experience in the southern division, where it has been possible to effect a high degree of co-ordination, makes it evident that if co-ordination to a like extent is attained in other divisions service can be improved and economies effected to the benefit of both the riders and the companies.

Garage and shop facilities were, during the year, extended and improved. A 140-bus garage was built at Bloomfield Avenue and Lake Street, Newark. In the same city a building on Frelinghuysen Avenue, owned by the Autocar Company, was purchased and is used in part as a garage. In New Brunswick a new carhouse and garage which will accommodate 70 buses was built. In Paterson the Lakeview and the Market Street carhouses were remodeled for garage purposes. In Rutherford the power house section of the Rutherford carhouse was converted into a garage. In West Hoboken one bay of the carhouse was remodeled for garage purposes and an adjacent building purchased for storage purposes, while a building at Spring and Angelique Streets, formerly used by the track department, was taken over as a garage.

Bus service buildings were erected at Broadway Loop, Market Street and Lakeview garages, Paterson, and at Hilton garage, Maplewood. Hydraulic gasoline systems were installed at the Lake Street, Sanford Street and Sherman Avenue garages, Newark.

Shop facilities are in shape to meet all present requirements. During the year 1,464 buses were completely or partially overhauled, while much bus equipment was rebuilt.

It has been the aim to consolidate, wherever possible, the facilities and working organization for cars and buses and substantial economies have resulted from this policy. In accordance with the privilege conferred by an act of the Legislature, approved

* Mile zone system in effect from Sept. 14 to Dec. 7.

Digitized by Google

March 19, 1925, the company is now carrying all of its own liability insurance.

Of the popular ownership plan the company says it has not only given the added strength that comes from a veritable army of citizens financially interested in Public Service, but it has afforded an opportunity of spreading a concrete knowledge of Public Service facts among a large part of the public and among company employees as well.

Surplus Increases.—The gross earnings of the Lake Shore Electric Railway, Cleveland, Ohio, for the period from Jan. 1 to Dec. 31, 1925, were $3,199,762, against $3,099,489 for a similar period of the year previous. The surplus was $105,092, against $92,198 for the twelve months period January to December, 1924.

Service Discontinued.—Passenger and freight service on the Cleveland, Painesville & Eastern Railroad, between Painesville and Ashtabula, Ohio, ceased operation on Feb. 27, following foreclosure of a $1,000,000 mortgage by the Cleveland Trust Company. Passengers hereafter will be transported over the Painesville & Eastern Railway between Cleveland and Painesville. It was said in ELECTRIC RAILWAY JOURNAL of Feb. 20 that the disposition of the railway following the sale of the electric light and power properties of the company was not known. The railway operated 38 miles of track.

Kansas Line Would Quit.—The Arkansas City-Winfield Northern Railway, Winfield, Kan., asked permission recently to abandon service and remove its equipment and tracks between the two cities. The line operates 20 miles.

Street Cars in Highland Sold.—The title to seven street cars of the abandoned New Paltz & Highland Traction Company, Highland, N. Y., was received by Morris Levinson at an auction sale on March 16. Tax Collector George Canfield offered the seven cars to recover $843 taxes and costs assessed against the railway. Mr. Levinson's bid was $910, whereupon Mr. Canfield called off the auction of the remainder of the company's property. The line which extends for 8 miles was built some twenty years ago.

Seek to Junk Line.—The town of Hampton, N. H., has voted by an overwhelming majority to junk the municipally operated electric street railway. It is said that the line has never been a profitable investment since the town started to operate it in 1921.

Offer Made for Savannah Company.—The Engineers Public Service Company seeks to control the Savannah Electric & Power Company, Savannah, Ga. The proposed transaction involves the exchange of common stock of the Savannah company for stock of Engineers and the purchase of a substantial amount of the preferred stock. The Savannah Electric & Power Company will be operated as a separate unit under the operating direction of Stone & Webster as in the past. No change in the operating or executive organization is contemplated. An improvement program to cover three years and cost $3,000,000 has been outlined.

Personal Items

E. J. Blair to Run Interurban

Assistant to B. I. Budd to Carry Forward Intensive Program for the Aurora Road

Edward J. Blair, assistant to B. I. Budd, president of the Chicago Rapid Transit Company, has been appointed general manager of the Chicago, Aurora & Elgin Railroad, sold recently to the Insull interests. In this post he succeeds J. H. McClure, who, as previously noted in the ELECTRIC RAILWAY JOURNAL, goes with the Cincinnati & Dayton Traction to serve the same financial interests that recently sold the Aurora property.

E. J. Blair

While strides were made in the rebuilding of the Aurora property under the direction of Mr. McClure that put the property on a paying basis, the Insull interests are understood to plan still further to develop this road as a unit in the vast system of similar properties recently acquired serving suburban Chicago and towns in the immediate vicinity. Other economies are possible in the absorption of this system with the North Shore, South Shore and other roads now under Insull operation. The program for the Aurora road includes intensive development of several pleasure resorts. All of this work will be under the personal direction of Mr. Blair.

After completing a course of study at Lewis Institute, Chicago, Mr. Blair went to Cornell, from which he was graduated in 1905 with a M.E. degree. In that year he began work in the Throop Street shops of the Metropolitan Railroad, Chicago, as a night helper. Two months later he was given a day job as pipefitter foreman, and four months thereafter he went into the engineering department as a draftsman and inspector on track elevation work. In the fall of 1906 he was made a carpenter foreman in the maintenance of way department.

After eight months spent at this work Mr. Blair was made a storage battery operator in the old Throop Street power house of the Metropolitan. In 1908 he was promoted to the position of engineer of substations and transmission lines, with jurisdiction over the entire distribution system of the company. He was again promoted in 1910, becoming electrical engineer of the Metropolitan lines. Upon the consolidation of the several elevated railroads he was made electrical engineer of the Chicago elevated railways.

Commissioned a captain of engineers in 1917, Mr. Blair was stationed at Camp Grant for nearly a year, at the end of which he was sent overseas with the rank of major. He was subsequently promoted to lieutenant-colonel. Upon his return to the Chicago elevated railways in August, 1919, he was given the title of organization engineer with the duty of studying operating conditions with a view to recommending improvements in methods. In 1920 he was made assistant to the president.

Mr. Blair is well known to members of the American Electric Railway Engineering Association through his connection with several of its committees. He was chairman of the 1922 exhibit committee, the year in which the A.E.R.A. convention was held in Chicago.

W. K. Myers Heads Philadelphia Rapid Transit

W. K. Myers was elected president of the Philadelphia Rapid Transit Company to succeed W. C. Dunbar at the organization meeting of directors following the annual meeting of stockholders on March 17.

Mr. Myers had been a vice-president of the company. Mr. Dunbar is temporarily released by the Mitten organization at the request of Dillon, Read & Company, the P. R. T. bankers, to aid them in the financial rehabilitation of the Detroit United Railway. Mr. Myers also succeeds Mr. Dunbar as a member of the executive committee.

W. P. Johnston Promoted at Spokane

W. P. Johnston has been appointed operating head of the Spokane & Eastern Railway & Power Company and the Spokane & Inland Empire Railway, comprising the "Inland" electric interurban properties of the community, in the Spokane, Wash., territory. He succeeds Waldo G. Paine, the late general manager. Mr. Johnston has the title of assistant general manager. The appointment came during a visit to Spokane of Albert W. Harris, president of the Harris Trust & Savings Bank of Chicago, and M. H. MacLean, of the same institution, when a complete inspection of the properties was made and improvements authorized for this year. Mr. Johnston began work with the "Inland" as an agent twenty years

Digitized by Google

ago. In the summer of 1923 he was appointed assistant general freight and passenger agent.

The "Inland" system disposed of the city electric lines in a merger with those of the Washington Water Power Company in 1922, when the Spokane United Railways was created. The Nine Mile generating station was sold to the Washington Water Power Company last July. The deficit of past years at which the remaining properties of the system have been operated has been overcome and the company is now in the "black."

C. S. Sale Heads New American Car & Foundry Motors Company

C. S. Sale, president of the new American Car & Foundry Motors Company, which has taken over the Fageol Motor Car Company of Ohio and the Hall-Scott Motors Corporation, represents a type of executive responsible for the expansion of American Car & Foundry interests into the largest equipment combination in the transportation field. His connection with Car & Foundry goes back to wartime days and the Federal Railroad Administration. He became assistant to the president of the Railway Car Manufacturers Association in 1917 and as such acted as a point of contact for the several car manufacturers in their various dealings with the administration at Washington. Largest among these manufacturers was the American Car & Foundry Company. His grasp of the many intricate problems arising in connection with that company's vast and diversified business ultimately led to his becoming permanently attached to the executive department of the company.

C. S. Sale

Mr. Sale has taken a leading part in the negotiations which necessarily were required by the growth of the Car & Foundry organization and the absorption of allied plants and properties. He serves as a member of the board of directors of a number of allied properties, including among others the Pacific Car & Foundry Company, the Carter Carburetor Company, the J. G. Brill Company and the new Brill Corporation. As president of the American Car & Foundry Motors Company, he is in direct executive charge of the development of vehicles for highway transportation.

Mr. Sale was graduated from Purdue University in 1906. Before he joined the Car Manufacturers Association he spent a period of approximately three years in editorial work with the *Electric Railway Review*, later absorbed by ELECTRIC RAILWAY JOURNAL, and with *Railway Age*.

H. F. Dicke Vice-President at Allentown

H. F. Dicke, assistant to the president of the Lehigh Valley Transit Company, Allentown, Pa., has formally succeeded H. H. Patterson as vice-president and director. Mr. Patterson resigned on Dec. 31 last. Mr. Dicke went to Allentown on May 1, 1925, from Salt Lake City where he had charge of the Utah Light & Traction Company as general manager for eight years. He has been acting vice-president at Allentown since the announcement of Mr. Patterson's retirement was made last fall.

Changes in Medical Staff at Baltimore

Dr. Roy W. Locher has been appointed chief surgeon of the United Railways & Electric Company, Baltimore, Md., to fill the vacancy caused by the death of Dr. Harrison. Dr. Locher has been associated with the United Railways since 1913.

Dr. Walter D. Wise has been named consulting physician and Dr. H. B. McElwain has been appointed assistant to the chief surgeon.

B. W. Arnold Appointed Assistant General Manager of North Shore

Another step toward the top of the ladder in the transportation field has been attained by B. W. Arnold of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., through his latest promotion from superintendent of the company's motor coach division to assistant general manager of the line with headquarters in Milwaukee.

Mr. Arnold joined the North Shore Line on Jan. 1, 1924, prior to which time he was connected with the Wisconsin Power & Light Company at Oshkosh as general manager of its electric railway and bus properties since 1917. The success with which Mr. Arnold has built up the motor coach properties of the company is disclosed in the fact that the number of bus divisions operating as feeders of the main line now number nine, while only three were in operation when he was assigned the task of directing the company's bus services.

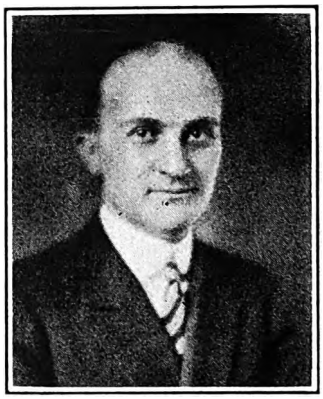
Mr. Arnold has spent practically his entire life in the railway work. He started his career at the age of fourteen as a call boy for the Wabash road in Clyde, Ohio. He later learned telegraphy and worked as an operator and dispatcher for the Wabash. He left the steam field and later was associated for eleven years with the Illinois Traction System as its division superintendent and superintendent of transportation.

Editor in Merchandising Post

James Ashton Greig Joins Railway at Toledo in Charge of Commercial Department

James Ashton Greig, connected with the editorial staff of *Electric Traction* for four years, the last three years as editor, has been appointed sales manager of the Community Traction Company at Toledo, heading the new commercial department. He took up his new duties on March 15.

In announcing Mr. Greig's appointment J. Frank Johnson, vice-president and general manager of the Community Traction Company, declared the time had come when railways must regard their business much as a manufacturer does his and secure a proper balance between production and marketing. He said the new sales or commercial department was being developed for the sole idea of selling transportation.



J. A. Greig

Mr. Greig brings to his new task a wealth of experience in railway and merchandising work. He was born in Chicago in 1892. Shortly afterward his parents moved to Scotland, but returned to New Rochelle, N. Y., when Mr. Greig was seven years of age. There he completed high school work and moved with his family to Chicago. He attended Northwestern University and was graduated in the letters and science course.

To earn money to continue his professional career, which he then decided was law, Mr. Greig took a position in the cadet school of the Marconi Wireless Telegraph Company, now the Radio Corporation of America. Later he went to sea for a year and a half in active charge of station KDM aboard the *Maracaibo* of the Red D line. While in this service he assisted in the original installation of station PJC on the Dutch Island of Curaçoa off the northern coast of Venezuela.

When he returned to school his interest in electricity dictated a change to engineering and he selected the University of Wisconsin, where he received his engineering degree in 1913.

Mr. Greig was employed by the Western Electric Company at its Hawthorne plant as general utility engineer, but later was promoted to engineer of elec-

Digitized by Google

trical methods. In this capacity he assisted in designing the first submarine loading coil for the telephone line under the Hudson River between Tarrytown and Nyack.

At the outbreak of the war he enlisted, trained at the school at Fort Leavenworth, Kan., and was then commissioned first lieutenant and assigned to Radio Company A, 331st Field Artillery, 89th Infantry, Division. At the close of the war he returned to Chicago and entered the employ of the Fred M. Randall Advertising Agency as merchandising manager. In this post he handled for two years the complete merchandising service for the Williamson Candy Company and assisted in the campaign for the now famous "Oh Henry" bar.

Mr. Greig joined *Electric Traction* in 1922 as editorial assistant. Later that year he was made associate editor, and the following year editor.

During previous summer vacations he had served as a reporter on the Chicago *Daily Journal*, the New Rochelle *Times-Standard* and the New York *Sun*, and one summer acted as salesman for a large wholesale grocery house.

R. Allyn White has been appointed comptroller of the Jamestown, Westfield & Northwestern Railroad and the Jamestown Street Railway, Jamestown, N. Y. Mr. White was with the New York Central Railroad for 36 years. He has devoted most of his life to railroad work, beginning as a ticket and freight agent of the New York, New Haven & Hartford Railroad at Harlem River Station near New York in the early '80s and going to the West Shore at about the time that road became a part of the New York Central System. Since then he has been connected with the New York Central and affiliated roads in the capacity of bookkeeper, disbursing chief clerk, auditor of disbursements, auditor and general auditor at different times. In recent years he has been with the E. W. Marvin Manufacturing Company of Troy.

D. D. Bentzinger, superintendent of the railway division of the Iowa Southern Utilities Company in Burlington, Iowa, has been advanced to the general offices of the company in Centerville, Iowa, effective April 1. Mr. Bentzinger has been in Burlington 22 years. At the time of the transfer of the Peoples Gas & Electric Company to the Iowa Southern Utilities he was superintendent of the People's Gas Company properties in charge of operation.

Bernard H. McGinn, in the service of the United Railways & Electric Company, Baltimore, Md., for approximately 30 years, has resigned to accept the post offered him by Mayor Jackson as head of the newly created municipal Bureau of Stores. The selection of Mr. McGinn is a high tribute to his efficiency as well as to the Baltimore company, for which he developed a model storekeeping system that has been copied by other industries. Mr. McGinn went with the United Railways on Jan. 13, 1895. For sixteen years he was storekeeper, leaving that position in May of last year to become supervisor of freight and tariffs in the purchasing agent's department.

E. D. Gilman Street Railway Director at Cincinnati

Edgar Dow Gilman, executive secretary to Col. C. O. Sherrill, City Manager of Cincinnati, Ohio, has been appointed Director of Street Railroads and Motor Buses, succeeding W. Jerome Kuertz, who resigned March 1 after serving six years in that capacity. Mr. Gilman is a former university professor. He has already assumed his new duties, having resigned as assistant to the City Manager. He is a man of wide experience in the engineering and technical fields. He was appointed secretary to the City Manager soon after Colonel Sherrill took the office on Jan. 1.

H. Martin Walker, in traffic work in Toledo for several years, has been named district passenger and freight agent of the Lima-Toledo Railroad, with headquarters in Toledo. Mr. Walker was formerly on the staff of the traffic commissioner of the Chamber of Commerce. He served for some time as traffic manager of the Rock Products Company in Toledo.

Obituary

R. S. Noden

Robert S. Noden, mechanical engineer of the Cummings Car & Coach Company, died suddenly at Paris, Ill., on March 12. Mr. Noden had been with the Cummings Car & Coach Company and its predecessor, the McGuire-Cummings Manufacturing Company, for more than 20 years. He was graduated from Armour Institute of Technology in mechanical engineering and after leaving school was for a time in the engineering department of the Pullman Company and with the Chicago, Burlington & Quincy Railway. Mr. Noden started with the McGuire-Cummings Company as a draftsman and advanced to the position of mechanical engineer. He had been actively indentified with the development of the company's products during this long period. Mr. Noden was born on May 30, 1885.

Frank C. Randall

Frank C. Randall, Eastern manager of the Christensen Air Brake Company, died on March 11. Mr. Randall was formerly vice-president and general manager of the Christensen Engineering Company up until 1912, when he left to engage in personal business. After being away from the railway field for about twelve years he was called back to the Christensen Air Brake Company, as Eastern manager.

Mr. Randall had long been prominently identified with railway work. His first railroad experience was in 1897 with the New York & New England Railroad as "performance of engine" clerk. Later he was appointed chief clerk of the motive department of the same road, at Hartford, for all divisions west of Willimantic, and afterward chief clerk of the motive power department of the Boston & Lowell Railroad and its leased lines. Upon the consolidation of the latter road with the Boston & Maine Railroad, he obtained a position in the shops of the Tripp Manufacturing Company, and was promoted to the position of superintendent of the plant. He resigned this position to become Eastern sales agent of the J. G. Brill Company, and later was made Western sales agent, with headquarters at Chicago.

After being in the employ of the J. G. Brill Company about six years, he became Eastern sales agent of the Christensen Engineering Company, and later was appointed general sales agent and then vice-president and general manager of this company and its successor, the National Electric Company. He was also for a long while connected with the Allis-Chalmers Company, Milwaukee. He was born in Taunton, Mass., 68 years ago.

T. G. Whaling

Thomas G. Whaling, vice-president of the Westinghouse Lamp Company, died in New York City on March 1. Mr. Whaling joined the Westinghouse Lamp Company in 1906 as assistant to the manager and held the successive positions of sales manager, assistant general manager, general manager and vice-president. He was one of the pioneers in the lamp industry. Prior to his connection with the Westinghouse Lamp Company Mr. Whaling was secretary and treasurer of the Milwaukee Electric Company, Milwaukee, Wis. He was a Yale (Sheffield) man, class of 1900.

D. M. Brady

Daniel M. Brady, president and treasurer of the Brady Brass Company, New York, and the first president of the American Street Railway Manufacturers Association, died at Atlantic City on Feb. 23. A little more than three years ago Mr. Brady completed a service of 50 years in the railroad industry and of 40 years in the metal trades.

Mr. Brady was born in New York City 71 years ago. In 1871 he entered the employ of the New York Central Railroad in the office of General Manager John M. Toucey. He was afterward chief clerk of the car department under Leander Garey, general superintendent of the car department of the company. Mr. Brady resigned from the New York Central Railroad in 1883 to join the then newly organized Paige Car Wheel Company, Cleveland, with which he was connected for a number of years. In 1888 he established the Brady Brass Company and was its president from that time. For many years he was also director of the Rochester Car Wheel Works. At the time of the reorganization of the American Street Railway Association, in 1905, he had a great deal to do with the organization of the American Street Railway Manufacturers Association.

William R. Benson, prominent in the early development of the city transit system of Philadelphia, Pa., and in more recent years employed in the offices of the Philadelphia Rapid Transit Company, died on March 4.

for Discussion of Manufacturing and Sales Matters

Car & Foundry Head States Prospects Before Sailing for Europe

William H. Woodin, president of American Car & Foundry Company and of American Locomotive Company, sailed for Europe recently on the *Majestic*. Prior to his departure he discussed briefly the outlook for these important companies in the transportation field. He made the point that both concerns are now operating in excess of 50 per cent of capacity. He said:

Both have operated on a common dividend earning basis to date this year. Equipment companies in 1925 experienced about the worst year in the last two decades, while railroads generally had one of their best years. This year things should be different with us. The railroads for the first time in years have plenty of money and are in a position to order equipment, and in my opinion they will be heavy buyers of locomotives and railroad equipment this year; as a result, companies of our type should enjoy a big year.

According to Mr. Woodin the acquisition of the Hall-Scott, Fageol and J. G. Brill Companies by the American Car & Foundry Securities Corporation should add materially to the earnings of American Car & Foundry Company. He said it was generally recognized that Hall-Scott makes one of the best motors on the market and, if the need arises, American Car & Foundry has four large car-building plants which may be turned over to bus-body making on short notice.

He denied that the American Car & Foundry Securities Corporation, whose stock American Car & Foundry owns 100 per cent, has bought into the Pierce-Arrow Company.

He also denied the rumor that American Car & Foundry is thinking of acquiring the Pullman Car & Manufacturing Company if it is ever segregated from the Pullman Company proper. The Federal Trade Commission would not allow such a merger. He said:

You will notice that the mergers in which we have participated have not been with competing companies.

Bridgeport Brass Advances Two Able Executives

At a recent meeting of the Bridgeport Brass Company Warren D. Blatz, general sales manager, and Walter R. Clark, general works manager, were elected to the board of directors in recognition of their ability as executives of the firm.

Mr. Blatz became affiliated with the Bridgeport Brass Company in 1916. His work has always been in the sales department. Five years ago he was made sales manager of the mill products division. About three years ago he was made general sales manager and since that time has been very active in building up Bridgeport sales throughout the country. He was born in Brooklyn, N. Y., attended the Hillhouse High School, New Haven, and later was graduated from the Boardman Manual Training High School in New Haven, in 1901. He then took a two years post-graduate course in higher mathematics.

In 1905 Mr. Blatz went to Bridgeport as junior clerk with the T. L. Watson Company at a salary of $6 a week, intending to earn money enough to get further schooling in the fall. He liked the work and remained with this company for twelve years, when he left to join the Bridgeport Brass Company organization.

Mr. Clark was graduated from Yale (Sheffield School), class of '99. In 1900 he started in as a draftsman in the Bridgeport Brass Company. He soon rose to be head draftsman and later was made chief engineer, which position he held until 1919, when the duties of works manager in the mill products division was added to his other duties. During this period the company expanded from its small site to its present place in the industry. Under his supervision, the Housatonic plant was built. In 1921 he was made general works manager in charge of both divisions, which position he holds today.

Bids on Cars to Be Asked by Seattle

The last legislative step necessary for the purchase of 80 new street cars for the Municipal Street Railway of Seattle, Wash., was taken recently when Mayor E. J. Brown filed with the city clerk the purchase ordinance duly signed. It is planned to operate the new cars on the pay-as-you-leave plan as well as the pay-as-you enter plan. It was announced by D. W. Henderson, superintendent, that the former plan will be in use when the cars are loading downtown during the rush hours, while the latter will be in force at other times. Thirty days after the ordinance was signed by the Mayor, the Board of Public Works will advertise for bids. The new cars will be 45 ft. in length and each will have a seating capacity of 58.

Locomotives for Montreal Harbor

Five electric locomotives will be delivered to the Harbor Commissioners of Montreal, Canada, this summer, for use on the waterfront. With the four already in use this will bring the number of electric locomotives owned by the commissioners to nine. The units are being made in England and are of the inclosed cab type with double end control and pantograph collection. To suit special requirements each locomotive has two master controllers, one at each end, in order to save time in freight operations. They weigh 100 tons and are rated at 2,400 volts.

According to the contract between the commissioners and the makers the first engine will be shipped on June 8 and should arrive in Montreal about

Franklin, Ill., screenings, Chicago	1.875
Central, Ill., screenings, Chicago	1.425
Kansas screenings, Kansas City	2.425

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.95
Tie plates (flat type), cents per lb.	2.30
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.25
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.35

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (28 gage), cents per lb.	3.25
Sheet iron, galvanized (28 gage), cents per lb.	4.50
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	12-18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13-17.50
Colored	10-14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.80
White lead in oil (100 lb. keg), cents per lb.	15.50
Turpentine (bbl. lots), per gal.	$1.03
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4-6

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	16.25
Rubber-covered wire, No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, cents per lb.	18.00

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$147
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.10
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.625
Light copper, cents per lb.	9.625
Heavy brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	4.50
Lead, cents per lb. (heavy)	6 50
Steel car axles, Chicago, net ton	$17 75
Cast iron car wheels, Chicago, gross ton	17 25
Rails (short), Chicago, gross ton	17 75
Rails (relaying), Chicago, gross ton	25.50
Machine turnings, Chicago, gross ton	9.00

Digitized by Google

June 21. The rest will be shipped one a week, so that the five are expected to be in Montreal by the end of July. Each will be assembled in Montreal in the harbor shops and, after preliminary trials, placed in operation on the waterfront. It is not anticipated that all will be in use this season. Rather, it is hoped to have at least two of the new engines working before the end of the season and the balance will be used as soon as navigation opens in 1927.

As practically all the waterfront is now electrified the commissioners feel that the new locomotives will be invaluable in handling traffic there. A total of approximately 70 miles of trackage on the harbor property has been electrified and only a few branch lines need to be transformed before the whole system will be electrified.

Public Controls the Rubber Situation

Present Supply of "High-Priced" Rubber Must Be Exhausted While the High Consumption Continues—Reclamation of Old Rubber Urged—British Sentiment Not Wholly in Favor of Stevenson Act

DESPITE British propaganda to the contrary, the official restriction on the rubber market still continues, according to a recent statement by a well-informed Washington official. While prices have fallen off considerably during the last few months, following the adoption of a policy of limited buying by American consumers, it is believed that much greater reductions will be felt in the future. These lowered prices can only be attained as the American public is educated to the need for careful conservation of rubber and for compliance with the terms of the so-called "buyers' strike," it was stated in authoritative circles.

Since these price reductions may actually be expected with a fair degree of surety it behooves manufacturers with large stocks of high-priced rubber on hand to dispose of them while consumption remains at its present high level. Should they not do so and should the cost of crude rubber hit the toboggan suddenly, practically all of the capital now tied up in these stocks would be wiped out. Certainly a disastrous eventuality such as this is to be avoided if it is humanly possible to do so, and it is the belief of Washington authorities that it can be avoided by prompt action on the part of the manufacturers. At the same time the policy of rubber conservation and of reclamation of old rubber may be carried out to an even more effective extent than is at present the case.

Of course it is necessary for large consumers of crude rubber to make their purchases some distance in advance of production, so that the constant danger of being caught short of necessary supplies for continued normal production may be escaped. However, it is the contention of the committee on interstate and foreign commerce, which has been investigating the crude rubber situation, that these advance purchases should be held to the lowest level consistent with safety. Furthermore, while reclaimed rubber may not be entirely suitable for use in tires, there are many applications to which it may be put with entire success. The policy of conservation has resulted in a very material reduction in the consumption of crude rubber, and the price of that commodity has fallen from a high of $1.10 in November to a slightly fluctuating level between 50 and 60 cents per pound for best grades at the present time.

As stated by the congressional committee, these deliberate controls of commodities violate economic law and produce disastrous economic results both to producer and consumer. The normal improvement in production by cheapening costs is suspended. The committee continues:

> The restriction of production prevents growth to meet future world demands which would ordinarily be the response to high prices. To the consumer it means not only unfair charges but substitution of inferior alternatives. To the manufacturer and distributor it means greatly enhanced hazards, the costs of which are passed on as a further charge to the consumer.

From authoritative Washington sources it was learned that the American public has paid large sums of money over and above the fair price of 36 cents per pound established by the Stevenson act. For the last five months these sums were as follows:

October	$22,000,000
November	26,000,000
December	32,000,000
January	38,000,000
February	35,000,000

The fact that these amounts increased while the actual price of crude rubber was falling is of course due to the fact that supplies had been contracted for several months in advance by the manufacturers. The Stevenson act established a maximum of 36 cents per pound as a fair price to be expected for the commodity. However, as the demand exceeded the supply no real effort was made by the British government to prevent the price from skyrocketing, it was said.

The British rubber industry has at no time been in serious straits, according to the committee report, and there was no apparent need for forcing conditions to their present undesirable condition. During the war many of the plantations earned 50 per cent on their original cost in a single year. Therefore there was not the excuse of bolstering up a weak and shaky industry, which the British government intimated.

It is interesting to note that there is considerable sentiment in England against the Stevenson act, particularly among industrial papers more or less unmoved by nationalistic considerations. Says the London *Economist* of Jan. 30:

> The whole story is an instructive lesson of the ramifications of effect which arise from government interference with the law of supply and demand.

The Malayan *Tin and Rubber Journal* of Jan. 15, 1926, likewise voices apprehension on the score that the recent high prices attained through the operations of the Stevenson plan have unduly stimulated Dutch production:

> In point of fact we are not over-eager to see such prices continue. They have disturbed the working of restriction, stimulated unduly the production in Dutch Indies, and given excuses for the rampage in America which causes wabbling at the knees among the weaker of our own countrymen.

The Westminister *Bank Limited Review* for February says in part:

> The resolution of the American House of Representatives, which at first sight appears to breathe the very quintessence of exclusive nationalism, proves on deeper examination to base its main argument on nothing less than the principles of Adam Smith. . . .
>
> We may conclude, then, that "artificial" national control of raw materials is a theoretically feasible, though not an economically desirable, proposition.

The Manchester *Guardian Commercial Thursday* of Jan. 21, 1926, has an editorial entitled "End Rubber Restriction," reading in part as follows:

> The calmer minds on both sides of the Atlantic seem to be agreed that in the long run government measures of restrictions are always ineffective, and that the most they can hope is to delay, but never to prevent, the operation of economic laws.

The Manchester *Guardian* of Jan. 12 said:

> It does not, of course, follow that we are wise in treating rubber as though we had a monopoly of the supplies and in getting a price for it which is several hundred per cent higher than would give a reasonable profit to the industry. We may not be moved by Mr. Hoover's arguments, but his conclusion may none the less be sound. And in one respect Mr. Hoover's argument is perfectly valid. He draws a distinction between commercial and state-aided monopolies. . . .
>
> The consequence (of the curtailment of British rubber exports under the Stevenson plan) was that the Dutch plantations not only secured the advantage of unrestricted export at prices made possible by the restrictions on the British companies, but were encouraged to increase the area under cultivation. The further result has been that the British supply, which used to be three-quarters of the total, has now fallen to one-half and is likely to fall further.

Expansions Planned in the Twin Cities

The Twin City Motor Bus Company will expend $750,000 in the Twin Cities, Minn., for expansion work. On April 1 work will begin on a $250,000 garage, service station and offices at Chestnut and First Avenue South and the Minneapolis & St. Louis and Great Northern Railroad tracks. About July 1 a similar plant will be erected in St. Paul. This will have the general offices of the line, at a point not selected. Outside the two cities a 550,000-gal. gasoline tank will be built to cost $150,000. One hundred thousand dollars will be spent on buses for the proposed bus line on Lyndale Avenue South from the downtown district to the Minneapolis city limits. Fifteen buses will be ordered for this line.

In the Minneapolis garage the Lyndale buses will be stored and serviced. The Glen Lake buses and half the equipment of the three interurban lines will also be cared for there. The building will be 300x150, concrete and brick at the start. In the St. Paul building will be serviced the remaining intercity buses and those operating to South St. Paul, Stillwater and White Bear points. The Twin City Motor Bus Company is a subsidiary.

Rolling Stock

International Railway, Buffalo, N. Y., is rebuilding 160 of its cars to increase the seating capacity of each from 40 to 58 passengers. Many of these formerly were double-end cars. They are being made over for one-man operation with an emergency exit in the rear. The first of the cars has already been placed in operation.

Toronto Transportation Commission, Toronto, Ont., has placed an order for ten type Z, 29-passenger Yellow buses with the Yellow Truck & Coach Manufacturing Company. This purchase was based upon the performance of buses purchased a year ago. At that time the company purchased 21 type Y parlor cars and more recently nine additional parlor cars and two of the smaller type X parlor car buses. Three of the present order of ten have been delivered. The seven others will be shipped in April.

Pittsburgh Railways, Pittsburgh, Pa., has just ordered from the Standard Steel Car Company 50 two-man center-exit passenger cars, similar to those now in operation on this line. Electric equipment will be supplied by Westinghouse Electric & Manufacturing Company, while the air brake equipment will be purchased from Westinghouse Traction Brake Company.

Pacific Gas & Electric Company, Sacramento, Cal., will start remodeling eight or ten cars. The company's budget provides $26,000 for this work, which will consist principally in the installation of air brakes.

Rockford City Traction Company, Rockford, Ill., will purchase six new cars of the two-man, one-man type, according to an announcement by Adam Gschwindt, receiver, who has asked the court to empower him to purchase the cars at a cost of $75,000. Bankers have tentatively consented to underwrite a $600,000 bond issue to rehabilitate the line, it is said. The cars will have a seating capacity of 50 passengers.

Montreal Tramways, Montreal, Que., has recently ordered ten type Z, 29-passenger Yellow buses. This is the third order which this company has placed with the Yellow Truck & Coach Manufacturing Company for this type of vehicle. Originally the company ordered four buses, which were followed later by another order for four. This recent order brings the total number up to eighteen of this type and manufacture.

Washington Railway & Electric Company, Washington, D. C., has petitioned the Public Utilities Commission for permission to purchase fifteen one-man cars of the latest type for service on the Wisconsin Avenue line. A storm of protest against one-man cars several months ago resulted in an order preventing the company from adding any more cars of this type on its lines. The company meets this ruling by offering to junk fifteen one-man cars now in service. The cost of the new cars will total $202,500. They will be equipped with both front and rear exits. The fifteen cars to be junked, should the commission act favorably on the petition, are of the front entrance and exit type.

Virginia Electric & Power Company, Richmond, Va., expects delivery of fifteen motor passenger cars, ordered from the American Car Company, St. Louis, Mo., by April 10. The order was placed on Dec. 15, 1925. Specifications follow:

Type of car	Semi-convertible
Seating capacity	44
Weight	30,000 lb.
Bolster centers, length	18 ft. 0 in.
Length over all	40 ft. 1 in.
Truck wheelbase	5 ft. 1½ in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	11 ft. 0 in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse Traction Brake
Axles	Brill
Bumpers	American Car
Car signal system	Faraday
Car trimmings	Statuary bronze
Center and side bearings	Brill
Compressors	Westinghouse
Conduits and junction boxes	American Car
Control	Westinghouse
Couplers	American Car
Curtain fixtures	Curtain Supply
Curtain material	Pantasote
Destination signs	Hunter
Door-operating mechanism	National Pneumatic
Fare boxes	Johnson DM 3
Fenders	H. B. lifeguards
Gears and pinions	Westinghouse
Hand brakes	Peacock staffless
Heater equipment	Consolidated
Headlights	Ohio Brass
Journal boxes	Brill
Lightning arresters	Westinghouse
Motors	Four Westinghouse No. 508, inside hung
Registers	International
Sanders	Ohio Brass
Sash fixtures	O. M. Edwards
Seats	Brill
Seating material	Plush
Slack adjuster	Westinghouse
Springs	Brill
Trolley catchers	Ohio Brass
Trolley base	Ohio Brass
Trucks	Brill No. 77 EX
Ventilators	American Car
Wheels	26-in. rolled steel
Special devices, etc.	Westinghouse variable load brakes

Trade Notes

William A. Edwards, branch manager of the Chicago territory for Ludlum Steel Company, Watervliet, N. Y., has been transferred to take charge of the southwestern territory with headquarters at Houston, Tex. This territory has grown to such magnitude as to require the services of one of Ludlum's most efficient managers.

Charles E. Criss, for the past three years in charge of sales for the General Tire & Rubber Company over a large portion of the State of Ohio, has been promoted and made branch manager at Los Angeles. Born and educated in Akron, Mr. Criss has had a wide experience in all branches of the rubber industry. Mr. Criss has left for the Coast to take up his new duties.

R. B. Fisher, formerly general sales manager of the Buda Company, Harvey, Ill., has been appointed vice-president of the company. In his new work he will have charge of the sales and engineering departments of the railway division.

J. S. Applegate, formerly of the Wagner Electric Corporation, has become associated with the Sterling Varnish Company, Pittsburgh, Pa. Mr. Applegate is a metallurgist by training and, as a materials and process engineer, has for years been conducting considerable research work in the testing, selecting and application of liquid and solid insulators. It is understood that he will be attached to the Pittsburgh office and plant, with the title of metallurgical engineer, as an additional consultant for the users of insulating varnishes and technical coatings.

Fageol Company, Kent, Ohio, delivered three gas-electric chassis to the New Orleans Public Service Corporation, New Orleans, La., in February.

General Railway Signal Company, Rochester, N. Y., has received a contract from the New York Rapid Transit Corporation, Brooklyn, N. Y., for 6.4 miles of signals, including color-light signals, to compose an automatic block system with automatic train stops to be installed throughout.

New Century Signal Corporation, Albany, N. Y., designer of signaling devices for railroads and autos, has been chartered at Albany with a capital of $100,000. G. B. Snyder, 57 Maiden Lane, Albany, N. Y., is attorney for the corporation.

Nichols-Lintern Company, Cleveland, Ohio, has found it necessary to increase its factory space and install special machinery to meet the demand of N-L ventilators, universal lanterns and other products.

Leo M. Dunn has been made vice-president of the Graybar Electric Company, formerly the supply department of the Western Electric Company. He will have charge of the merchandising and accounting phases of the new corporation. Mr. Dunn's association with the Western Electric Company has extended over a period of many years. His first position was in the capacity of office boy with the Central District Printing & Telegraph Company, Pittsburgh. This connection was formed in March, 1886. Stepping into his first supervisory job at the age of nineteen, Mr. Dunn started on a career of increasing importance in the distributing business of Western Electric.

Locke & Company, Detroit, Mich., manufacturers of passenger car and bus bodies, will move from Detroit to Rochester, N. Y., within a few weeks, according to an announcement by the Rochester Chamber of Commerce. The Locke company has purchased the former Symington Company munition plant in the Kodak City and already begun the installation of machinery. The plant will employ 1,000 persons. It plans to manufacture custom buses on a considerable scale as well as bodies for passenger automobiles. Officers of the company are Charles Fleischmann, president; Louis L. Breden and Newton H. Manning, vice-presidents; William C. Miller, secretary, and N. A. Gorman, treasurer. Mr. Manning will be in direct charge of the Rochester plant. He was formerly with the Rolls-Royce Company. Duncan G. Stanbrough will be factory manager.

H. C. Osman, sales manager of the Nugent Steel Castings Company, Chicago, Ill., has been elected secretary of the company. He will continue to have charge of the sales for the company. C. A. MacDonald, former secretary, has been elected treasurer.

New York's Municipal Trolleys Make a Sorry Record

NOT many transportation companies can afford to run up an operating deficit of $717,508 in five years. That is what the city of New York has done in managing the 32-mile railway system with 6.3 miles of trackless trolley that it took over in the Borough of Richmond (Staten Island) after the owners had failed to make it successful under the conditions of operation imposed by the city.

A brief review of the situation is pertinent. The Staten Island Midland Railway was one of the two street car systems that for many years gave local transportation on the island. It was formerly owned by the H. H. Rogers estate. After the cessation of war activities, which had caused a fair amount of traffic, both this and the other railway line found it impossible to carry passengers at a 5-cent fare. Their repeated pleas for an increase were consistently refused in Shylock fashion by the Hylan administration since the franchises called for that rate. Finally the two systems ceased operation.

In order to give some kind of transportation in the emergency, Hylan marshaled together a miscellaneous collection of buses, which were run by their private owners at a 5-cent fare until they found operation unprofitable and quit. In order to make good on its promises to keep the low fare the city took over the Midland line and resumed operation at the franchise rate of 5 cents. A trackless trolley line to reach a hitherto unserved section was constructed and opened with a great flourish. Some new Birney cars were purchased and old cars of the former company were revamped. For a time it looked as though the city had been able to accomplish what the private operators could not do.

The city refused consistently to make public a balance sheet or true operating costs of its system. It was only after the overthrow of the Hylan régime that the true cost was published. The figures were given in detail in a report by Comptroller Berry, abstracted in the news columns of this paper for March 20. In the five years up to the end of 1925 the surface railway cars had taken in $2,171,907 and had spent all that and $371,276 more. Bad as that was, it was as nothing compared with the record of the trackless trolleys, which in about the same period took in revenues of $210,400 and according to the city's engineers had an operating loss of $346,232.

Operating figures do not tell the whole story. The trackless trolley system is nearly worn out. It has been necessary for the city to provide new paving for the roadway over which it runs. The bonds of the railway, amounting to $1,000,000, come due next June. It will be necessary to invest additional funds for the purchase of new cars, construction of track, a substation and a carhouse, totaling between $1,500,000 and $1,750,000.

As an easy way out, it has been proposed that the city abandon operation and issue permits to a private bus company, with a fare sufficient to meet the cost of service.

Repetition of New York Fiasco Should Be Avoided Elsewhere

CASTING about to find a motive for the expenditure of such sums of money as those wasted in the municipal operation on Staten Island, one is at a loss, except that it was a means of fighting the hated "interests." But to show their attitude, residents of Staten Island living along the lines of the other company made a gentleman's agreement to allow it to charge a fare of 8 cents. That rate has been in effect for several years now, and the company has given service that is far better than the city's, while paying operating expenses.

The claim of the former administration that the municipal operation was necessary to permit development of the territory has not been borne out. Comptroller Berry in his report sees no likelihood that increases in population will be such as to put the system on a self-supporting basis. In some cases gain in property valuation might justify operation at a loss, but here it would not.

It should be stated that the system has not been maintained or operated in a manner which would be permitted of any private operator. The cars are dirty and ill kept. Schedules are insufficient to meet the demands at certain periods, and no attempt is made to maintain them. Failures are a matter of common occurrence. Ordinary courtesy is not observed by the trainmen and others who come in contact with the riding public. In brief, there is no inducement to ride from any motive other than that of necessity.

This, then, is the record of an experiment by the greatest city on the western continent in municipal transportation. With its immense resources, the administration was able for a time to cover up the huge losses. The futility of this was apparent when a new administration made public the facts. No situation exists that justifies the city in spending 12.2 cents to secure a nickel car fare, as it does on the trackless trolley line.

The entire affair carries a message to any other city contemplating municipalization of its transportation facilities. When private capital is willing to furnish service at a reasonable fare and with reasonable regulations, why not let it do so? Even with all the faults that municipal ownership zealots ascribe to private operation, it certainly is far ahead of the record of New York in the Staten Island lines.

Looking Ahead in Establishing Bus Rates

ELECTRIC railways have had a long and sad experience with the principle of a fixed rate of fare. Many receiverships occurred before any progress was made in shaking off the association between a 5-cent fare and a street car ride that had been allowed to grow in the public mind. Even now, in New York and many other cities, the fixed fare stands in the way of good transportation service.

In discussing the recent bus proposals for New York, the *Wall Street News* suggests editorially that it might be worth while to consider how much street railway service could be improved in that city with a 10-cent fare. It is not difficult to predict what could be done, but it has never been possible to bring such improvement about. The 5-cent fare has hung on in New York despite all efforts to dislodge it.

There is today serious danger that the bus will not profit from this example. Those who are really interested in the future of this new transportation vehicle may well view with alarm the tendency to drive bus fares down to a minimum.

It is unquestionably a serious mistake to permit the bus to be considered generally as a street car on rubber tires. It has a much broader destiny. It is capable of rendering a distinctive service providing ample rates are permitted. Promoters who are eager to compete with street cars and who point to the bus as the future mass transportation agency are not friends of the bus. Their perspective is limited. They see only the immediate at the expense of the future. Progressive bus men are looking ahead in establishing bus rates.

Cleveland Co-ordinates the Bus Without Affecting Street Car Traffic

THAT the Cleveland Railway should adopt the bus is entirely in harmony with the policy of progressive management that has held this company in the foreground for the last fifteen years. Neither its officials nor the people of Cleveland believe that the bus will supplant the street car. They do believe, however, that the bus will bring back business lost ten years ago or will create new business developed by the private automobile.

Three distinct ideas form the basis of the Cleveland bus operation: First, feeder service or extensions of car lines into newly developed areas; second, crosstown service to provide ready means of movement between outlying areas, and third, a purely supplemental service on heavy street car routes or immediately adjacent thereto. Early results indicate that the feeder or extension service does not pay any better than the tail ends of street car lines and their operation must be considered as related to the whole project. This is told in greater detail in an article in this issue. Crosstown service pays somewhat better and is much appreciated in a city such as Cleveland that has so many residential areas lying on the outskirts of the city itself. As decentralization takes place a demand for intercommunication naturally develops. Buses, or "coaches" as they are called in Cleveland, provide a splendid vehicle for this service.

The most important service, however, from the standpoint of volume and potential profits, lies in the supplemental line of double-deck coaches on the Carnegie-Clifton route passing through the Public Square from the eastern to the western city limits. This service paid more than 44 cents per mile during the lean month of January and its use is increasing. No apparent effect has been noticed on the car lines it parallels. This bears out the theory that high-class coach service will draw from traffic sources lost years ago or else it will develop its own clientele from Mr. Wickwire's "Automotiviks."

J. H. Alexander, vice-president of the Cleveland Railway, has said that the consummation of present plans will probably mean a more rapid acquisition of coaches in Cleveland than cars. This is because the coaches will be used to provide the extension service that Cleveland needs today. New cars will be bought for replacements, and eventually, as electric car extensions prove economical in fields developed by the buses, more cars will be used.

Rubber Urge Is Too Strong

"DOUBLE-DECK PEEPERS" is the latest aspersion cast upon the bus, the perennial object of encomiums, and the target of the jeers in a sometimes faultless and other times faulty transportation world. In turn, the bus has been heralded as the panacea for all ills and as the strongest deterrent to traffic flow, as the cheapest means of handling masses and as the most expensive system, as the successor to the railway and as its supplement. In addition there are many specific complaints—the bus as a vehicle is a menace to safety, a veritable Babel to the meditative soul and a destroyer of pavement and plaster. Not long ago the buses were scored because they were the scene of amorous amenities where young men refused to restrain their exuberant spirits and the result was a "buss" on a bus. For a while the censors (all married men) were on deck and the young men were remiss in reminiscence only.

But now the latest wail is so loud that it has reached the ears of the commission—sightseeing rubbernecks peer into bedroom windows, taking away all privacy from second stories. Of all problems before the traffic authorities this would appear to be the most insoluble. The residents can't keep their shades down always nor can they recondition their homes so that those on the espial might only become acquainted with the recipe for mixing grapes and cider instead of the art of harmonizing Madame Brunette rouge and Manon Lescaut powder. And why penalize the residents? It's the bus rider who is guilty of the unpardonable sin of peeping.

The traffic managers, after the manner of immigration chiefs, might exact certification of good morals from all aspirants for the upper bus level. But such segregation would be discriminatory and deleterious in effect, for the original complainants would become the new offenders peeping out of the much-maligned bedroom windows. Then all illusions would be destroyed in the knowledge of how the other half of the world lives and the second predicament would be worse than the first.

Perhaps a compromise might be reached whereby the residents would supply shades for the buses with the bus management promising "all shades down" at the psychological minute. Just as that ever alert and solicitous conductor admonishes the rider "keep your seat, low bridge" he might also cry "shades down, roll your eyes." If co-ordination of thought and speech ever failed him—well, embarrassment must be suffered

Digitized by Google

by all at times, even by the commissioners themselves who must settle these ever-perplexing questions. Of course, the commissioners might divert bus traffic to broader thoroughfares, but why can't both the bus rider and bedroom complainant be like Cæsar's wife—above suspicion.

Noise Elimination Is an Asset in Public Relations

NOISE is generally the earmark of wasted energy. It is more. It is wasted public relations. No amount of advertising or publicity can counteract the rattle of a car in bad order on a stretch of poor track.

A noted operator of public utilities once wisely said that the physical property of a railway was too much in evidence. A passenger comes in daily contact with two or more employees, pays out money several times a day, rides in several of the cars, and sees all of the others pass him on the line. He sees and is otherwise aware of the track, and possibly sees the car shop and a good part of the power distribution system along the route of his trip. This, of course, makes an invidious comparison with the gas or light and power companies whose equipment and personnel is so little in evidence and whose service is paid for only once a month by the customer.

With no immediate likelihood of being able to submerge the equipment and personnel so that they are out of sight and hearing, the next best thing that can be accomplished by railway operators is to make the equipment more pleasing to eyes and ears. So no effort should be spared to reduce the unpleasant noise of operation.

Much has been accomplished along these lines, but much more remains to be done. The automobile is a bogey to shoot at. Perhaps it can be bettered. Nothing is impossible with the combination of right thinking and a desire to win.

Massachusetts Has Pointed the Way to Pennsylvania

GOOD reasons aplenty can be found for opposition by electric railways in Pennsylvania to the Reading Railroad's plan to run buses in competition with them. These reasons are time worn, but they hold today just as well as when they were evolved. The Pennsylvania Street Railway Association, as indicated in this paper for March 20, has summarized its contentions in the proposed appeal to the commission of that state against the Reading road. Ordinarily, one would say that if the projected routes were likely to work to the detriment of the electric railways to the extent that their representatives believe, the commission would be in duty bound to disallow them. If that be true, then it would seem that the Reading Railroad officials were guilty of a *faux pas* in seeking such rights.

Here, then, is a case not for argument, but for conciliation. Massachusetts had a similar problem. Before the law could catch up with events there, competition between steam and electrics over bus territory appeared to be in prospect that would have been ruinous to both. At first the disposition was to fight. Conciliation finally prevailed, best exemplified, perhaps, in an understanding about the division of territory reached by the Eastern Massachusetts Street Railway and the New York, New Haven & Hartford Railroad.

With due respect to all the parties concerned in the Pennsylvania proceeding, it does appear a bit incongruous that contestants who know so well the economic principles involved should find themselves opposed to each other before a state board or any other such body over a question that is so vital to them. Where there can be nothing but agreement between the principles over the fundamentals that are involved there should be no room for disagreement over the application of the principles. Pennsylvania would do well to take the Massachusetts settlement seriously to heart. It will pay the steam road least of all to be pugnacious.

The Extent of Co-ordinated Service in New Jersey

SIGNIFICANT, indeed, are the figures contained in the annual report of the Public Service Railway of New Jersey, digested in the issue of March 20. They show the extent to which the bus is being used in co-ordinated service in the territory served by that company. The number of bus passengers carried has increased from 1,952,059 in 1923 to 69,383,643 in 1924 and 146,053,237 in 1925. More significant is it that the total of passengers carried by both trolley and bus in 1924 was 497,212,087 and in 1925, 562,841,858. The previous high year for trolleys alone was 1917, when 476,974,983 passengers were carried.

Important as are these figures of the extent of the bus service, sight should not be lost of the diversity of this operation. It is true that this story has been spread before the industry in articles in the JOURNAL and that it was told at Atlantic City, but the report to the stockholders spreads the facts before those who are financially interested in the company and before the public which it serves, many of whom have been converted into partners in the enterprise through customer ownership. Even though to those in the industry much of the material contained in the report is not new, the recapitulation of the figures furnishes material for placing the matter in the proper perspective.

So far as the general aspect of the situation is concerned it, in a way, is contained between the lines of the printed report. There is a hint of it here and a hint there. But these hints are better even than the picture would be were the attempt made to paint it in bold relief. One little scrap of information sometimes tells a whole story. Such a scrap is the reference to the purchase of 333 buses at one clip to replace obsolete equipment acquired from previous bus operators. Another, with perhaps an even more colorful character, is the statement that at one point on the system there is a 140-bus garage and that at many other locations buses and street cars are housed under one roof in improvised quarters. All these give some idea of the magnitude of the problems being encountered in co-ordinating rail and bus.

The company is doing its part, just as it said it would. The problem now has resolved itself into one of economical and at the same time efficient operation. In many respects the company has about reached the limits to which, unaided, it can go. It wants greater co-operation from the communities which it serves. To this end it has entered the well-made plea that better traffic regulation be enforced and that the company be relieved from unfair paving requirements. It is a fair plea against an unfair practice—a plea that in the end it is more important be heeded in the interest of the public than in that of the company.

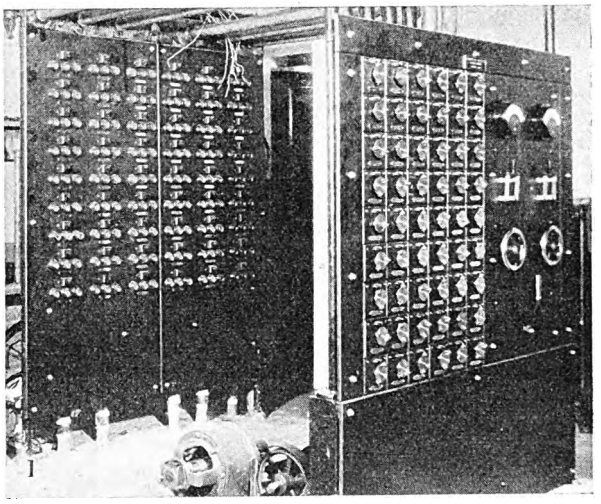
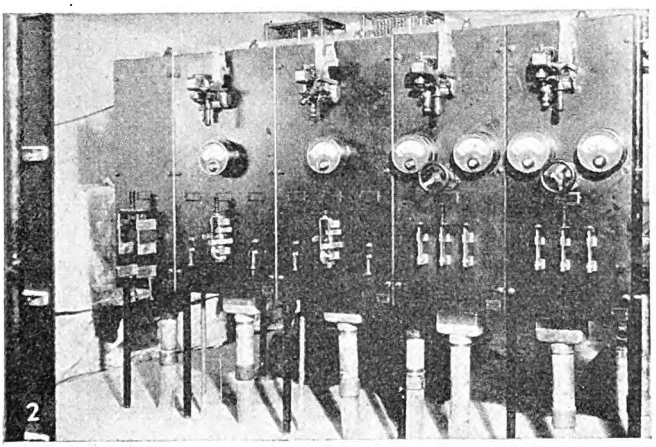
Carefully Planned Mechanism Controls the Chicago Traffic Signals

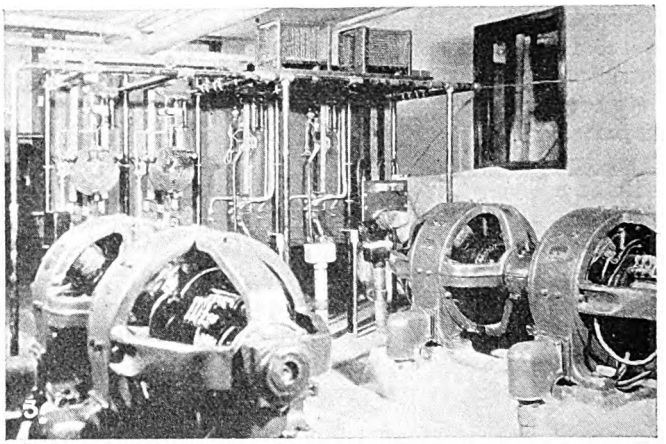


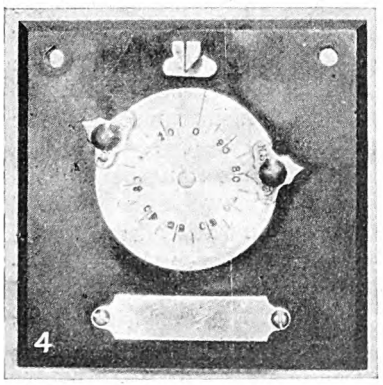
1. Front view of relay panel and behind it the individual fuse plugs placed in each circuit leaving the control tower. Both relays and fuse group controlling each intersection are placed in the same order that they appear on a map of the Loop. On the front panel may be seen the handwheels that control the duration of the cycle, the time in seconds being indicated by the meters at the top of the board actuated by small tachometers attached to the gear train. The lever at the bottom of the panel actuates the clutch that connects one driving set or the duplicate.

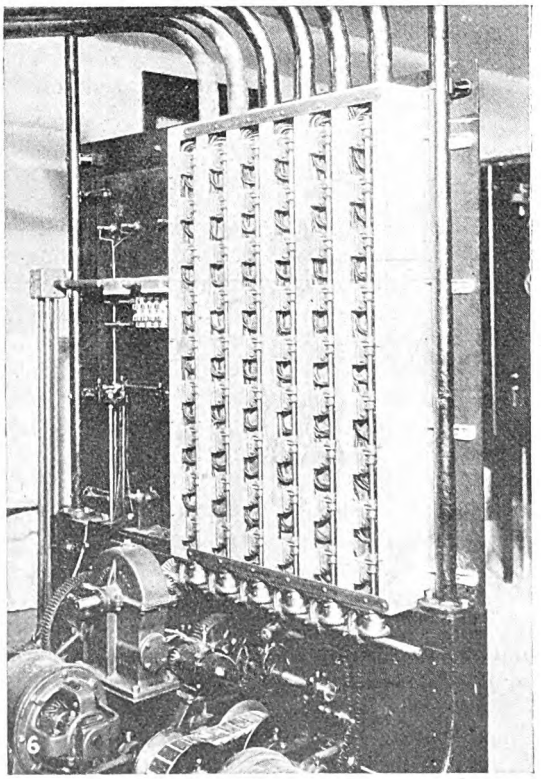
2. Front of the switchboard controlling the two 40-kw. Western Electric sets used to supply energy to the traffic control lights.

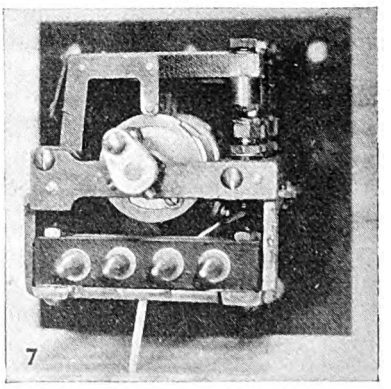
3. Two 40-kw. motor-generator sets and back of controlling switchboard used to operate Chicago's co-ordinated traffic control signals.

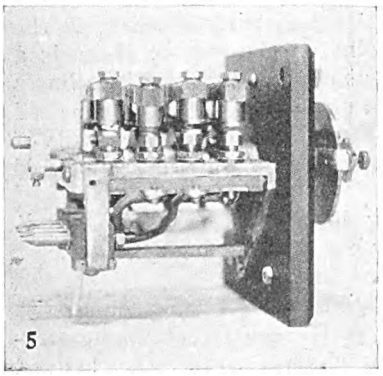


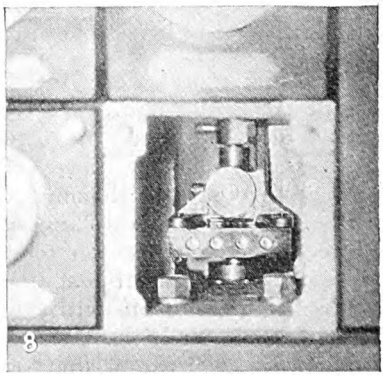












4. Face view of an individual relay removed from the main board. The space between markings on hands "NS—NS" is the proportion of time allowed for north-south movements across the intersection that this relay controls. The balance of the cycle is for east-west movements. The hands are adjustable and control the setting of cams which operate the contacts.

5. Side view of an individual relay showing the four individual contacts. Three of these contacts are raised, and one is closed in this picture.

6. Rear view of the relay bank. The duplicate motor drive may be seen. Note the horizontal operating shaft bevel geared to the vertical shafts, which in turn actuate each individual relay through a small bevel gear. All bearings are supplied with oil cups.

7. Rear view of an individual relay showing the cams, and the crankshaft that fits into propelling mechanism, and the four plug contacts.

8. The control board looking into the recess in which is housed one of the operating relays.

Co-ordinated Lights and Rerouting Speed Up Chicago's Loop Traffic

First Month's Operation of Traffic Signals of New Design Prove Very Satisfactory—Rerouting and Elimination of Left-Hand Turns Accomplished More than a Year Ago Was the First Step in Accelerating the Loop Traffic—The Two Steps Together Have Resulted in 50 to 80 per Cent Increased Speed of Movements

By John A. Dewhurst
Associate Editor ELECTRIC RAILWAY JOURNAL

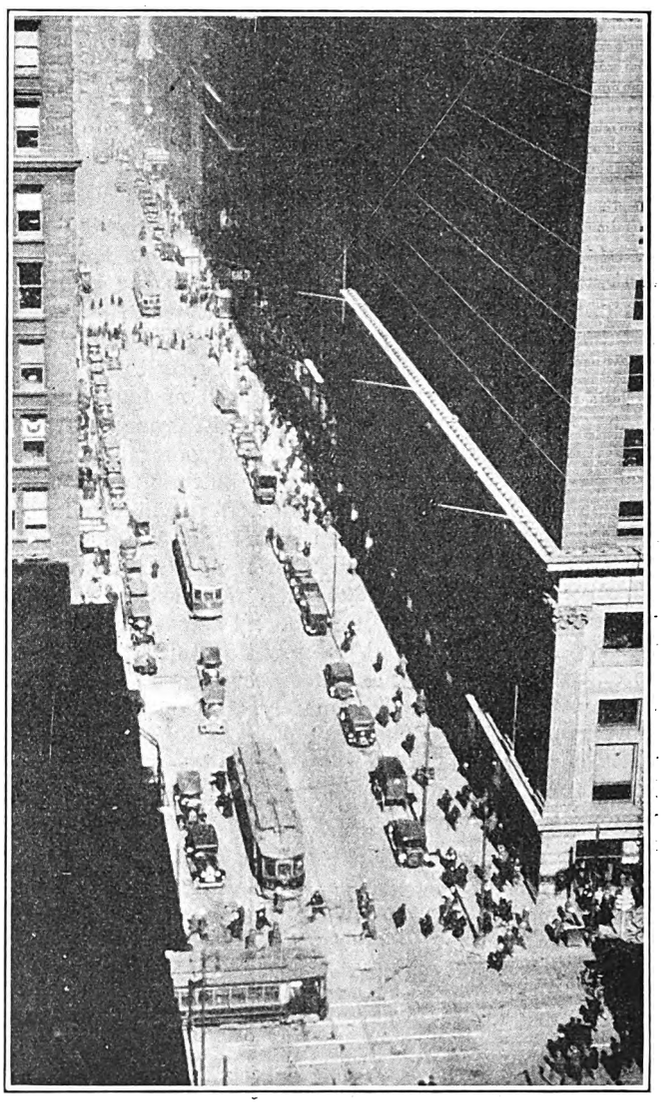
CHICAGO'S Loop has had a second major operation performed upon it which after one month's trial has so speeded up the car and vehicular traffic that much of the congestion has been eliminated. This improvement is not theoretical, but an astonishing fact that can be readily observed by any visitor familiar with previous conditions. The operation was simple, consisting of the installation of an automatic but non-synchronous system of traffic control lights, the sequence of operation having been first determined by engineering studies based on traffic checks continued for more than a year.

While several minor changes have been made during the first month, the system worked and worked well from the time the master switch was closed on Feb. 8. Many checks made during this first month show that movements through the Loop have been speeded up from 25 to 50 per cent by these traffic signals alone. Cars that formerly required from eight to twelve minutes to cross the Loop now require from five to six minutes.

This saving, combined with the rerouting plan made effective late in 1924, has speeded up Loop traffic from 50 to 80 per cent and is equivalent to adding this much more capacity to the streets of central Chicago. These signals are believed to have possibilities for use on high-speed boulevards that promise revolutionary increases in speed of movements over that possible with the synchronized system that requires positive stops every so often. It is not claimed by those responsible for the installation that the exact layout used in Chicago will fit any other situation, but the principle of this co-ordinated control can be adapted to other conditions with equal success.

Every schedule of the Chicago Surface Lines that controls cars passing through the Loop must be reconstructed to cut the slack time from Loop movements—an imposing task in itself. Approbation is heard everywhere. Newspapers are unanimous in their approval of the system. Individual talks with numerous police officials in the traffic department, taxicab drivers, individual car operators, motormen and others who for years have battled with the old system of police whistles and individually controlled corners are unanimous in their approval of the system. It is not an uncommon occurrence to drive through the Loop from one edge to the other without a stop or shift of gears even in the busy hours of the day.

The first impression in driving through the Loop is that of a perfect "break" of luck, the lights changing to green just as the approach to the corner is made or staying green until the crossing is made. The traffic officers, who a month or more ago were risking their lives while they lustily blew their whistles so familiar in Chicago, are now busy regulating pedestrians, the only kind of traffic that won't be governed by the lights. Instead of the whistles one now hears "watch the lights."



Clark Street, Chicago, Looking North from Office of Chicago Surface Line. Intersection in Foreground Is Adams and Clark. Picture Was taken During the Noon-Day Period

A second natural impression is that there are not as many vehicles in the Loop as usual. To be sure

there aren't, because they pass through and out about twice as fast as formerly. Another impression that bewilders the traveler trying to see how it is done is that an observation up one street shows the lights at the different intersections blinking first red then green without any apparent relationship one to the other.

A study of the system leads one directly to the offices of the Chicago Surface Lines as well as backward in time at least two years. Under the generalship of G. A. Richardson, vice-president and general manager, and in conjunction with the city officials, a complete rerouting of car lines was effected which eliminated left-hand turns in the Loop district and reduced the right turns to a minimum. After this rerouting became effective on Sept. 14, 1924, the improvement was so noticeable that the city ordered all left-hand turns of vehicles eliminated about one month later. The cost of special work and track changes necessary to accomplish the rerouting was approximately $150,000. Based on movements of street cars at intersections this improvement gave a time saving estimated at 27½ per cent. Many time studies of street car operations showed the various times of movements at intersections averaged the following before the rerouting:

	Time Through Intersection, Seconds	
	Single Car	Motor and Trailer
Straight across.....	10	14
Right hand turn...	15	20
Left hand turn.....	20	20*

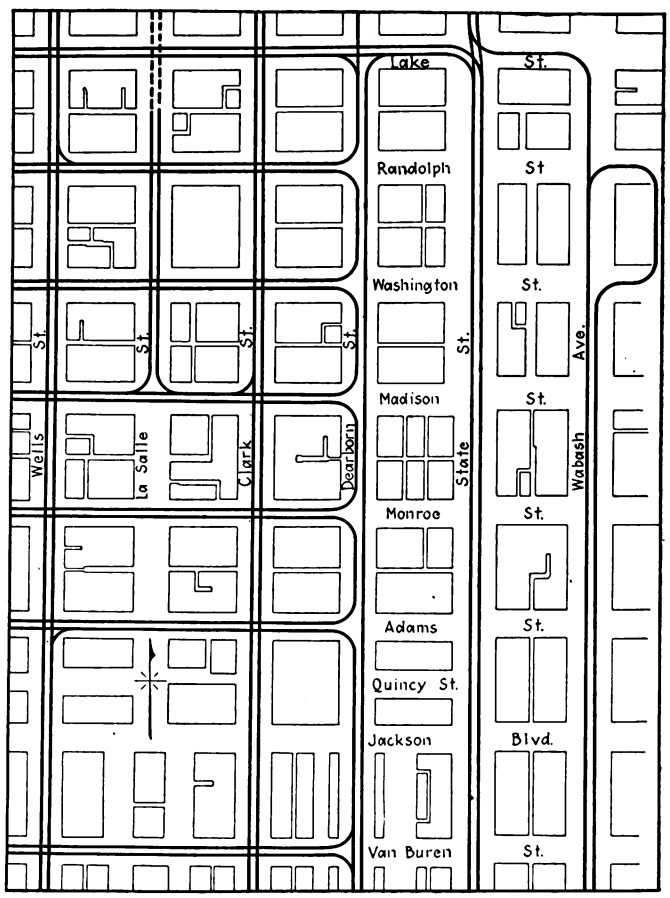
*This low value resulted from the fact that no left-hand movements of trailer trains were made in the center of the Loop, but only at the edge, where congestion was less.

Elimination of left-hand turning movements was considered desirable to the proper control of traffic under any system. This accomplished, the city announced its intention to install a system of traffic control lights. The problem was turned over to the traffic committee of the Association of Commerce. A sub-committee was formed to which E. J. McIlraith, staff engineer of the Chicago Surface Lines, was appointed. Mr. McIlraith designed the system with the assistance of H. B. Cammack, traffic engineer of the Surface Lines. To these men belongs the credit of applying engineering principles to the control of one of the worst traffic situations in the country.

While the Loop is an intangible area in Chicago, in this discussion it is bounded by the streets over which the elevated loop line is constructed—Lake Street on the north, Van Buren on the south, Wells Street on the west and Wabash Avenue on the east. Technically, this is the Loop. Following the order of Sept. 14, 1924, and the vehicular order two months later, left-hand turns are allowed on these border streets except Wells, but no parking. Inside the Loop no left-hand turns are permitted but limited parking is allowed. The traffic control system discussed in this article is confined to the intersections within this area and on the bordering streets, 49 in all.

Apparatus Allows Great Freedom of Control

Of primary interest is the scheme of establishing the inter-relation of signals controlling the traffic lights at the intersections. The signals themselves are not unusual, consisting of three-lamp standards, one at each corner of an intersection, the illuminating signals facing in opposite directions as illustrated in the sketch. The usual colors of red and green for "stop" and "go," with amber for an intermediate signal, are used. From each lamp standard emerge the five control wires that operate the three different lamps. The five wires from each of the four standards at an intersection are interconnected. In this way five wires operate all lamps at one street intersection, theoretically in the same



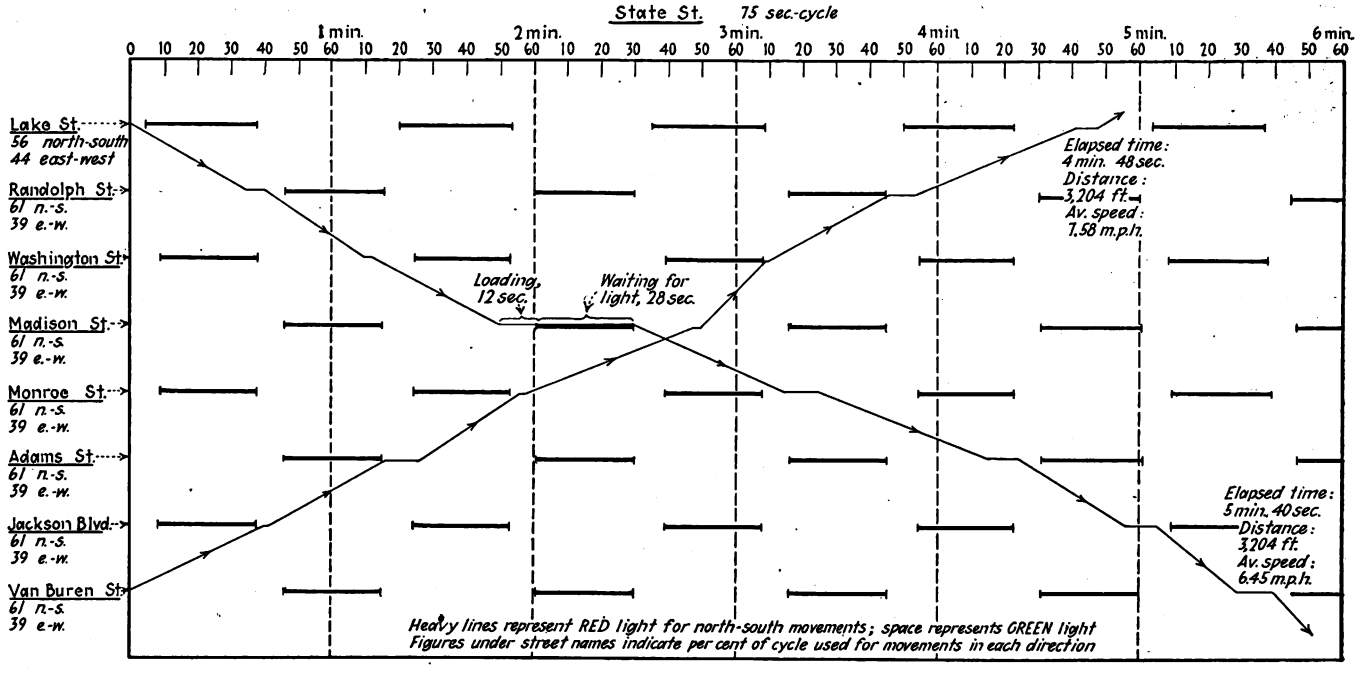
Tracks Used Daily in the Chicago Loop
Preliminary to the design of the co-ordinated traffic flow signal system, Chicago eliminated left-hand turns for cars and vehicles except on border streets. This map shows the present routing and trackage to scale that is used in daily operation. Other tracks and special work have been omitted for simplicity. Only two left-hand turns for cars are used on border streets, although vehicles may make such turns at any intersection on Lake, Wabash or Van Buren.

Digitized by Google

manner as if the intersection were controlled by a single set of three lights hung from span wires over the center of the intersection. While four wires are enough electrically to operate the three lights, the fifth wire acts as a neutral for the amber lights, thus avoiding a change in brilliancy when the amber lights burn coincidentally with the red or green.

The operating wires from each intersection are carried underground to the control room in the basement of the City Hall. Each set is connected to the terminals of an individual relay. On this control board are mounted 54 relays in a bank, six wide and nine high. Each relay is the control for an individual intersection. a minimum. In this way the action of the 49 individual relay shafts is synchronous and each completes one revolution in the predetermined time-cycle of operations that controls the entire system. The individual cams, however, can be controlled separately from the face of the relays and can be co-ordinated in their relationship of operation.

Consider any one instant as zero, for the system as a whole. The cams controlling the contacts of each relay can be rotated on the face of each relay and set, so that the point of starting a north-and-south movement, for instance, may have a plus or minus time relationship to that of any other. Likewise, the pro-



Typical Chart Used in Designing the Chicago Traffic Light System

Two typical car movements are traced through the Chicago Loop. Readings are taken from checks made on State Street, which runs north and south. The first car enters the Loop (lower left-hand corner of chart) at the beginning of the permissive signal for north and south movements, requires 41 seconds to arrive at Jackson Boulevard, stops there one second and proceeds to Adams Street, 71 seconds after entering the Loop. Here eleven seconds is required for loading and discharging of passengers, but the light controlling the intersection is green and the car proceeds across eight intersections without once being held for lights.

A southbound State Street car picked at random from the company's check enters the Loop at Lake Street and crosses the intersection on the tail end of the permissive light. However, this car progresses without delays until Madison is reached. Then it is held twelve seconds discharging and loading passengers and just misses the light and hence is delayed 28 seconds. Now the car is in step and passes through the Loop with no further delays. It is only chance upon entering the Loop whether on the beginning or the tail end of the permissive signal. If on the tail end the chances are that one delay will take place.

Since there are only 49 intersections in the Loop five relays are spares. In case of trouble, these can be interchanged in a few seconds time. The arrangement of these relays on the vertical board is in exactly the same order as they would appear on a street map, so that an operator familiar with the streets in the Loop district can readily find the relay controlling any intersection.

The propelling mechanism, consisting of a 1-hp. electric motor and gear drive, is in duplicate and is mounted at the rear of the relay rack. A single throw of a lever disengages one clutch and throws in the other motor and gear reduction drive. The speed of the motor is reduced by a set of gears that drives a horizontal shaft along the bottom of this relay bank. A vertical shaft driven from the lower horizontal shaft through bevel gears rises just behind each vertical tier of relays and propels each one separately. The four electrical contacts of each relay consist of coin silver points, the upper one in each case being raised or lowered by cams on the individual relay shafts. Condensers wired across the contacts reduce arcing to

portion of time can be changed at will so that the north-south movement may be given 40 per cent of the time elapsed in the cycle and the east-west 60 per cent, or 35 per cent and 65 per cent, or 75 per cent and 25 per cent respectively, or any other desired rate.

By means of a variable speed control device (Reeves drive) between the propelling motor and the main driveshaft the duration of the controlling cycle for the system can be changed at will to meet the demands of traffic in different periods of the day. At present the base cycles used are as follows:

7:30 a.m. to 8:00 a.m.	60 seconds
8:00 a.m. to 9:00 a.m.	70 seconds
9:00 a.m. to 4:30 p.m.	75 seconds
4:30 p.m. to 6:00 p.m.	80 seconds
6:00 p.m. to 12:30 a.m.	60 seconds

Saturday the longer cycle is used beginning about noon and on Sundays a 60-second cycle period is used. This schedule is subject to change, being dictated by traffic demands only.

State Street, Chicago, Looking North at 4:15 p.m. on a Monday in March

This snapshot was taken just after the intersection from which the picture was taken was cleared of north-south traffic and just at the time the intersection to the north started to move north and south. Note the apparent absence of traffic, an impression created by the greatly facilitated traffic movements.

The entire installation of equipment cost approximately $230,000. The lamp standards were designed by the architects, Graham, Anderson, Probst & White. The control equipment was manufactured by the Harrington Seaberg Corporation of Moline, Ill. The power supplying the lamps is direct current obtained from two (one a spare) 40-kw. Western Electric motor-generator sets designed for flat compounding and installed in the control room.

Incoming wires come to a terminal board erected behind the relay bank and are fused individually, so that a short circuit on any wire can only put out of commission the lights at one intersection controlled by the wire affected. In order to overcome the line drop to distant points and to allow all lamps to burn at normal brilliancy, resistances of the proper value are inserted in nearby circuits. These are wound on tubes and screwed into standard Edison sockets.

This somewhat detailed description of the equipment is given in order to visualize the system. It is really putting the cart before the horse, because the apparatus was designed to fit the kind of a system deemed necessary to accomplish the desired results.

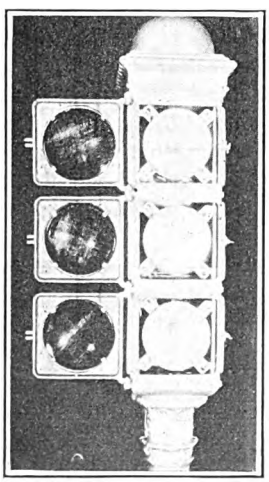
Because of the narrow streets in the Loop only in a few instances are safety zones used. At corners where there are no safety zones vehicular traffic must wait behind loading street cars. In a sense the cars control the speed of all traffic, and it was of prime importance to move them with as little delay as possible. Besides, as in most cities, the street cars carry more than three-quarters of all the persons riding in vehicles of all kinds.

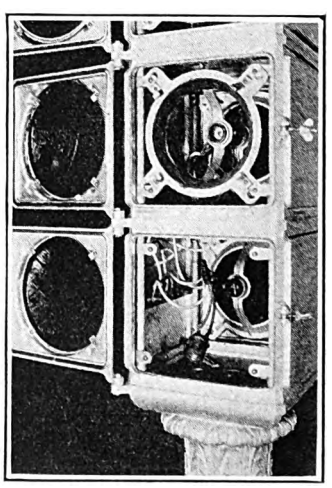
For this reason the lights are designed primarily to move the cars—not to stop them. A car entering the Loop may find the light green or else may have to wait. Once it passes the first light, it is then in step with the co-ordinated system, unless it enters at the end of the permissive signal. The car then takes the normal time to arrive at the next corner and consumes the allotted time plus about ten seconds to load. The second light changes to green. Again the process is repeated and after the third corner has been reached and passengers discharged and loaded this light also is green, and so on through the Loop. In this way waiting for traffic signals is greatly reduced and the time thus saved is responsible for the faster movement.

The normal time required for a car to move from one block to another plus the normal time for loading and discharging of passengers has all been previously determined by many painstaking checks and averaged to obtain average conditions. The timing of the lights has been made to fit the facts. Of course, the timing for the north-south street must be co-ordinated with the east-west movements and adjustments made. Effecting this adjusted combination is, of course, the key to the success of the operation.

As shown in the diagram, all east and west cars turn on Dearborn Street, entering the Loop on one street, leaving on the next street south after passing over Dearborn Street for one block. Each line is returned to its normal street several blocks to the west. The signals are arranged to allow these movements to be made in a continuous manner, the time interval of passing along a block and loading and discharging passengers being used to allow passage of opposing traffic over the intersection just ahead.

In this way traffic moves in waves. A car or an auto passes over its route as if riding the crest of a wave. As the crest of an east-west wave passes over an intersection the north-south wave is at the valley.





A Six-Lamp Traffic Control Unit Is Placed on Each of the Four Corners of an Intersection

At the left is the top of one of the three lamp standards with the lens covers swung back to show lamp and reflectors.

The center view is a typical installation showing three of the four standards at Washington and Clark Streets, Chicago.

At the right is a close-up of the lamp standard partially disassembled to show construction of interior.

Digitized by Google

The diagram reproduced is for State Street, one of the principal north-and-south thoroughfares. Ordinates represent intersections with east-west streets to a scale corresponding to the distance between such intersecting streets. Abscissas represent time. The heavy horizontal lines with gaps between represent the stop and permissive signals as they appear to traffic on State Street. A line represents the stop or red light, the gap a green or permissive signal. The two diagonal lines show the progress of two typical cars picked from the many checks made since the installation of the system. The diagram appears quite similar to the "string diagram" long used in schedule making. Only the co-ordinated lights are added. It is necessary to pass the cars and the traffic across the intersections in the gap or gate as it were.

MANY WAITS FOR SIGNALS ELIMINATED

From these two typical cases it is seen that the northbound car entering the Loop at Van Buren Street passed through without once having to wait for lights. A total distance of 3,204 ft. was covered in four minutes 48 seconds, or at average speed of 7.58 m.p.h. The southbound car chosen to illustrate an actual condition entered the Loop near the tail end of the green light indication, crossed Randolph on the tail end and Washington near the end of the green lights at each of those intersections. At Madison the car required twelve seconds to load and unload and just missed getting started before the red light flashed. At this point the car was delayed 28 seconds waiting for lights, and then started at the beginning of the green signal. From then on it was perfectly in step with the system and despite long loading periods at the four remaining intersections left at Van Buren well within the green light period. Even with this 28-second delay the trip of more than half a mile was made in the late afternoon at an average speed of 6.45 m.p.h. and the car waited for lights at only one of the eight intersections. This chart is a section of a large chart used by the Chicago Surface Lines in designing the timing for all car movements. The completed system was worked out with great care from the data obtained in numerous time checks. It is this application of traffic engineering data that differentiates this from the usual synchronous system.

It is seen that at State and Lake Streets 56 per cent of the cycle is used for north and south movements and 44 per cent for east-west movements. At all other intersections along State, except Jackson, 61 and 44 per cent respectively are used. If traffic conditions should demand it, these periods could be varied or the relative split at any one intersection could be changed either by cutting off the time of one movement at each end of the cycle or one end only, thus causing a "slippage" in the relative relationship. This has to be done on certain other streets having double length blocks, but it is so arranged as to give the correct timing for a steady movement along each street.

The amber light shows for three seconds during the tail end of each red or green signal period and is a warning of the coming change. Traffic may not start to cross after the amber light shows with the green. Right-hand turning movements are always made on the green light for the street out of which the turn is to be made.

When the system was planned the data indicated that a 90-second base cycle would be necessary. Practice has proved, however, that traffic movements were so facilitated that considerably shorter periods were possible, from 60 seconds when travel is light up to 80 seconds in the rush hours. Traffic checks also showed that cars turning back at Dearborn Street took a longer time to enter the Loop than to leave it. The new system has cleared up this situation, so that it takes about the same time for the outbound as the inbound trip. Such slightly changed conditions were the cause of the few minor modifications in timing and co-ordination that have been found desirable.

Cleveland Railway and Police Officials Inspect Chicago Traffic Lights

SINCE the installation of the co-ordinated traffic control lights in the Chicago Loop, many visitors and students of traffic have visited Chicago. The picture reproduced here shows Ralph W. Emerson, general manager of the Cleveland Railway, and a party of police officials from Cleveland and near-by communities.

Reading from left to right are: L. D. Bale, Ralph W. Emerson of the Cleveland Railways, Commissioner E. J. Donahue of the traffic division, city of Cleveland;

L. G. Corlett, chief of police of East Cleveland; L. B. Miller, chief of police, Lakewood; C. E. Egeler of the National Lamp Works, General Electric Company; H. B. Cammock, traffic engineer Chicago Surface Lines; Lieutenant Flynn, Chicago traffic police department; E. J. McIlraith, staff engineer of Chicago Surface Lines.

31,000,000 Passengers Carried Without Fatality

A REMARKABLE safety record, realized by the Texas Electric Railway, Dallas, Tex., has just been announced by James P. Griffin, general passenger agent of the company. The interurban carried 31,000,000 passengers on its cars since Jan. 1, 1917, when the Texas Electric Railway began its operation, without a fatally injured passenger. The company is publishing this news in some 75 daily and weekly newspapers in that section of the country and is running a series of large advertisements this year in the *Star-Courier* to increase interurban travel, and also to help the traveling public cut down the number of casualties resulting from automobile accidents. In line with this safety campaign the electric railway is planning to build warning signs on the highways to advise motorists of dangerous curves and bridges ahead.

Depreciation as an Operating Expense

THIRD AND FINAL ARTICLE

Determination of Size of a General Reserve Involves Many Practical Problems—Exact Theoretical Calculations Are Not of Paramount Importance if Replacement Is Used as the Basis—Changes in Company Policy Can Be Taken Care of by Proper System of Charges

By W. H. Maltbie
Late General Counsel United Railways & Electric Company of Baltimore

SOME months ago, as the result of a conversation with one of the editors of this paper, the author undertook to prepare a series of articles on the subject of depreciation. This series was looked forward to with great interest, as Mr. Maltbie was an outstanding authority on the subjects of valuation and depreciation. After his death, the manuscript was located and forwarded to this paper through the kindness of J. H. Hanna, chairman of the A.E.R.A. committee on national relations sub-committee on depreciation, of which Mr. Maltbie was a member.

These articles were written from the viewpoint of the present investigation by the Interstate Commerce Commission of the whole subject of depreciation of electric railway property. This investigation was undertaken with a view to establishing definite rules and regulations covering the allowance of charges for depreciation as an operating expense on all roads subject to its jurisdiction. Since there is a possibility that any regulations of this sort established by the I.C.C. may be accepted as a precedent by various state commissions it is important that all street railway executives should be familiar with the present situation.

These three articles, dealing respectively with causes of depreciation, methods of setting up funds to provide for depreciation and practical methods of building up a retirement reserve, constitute a valuable contribution to the literature on the subject. They were probably the last creative work of the author.—EDITOR.

WHEN dealing with a large aggregate of units in place of a single unit there arises a practical question as to the size of the aggregate reserve for the property. Confining our attention to the retirement reserve, and dealing with a single unit of property, there is no question but that the ultimate reserve must be equal to the cost minus salvage. Certain theoretical students of the subject have fallen into the error of assuming that because this is true for the individual unit of property it must be true for any aggregate of units. As a matter of fact, however, when we come to deal with a large aggregate of separate units we find the magnitude of the necessary general retirement reserve dependent on whether the business looks forward to an ultimate liquidation or to perpetual operation. For example, consider the case of a large urban transportation company, operating about 2,000 cars, which has adopted the policy of regularly retiring cars at the end of 20 years service in order to take advantage of the latest changes in the art. Naturally the business of the company grew to its present magnitude over a long term of years and its cars are therefore not all of the same age, but of all ages, and, in fact, it is now keeping up its car equipment by an annual purchase of approximately 100 cars per year. Assume an initial cost of cars, exclusive of scrap value, of $10,000 each, so that the annual allowance for depreciation on each car is $500. At the end of the twentieth year there will be 2,000 cars so purchased. Their average age will be 10½ years, their average reserve $5,250 and the total reserve $10,500,000. But under the system of the company only 100 cars are to be retired at the end of the 20th and the beginning of the 21st year, and the total amount of cash needed, therefore, is only $1,000,000. During the 21st year, with the full 2,000 cars in operation, the contribution to the reserve will be $1,000,000, and at the end of that year the retirements will again be 100 cars, utilizing only $1,000,000. In other words, under these conditions, so long as they remain static, there is a reserve of $9,500,000 for which the company has no need, unless it decides to liquidate.

On the other hand, a transportation company in an urban community will not liquidate unless the community dies or the art of transportation changes. This accumulated reserve is usually invested in the property, and therefore in the event of liquidation for either of the above reasons will, like the rest of the property, have little if any value. It is therefore argued by many students of the problem that since this excess reserve will never be needed for retirement it is not a matter in which the public is interested, and should be demanded by a regulatory body only in those cases where the investors set up a claim for it as an economic right.

THE PRACTICAL SOLUTION MORE IMPORTANT THAN THE THEORETICAL

The whole problem is one which evidently calls for a practical rather than a theoretical solution.

This practical solution must depend very largely on the financial condition of the company and on its probable future. If a company by virtue of fortunate situation, density of traffic, or other reasons, is able, with a satisfactory rate to its public, to earn a full theoretical reserve, it will accumulate in a comparatively short time a very large sum of money, for the greater part of which, if it does not look forward to liquidation, it will never have any need. It has, therefore, the opportunity of making its extensions without increasing its capitalization, and thus, whether it in-

Digitized by Google

creases its earnings or not, strengthens its financial position.

Other properties, perhaps less favorably located, nevertheless look forward to an ultimate liquidation through expiration of franchises or the exercise of reserved rights of repurchase by the municipality, and some utilities, such as those which serve mining, quarrying or similar interests, look to ultimate liquidation as the result of the disintegration of the communities which they serve. These will all insist, and properly, upon a full theoretical reserve amounting to the full value of the investment, less junk or resale value, at the time of the anticipated cessation of their activities.

A Balancing Reserve

A third group of companies does not look to any ultimate liquidation and believes that it is wiser to make expansions and extensions by the direct introduction of capital, rather than by the investment of superfluous reserves. Companies of this group appropriate for depreciation each year a sufficient sum to take care of normal average retirement costs, and something over, so as to accumulate a small reserve sufficient to take care of any abnormal variations from year to year. As soon as this reserve reaches a moderate amount in comparison with the total value of the depreciable property, appropriations to it are decreased, so as to hold it practically constant.

The depreciation reserve of a new company is built largely during the first life cycle, and this policy enables the company to offset a lower depreciation charge against the higher operating costs that come during the initial period of an organization.

In the case of an old company without an adequate reserve, the theoretical depreciation reserve, if built, is built almost entirely during the first cycle of replacement, during which time operation must also care for the retirement of the equipment already on hand. Therefore, the adoption of the policy of building a full reserve by an old company represents a burden imposed almost entirely upon the users during the first cycle of replacement.

In either an old or a new company, therefore, the adoption of the plan of accumulating a moderate reserve to serve as a balancing fund for variation in annual retirement cost operates to the benefit of the present generation and imposes no burden upon the future generation, the only danger being to the investor in the event of an ultimate liquidation.

The Practical Reserve Simplifies the Sinking Fund Method

The adoption of this practical form of reserve, providing only for the equalization of retirement costs and eliminating provision for ultimate liquidation, also removes the accounting difficulties which have made some companies unwilling to consider the sinking fund method of handling the reserve. If we assume a full theoretical reserve set up separately for each unit of equipment, with proper allowances for additions or changes, the accounting difficulties of the sinking fund method are numerous. Consider, for example, the purchase of a car having a depreciable value of $10,000 and an estimated 20-year life. If the reserve is to be set up on the straight line basis, there is nothing more than a single charge of $500 per year. If, however, it is set up on a sinking fund basis, an estimate must be made as to the probable earnings of the contributions to the fund and then a special depreciation charge worked out which, with its earnings, will yield $10,000 at the end of the 20-year period. If at any time during the life of the car it is remodeled or has additional equipment or accessories added, the rate must be changed. If it is desired to set up a system of this kind for 50 cars the present age of each car must be determined, and the rate will vary with every difference of age of the cars already owned. The accounting system in such a case is admittedly complex and the advantages probably do not justify it.

If, however, we are dealing with depreciation from the other point of view, are appropriating annually to depreciation the average retirement cost and are carrying in addition a certain balancing fund with which to take care of abnormal requirements, the sinking fund method merely requires that any income from the reserve shall be added to the balance of the fund. This strengthens the balancing fund and at the same time leaves operating income undisturbed by the introduction or addition of an investment return.

An excellent illustration of this method is the system approved by the District of Columbia Public Utilities Commission for certain of the utilities under its jurisdiction. The reserve is subject to the commission's supervision. It is not invested in the business, but the utility is authorized, with the permission of the commission, to borrow on the company's own notes such portions of it as may be needed, paying into the fund annually an agreed interest rate for the portion of the money borrowed. In this way the plant owned by the company always represents investment, and the company's indebtedness to the depreciation fund belongs in the same class with its short-term notes. The system apparently has much to commend it.

The Practical Method and the Replacement Reserve

If a company has adopted this practical plan of accumulating merely a balancing fund in place of a full theoretical reserve there is, of course, no effort to allocate the reserve to individual units of property or to make the amount in the reserve for the property as a whole equal to the difference between original cost less salvage and unexpired life value. It is therefore possible for such a company to adopt the plan of providing through its depreciation charges a replacement reserve rather than a retirement reserve without meeting the difficulties above mentioned as confronting the owner of a single unit.

If a company which has adopted the policy of building a replacement reserve is confronted with a change in replacement costs due to a change in the purchasing power of the dollar, a corresponding change in the charge of transportation will automatically adjust the annual contribution for depreciation so as to take care of the current replacements and make a contribution proportionately increased or decreased to the balancing reserve. In other words, if the purchasing power of the dollar is changing, the replacement reserve will call for a corresponding change in the cost of transportation, while the retirement reserve will cause the cost of transportation to lag behind the general price trend. Thus, on an ascending scale of prices the strict retirement reserve holds the cost of transportation down and on a descending scale of prices holds the cost of transportation up, while the replacement reserve keeps it in line with the general trend.

Digitized by Google

There is also a distinct economic advantage in the adoption of the replacement reserve. Under the retirement reserve the change in the cost of an article which is to be replaced in kind is a matter for the investors and not for the patrons. On an ascending scale of prices this means that additional money must be put into the property without in any way increasing its productive capacity. Thus, a street railway system which finds it necessary at the present time to rebuild 20 miles of pre-war track in paved city streets must, if it limits itself to the retirement reserve theory, invest not far from a million dollars of new money which does not in any way increase the system's productive capacity. Financing of this sort is difficult and, if the amount of it is large, may easily lead to an increased cost of money or an impairment of credit, both of which react not only to the injury of the investor but to the injury of the general community.

On the other hand, if the price scale is descending, the retirement reserve forces the public to contribute more money than is necessary to maintain the plant and therefore provides either for a partial liquidation of the investment by an actual distribution to the investors or for an expansion of the plant without increase of capitalization.

Reserves Under Investment and Reproduction Theories for Rate Base

Any attempt at the theoretical solution of the problem of the choice between the retirement and the replacement reserve proves, however, to be inextricably tangled up with the question as to whether the rate base is to be actual investment or reproduction cost.

Consider, for example, the case of a company which in the pre-war period was operating 1,000 cars of 20 years life, and an initial investment, less salvage, of $5,000 per car. Assume, further, that the company had been in operation long enough to equalize its renewals so that it was maintaining its equipment by an annual replacement of 50 cars per year, and that the economic changes due to the war raised replacement costs, less salvage, to $10,000 per car.

In the pre-war period the annual charge for depreciation was $250,000 per year, and the demand for it was justified by the fact that the investor was entitled not only to earn upon his investment but to have it maintained intact, so that the $250,000 paid under the name of depreciation was merely a payment by the public for consumption during that year of the one-twentieth portion of the useful life of all cars. In addition, if we assume an 8 per cent return, the public must pay a return of $400,000 or a total payment of $650,000.

Now that the change in price has taken place, under a strict application of the investment theory of the rate base, the public would pay during the first year after the change a fair return (say 8 per cent) and a depreciation allowance of 5 per cent (a total of 13 per cent) upon 950 old cars at $5,000 each and on 50 new cars at $10,000, a total of $682,500, or $32,500 more than its total payment in the previous year. During the second year after the change the contribution will be on 900 old cars and 100 new, a total of $715,000, or a further increase of $32,500, the additional money necessary to purchase the new cars having been furnished by the investors. If the new price is permanent the annual contribution by the public for return and depreciation will increase by $32,500 annually, and at the end of the first life cycle of 20 years the total payment by the public will be $6,825,000 in excess of the amount it would have paid had the pre-war prices continued. Under the reproduction cost theory of the rate base the public must pay each year after the increase in price the full return upon the reproduction cost of all the property, or, in our illustration, 8 per cent on $10,000,000, or $800,000. If the public is also to pay under the name of depreciation the current value of the one-twentieth of the car value consumed, this amounts to $500,000 additional, or a total payment of $1,300,000.

As frequently happens, a compromise method may be devised which does not fit either extreme theory, and yet offers certain practical advantages.

Let us assume that the public is willing to free the company from the necessity of procuring the additional capital and meets the full cost of replacement, paying a return only on money furnished by the investor. The public then pays for return $400,000, and for replacement $500,000, a total of $900,000, or $250,000 per year more than before the price change. In the first life cycle this amounts to $5,000,000, or a saving, as compared with the first method, in this 20-year period, of $1,825,000, and thereafter a saving of $400,000 per year as long as the high price continues.

In general, the annual payment under the compromise method becomes less after $\frac{1}{R + D}$ years after the increase in price, when R and D are the rates of return and depreciation, and the total payment becomes less after $\frac{2}{R + D} - 1$ years. This latter period is lengthened if R is less than $D \frac{(1 - D)}{(1 + D)}$ since the annual increase under the first method ceases at the end of the first life cycle.

In the long run, therefore, this compromise adjustment will be beneficial to the public if the increase in price continues for a sufficient length of time. If prices are decreasing, conditions are, of course, reversed; the public gains temporarily and loses in the long run, the ultimate advantage with fluctuating prices depending, therefore, upon whether the general trend is to be upward or downward.

Attitude of the Depreciation Section of the Interstate Commerce Commission

The present attitude of the depreciation section of the Interstate Commerce Commission may be inferred from its recommendations in the case of the steam roads. These, as noted above,* recommend that no depreciation reserve be set up for track; that a unit reserve be set up on the straight line method for all units of equipment, and for all other units with a cost of over $1,000 which can be satisfactorily individualized, and that group reserves be set up for certain other classes of property which cannot be individualized. They also provide that the commission shall establish definite rates of depreciation, based upon an average life, including obsolescence, inadequacy and other elements, as well as wear. They do not, however, contemplate a single set of depreciation rates for the entire country, but rather the breaking up of the carriers into as many groups as may be necessary, and the determination of rates for each group. They also make provision for modification of the rates in the case of any carrier who finds them, after trial, unsatisfactory.

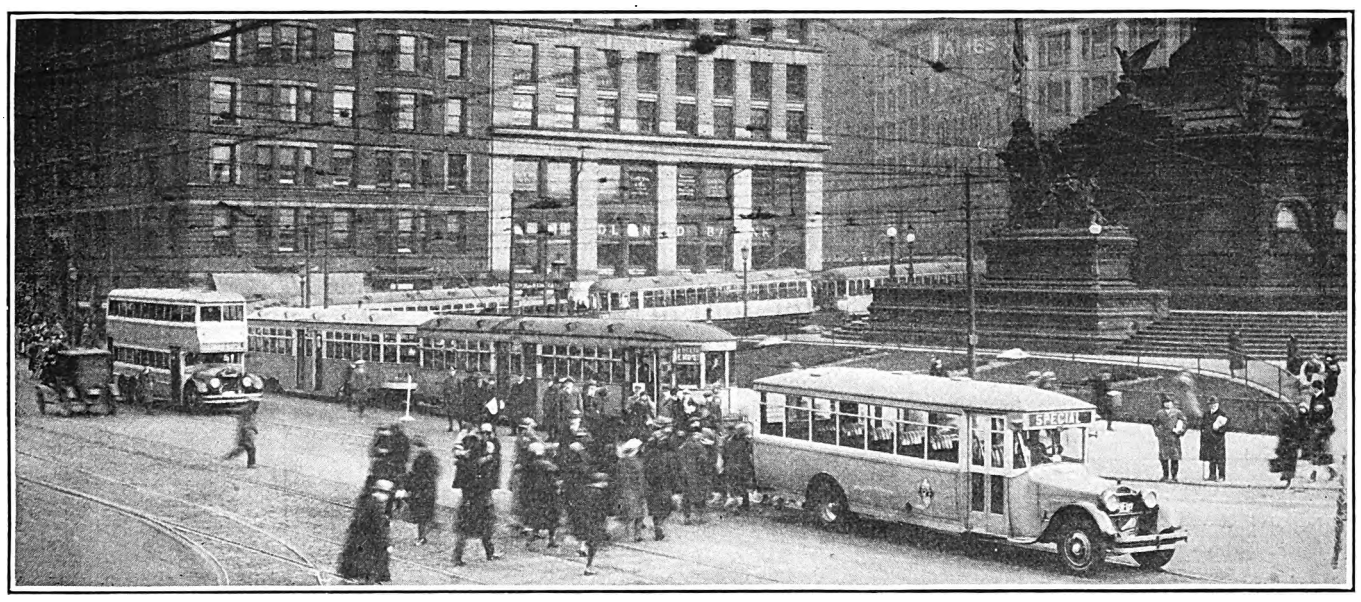
Cleveland Sees in Buses an Opportunity for Extended Service

More than 100 Buses Will Have Been Placed in Service in a Little More than Six Months Time Upon Completion of Present Shipments—Early Routes Were in Crosstown or Feeder Service and More Recent Ones in Through Service, Using Double-Deck Buses—Other Routes Contemplated



Cleveland's Famous Public Square and the Modernized Common Carriers Used Today by the Cleveland Railway
Both single-car trains and motor and trailer trains, a new Six-Wheel double-deck coach and one of the White model 50-A coaches can be seen in the foreground amid a typical noonday traffic movement about the square

SINCE Aug. 17, 1925, the Cleveland Railway has built up a notable bus operation co-ordinated with its rail system. Of the eight bus lines already started three are in feeder or extension service, three are crosstown connecting lines, one, the downtown loop line, the first to be started and the only one yet discontinued. Of greatest importance is the Carnegie-Clifton main line route, requiring 30 double-deck buses.

This latter route, 10.24 miles in length, extends from the East Boulevard (the eastern city limits) along Carnegie, Prospect and Euclid Avenues, through the business center and the Public Square over the high level bridge, Franklin Avenue and Clifton Boulevard to the western city limits at West 117th Street, adjoining the city of Lakewood. For the entire distance it parallels car lines and is a purely supplemental service.

Ten cents is charged on all buses, except certain extensions in the suburbs, and free transfers are given to existing rail cars and buses at intersecting points. The present fare on the cars is 6 cents and 1 cent for a transfer. Hence a passenger originating on a car can board a bus with a transfer and pay 3 cents additional, putting him on the same basis as if he began his ride on a bus.

On the Carnegie-Clifton line double-deck Safeway coaches, manufactured by the Six-Wheel Company, are used. Thirty of these are in service and ten more are on order. Full eighteen-hour schedules are provided, giving a 7½-minute base headway and a five-minute headway during the rush hours. Except for one single-deck Six-Wheel coach all the others are Model 50-A of White Motor Company manufacture with Kuhlman bodies. The double-deck buses are fully inclosed on both decks, including the rear entrance and stairs to the upper deck. The bodies were manufactured by the American Body Corporation.

ROUTE AND SCHEDULE DATA OF CLEVELAND RAILWAY'S COACH OPERATION

Main Line Route	Length One Way Miles	No. of Coaches in Service	Seating Capacity	Headway, Schedule Speed M.P.H., Minutes Excluding Layover Base	Rush	Base	Rush	Type of Coach
Carnegie-Clifton	10.24	30	62	7½	5	12.8	11.8	Six-Wheel double-deck

Two men are used. The driver operates an exit door by manual control from his seat and the collector operates the rear door from his normal position in the rear vestibule. Fares on the lower deck are collected after the passengers are seated, in the intervals between stops. The upper-deck passengers pay upon leaving, thus avoiding the necessity of the conductor working on the upper deck at any time. The Rooke register is used for the 10-cent fares and the 3-cent additional fares paid by street car transfer passengers are collected by hand.

Route data for all bus lines are given in an accompanying table and the location of routes is shown on the map. The downtown loop line connecting railway stations, hotels and other important points was apparently demanded and service was started on Aug. 7. This operation proved unsatisfactory, being in the congested district all the time, and the results proved it to be a losing venture. It was discontinued by common consent of city and company on Jan. 30.

The double-deck route has been described above. The eastern half of this line to the Public Square was started Nov. 7 and the full route to the western city limits one month later, Dec. 7.

The Lee Road-East 113th Street route is in the eastern section, extending from East 123d Street and Superior through East Cleveland, Cleveland Heights, Shaker Heights on Lee Road to Woodland, on Woodland to East 130th Street, on 130th and 131st Streets to Alvin Avenue in Garfield Heights. Most of this line lies just outside the easterly city limits and provides crosstown service to eight car lines. This service was started Oct. 6.

The Nottingham route starts on Lake Boulevard, continues northeast to East 185th Street, to Waterloo Road, to East 152d Street, to Darwin, to East 140th Street, Aspinwall Avenue, Saranac Road, East 152d Street, Ivanhoe Road to the Nela Park Lamp Works of the General Electric Company. This line will run directly through on East 152d Street upon the completion of a bridge now under construction. Service was commenced Sept. 11.

The Rocky River feeder line extends from the end of Lorain Avenue line for 2.2 miles out Riverside Drive. It was started Sept. 6.

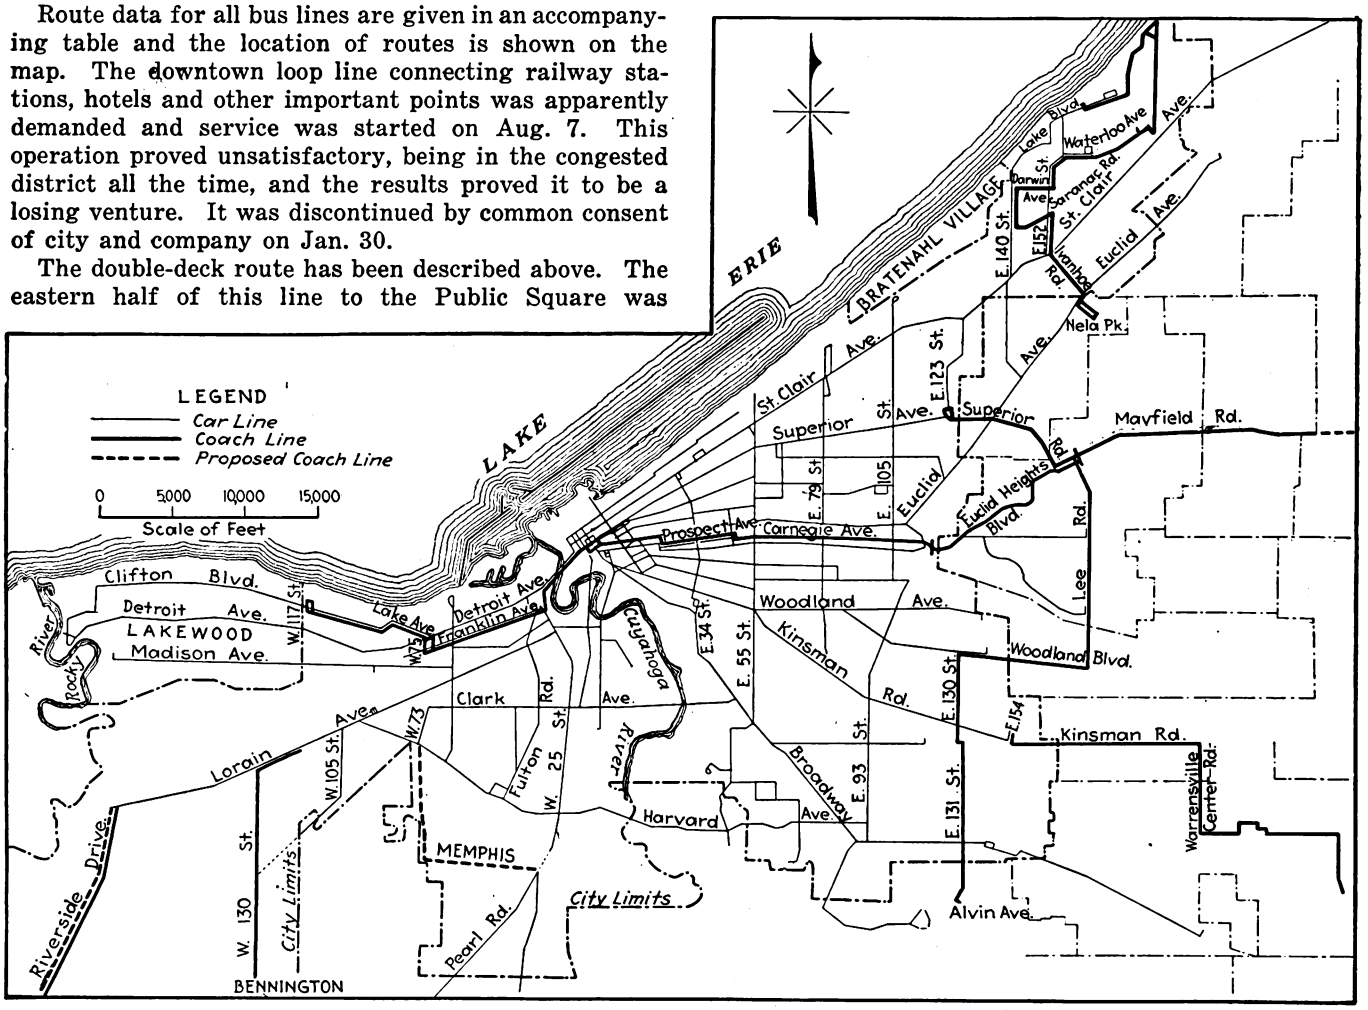
The Warrensville line acts as an extension to the Kinsman Road car line, beginning at East 154th Street and extending out Kinsman Road to and on Warrensville Center Road to the three Warrensville institutions. Service started Sept. 23.

The Mayfield Road route begins at the outer extremity of the Euclid Heights car line at Lee Road and extends easterly on Mayfield Road to Green Road, 2.64 miles in length. A 5-cent fare is charged with no transfers. Service commenced Nov. 25.

Also on March 8 an extension line was started beginning at West 117th Street and Lorain Avenue, running west on Lorain Avenue to 130th Street, thence to Bennington, as shown on the map.

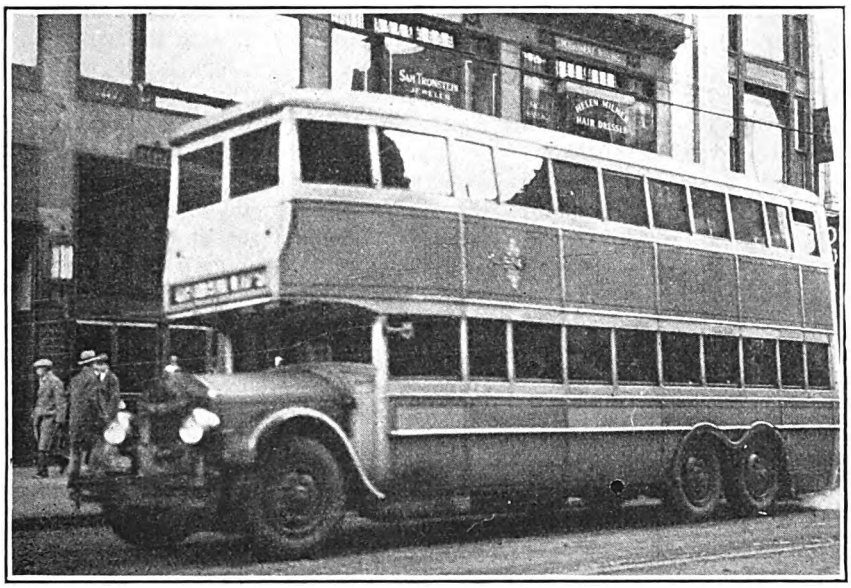
As this paper goes to press, one other line is contemplated. This new route just starting is in crosstown service from Dennison Avenue and West 73d Street, skirting the city limits and terminating on Pearl Road. This line is 3.26 miles long. A base headway of fifteen minutes with eight-minute rush service is planned for this line.

It is thus seen that some considerable part of the service offered by the Cleveland Railway coaches is naturally of an unprofitable type. Of the three feeder lines, excluding those started since Feb. 1, comprising 9.44 miles of route, there were operated in January of this year 24,684 bus-miles at a gross revenue equivalent to 12.6 cents per bus-mile.



Present Coach Routes of the Cleveland Railway Have Been Laid Out to Supplement Rail Service. Several Additional Routes Are Under Consideration

Digitized by Google



Both Decks as Well as the Rear Vestibule of the Double-Deck Bus Recently Adopted by the Cleveland Railway Are Totally Inclosed. Passengers Enter at the Rear and May Leave by the Front or the Rear

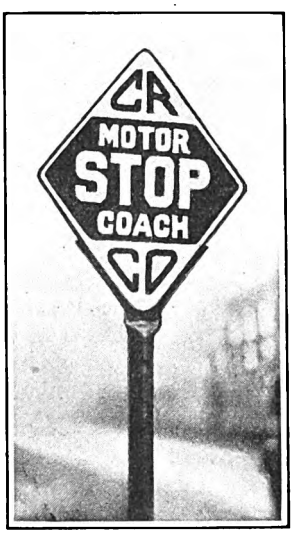
In crosstown service, comprising two lines, or 17.35 miles of route in operation during January of this year, there was operated 91,558 miles at 25.9 cents per mile.

On the double-deck main line, having a route mileage of only 10.24, there was operated during January 104,344 miles at an average of 44.24 cents per vehicle-mile.

For 30 days of January the loop line ran off 14,172 miles at an average gross of 14.71 cents per mile before final discontinuance.

The feeder service is seen to pay the least, the crosstown service somewhat better, and the main line with double-deck two-man buses the highest. Better results are anticipated by the management after the service has been established for a longer period.

For the entire month of January the operating statement set up on the A. E. R. A. method of accounting is as follows:



Green and White Enamel Signs Indicate Stopping Points

Gross revenue—January, 1926	$75,076
Operating expenses, including depreciation	71,284
Gross revenue less operating expense	3,792
Taxes and interest	3,755
Surplus	$37

Note—Depreciation was calculated on basis of 300,000-mile life of coaches and 10 per cent of original cost as salvage.

It is observed that the operations so far are just breaking even. As business develops and with the curtailment of the loop line, future months are calculated to show a somewhat greater surplus. At best, January was estimated by the management as a lean month to use as a basis for comparison, but changes and additions have been made so rapidly that it is difficult as yet to pick a representative period.

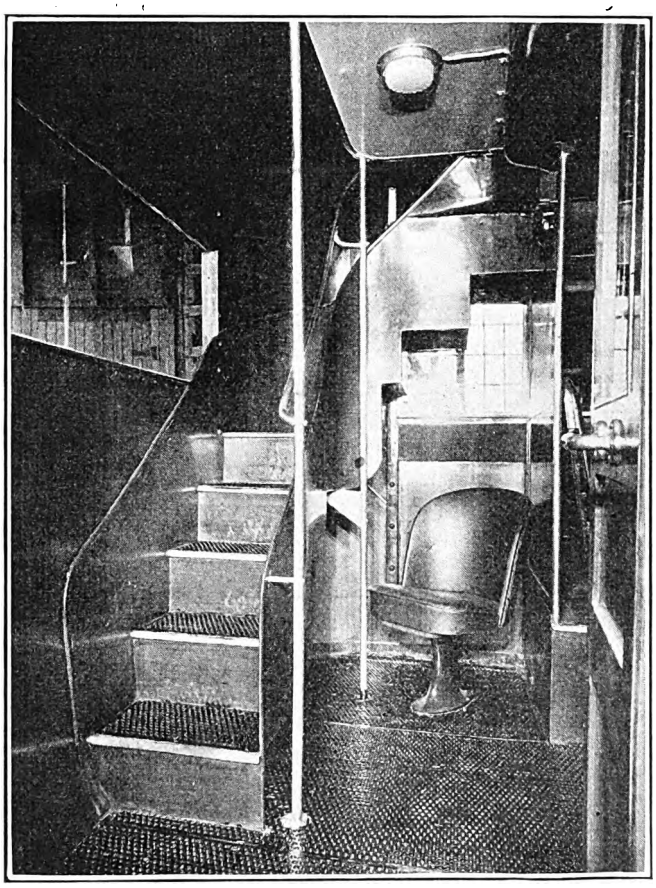
Digitized by Google



Rear Vestibule and Stairs to the Upper Deck. The Seat Is for the Conductor's Use

The Cedar garage, located at East 107th Street and Cedar Avenue, near the end of the east side of the double-deck line, has an area of 20,000 sq.ft. and a capacity of 42 coaches. Near the downtown business district at 24th Street is located the Central garage, having an area of 12,000 sq.ft. and a capacity of 22 coaches. Eventually this garage will be the central bus repair shop for the system, after completion of the garage at Berea Road. At Berea Road and 104th Street a building is now being remodeled and will be equipped to serve 70 coaches. This building has an area of 33,000 sq.ft. All garage space at present is on a yearly rental basis.

The present service and maintenance schedule is to wash, gas and replenish crankcase oil every night. All parts are oiled or greased every week. Buses are inspected every 2,000 miles and every 16,000 miles this inspection includes an internal examination of the motors. It is planned to make a general overhauling every 50,000 miles.

While depreciation is based on an outside life of 300,000 miles, it is the thought of the management that this mileage will be exceeded if proper care is taken of the equipment during its early life.

Another feature to be considered in comparing the operating costs given above with other operations is that the Cleveland Railway has for seven years been unable to finance from new money derived from the sale of common stock, which, under the Tayler grant, must be sold at not less than par. The rate of earnings, also fixed at 6 per cent, has kept the market price of such securities below par, thus effectively shutting off new money from the natural source contemplated by Judge Tayler.

Capital that has been used for the purchase of buses and for other purposes in connection with the expansion of the property in recent years has been obtained through certain allowances, for which provision was made, and the writing off of certain elements of capital as obsolete. Thus earnings could be diverted to new equipment to the extent of such writing off instead of to the balance account, which would ultimately be reflected in lower fares. For this reason much expense that might be properly capitalized finds its way into the operating accounts. Such a condition redounds to the benefit of the stockholder, but throws unjustified aspersions on the management for its ability to operate economically.

Due to this difficulty of raising new money, only actual cost of buses and major expenditures for garage equipment purchased for their maintenance are capitalized. Under this plan the present capital assets for bus operation are as follows:

30 Six-Wheel double-deck coaches 1 Six-Wheel single-deck coach 30 White single-deck coaches 4 Tire and service trucks (¾-ton White) 1 Large service truck (2½-ton White)	$603,251
Garage equipment, gas pumps, air compressor, grinders, greasers and tools	7,496
Bins, furniture, etc.	2,500
	$613,247

About $15,000 worth of stores on hand are charged to maintenance as used.

In addition the buses now on order, consisting of ten Six-Wheel double-deckers and 30 single-deck White coaches, will bring the capitalization up to well over $1,000,000.

Natty uniforms for coach operators of gray whipcord add materially to the excellent and courteous treatment the coach passenger receives. Coach stop signs, as shown in one of the views, are also placed at all stopping places to aid the prospective passenger. The signs are enameled in green and white.

Advertising Car Does Missionary Work at Muskegon

By L. E. Blue
Engineer Muskegon Traction & Lighting Company

IN AN effort to impress upon the citizens of Muskegon a better understanding of the conditions pertaining to the transportation situation in the community the Muskegon Traction & Lighting Company recently prepared an advertising car with appropriate slogans painted on it. The idea is similar to that which has been used in other places, but the purpose is slightly different. Bus competition has been very severe in spite of an attempt which was made four years ago to eliminate it. A popular vote was taken at that time and the people declared themselves in favor of the street railway by a large majority. Then the city stopped the operation of two of the competing bus lines, but three others which were only partially competitive have been allowed to continue.

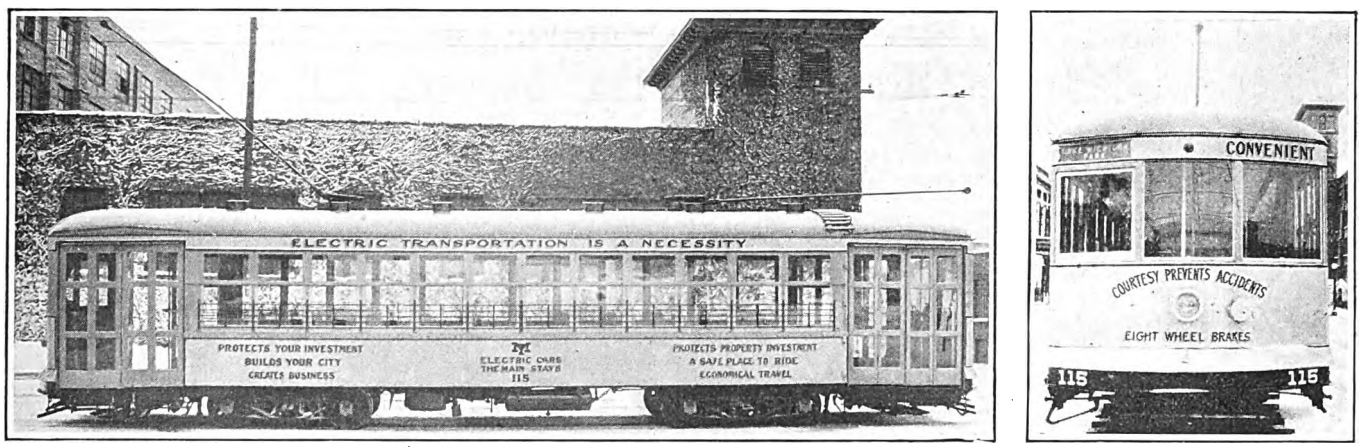
If the railway could have the business which is now going to the bus lines it would be in a position to turn a loss into a slight profit. Operation cannot be continued indefinitely under the present conditions. Therefore, the company is attempting to arouse some public consideration of the matter by the advertising car and such slogans as:

"Relieves Traffic Congestion."
"Electric Cars the Mainstays."
"Protects Property Investment."
"Builds Your City."
"Street Cars Do Not Skid."
"A Shopping Convenience."
"A Safe Place to Ride."
"Ride the Trolley Cars and Save the Difference."
"The Modern Electric Way."
"Electric Transportation is a Necessity."

In regard to the latter slogan the question may be raised, "Is electric railway transportation a necessity in a community the size of Muskegon, with a population of 50,000?" It may develop that buses are what the people want and will entirely supplant the street railway service. This remains to be seen. In the meantime it is the belief that electric cars are the mainstays or the backbone of the transportation system and buses should be used only as feeders to the railway or in developing new territory.

The car which was used for the advertising is a large double-truck, safety, one-man car of the latest type built by the St. Louis Car Company. Since this car was to be the company's salesman or missionary, only the best that was available could be considered for the purpose. A few modern cars are being operated and this type is in accordance with the kind of equipment and class of transportation the company hopes to be able to provide. Improved service, however, will only be possible through increased patronage of the street railway lines.

In contrast with the usual yellow and orange colors of the other cars, the advertising car was painted a fawn gray trimmed in orinoco blue and vermilion. The lettering is in black shaded with blue and is easily read at considerable distance. In general the car is attractive in appearance and it is planned to paint all the cars with the same color scheme. The interior of the car was cleaned and revarnished so as to be in keeping with the external appearance. The car operators were requested to have their uniforms pressed and to appear for work clean and neat in appearance. This was a detail which was considered to be consistent with the rest of the program.



Latest Type Light-Weight Double-Truck Car Was Used by the Muskegon Traction & Lighting Company to Carry Its Message to the Public

The advertising car has been operated on the streets since Jan. 26, and so far has aroused favorable comment from the city officials, individuals and the local newspapers. It will be run for several months.

Views of Salt Lake Manager Aired Before Engineering Council

THAT traffic problems are by no means confined to certain portions of the country was emphasized at a recent meeting of the Engineering Council of Utah held in the Hotel Utah, Salt Lake City. The question was gone into thoroughly from various angles. Both city and highway traffic were considered, and the findings of the meeting were compiled and forwarded to Washington, where they will be used by both the American Engineering Society and the Hoover conference in nation-wide studies of the subject.

Various state and local regulations to do away with or at least alleviate the frightful accident toll of traffic accidents were discussed. E. A. West, manager of the Utah Light & Traction Company, was an active participant in the proceedings. He took for the keynote of his address "Streets for Traffic and Not Garage Purposes." Mr. West told why he believed the problem could be alleviated by prohibiting parking on the main downtown streets altogether.

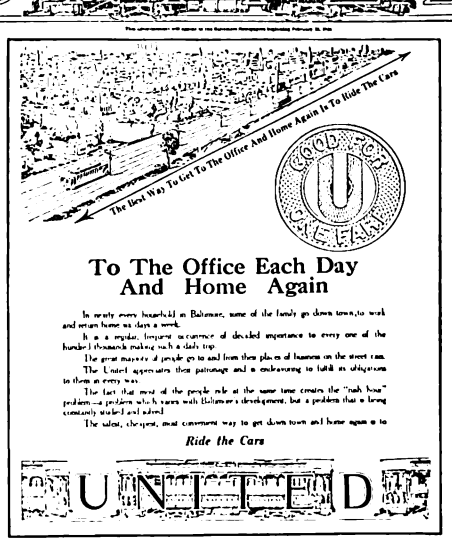
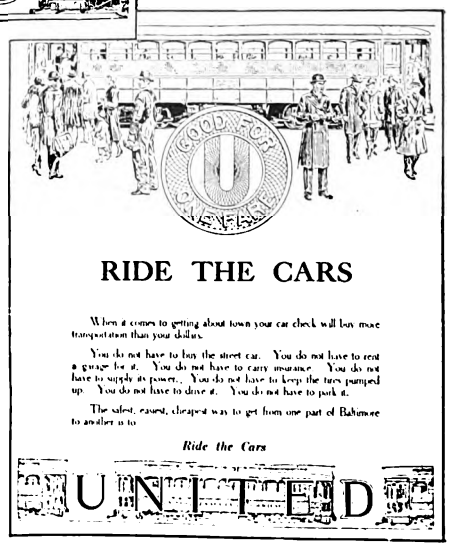
Unprecedented Newspaper Space Used at Baltimore to Sell Rides. The New Campaign Attacks the Subject with Vigor, Determination and, Best of All, Logic

Readiness to Serve Is the Big Idea Behind the Baltimore Campaign, Best Instanced, Perhaps, by These Recent Examples of Newspaper Display. Note the Familiar "Ride the Cars"





Digitized by Google

Nothing to Sell but Service

Unprecedented Newspaper Advertising Campaign Being Carried On by United Railways & Electric Company of Baltimore as a Means of Selling Rides—Nothing Profound—A Straight Sales Plea

ADVERTISING which strikes a new note in traction publicity is being conducted by the United Railways & Electric Company, Baltimore, Md., as part of a persistent effort to stimulate patronage by the general public. The campaign is still young, but already it has attracted attention among railway officials in other cities. Letters of inquiry to the railway and requests for specimens of the material published in the local papers testify to this.

A novelty of the advertising is that it treats the car ride as an article of merchandise, to be sold by the methods that have created markets for cameras, cleansers, clothing and cod liver oil. In this respect, and in the amount of space occupied, the announcements constitute a departure from traditional advertising methods followed by most other utility companies. Neither text nor design suggests practices with which the reading public is familiar.

With merchandising as its central theme, the company is proceeding on the well-considered theory that it has something to sell and that intelligent effort will create outlets not otherwise available. The theory shows total disregard of the time-honored belief that the car ride is not a commodity in the sense of other forms of merchandise. In blazing the new trail the Baltimore system reveals a conviction that the 7½-cent car check is something for which the public has greater need than it realizes, and that the people can be stimulated to the purchase and use of the metal tokens in increasing quantities.

There is something impressive to the habitual car rider in the sight of an established railway discarding old ideas and supplanting them with evidence of an ultra-modern belief that advertising will produce a greater number of coins in the conductor's fare box. True, the company has advertised before, but for the most part the Baltimore company had restricted its stimulative efforts to the spending of small sums devoted almost entirely to the exploitation of Bay Shore Park, an amusement enterprise owned by the corporation. The advertising displays which have appeared previously in the Baltimore papers have been small and perfunctory as to character and treatment. Attempts to change the car-riding habits of the community as a whole have played no part in the publicity. Until now there has been no indication that such attempt has been even considered. The space used is a full page once a week in each of the five daily newspapers of Baltimore, the *Sun*, the *Evening Sun*, the *American*, the *Evening News* and the *Daily Post*.

For its dominant note the advertising copy takes the car ride as an article of merchandise, with skillful presentation of the "selling points" with which the commodity is endowed. Propaganda and pleas for public sympathy are conspicuous for their absence. The advertisements offer no profound essays on the economics of urban transportation. There is no facsimile of the presidential signature. Personalities are submerged as effectively as arguments in favor of higher car fare. The one text is that the company has something to sell, and that there are many reasons suggesting that the people should buy it in greater quantities—for their own convenience and economy.

Throughout the entire series, as so far published, the advertising matter emphasizes the convenience and economy to the public. The treatment of these points is typified by one of the displays dealing with the daily trip to business, as made by a large percentage of the city's population. This advertisement has the obvious purpose of showing the advantage of the city trolley as compared with the automobile.

Persistent attention to the automobile is manifest in various individual advertisements. In offering its selling arguments the company lays stress on the relative place of street cars and motor vehicles in the congested portions of the city. This point is presented with striking force in a large illustration, reproduced from a photograph depicting conditions in the heart of the shopping district.

Readiness to serve is the basis of another display. This advertisement carries a top row of line drawings illustrating the company's 1,357 cars, 5,125 employees, 433 miles of tracks and trolley, its consumption of electric current and its annual tax payment. These are not made the excuse for an appeal to public sympathy, as constituting a burden of operation, but are cited as indicating what the people of Baltimore have at their command. "All these and a transfer for your car check" is the offering of this advertisement.

The entire series lays stress on the convenience and money-saving possibilities of street car rides. The keynote of the merchandising campaign is found in the persistent repetition of the simple phrase "Ride the Cars." This phrase appears at the bottom of each advertisement in the place usually occupied by the dashing signature of the railway president. The fact that the terse injunction to patronize the system occupies this particular place of honor may be taken as typifying the whole spirit of the campaign and stamping it as one of merchandising instead of propaganda.

The explanation of the series was not long in reaching popular comprehension. The entire spirit of the advertising made it manifest that the United was not seeking something as a matter of course, but that its search was definitely aimed at increased patronage—that the company was buying advertising space because it was a merchant with something to sell. The present comment is wholly favorable.

In replying to letters of inquiry from other electric railways, the officials of the United have expressed themselves as enthusiastic over the public reception of the new line of advertising.

The campaign was started on Jan. 28. It will continue for an indefinite period.

Association News & Discussions

Illinois Association Celebrates Silver Anniversary

Railway Leaders Take Optimistic View of Future—Basic Conditions Held to Be Improving—Public Relations Occupies Important Place on Program

NEARLY one thousand utility men, members of the Illinois Electric, Gas and Electric Railway Associations participated on March 17 and 18 in the combined annual meeting of the three organizations, which this year marked the 25th anniversary of the Illinois Electric Association. Particularly fitting to this occasion was the selection of Springfield, Ill., last resting place of the great emancipator, Abraham Lincoln, as the place for the meeting.

Public relations occupied a foremost place on the program and in the discussions. Since this subject is of equal importance to all branches of the utility business, combined morning sessions of the three associations were devoted to various phases of public relations work. The work of the Illinois Committee on Public Utility Information occupied the entire morning session on the second day.

In his opening address J. P. Clayton, president of the electric association, said that there is evidence of increasingly cordial relations between the various public utilities in the state, their customers and the general public. He maintained that permanently successful public utility service cannot be rendered except in the presence of such relations between the companies, their customers, the general public and the public authorities. He called attention to the success with which employees and the public have been enrolled as stockholders through the sale of preferred stocks. This, he cautioned, places on utility managements the heavy responsibility of maintaining a safe margin of value junior to the publicly held securities to safeguard the prompt payment of preferred stock dividends. Mr. Clayton pointed to the success which has accompanied the effort by the electric railways of the state to meet their many problems as evidence of the rapid improvement which may be expected in the immediate future.

MUCH WORK TO BE DONE

That there is still room for much improvement in the work being done by utilities to better their relations with the public they serve was the opinion expressed by J. E. Davidson, president National Electric Light Association. "Most public relations work," he said, "is conducted without a definite plan. There is a tendency to become impatient if results are not obtained almost immediately." Mr. Davidson took the occasion to comment particularly on the electric railway situation. He expressed great confidence in their future, and pointed out that some of the very factors that produced difficulty in the past are today putting riders back on the cars. In his opinion, growing street congestion, fear of accidents and parking problems are all tending to encourage use of electric railway service.

"Railway men today have a rare opportunity," he declared. "They are the chauffeurs of the American public. They offer a combination of the safest and most economical transportation on the streets." He added the suggestion that electric railway operators should endeavor to duplicate in their service the best features of an automobile ride. This, he said, should include a strenuous attempt to humanize the service and to beat the automobile on its own ground of comfort and attractiveness. One of the healthiest factors in the present railway situation, according to Mr. Davidson, is that politicians have lost the support of the public in attacks on electric railway properties. He said that it only remains for railway managements to take advantage of this condition by bending every effort toward the improvement of service and the dissemination to the public of facts regarding local transportation. Such a program, he held, will completely destroy the popularity of utility baiting as a political sport.

OPTIMISM FEATURES RAILWAY DISCUSSION

Papers and discussion dealing specifically with the railway situation developed a decided spirit of optimism regarding the immediate future. The high spot of this program was an address by Lucius S. Storrs in which he called on railway men to concentrate their efforts on the future and outlined five major subjects that are of paramount importance to the industry at this time. These include complete cooperation of all forms of local transportation under one management in each community, making transportation extension a definite part of city planning programs on a broad constructive basis, co-operation between management and employees, scrapping of archaic franchise agreements by the substitution of terminable permits, and the revision of local transportation taxes along scientific lines. An abstract of Mr. Storrs' address is published elsewhere in this issue.

J. F. Egolf, president of the Illinois Electric Railway Association, said that a vision of the future of the industry is beginning to open up under the inspiration offered by leaders of thought. Only faith in the industry itself and demonstrated sincerity in putting into practice the expressed principles of public service will bring about success, he added. In the case of electric railways, he explained that the customer must be induced to go after his service. Unless it is sufficiently attractive failure will result. In some cases, he held, managements have been lacking in imagination and in the vision necessary successfully to carry the burdens and responsibilities of public service.

Taking as his evidence the simple fact that electric railways did not succumb during the trying years following the war, D. W. Snyder, Jr., vice-president Illinois Traction System, declared in a paper on the future of the industry that this is most conclusive proof that the service rendered is essential in every sense of the word. An abstract of Mr. Snyder's paper is published elsewhere in this issue.

A paper on the rehabilitation of elec-

tric railway properties, prepared by A. P. Alshuler, general attorney Western United Gas & Electric Company and Aurora, Elgin & Fox River Electric Company, was presented by John Flannigan. Mr. Alshuler said the public is principally concerned in service and that when properly informed will grant rates of fare sufficient to maintain good transportation. He said that if electric railways had done their part in the past by laying the facts effectively before the public, the difficulties experienced in obtaining fare increases to meet post-war conditions would not have occurred.

"What a commentary!" he declared, "That we must resort to the courts when an ordinance expires, so that we may be permitted to serve the public which requires service; that we must resort to courts to obtain fares so we may exist to serve the public requiring service." He said that the present form of limited term franchise is a ridiculous arrangement that results in periodic interruption of railway development. In seeking improvements, he recommended that owners, operators and employees maintain confidence in the fairness of the public. The industry has suffered from early promotional abuses, he explained, and it requires years of earnest endeavor to restore them completely in the public mind.

Bus Operation Requires Knowledge of Job

Knowledge of the job was held by B. W. Arnold, assistant general manager Chicago, North Shore & Milwaukee Railroad, as the most essential requirement for successful bus operation. He cautioned against undertaking the operation of buses when there is lack of faith in the results to be accomplished. An abstract of his paper is published elsewhere in this issue.

H. H. Adams, superintendent of shops and equipment Chicago Surface Lines, discussed the maintenance of equipment in its relation to reliability of service and the demands of schedule requirements. He said that eternal vigilance is the price of satisfactory results. This includes not only the day-to-day operations and the systematic inspection of the entire car at regular intervals, but also requires that certain critical points be subjected to thorough examination at seasonal periods. These include rheostats and their leads, motor connection boxes, fuse boxes, trolley connections at bases, lightning arresters and similar points at which trouble sometimes develops. Mr. Adams said that inspection of cars on a kilowatt-hour basis instead of a mileage basis had resulted in increasing the mileage between inspection on the Chicago Surface Lines approximately 30 per cent.

New Devices Facilitate Maintenance in Chicago

The use of a Wheatstone bridge ohmmeter for detecting open circuits in armatures has proved particularly successful, according to Mr. Adams. He said that this method is preferable to the customary growler or battery buzzer test and results in the detection of armature defects that would be missed with the ordinary tests. Armature leads that are only partly broken through have been detected by this new method since it was adopted. As a result of the improvement effected, the number of armatures brought into the shop for open circuits has been considerably reduced. During the year 1925 this number was 12 per cent lower than in 1924.

Another improvement in maintenance practice that has resulted in a considerable reduction in service failures while at the same time effecting large savings in the cost of rewinding armatures, according to Mr. Adams, is the installation of chrome-nickel alloy armature shafts in place of quenched and tempered carbon steel material. The process of substituting these alloy shafts has been carried on for a period of about six years. During that time 3,200 shafts have been installed and only two failures have occurred. In each of these cases the cause of failure was determined.

The magnitude of maintenance operations on a property as large as the Chicago Surface Lines was illustrated through the presentation of several statistical items. During the fiscal year ended Jan. 31, 1926, there were rewound at the two shops of the company 29½ per cent of all the armatures in operating passenger cars, including air compressor armatures. During the same period, 12,121 new wheels were installed, 15,207 pairs of wheels were turned, 1,467 cars were overhauled and painted and 1,441 cars were repaired for damages.

Overhaul of cars is conducted on a two-year basis, which requires half of the equipment owned to pass through the shops each year. To meet the requirement of keeping a maximum number of cars in service, this overhaul work, together with the repair of damaged cars, must be carried on with a minimum number of cars in the shops. In the two shops of the company, 68 cars are required for an overhaul output of 32 cars per week, or an average of 2⅛ cars in the shops for each car turned out.

Mr. Adams described the steps taken by his department to put the maximum possible number of cars in service during the heavy traffic period immediately preceding the Christmas holidays. For a nine-day period from Dec. 14 to Dec. 24 there was available for service 99.5 per cent of the total equipment owned, and for the two days immediately preceding Christmas this was increased to 99.8 per cent. Out of a total of 3,539 cars, all but seven were operated during this two-day period.

Other Maintenance Practices Are Discussed

Maintenance practices of the Chicago, North Shore & Milwaukee Railroad were described by Henry Cordell, master mechanic, in a discussion of Mr. Adams' paper. One-man operating methods of the Aurora, Elgin & Fox River Electric Company were outlined by J. C. Johnson, superintendent. He said that the employees, who at first were opposed to one-man operation, had since become converted to this more economical and satisfactory plan for increasing service and reducing operating cost. Forms and routine practices of the transportation department were described by Mr. Johnson. New cars of the company are equipped with Economy meters and the record of each operator is posted for comparison. Energy consumption averages 0.98 kw.-hr. per car-mile for the small city cars and 1.57 kw.-hr. per car-mile for both city and interurban cars.

C. F. Handshy, Illinois Traction System, was elected president for the ensuing year. G. W. Welsh, East St. Louis & Suburban Railway, and R. F. Palmblade, Illinois Power & Light Corporation, became first and second vice-presidents, respectively. Members of the executive committee elected to fill expiring terms were D. W. Snyder, Jr., J. R. Blackhall and E. J. Blair.

Bluff Point Selected for New York State Meeting

HOTEL CHAMPLAIN, Bluff Point, N. Y., has just been selected by the executive committee of the New York Electric Railway Association for the annual meeting of that body. The sessions will be held on Friday and Saturday, June 25 and 26. This place has been a favorite with the association for many years and a good convention may be expected. Facilities for golf and water sports are available for members and guests.

The program is being prepared and an announcement regarding it will be made in a future issue.

Concentrate on the Future—There Lies Opportunity*

Complete Co-ordination of Local Transportation, Inclusive of Transportation in City Planning, Co-operation of Employees, Adoption of Terminable Permits and Relief from Burdensome Taxes Constitute Major Objectives for the Industry

By Lucius S. Storrs
Managing Director American Electric Railway Association

CONTRAST between the local transportation situation in 1900 and that of last year, both locally and nationally, is most striking. In round numbers, three times as many persons, a total of approximately 16,000,000,000, were carried by electric railways during last year as were carried 25 years ago. Illinois did a little better than to maintain the national average, carrying last year in the neighborhood of 2,000,000,000 passengers as compared with approximately 500,000,000 a quarter of a century ago.

I merely point out these facts, touching on ancient history, to show that we are progressing. The thing that I particularly want to discuss, however, is not what we have done in the last quarter of a century, but what we are doing today and the necessity for our planning extensions at least a quarter of a century ahead.

When an individual begins to overindulge in reminiscence it is a pretty good sign that his arteries are hardening and his step soon will begin to slow up. Likewise, when an industry devotes its principal discussions to past endeavors, it is a danger sign of losing step with progress.

Must Keep Ahead of Times

Local transportation men particularly should realize the necessity for keeping ahead of the times in their business. The fact that their keenest competition in the last 25 years has come from an industry which had no history to which to refer nor any time-worn methods of operation to restrict its activities should be sufficient proof of the wisdom of focusing our principal efforts on the future rather than on the past. Surveys are beneficial sometimes, but it has occurred to me, especially in these days of rapidly changing transportation methods, that searchlighting the future is far more beneficial to us than surveying the past. Every local transportation man in the United States who is going ahead—and the number of them is legion — today has his searchlight on the future. Furthermore, the outline of what the future holds is becoming clearer almost daily, and, hence, we are able to formulate our plans with definiteness.

Careful consideration of transportation requirements of the present and future show the need for the following principles:

1. Complete co-ordination of local transportation, by rail, bus and any other practical service which may be devised, to be operated by single managements, preferably those now in charge of electric railways, because of their experience in rendering service.

2. The making of transportation extensions a part of definite city planning programs designed to meet requirements for long periods of years, and not haphazardly done to meet immediate needs, individual or group desires.

3. The closest co-operation between employees and employers in improving service and selling it to the public.

4. Scrapping of archaic franchise agreements and universal adoption of the terminable permit.

5. Revision of electric railway and other local transportation taxes along scientific lines.

I do not maintain that there are no other subjects which require attention, but the foregoing five seem to me to be pre-eminent now and give promise of remaining of outstanding importance for some years to come.

Very few persons nowadays seriously question the advisability of co-ordination of all local transportation service under single managements, but there is a wide divergence of opinion on what constitutes co-ordination.

The attitude of the electric railway industry should be that permission to render co-ordinated service carries with it an obligation to give the most comfortable ride with the fewest possible transfers. Distinctly, it should not be interpreted as meaning that an electric railway company would have discharged its obligations of co-ordination when it continues to run its same old cars under the same old plans, and adds one or two buses in order that it may be said to be operating buses in conjunction with its electric lines. Fortunately, not many managements are assuming this attitude.

Use of Buses Rapidly Extended

What is happening is that some 275 electric railway companies in this country are establishing up-to-date co-ordinated service with both buses and street cars. The number of buses now being used by electric railways is in the neighborhood of 6,000 and they are covering some 12,000 miles of route, practically all of which is new.

The whole question of co-ordinated service still is an open one. Save for a few general principles, little of a definite nature has been established regarding the best methods of operation. It has been proved that bus transportation cannot be provided as cheaply as rail car rides and that 10-cent minimum local fares should be established except on short routes in the most densely populated communities, that buses often may be advantageously substituted for non-paying rail lines and that a good outside business can be built up by chartering buses to special parties. It also has been established very definitely that buses cannot be successfully run in a haphazard manner any more than can electric cars. A speaker at one of our recent meetings in Chicago summarized the situation very well the other day when he said that you couldn't run bus lines with carpenters. The automotive business is one requiring the services of experts, and when you go into the bus business you had better make up your mind to hire the best available automotive experts to look after your property. Otherwise you won't have much automotive property very long.

The one thing that has been definitely established above all else by practical experience is that the bus is not going to supplant surface car lines in large communities to any appreciable degree. Much misinformation has been passed around regarding the possibility of buses supplanting cars, but the fact remains that they do not do it to any extent. One of the most recent cases of misinformation along this line has come within the last few weeks in connection with a proposal to substitute bus service for some 200 cars in the city of New York. I am going to take just a moment to give you the facts in that case because you not only should know them, but you should carry them home to your riders.

New York Bus Situation Misinterpreted

For some years the New York Railways Company has been operating street cars on 25 of its 73 miles of track at a loss under the 5-cent fare. Recently it made an arrangement with the Fifth Avenue Coach Company to make a proposal to the city that buses be substituted, under a 5 and 10-cent fare arrangement, for street cars on the present unprofitable 5-cent lines. The short crosstown rides would be 5 cents, but the longer up and down town rides 10 cents.

Compared with the city's total riders, the number affected by the proposed change would be small. Passengers carried on the cars operated over this 25 miles of non-paying track in 1925 represent about 4 per cent of the city's surface lines' total of 1,035,977,724 revenue riders, and this surface line traffic is 36 per cent of all electric railway passengers. Subway and elevated lines carried 62 per cent, or 1,680,800,254 passengers.

Various individuals and groups have hailed this proposal as marking the "obsolescence of the trolley." It is nothing of the kind. This suggestion is simply another move to carry out a definite policy of the local transportation industry. That policy is to render service either by electric railways or buses, and particularly to supplant non-paying lines with buses at a rate of fare which will insure fair earnings. There have been similar replacements proportionally as great elsewhere in the past, but invariably the electric railway has remained the backbone of the system.

Incidentally, it always should be remembered that a distinctly local situation exists in New York transportation. Subways provide the backbone of service, and all other means of transportation are necessarily of a supplemental character. In most cities the local electric railway property is the main artery of local transportation as the

*Abstract of address before annual meeting of Illinois Utilities Associations, Springfield, Ill., March 17, 18, 1926.

Digitized by Google

subway is in New York. To talk of doing away with surface lines in most cities is equivalent to talking abandonment of subways in New York. And that isn't being done.

The unassailable truth is that prospects for the future of the electric rail lines manned by progressive managements in communities where service is warranted never were better. Neither the private automobile nor the bus is going to put the electric railway lines out of business. Every evidence points to the fact that the pleasure car eventually is going to be a great help in returning riders to cars and buses. Street congestion, caused by the increase in the number of pleasure cars, is rapidly driving people back to use electric line service. This congestion is steadily becoming worse. More and more the public must depend on electric railways, not only to carry them, but also to carry their intercity freight. I cannot see how anyone can fail to appreciate the facts in this situation, nor can I see why electric railway executives and city officials alike are not now planning ahead for the time when the electric railway must be of greater service because of this present congestion problem.

Careful Planning for Future Needed

The question of local transportation as built around the electric railway is a growing one and it is not going to be settled by slipshod planning. It is going to be settled by city officials, business men, traffic experts, leaders of civic thought and operators and owners of local transportation properties sitting down together and scientifically planning for the future.

Everyone should appreciate that a city without adequate transportation is as helpless as a man without legs. It is folly to plan general city improvements without first taking into consideration the transportation service. Likewise, it is folly to plan transportation service independent of other city activities. In the past there has been entirely too much independent action on all sides. Skyscrapers have been erected, new sections developed, traffic regulations adopted and other steps vitally affecting transportation taken with only passing consideration of the effects on the car rider. In this regard especially should the 25-year searchlight be turned on the situation. City planning on a 25-year basis embraces a brief enough period. Yet the leaders of very few communities now are working on a quarter of a century basis.

Consideration of the kind of contract with the community under which the local transportation company should operate dovetails naturally into the subjects of co-ordinated service and city planning. The old-time limited franchise has run its day, and leaders of thought throughout the country are recognizing this fact. Within recent years the terminable permit has been substituted for the limited franchise in half a dozen states and today it is gaining headway rapidly.

The terminable permit is really a very simple thing. Unfortunately, it has been shrouded in mystery and bogged down in legal phraseology to the confusion of utility expert and layman alike. In simple language it is a permit to operate during good behavior. The manifold advantages of the terminable permit arrangement are obvious. They are particularly helpful in financing. Bankers much prefer to deal with a company operating under such a permit. This fact is of particular importance to local transportation companies at the present time because so many of them need new financing.

The reason bankers like the terminable permit is that under its operation the possibility of recurring franchise fights is eliminated. They long have been the cause of much trouble. Many things have been written into franchises in order to assure their passage which never should have been in them. Often methods used to assure passage of franchises have been questionable. The blame for this latter situation belongs alike on the public and its representatives and the utility managements. It has redounded to the credit of neither.

You have in Illinois at present a most striking example of a crying need for the terminable permit. I refer to the situation in which the citizens of Chicago find themselves in relation to their surface transportation service. Here is a case where the company is rendering splendid service, carrying nearly 850,000,000 passengers a year, making a good return on an investment which is profitable both to the company and the city, and yet, because its franchise expires next year and some $160,000,000 of its bonds automatically become due, its whole future is in a fog. By every rule of reason this company should be permitted to continue to render service without interruption. Its operating record alone should guarantee this privilege. At present more than 99 per cent of the rolling stock of this organization is in actual use. It is rendering a high type of service. It has efficient employees and executives of the progressive type. In truth, any city in the United States should be proud to have such service as now is being rendered in Chicago by the Surface Lines organization.

If this company had a terminable permit, its smoothly running machinery would not be interrupted for a single day. But having an old-style franchise, which is as out of date as a mustache cup, there is no telling what the future holds for it. While, of course, the citizens of Chicago are not going to permit the operation of such a splendidly functioning property as the Chicago Surface Lines to be interrupted for an extended period, nobody knows just how the problem is going to be solved. The Illinois people, however, are approaching this situation in an intelligent way and I feel sure that the recommendations of your legislative committee will be progressive. Certainly, it could take no greater forward step than to indorse unreservedly the terminable permit plan.

About half a dozen states now have adopted the principle of the terminable permit, and its provisions are steadily becoming more popular. I predict that when your association meets a quarter of a century hence to celebrate its golden anniversary, its members will marvel at the long time it required to bring the terminable permit into nation-wide use. If its merits are properly presented by utility men, I sincerely believe that more than a majority of the states will have adopted the plan within the next five years.

Employee Enthusiasm Necessary to Success

A business which is so dependent for its success on the good will of the public as a utility is should avail itself of every legitimate means of friendlyizing its customers. In our employees, not only in the transportation field but throughout the entire utility business, we have an army of potential salesmen eager, when properly trained, to be of assistance to us in selling our goods.

A great deal has been said at utility conventions in recent years about "public relations." So much, in fact, that I sometimes think the phrase has become a stock one and that the words are frequently rolled off the tongues of speakers without a proper appreciation of their meaning or importance. Of greater concern to all of us just now, however, should be employee relations. Good relations with employees must precede good public relations.

The training of employees to be helpful in selling their company to the public cannot be performed by just anyone to whom the job is assigned. Primarily, enlisting the co-operation of an employee is the work of a high executive of a sympathetic and friendly nature. He must create in the employee a desire to render the selling service wanted. Rules, regulations and lectures on the duty of the employee to become a good representative of the company never will instill in him the desire. You must create in that employee first of all an interest in his job. The shortest way to create this interest is to arouse interest in himself and his own welfare. This can be done by showing him that the standing of his company with the public and its prosperity is of direct personal interest to him. The job to most of us is the most interesting thing in life, and to arouse greater interest in this job and thus arouse greater interest in the company's welfare is to win an employee's undivided support.

Once this interest is aroused and the company's problems are made plain to the employee, he will become an agent of great value. The job, however, must hold out some incentive. You cannot expect an employee to respond enthusiastically to platitudes uttered in a half-hearted tone by some near-executive. Enthusiasm for the job is created only by those who believe in our industry.

The record of attempts to convert employees into salesmen in the utility business speaks for itself. These attempts have been just about as successful as they have been wise. Companies throughout the land which have inaugurated popularizing campaigns founded on sincerity and a desire to do the right thing by their employees and the public, and directed by a real executive, have been successful. The failures in such campaigns can be traced largely to companies that had little to offer and tried to make the

Digitized by Google

campaign a duty instead of a pleasure and a profit. In many cases of failure the job was assigned to a man who did it indifferently.

Electric railways are carrying an unfair taxation burden and for the sake of improved service, at least, they should be relieved from it. Approximately one-tenth of all the gross income of electric railways now is paid out in local, state and national taxes. This is the largest tax in proportion to gross income which any national industry pays. It is the direct result of legislative bodies loading up utilities with levies merely because this seemed to be the quickest and surest way of getting money. As a result of these onerous tax burdens many companies in recent years have paid out more in taxes than they have earned in net incomes. But what is of more interest to everyone affected by good or bad transportation is that service in many cases has been impaired by this unfair tax load. It is safe to say that if a fair readjustment of taxes were made, service could be improved proportionally on every electric railway in the country.

Relief is being afforded in many sections, particularly in relation to the paving tax. This archaic levy, originatating in the days of horse cars when old Dobbin wore out the paving between the rails, is so obviously unfair that three states and 50 communities have relieved transportation companies from it. Doubtless further relief from this tax will be widespread in the next few years. It is wholly indefensible.

I have addressed myself particularly to transportation problems, but I believe most of them relate in some way to the entire utility industry. Our job is a common one. We should work together and not as individuals. Our object is to give the best possible service to the whole public. We can accomplish this best by standing shoulder to shoulder and helping one another.

In this city of Springfield, hallowed by the presence in Oak Ridge Cemetery of the mortal remains of the great emancipator, we can do no better than be guided in our endeavors by his words: "Let us have faith that right makes might; and in that faith let us dare to do our duty as we understand it."

Electric Railway Trend Is Upward and Onward*

Survival of Unprecedented Hardships Is Proof of Essential Nature of Service Rendered—Small Railway in Large Utility Group Is Sometimes Neglected—Modernization Has Saved Many Lines

BY D. W. SNYDER, JR.
Vice-President Illinois Power & Light Company

ANY student, or even casual reader, of the history of the steam railways knows of the doubts and disappointments of the early days of railroading; the failures and reorganizations in 1873 and again in 1893; the public antagonism that produced drastic and oppressive regulation, resulting in a reduced net that so handicapped the railroads just prior to the war period. We know of government operation and control and the disastrous period of readjustment, and how in 1920 the combined net of class "A" roads dropped to less than $100,000,000.

We also know that throughout these periods of stress the railroad managements did not lose courage. The Hills, Harrimans, Markhams and Van Sweringens refused to accept defeat, and today we find the great majority of the country's railroad mileage in splendid physical shape, with ample equipment in good condition. Public opinion is friendly and regulation is more reasonable. Today railroad credit is better than in years and the combined net last year of class "A" roads exceeded $900,000,000.

All of the transportation problems are not yet and never will be permanently solved. The railroads are still faced with the disposition of many unprofitable short lines, unregulated bus and truck competition, wage and rate controversies. The important thing is that the railroads have proved that they are an essential industry, that they did not lose courage in times of distress and that the public was not unmindful of their rights. Because of these facts the industry as a whole is today on a sound foundation.

The gas companies can point to a very similar experience. Today the industry is on a most stable basis, and again the reasons are that the business proved itself an essential industry, that its leaders had courage and that the public will be fair if given the facts.

How does the electric railway industry measure up according to these yardsticks? Is it an essential industry? The answer is "Yes," if their service is of value to the community or territory which they serve. If their service is of value, I firmly believe that the community or territory will pay adequately for a job well done.

One measure of value of electric railway service is its use. By this measure the railways have proved themselves of essential value. The American Electric Railway Association tabulation of a large percentage of the railways of the country showed that the electric railway properties carried 39,715,479 more passengers during the last six months than in the same period a year ago. The report for last month showed that 6,426,176 more passengers were carried in February, this year, than in February, 1925. Reports from Illinois properties are likewise favorable. The number of passengers carried, according to recent reports, are increasing on the city lines in Chicago and on the four largest electric interurban railways in this state. The interurban railways are rapidly expanding their freight and express facilities. One system in Illinois last year increased its freight business more than half a million dollars. A combined statement of passengers handled by the electric railways, including bus auxiliaries, in the cities of Danville, Champaign, Decatur, Bloomington, Peoria and Quincy shows an increase of more than a million riders in 1925 as compared with 1924.

Recently here in Springfield the citizens of one of the less densely settled sections of the city insisted on retaining street railway service on steel rails instead of a proffered bus service. The street railway company, by substituting buses, desired to save the rather large capital investment in new tracks and paving. The citizens, however, are property owners and they know the value of street railway service, both as to the convenience and cheapness of transportation and also as it affects real estate values.

INDUSTRY SURVIVED UNPRECEDENTED HARDSHIPS

Prior to the period immediately preceding the World War the general prosperity of the electric railroads was gradually reflected in the franchise and tax burden which they freely accepted and doubted not their ability to pay. The amazingly rapid increase in the number of motor vehicles and the hard-surfaced street and highway construction programs that followed, coupled with the increased costs incident to the war period, literally changed the golden day of prosperity of the industry to a black night of despair. These suddenly changed conditions resulted in receiverships, abandonments, violent labor disputes, collapse of credit and, of course, impairment of service. Never was so vast a national industry and one so important to the welfare of the people faced with such difficulties. The uneconomic franchise and tax burdens were fixed for long-term periods by contract, the public had been educated for years to the belief that the convenient nickel was the proper and fixed street car fare, the investment bankers had lost confidence, and many people seriously thought that the jitney auto would supplant the electric cars. Young men avoided entering the industry. The demagogue and peanut politician still believed that the street railway was a good ladder on which to climb into public office.

It seems to me that the simple fact that the electric railways did not succumb during these trying years is most conclusive proof that the industry is essential in every sense of the word.

MODERNIZATION PROGRAM SAVED MANY LIVES

The street railway industry is to be congratulated on the courage of its leadership. It has been guided back from the darker days of the war period. Receiverships are gradually being lifted. The introduction of the one-man car and a modernization program have saved many lines. The city and interurban lines are utilizing buses more adequately to serve their territories. The interurbans are intensively and successfully developing their freight and express opportunities. The bankers are again having confidence. The manufacturers are helpfully alive to the

*Abstract of paper before annual meeting of Illinois Electric Railway Association, Springfield, Ill., March 17, 18, 1926.

Digitized by Google

situation. The public is better informed.

Therefore, I believe the electric railway industry trend is onward and upward and will eventually reach its goal of adequate service to the public—this at a cost consistent with a return to the stockholders that will secure the necessary supply of new capital to develop and expand the transportation needs of the community or territory served.

Not all electric railways will recover, as some lines should never have been built. Good management cannot overcome the initial bad judgment of the builders. Fortunately, most of the electric railways serve well-populated and growing communities and are not in the above class.

Recently I attended a gathering of railway executives, most of whom were either operating large railway properties or were operating large combination properties of electric railway, electric and gas utilities. The expressions of most of these men were optimistic, and I overheard an executive from a comparatively small city whisper to his neighbor, "This sort of talk is all right, but it doesn't put the people on the cars."

Small Railway Unpopular in Combined Management

The problem facing railway operation in the smaller cities from 25,000 to 50,000 people is somewhat more complicated than that of the large city systems. Most of these railway properties are operated as part of a combined gas, electric and railway property. In this combination there is both strength and weakness. The elements of strength are well known and need not be mentioned in this paper; the elements of weakness are rather vital and I believe can be profitably discussed.

The "combination" manager, during the last few years, has had the experience of having most of his troubles come from the railway department and most of his business growth in the gas and electric departments. He has learned that a given amount of energy and effort and capital in the gas or electric department will bring just now greater returns than in his street railway. He has been bombarded by the broadsides of the automotive industry and listened to the siren songs of the bus salesman. He probably drives his own private auto, using his gas and electric interests as a reason, and has unconsciously been weaned away from his street railway. He has, in most cases, a capable old-time railway organization that maintains the equipment in good condition, keeps the cars clean and well painted, properly operated and on schedule. He has from time to time, as he saw the wrong color of ink on his railway reports, spurred his organization to better efforts, which usually cease when the executive pressure ceases.

This manager usually has a satisfactory combined property showing, and, being human, tends toward following the line of least resistance. No man, however, ever accomplished any worthwhile thing following the line of least resistance.

The result of such a condition is the gradual but inevitable conclusion in the mind of such a manager that the railways are doomed, and from then on his railway will begin to prove his conclusions. Capital expenditures are withheld, maintenance is curtailed, frequently the supervision and traffic departments are cut. Such measures will afford temporary relief, but only serve to augment the trouble in the immediate future, due to the inevitable impairment of the service. Instead of such curtailment methods, I recommend to managers who have lost heart an honest trial of Mr. Storrs' daily dozen. I believe they will be agreeably surprised at the results.

In concluding, I can only repeat that a large portion of the industry is surely on the mend, that the remaining problems are a challenge to the men in our industry and I firmly believe that this challenge will be successfully met.

Operate Motor Coaches for Profit, Not Loss*

Pessimistic Attitude Toward Possibilities of Motor Coaches Will Inevitably Result in Loss—Too Many Railways Have Started Bus Operation with This Viewpoint

By B. W. Arnold
Assistant General Manager Chicago, North Shore & Milwaukee Railroad

WHEN we, as railway operators, were confronted with the automobile problem, which gradually grew more serious first from jitney operation and then moved to the larger type of a carryall known as the motor bus, we were a little bit slow in realizing what it was all about. The vehicle was usually some sort of a body, built upon a truck chassis, without any thought as to spring arrangement or to the comfort of the occupants. It is strange that, even with this crude vehicle, a great many electric railways saw passenger earnings decrease by reason of competition with one of these conveyances which the public was pleased to call a motor bus.

When the automobile and bus first began to affect passenger receipts many railway operators looked with considerable distrust upon any automotive vehicle, except the ones they drove to the office, but wondered why the people did not ride the street cars. A great many of them knew that sections of their communities had been developed to the point where transportation was needed, but in many cases a lack of foresight, combined with lack of capital, prevented them from providing the additional facilities. The result was that many individuals with exaggerated ideas of the earnings of transportation companies started to operate various sorts of motor buses to serve newly developed territories. In a great many cases such vehicles were operated down into the center of the communities, paralleling existing railway lines and picking up business which naturally would have gone to the railway. This private bus operation was looked upon with favor by a great many city officials, especially those of the old type who still continued to think that the utility serving their city constituted an excellent political football and that the bus gave them a valuable ally to assist in kicking it around.

The present effort of railway companies to promote good will and their willingness to spend real money for this purpose was not in vogue when the bus first appeared. In a great many cases, instead of investigating this new type of transportation, railway managements added a prefix to the word "bus," and to the industry as a whole it became the "damn bus." The automobile manufacturers were not slow in seeing that there was a field for the new vehicle and in a great many cases assisted materially in financing pirate operators running parallel with existing transportation facilities. In fact, I am quite sure that a great many motor coach routes, established by high-pressure automobile salesmen, will be abandoned due to the fact that the population is not sufficient to give earnings necessary for their operation.

Progressive Operators Realized Responsibility

Several of the thinking operators whose minds were open and who realized that they were in the transportation business, and not simply in the railway business, commenced to make exhaustive investigations of bus operation. The responsibility of any transportation agency, as such men saw it, includes the full obligation of the name; that is to supply transportation in the territory they serve and to carry the people of this territory in whatever manner they want to travel, whether it be on rails with electric cars, on the highways with rubber tires, or in the air.

The North Shore Line was one of the first to recognize in the motor coach a valuable ally with which to supply transportation to newly developed communities in need of such service, without the necessity of heavy investment in track and overhead construction. A city motor coach line was established in Waukegan in 1923 to serve a part of the city not touched by the railway. The same fare was charged on the coaches as on the street cars. Transfers were issued and accepted between car and coach. This division, within a very short time, was able to pay its way in addition to putting on to the railroad passengers which it would not have carried had it not been for the motor coach. There was an immediate development in the territory served by this line and it has been necessary to reduce headways and supply additional equipment twice since the line was started.

The main line of the North Shore electrically operated railroad, which extends 85 miles from Chicago to Milwaukee and parallels Lake Michigan for the entire distance, is so situated that all feeder divisions must come from the west, having nothing but the lake on the east for the entire distance.

*Abstract of paper before annual meeting of Illinois Electric Railway Association, Springfield, Ill., March 17, 18, 1926.

Digitized by Google

Such lines have been established from Lake Geneva, a distance of 32 miles; from McHenry to Waukegan, a distance of 25 miles; from Channel Lake to Waukegan, a distance of 25 miles; from Wheeling to Glencoe, a distance of 8 miles; from Deerfield to Highland Park, a distance of 4 miles, and from Glenview to Wilmette, a distance of 5 miles. Lines parallel to the railway have been placed in operation between Deerfield and Glenview and between Waukegan and Kenosha, both being operated on state trunk highways at a distance of about 2 miles from the railroad. These lines have all been the means of developing the territory adjacent to the railroad property and by doing so are putting on to the railroad a considerable number of new passengers.

These feeder lines serve, to a large extent, the lake territory of northern Illinois and southern Wisconsin, all of which is tributary to Chicago. The population of Chicago and its suburbs, being more than 3,000,000, gives a wonderful field for the development of combined rail and motor coach trips. At several different points on our interurban routes during the winter months detours are made to pick up school children attending school in the cities. While from a revenue standpoint this has not been altogether attractive, it has built for us a spirit of good will on the part of the communities adjacent to our railroad which could not have been accomplished in any other manner.

Bus Feeders Serve Three Purposes

Bus feeders in connection with railway operation, as we see it, have three functions to perform: Properly to serve the territory adjacent to the railroad property; to add revenue to the railroad; to create, foster and maintain proper public relations, which we have found to be so necessary in the conduct of our business. We should remember that at the start in new communities very few lines, either motor coach or railroad, can be counted as paying ventures. Nevertheless they are very necessary in the development of the communities served.

Careful thought should be given to the selection of motor coach equipment. All too frequently equipment is provided which cannot be operated with any degree of satisfaction or with any promise of satisfactory financial return. The maintenance of this equipment is something that must require the attention of the operators. In too many cases railway companies have attempted to maintain automotive equipment with carpenters, car cleaners and trackmen. On one railway property with which I am familiar and where they are operating motor coaches I found on a recent visit that the barber who had always shaved me in that city was in charge of motor coach equipment. The manager was wondering why it was costing him so much money to operate. This would not be tolerated in the maintenance of electric car equipment. We feel that specialists are required for such work. If that is so on the electric car why not on the motor coach?

Proper facilities for garaging and proper equipment for maintenance are absolutely necessary to the success of any motor coach operation. Careful attention must be given to tire costs, gas consumption and lubrication methods. Competition between drivers in connection with these matters should be encouraged. I believe that one of the causes for unsatisfactory results obtained by a great many railway companies in the operation of motor coaches is that they have not gone at the job wholeheartedly and have admitted defeat before they started.

Don't Start Out to Lose Money

I was very much impressed at Atlantic City last October, in listening to the discussions of the report of the committee on bus operation, to hear no less than six or seven executives start their talks with the statement that they did not want to go into the bus business, but had been forced to do so and expected to lose money. I am quite sure that any one who embarks in any business with that feeling will obtain exactly the results that he anticipates. I once heard a traveling man say that the first necessity of a successful salesman was to believe in what he was selling; know it, and show it. That, I believe, is the point of view necessary in the operation of motor coaches in connection with our railway lines.

New England Club Holds Annual Banquet

UNQUESTIONABLE evidence of the growing enthusiasm in the industry characterised the 26th annual banquet of the New England Street Railway Club at the Copley Plaza Hotel in Boston on March 25. Latest returns from the membership drive that was conducted through the year under the able leadership of J. B. Crawford, Concord, N. H., showed 225 new members. The result was an attendance at the banquet that crowded to capacity the spacious ball room of the Copley Plaza hotel.

For the first time in the club's 26 years of activity the ladies were invited to the annual meeting. Their interest was manifested by the large number who responded and augurs well for a repetition of the invitation at future meetings.

At a short business meeting preceding the dinner the following officers were elected for the ensuing year: President, F. D. Gordon, Portland, Me.; vice-presidents, H. F. Fritch, Boston, Mass.; J. K. Punderford, New Haven, Conn.; John B. Crawford, Concord, N. H.; T. B. Jones, Burlington, Vt.; E. M. Graham, Bangor, Me., W. C. Slade, Providence, R. I.; secretary, J. W. Belling, Boston, Mass.; treasurer, Fred F. Stockwell, Cambridge, Mass.

Executive committee members elected were as follows: H. M. Steward, F. B. Walker, H. R. Whitney, C. C. Peirce, H. S. Day, E. W. Davis, P. P. Crafts.

Short addresses on the work of the club by retiring president L. D. Pellissier and president-elect F. D. Gordon, opened the speaking program after the dinner. Labert St. Clair, American Electric Railway Associjation, acted as toastmaster. Speakers included W. S. Vivian, Chicago; C. C. Peirce, Boston, and Dr. John L. Davis, New York. Vocal selections by Rose des Rosiers of the San Carlos Grand Opera Company; exhibition dancing and general dancing completed the entertainment program.

American Association News

Power Transmission and Distribution

THE midyear meeting of the power transmission and distribution committee was held in Chicago, March 8 and 9. Tubular steel poles, review of manual sections, electric wire and cable terminology, specifications for galvanizing and sherardizing, design of cap and cone hangers, selection of poles for trolley line construction, specifications for rubber-covered wires and cables for power distribution purposes, specifications for electric conduit construction, line lightning arresters, catenary material specifications and trolley wire wear and specifications were the subjects discussed.

On the subject of radio interference Mr. Quinn stated that the committee had conducted a further series of tests using different types of receiving sets for picking up interferences, and it is submitting a report on the details of these tests. It appears to be a more serious factor since the sets now being used are more sensitive and can pick up the disturbances a greater distance away from the trolley wire and feeders. He also stated that it has been shown that interference can come from car buzzer circuits, light circuits, sparking at the trolley wire and the most serious place being the sparking at the rail and car wheel. It has also shown that interference of that kind on the trolley wire can be transferred to paralleling pole lines and can be transmitted a considerable distance from those lines.

Review of specifications for 600-volt direct suspension trolley overhead construction and joint use of poles were other matters considered.

It was decided to hold the June meeting at the association headquarters in New York on Monday and Tuesday, June 7 and 8.

Those present were C. H. Jones, J. W. Allen, J. C. Damon representing W. H. Bassett, M. W. Cooke, James H. Drew, D. D. Ewing, C. L. Hancock, C. J. Hixson, A. J. Klatte, F. McVittie, H. S. Murphy, J. F. Neild, W. J. Quinn, W. Schaake, A. Schlesinger, Mr. Casey representing G. F. Wennagel, and M. B. Rosevear. Guests included M. Aldrich, Chicago, South Shore & South Bend Railroad; Ralph Rice, board of supervising engineers Chicago Traction; P. E. Murray, Chicago Surface Lines; Mr. Smith, Ohio Brass Company; Dwight L. Smith, Chicago Rapid Transit Company, and C. Huttleston, Chicago, North Shore & Milwaukee Railroad.

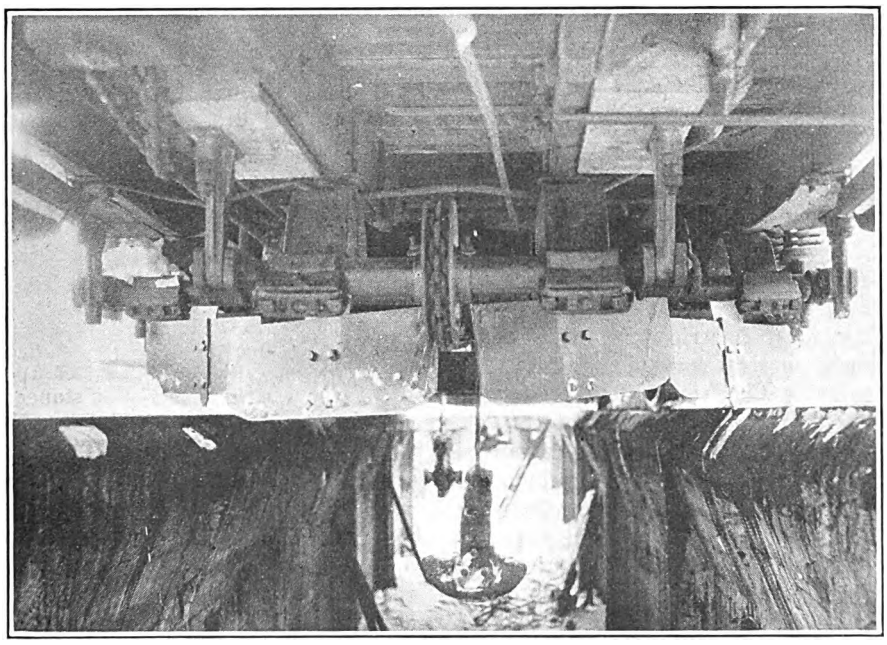
Maintenance Notes

Scraper Car a Handy Accessory

ONE of the principal troubles from a snowfall in the metropolitan district, New York City, comes from the packing down of the snow by automobile traffic running over the lines. As the subsurface contact system is used in New York, it is also desirable, when the snow melts, to provide some efficient method for cleaning the underground conduits. To assist in this work, the Eighth Avenue Railroad uses a scraper car. This is an old single-truck passenger car 32 ft. long. In order to gain adhesion, the car is loaded with scrap metal.



Arrangement of Scrapers for Removing Snow from Between Rails and 9 In Outside and for Cleaning the Slots and Tubes of Underground Conduits

An accompanying illustration shows the method of installing scrapers and a type of slot and tube scraper that is used. The scraper equipment is of No. 5 Kalamazoo type. The two center scrapers are clamped to a 2½-in. shaft. Clevis type bearings are used at the ends of this shaft and the two clevis castings fasten to two hangers which are supported from substantial wooden blocks attached to the underframing of the car. These blocks are 8 in. x 8 in. x 2 ft. long.

The two spring scrapers in the rear are fastened similarly to a 2½-in. shaft and hang through clevises and hangers to the car body. The scrapers are raised and lowered from the car platform by the motorman through a handwheel and pull rod. The pull rod is attached to a lever on the back shaft and the two shafts on which the scrapers are mounted are connected by sheaves and a chain. This type of scraper will clean snow from between the rails and 9 in. outside, throwing it each way from the center. It also cleans the rail and groove.

The form of the slot and tube scraper may be seen in the center part of the illustration at the back. This consists of a large casting with a rubber bottom and nose. This casting is fastened to the upper support by two side clevises. The upper support is a steel plate ⅜ in. x 10 in. x 28 in. It has a slot cut at the top 3 in. x 13 in. long to go over the beam on which it slides. This beam is provided with a carriage to provide for easy movement. The plate is held in place by two pins. All parts below the surface of the slot are insulated with oiled linen and friction tape. This provides a very effective method of cleaning out the underground conduits and the construction is such that there is no danger of it coming in contact with live parts to cause damage.

Portland Signal Failures Still Decreasing

BY H. J. CHARTERS
Portland Electric Power Company, Portland, Ore.

FAILURES of block signal apparatus are directly dependent upon three factors—speed of trains at contactor locations, maintenance, and weather conditions. This is conclusively shown by the annual signal report recently compiled by the Portland Electric Power Company, Portland, Ore. Information for the years 1921 to 1924 inclusive was given in ELECTRIC RAILWAY JOURNAL for Feb. 14, 1925. To this have now been added figures for 1925.

As presented in the report the item of No. 5 switch failures has been steadily increasing for the past three years since time-table changes made it imperative to use higher speed at contactor locations. The percentages of total failures were in 1923, 7.40; in 1924, 17.24, and in 1925, 15.55. Replacement of switches during 1925 undoubtedly reduced the number of failures from this cause during the year. The fact that most of the switch failures resulted from broken parts also reflects the cause as being too high a speed as distinguished from failures due to worn parts, faulty insulation, broken leads, etc.

During the year just past reconstruction of some of the pole lines carrying high-tension as well as railway wires was taken advantage of to replace parts of the signal lines and equipment. At such locations new directional relay housings were installed and all rubber-covered wire in pole cables and contactor leads was replaced. It is worthy of note that no failures due to those parts of the equipment were recorded. At other locations some of the relay boxes and wiring were replaced. The boxes used were constructed of first grade spruce and put together with

screws, then being well painted. This type of box has been in use for several years and gives very good service as it rarely weather checks and remains water-proof indefinitely.

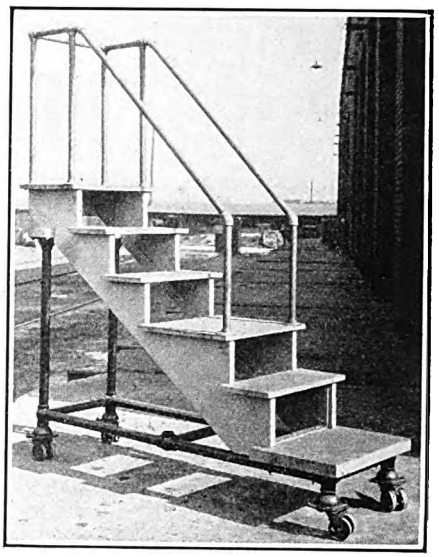
The weather conditions during most of 1925 were very favorable. These conditions are faithfully reflected in the table for failures by months and years. It will be noted that 42 per cent of the 1925 failures occurred in the first three months of the year. The winter of 1924 was quite mild, but during 1923 an excessive rainfall occurred during the first three months. This is clearly shown in the table, as is the fact that the wet month of June always registers a large number of failures.

In the report the number of movements per failure is computed on the basis of failure of the signal until repaired and not on failure of the signal to give correct indication—or, in other words, a failure is not recorded for each train passing the signal while out of order. While this may not be entirely correct from a signaling standpoint it simplifies reports and gives all essential information upon which maintenance methods may be based, except that of time elapsed before signal is restored to service. A signal movement is counted each time a car passes under a contactor, as it is thought this indicates more correctly the wear on lever bearings and arcing contacts.

Rolling Steps for Spray Painting

IN ORDER to obtain the greatest efficiency from use of spray painting, most electric railways are using some sort of portable scaffolding or movable platfrom. The accompanying illustration shows some movable steps that are used for this work in the Kenmore shops of the Northern Ohio Traction & Light Company, Akron, Ohio.

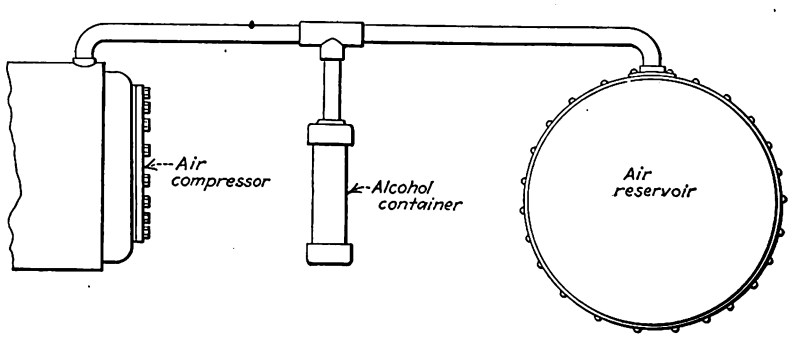
These steps consist of an iron pipe framework with four casters to permit easy rolling about the shop. The bottom step rests directly upon the iron pipe framework and five additional steps are supported by wooden risers. An iron pipe railing starts from the third step and extends so as to surround the top platform. This affords protection to the workman, particularly when he has to reach over in order to paint some inaccessible place. By the use of these movable steps painters can work alongside of the car and shove the platform ahead or back as desired without the necessity of dismounting each time a new location is to be painted.



Convenient Form of Portable Steps Used for Spray Painting in the Shops of the Northern Ohio Traction & Light Company

Small Alcohol Tank on Air Line

EXPERIMENTS are being made by Ben Singleton, shop foreman at Roseville carhouse, Public Service Railway, Newark, N. J., with alcohol vapor as a means to prevent freezing of air pipes. On each car a small alcohol container has been installed between the air compressor and the reservoir. A section of 2-in. pipe about 5 in. long capped at the bottom has been suspended by a T connection from the pipe connecting the pump and the tank. This container will carry approximately 1 pint of alcohol. The rate of evaporation averages about ½ pint per month, so that the supply in the container will last approximately 60 days. This device has



Fumes from Alcohol in the Container Pass Through the Pipe to the Air Reservoir and Prevent Freezing

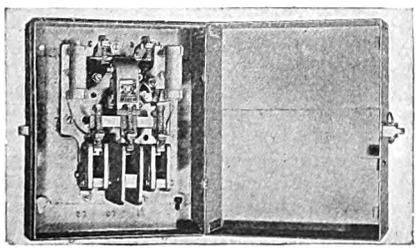
Digitized by Google

been installed on five cars and no trouble of any kind on account of freezing of air pipes has occurred since they were thus equipped.

New Equipment Available

Unit Construction for Starters

ACCESSIBILITY has been stressed particularly in a new design of across-the-line starters just brought out by the Westinghouse Electric & Manufacturing Company. This is furnished in reversing and non-reversing types, both of which are very compact in design. Two slotted hexagonal screws hold the starter unit in place in a sheet steel cabinet. Thus the starter may be taken out as a unit by removing these two screws, making the inside of the cabinet accessible for attaching conduit bushings and pulling in leads.



Non-Reversing Type Starter that Can Be Removed as a Unit from the Case

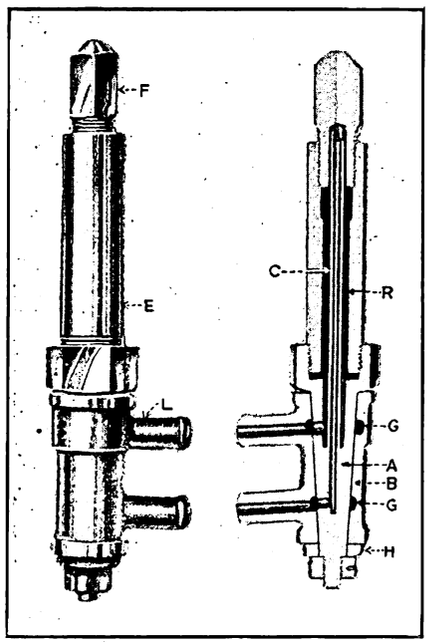
The starter consists of a three-pole contactor with electrical interlock. It is completely inclosed and is operated entirely from a push-button station. In addition to this safety feature, a floating armature type three-pole contactor is used that provides smooth and positive contact. Contactor tips are kept clean by the rolling and wiping action in closing.

Where operating conditions necessitate the protection of the starter against an accumulation of chips or other foreign matter, a door interlock may be furnished that makes it impossible to start the motor unless the cabinet door is closed.

The non-reversing starters, class 11-160, are for use on machine tools such as lathes, boring mills, grinders and cutters, and also for wood-working machinery. The reversing type, class 11-165, can be used advantageously on turret lathes and machine tools that require a reversing type of control.

Water-Cooled Electrode

WATER - COOLED electrodes have been placed on the market by the American Electric Fusion Corporation, Chicago, Ill. Referring to the letters in the illustration, *A-B* are brass castings internally machined to a taper and lapped in for a watertight joint. *C* is a brass tube taking the water from the entering duct *D* to within ¾ in. of the welding tip, where it drains down the passage *R* to the outlet *L*. *E* is the copper electrode tube fitted at the top end with *F*, which is the welding tip made from hard-drawn copper bar. The tip is held in the tube on a standard pipe thread to prevent leaking and is easily and quickly removed.

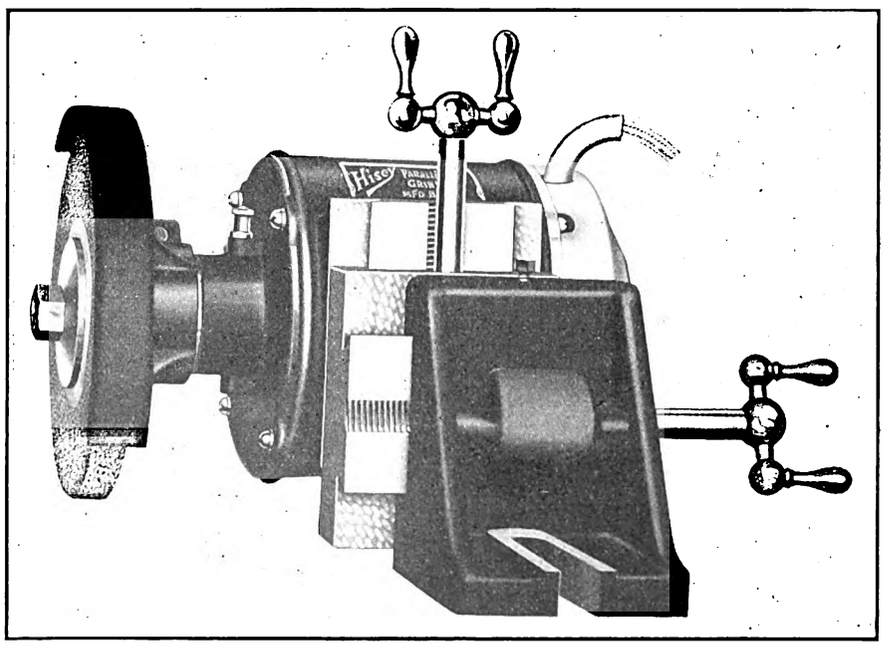


New Type Water-Cooled Electrode

Casting *B* has cored holes, *G*, which allows free circulation of water regardless of the position of the casting *A*, which is attached to the rubber hose connection of the circulating system. The nut *H* is provided to hold the casting *A* to *B* on the tapered joint.

Double Slide Angle Plate Grinder

PROVISIONS for supporting and adjusting heavy pieces of equipment which are to be ground so that accurate work will result is sometimes quite a problem for the shop men. In order to provide a grinder that can be adjusted both vertically and horizontally, the Hisey-Wolf Machine Company, Cincinnati, Ohio, has just brought out a double slide angle plate mounting for two of its standard machines. This consists of an angle plate support with double slides. The slide travels vertically 5½ in. and horizontally 4¾ in. Both slides operate independently, which permits quick and accurate adjustment to the work. Double slide grinders are furnished with wheels 8 in. x ¾ in. operated by ½-hp. motors. The no-load speeds of the two sizes are 3,000 and 3,400 r.p.m. respectively. Each of the above machines is supplied with the regular equipment, which consists of wheel guards, electric cable fitted with attaching plug, operating switch and grinding wheel of size as listed.



The Double Slide Mounting Permits of Accurate Adjustment of the Grinder to the Work

The News of the Industry

Flood Closes Oil City Line for a Few Days

Facts are available about the effect of the flood of this week on the utilities in the Oil City-Franklin district of Pennsylvania. Early in the week the power station of the Citizens Light & Power Company had to be shut down and railway service suspended.

The primary cause of the flood was low water in the Allegheny River early in the season. This allowed the ice to collect in the gorges and the water backed up behind this ice dam. Finally, with the warm weather and rain which came the early part of this week, the ice blockade gave way. The lines of the Citizens Traction Company shut down when the power station in Oil City, from which power is received, was flooded. Through a high-tension tie connection with the Pennsylvania Public Service system it was possible for the company to continue its lighting and power service in Oil City, but with the rotaries under water it was impossible to supply power to the railway.

The stoppage of the rail lines was for a few days only, as emergency rotary equipment was put in operation and the railway resumed service on the morning of March 25.

The only other injury to the railway system was the loss of track laid on the Big Rock bridge, which was carried away by the flood.

It is expected that the machinery in the Oil City power station will be dried out and be ready to begin service again in a week or ten days.

Transit Topic Taken Up at Toledo

Early action on a settlement of street railway difficulties at Toledo, Ohio, is forecast in the correspondence which has been passing between Henry L. Doherty, head of the Toledo Traction, Light & Power Company, owning bonds of the Community Traction Company, and Mayor Fred J. Mery, who promised an adjustment of railway matters as the major issue in his campaign.

It is expected that the report of H. E. Riggs, who made an extensive survey of the Toledo situation last fall, will be the basis for final agreement. Professor Riggs suggested amendment of the Milner ordinance so as to centralize control of service and fares in the board of street railway control instead of the City Council, the abolition of the sinking fund plan of purchasing the lines, rerouting and physical changes, and development of a complete co-ordinated bus and railway system under co-operation of city, company and car riders.

Mr. Doherty has informed the city that there are points of differences between his engineers and Professor Riggs in their findings and has suggested conferences.

The city, through Mayor Mery, has asked Mr. Doherty twice for some specific answer as to what the differences are so that arrangements for negotiations may be undertaken. In a recent letter the Mayor informed Mr. Doherty that Professor Riggs was not now in the employ of the city and that he would have to know whether the Doherty objections to the Riggs plan were of an engineering, financial or legal nature before seeking help to negotiate the differences.

The latest letter, dispatched on March 22 by the Mayor, offers to turn over to the Doherty engineers all of the data of the Riggs survey with full permission for the Doherty group to discuss them with Professor Riggs without legal or financial obligation to the city.

While the system is now turning in a monthly deficit and there are no hopes of surplus except possibly in two or three peak winter months power revenue and bond retirements far offset the apparent losses.

Under present operation labor conditions are tranquil and the company has practically complete control of service and bus extensions.

Columbia the Gem of Transportation

Southern City Struggles with Several Systems on Its Streets—Street Cars, Buses and Jitneys Are Changing Ten-Cent Fares—Decrepit Jitneys Run Wild

SOME cities may be suffering from a shortage of transportation facilities—not so Columbia, capital of South Carolina. That city may be said to be suffering from a plethora of transportation. There are three separate, distinct and independent means of getting from one part of the city to another.

The street cars operate at a 5-cent fare under the zone system; the 29-passenger White buses operate at a 10-cent fare in sections of the city not served by the street car lines, and, lastly, the free lance jitneys, with a tattered flag fastened to a short staff attached to the radiator caps, run here, there and everywhere within the city limits for 10 cents.

Are any of the three clearing any money? That is a question not easy to answer. Prior to last December the street cars were charging 7 cents with 3 cents additional for transfers. The railway claimed to be losing money—some $7,000 to $8,000 a month. In an effort to enable the railway to continue to operate, many citizens feeling that a backward step would be taken were street car service to be suspended, the company was ordered to put into effect a "zone" system, with 5-cent fares in each zone. The "zone" system, instead of increasing revenues, seems to have reduced them, though it has not been in effect long enough to render a final verdict as to its revenue-earning possibilities. In November last, before the "zone" order became effective, the revenues of the railway were $12,330. The "zone" rule became operative about Dec. 16 and revenues for that month were $12,411, but it should be kept in mind that some of this revenue was derived when the 7-cent fare was the rule and the balance while the "zone" ruling was in order. In January, with the zone order in effect throughout the month, the revenue was $11,541, according to the vice-president of the company. In February the revenue was $11,486.

The new Carolina Transit Company, which has been operating buses in Columbia since early in the year, has been received cordially by the people.

"We have not been soliciting patronage so much as we have been endeavoring to establish schedules," the manager, Chester Hawkins, said when asked about the system and its patronage. "Right now I could not tell you when one or two of the buses will reach a certain point."

Despite the irregularity of certain lines, the buses are fairly well patronized and people are getting in the habit of waiting for them at street intersections just as they wait for street cars. An active bid for patronage, with a printed announcement of all schedules, will probably be offered soon by the company.

As to the jitneys, no man can say. They run practically without restriction; they ply back and forth on streets through which the street cars run, and are fairly well patronized. They carry patrons direct to their homes and to their places of business, having no established routes, and so have a certain advantage over both street cars and buses. Whether or not they make any money for their operators is a problem; some hold that many will have to stop running about the time it becomes necessary to buy a new set of tires all around, while some of the drivers themselves say they are able to make a living. Practically all of the jitneys are Fords, bought on the monthly payment plan.

Citizens generally seem to "take the first thing that comes along," be it street car, bus or jitney, provided the vehicle happens to be going in their direction.

52 Miles of Pennsylvania at Philadelphia to Be Electrified

Preliminary steps have been taken in the program of the Pennsylvania Railroad for electrification at Philadelphia which entails the expenditure of $10,000,000 in addition to the cost of electrically equipped cars. The railroad's entire program is scheduled for completion in 1927.

The plans contemplate electrification of the lines between Philadelphia and Wilmington and West Chester via Media as the initial part of the railroad's general program of electrification of all suburban lines in the Philadelphia district.

In respect to mileage, the work now proposed to be carried out will constitute the most extensive project of the kind on the Pennsylvania Railroad. involving four tracks between Philadelphia and Wilmington with double and single track sections between Philadelphia and West Chester. The total number of miles of line electrified will be about 52 and the total number of miles of track will be about 150.

The distance to Wilmington is 27.1 miles and to West Chester 25.5. The total number of miles of line included in the present Paoli, Chestnut Hill and Fort Washington branch electrifications is about 38 with nearly 114 miles of track.

Plea Made for Drawbridge Closing

Request has been made to the Secretary of War by the chairman of the North Jersey Transit Commission, the presidents of the several electric and steam railroads operating in that district and the authorities of the various municipalities for changes in the regulations governing the use of the drawbridges over Newark Bay and the Hackensack and Passaic Rivers to permit the draws to remain closed during rush hours. The last public hearing in respect to the closing of these bridges for definite periods of the day was in 1918. At that time the War Department decided that conditions did not warrant any change in the rules. Since 1918 the situation has become increasingly serious. The time lost by commuters to New York because of drawbridge delays has been growing steadily.

Over some of these bridges there is a movement of 25 passenger trains an hour during the rush period. The delay of one train in the early part of the rush is very apt to be reflected upon all the trains arriving thereafter. From 12 to 15 per cent better service during the rush hours could be afforded if these bridges were to remain closed. The cost of stopping and starting trains is also a material item. The record shows that 4,564 trains were stopped during July, 1925, due to the opening of the bridges. There is a further economic loss brought about by the delays at the highway bridges over these waterways. Street cars of the Public Service Railway and buses use these highway bridges, and the time lost by their passengers must be added to the time lost by the railroad passengers.

A situation analogous to that in the North Jersey district prevailed in Boston in 1910. On account of the serious interruptions to suburban service, request for a change in the regulations was made to the Secretary of War by the Boston Chamber of Commerce and by the railroads. As a result of this application, closed periods were ordered for both the highway and railroad bridges over the Charles and Mystic Rivers and the Fort Point channel.

City Street Railway Department to Be Expanded

Colonel Sherrill, City Manager at Cincinnati, Ohio, and his aids are workings on plans to enlarge the scope of the duties of the office of Director of Street Railroads and Motor Buses, now headed by E. D. Gilman. Under the proposed change the department would become a bureau of public utilities, handling, in addition to electric railway and bus affairs, gas, electric and telephone service and other business. Colonel Sherrill said that he believed the Street Railroad Department when enlarged to take in other public utility matters would prove exceedingly useful to the city under the direction of Mr. Gilman.

Transit Baiter Defeated at Tacoma

Mayor A. V. Fawcett of Tacoma, Wash., candidate for re-election, has been defeated by Melvin G. Tennant in the recent city election. Mayor Fawceet has served Tacoma for four consecutive terms. During that time he has consistently fought the Tacoma Railway & Power Company, and during the past eighteen months has permitted a number of bus companies to operate jitneys in competition with the railway lines of the Tacoma Railway & Power Company. Mayor Fawcett recently advocated the purchase of the Tacoma street railway lines. The new Mayor promised to settle the transportation problem, subject to ratification of the voters at a general election. He has declared himself to be unalterably opposed to the purchase of the Tacoma Railway & Power Company's system by the city.

Complains of "Rubbernecks" in Washington

Residents of Kennedy Street, Washington, D. C., have protested to the Public Utilities Commission against "rubbernecks" of the Washington Rapid Transit Company who peep into bedroom windows. The complainants, through Mrs. J. G. Willis, their spokeswoman, at a hearing before the commission on March 10 stated that they were compelled to keep their bedroom curtains drawn. In addition to the inconvenience of drawing down the shades on the second floor front windows Mrs. Willis also informed the commission that the buses were dangerous and "imperil the lives of children every time they turn into Kennedy Street." Her protest came up in connection with consideration of the application of the Washington Rapid Transit Company to operate a bus line from Fourteenth and Kennedy Streets to Silver Spring and other points in nearby Maryland carrying intrastate as well as interstate passengers.

Higher Fares Sought in Bluefield

Application was made to the city of Bluefield, W. Va., by the Princeton Power Company for an increase in railway fares in that city. Embodied in the company's application were certain requests in which the company sought to have a new franchise drafted, and also to be relieved of the payment of $2,500 yearly for a seven-year period for the privilege of operating on the north side of East Princeton Avenue.

The city and the company were not in accord as to the three requests embodied in the company's application for increased fares. Neither did the city board approve changes suggested in the rate of fares. The Princeton Power Company officials subsequently modified their application, particularly with respect to the proposed increase in school tickets and transfers.

The proposed railway rates follow:

The present 6-cent cash fare to be made 8 cents.

The present twenty-ticket book to be raised from $1 to $1.20.

A four-ticket book or token to be sold for 25 cents.

The present school ticket book or 50 tickets to remain at $1.50 and not be increased to $2, as had been proposed.

One cent to be the transfer charge at the junction of Bland Street and Princeton Avenue, instead of 2 cents, as had been proposed.

It is understood the city approves the modified rates.

Four Years to Build Three Blocks of Subway in Heart of New York

The Fifth Avenue station of the Queensboro subway extension in New York City was placed in operation on March 22, marking the opening of service on the extension between Grand Central and Fifth Avenue and 42d Street. Construction on the extension was begun nearly four years ago. The full extension will run under 42d and 41st Streets to Eighth Avenue, connecting with the I. R. T. and B.-M. T. subways on the west side. The part of the extension on which service has been begun is only three blocks in length, but it is expected to be a great factor in relieving congestion of traffic at Grand Central and on the shuttle between Times Square and Grand Central. The extension is expected to be complete to Eighth Avenue in June.

Wage Agreement in Scranton

Trainmen, carhouse men and trackmen employed by the Scranton Railway, Scranton, Pa., voted on March 16 to accept a new agreement running from April 1, 1926, to April 1, 1927. By its terms operators of two-man cars will continue to receive 58, 61 and 64 cents an hour, the last figure being paid to men in the employ of the company more than one year. Operators of one-man cars get a small increase in their pay, due to the fact that they will be paid full time in returning from the carhouse after work to complete a report of the day's business. The rate of bus drivers remains at 69 cents an hour. The union sought to make the bus driver rate the same as for operators of one-man cars—72 cents an hour. Carhouse men and trackmen will benefit only by a change in working hours.

Another Step Toward More Subways in New York City

The New York Senate on March 17 concurred with the Assembly in passing unanimously the Nicoll-Hofstadter concurrent resolution proposing an amendment to the Constitution which would permit New York City to increase its borowing power by $300,000,000, the money to be used in the construction of new subways. The resolution will have to be approved by the 1927 Legislature and can then be submitted to the voters at the next election.

Senator Nicoll and Assemblyman Hofstadter, said:

> New York City must have new subways. The present transit condition is intolerable and must be relieved. While there has been serious question as to the correct method of financing this new construction, the present city administration has insisted upon the bond issue as the only means by which it can accomplish its objects.
>
> The Legislature has co-operated to the fullest extent within its power to permit spbway construction in the manner determined upon by those accountable for that undertaking. But with power goes corresponding responsibility, and the people of New York City have the right to look to the city administration to employ these funds economically and for the maximum benefits possible.

New Method of Presentation for Tennessee Utility News

With the issue of the *Tennessee Utility News* for March, 1926, the Tennessee Public Service Association, composed of the utility companies of the state, is presenting to its readers and the public generally a publication in an entirely new form.

The *Tennessee Utility News*, a sixteen-page booklet, is to be issued once each month. It is scheduled to come off the press about the fifteenth of the month. It will be non-partisan and non-political. Its purpose will be to enlist the friendly interest and co-operation of the public, public utility customers, investors and employees, so that a better understanding of mutual problems may be reached. *Utility News* will be devoted solely to information about the utility industry and particularly that portion within the state.

Wage Increase Ahead for San Francisco Municipal Men

Trainmen of the Municipal Railway in San Francisco, Cal., may get a larger increase in pay than they have requested. They are at present receiving $5.40 a day for eight hours and have asked for a raise of 60 cents, bringing their wage up to $6 a day.

If a new rezoning and standardization plan of wages of municipal employees goes through as now outlined, the platform men will be placed in Zone 4 and will draw a monthly wage of from $160 to $175, or at the rate of from $6.21 to $7 a day.

This plan is now practically ready for presentation to the Civil Service Commission. The salary question of city railway employees has been agitated for more than a year. It has been made plain to the men that until some reorganization plan has been perfected and adopted they will have to wait for their increase.

The last monthly report of the railway showed a net income of $70,734 prior to federal income tax deduction and for two months ended Feb. 28 net of $119,387. The gross income for February was $152,767 and for the two months $283,529.

Two-Cent Wage Increase in Louisville

An increase of 2 cents an hour in pay of all platform men of the Louisville Railway, Louisville, Ky., was announced on March 17. The increase, retroactive from Feb. 1, 1926, affects about 1,500 men, and, according to President James P. Barnes, increases the annual payroll $100,000 a year. This increase brings the wage of platform men up to 47 cents an hour on two-man cars; and to 50 cents an hour to operators of one-man cars.

No formal request was made for an increase, but the matter has been under consideration for some time. The agreement covering wages was reached at a recent meeting of the general committee of the co-operative association of the Louisville Railway. The new wage does not equal the peak wage of 48 cents in effect following the war, but is higher than the 45-cent rate of the War Labor Board period.

Shortly after Mr. Barnes became president of the company in 1921, the wage was advanced to 48 cents, over a period of six months, then reduced to 43 cents, but three months later was increased to 45 cents, and remained at that figure. Operators of one-man cars have for some years received 3 cents an hour more than operators of two-man cars.

Wants Seven Cents in Huntington

The Ohio Valley Electric Railway, Huntington, W. Va., in the opinion of its executives, is entitled to a 7-cent fare, and is restrained from asking for a fare increase before the State Public Service Commission only by a fear that a higher fare might produce a smaller revenue in the long run than the present 6-cent fare. George I. Neal, counsel for the street railway, outlined the attitude of the company toward a demand for fare zone extension and service improvements. A word picture of the railway as a public service corporation facing almost certain poverty unless relief in the form of increased revenue is soon forthcoming was drawn by Mr. Neal as a rejoinder to demands launched at the city hall by Commissioner Yeich for fare zone extension. He said it might become necessary for the company to ask the right to make an additional charge for transfers, or resort to other expedients.

City Attorney P. P. Gibson was notified recently by the City Commission of Huntington to investigate the "right of the Ohio Valley Electric Railway to maintain fare zones within the corporate limits of the city and to prepare an application to the Public Service Commission requesting restoration of a 5-cent fare with transfer privileges on all of the city lines of the railway."

Guelph Rejects Plan of Purchase

A proposal to issue $300,000 in 30-year 5 per cent debentures to purchase the Guelph City District Railway, Toronto, Ont., from the Hydro-Electric Power Commission was flatly rejected by the ratepayers recently, when a by-law for this purpose was defeated, 868 to 295. The outcome of the vote was a complete reversal of the January municipal election, the citizens on the first occasion favoring a plebiscite for management of the railway under a civic commission by a majority of 856.

The Guelph system has been operated for the past four years by the Hydro-Electric Railways, which is controlled and operated by the Hydro-Electric Power Commission of Ontario. The municipal election was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Jan. 16, page 127.

Omaha Report Adopted

The Omaha City Council in committee of the whole on March 9 adopted the form of consent as reported by its street railway committee and recommended it for passage. Later the Council made some minor amendments to the proposed grant to be made to the Omaha & Council Bluffs Street Railway. When it is finally adopted the grant will be published in full in the daily newspapers every day for 30 days prior to the special election.

Northampton Property Will Run Electrified Branch

The Northampton Street Railway, Northampton, Mass., has entered into negotiations with the Boston & Maine Railroad on proposed electrification of the Mount Tom branch, which the street railway proposes to take over and operate. The subject was first taken up last fall, but the street railway made its official proposal only a few weeks ago, and is now awaiting a reply from the railroad. The Northampton company desires to electrify the road, and will then abandon the East Street trolley line and also the Clark Street line as far as Cottage Street, both in the town of Easthampton.

Two-Cent Wage Increase in Salt Lake City

An increase in wages to motormen, conductors, carhouse men, shopmen and trackmen which amounts to about 2 cents an hour for each of these employees has been granted by the Utah Light & Traction Company, Salt Lake City, Utah, effective April 1.

When the last wage agreement was entered into between the employees and the traction company the "cost of living index" based on the prices prevailing at the time was 168.8, with the year 1913 taken as a normal year, with an index of 100. The wage contract provided for an arbitrary increase or decrease of wages as the cost of living index went up or down. The basis was to be the official government statistics as published in the Monthly Labor Review, issued by the United States Department of Labor.

City Club at Chicago Makes Franchise Suggestions

Transportation conditions regarded to be desirable have been recommended to the City Club of Chicago by a special committee of that organization authorized to study the subject so that the club might go on record with respect to its attitude on the subject of the surface railway franchises soon to expire. The committee suggests:

1. Service is the fundamental requirement—the ability to travel from one point to another with safety, comfort and speed.
2. Unification of bus, street car and rapid transit lines. Ultimate unification of ownership, if desirable.
3. Conditional terminable permits provided that:
(a) The city shall be given actual financial as well as legal power to purchase.
(b) All rights to the use of the streets shall be terminable by the city for non-use or for misuse.
(c) The city shall have full rights to control service, extensions, additions and improvements.
(d) The state, through its regulatory body, shall have the right to control the issue of securities.
(e) The permit shall provide for the methods of: (1) valuation; (2) determination of fares; (3) accounting; (4) depreciation and obsolescence; (5) termination for non-use or misuse.

Petition for Ferry Denied

After long deliberation the California Railroad Commission has denied the Golden Gate Ferry Company a rehearing on its application to institute ferry service between Berkeley and San Francisco for the transportation of pedestrians, automobiles and their occupants and freight. A former application was denied Jan. 25 and a petition for a rehearing was filed on Feb. 2.

The commission declared the company had failed to prove the service was essential to the convenience of pedestrians. It took the attitude that if the ferry company should amend its petition to eliminate pedestrians a new hearing might be granted.

Installation of the new ferry was opposed by the Key System Transit Company and the Southern Pacific, both of which were recently awarded higher transbay rates by the Commission.

Suggestions Received on Improvements in Pittsburgh

The Pittsburgh Railways, Pittsburgh, Pa., has received about 5,000 replies to its suggestion blanks soliciting hints on how to improve service and add to the comfort of the riders. About 90 per cent of the replies offered suggestions on operating and equipment subjects. They embrace special fares for school children, express service, reduction in the price of the weekly pass from $1.50 to $1.25, and offered remedies for the solution of the loading and unloading problem in the downtown district.

Action Against Jitneys in Louisville

Merchants on Market Street, Louisville, Ky., have adopted resolutions calling upon the city to regulate jitney operations in the interest of the safety of the public and eliminate rowdy tactics employed by operators. Practically all of the Louisville jitneys operate on Market Street. These operators block traffic, take on passengers in the middle of the street, instead of at the curbing, interfere with trucks serving the merchants, turn in the middle of the street and are noisy, rough and objectionable in many other ways.

Waukesha-Milwaukee Agreement Accepted

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has accepted the franchise agreement offered by the city authorizing the construction and operation of the cut-off interurban line to Waukesha. This step marks the end of a controversy between the company and the city over the right of the company to build this line without first obtaining a franchise from the city. The company contended that the certificate of convenience issued by the Railroad Commission was sufficient to warrant it in going ahead with the project, a road being built over a private right-of-way. Under the terms of the franchise the company must reimburse the city for any additional cost above that normally expended by the city on an ordinary thoroughfare for improvements. The approval of the Milwaukee-Waukesha franchise was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 20.

Wage Demands of New York State Men Undecided

Employees of the New York State Railways in Rochester, Utica and Syracuse have been unable to agree on demands for a new wage and working agreement to take effect on May 1. Following conferences of union officials in Syracuse, it was reported that the deadlock is caused by the request of Rochester employees for the right to petition for a wage increase independently of the men in the two other cities.

The Rochester union voted in December to ballot on contracts separately. This action was due to the Rochester workers being overruled by a heavy vote in the balloting of last spring when Utica and Syracuse men accepted a company offer to which Rochester was opposed.

The right of Rochester workers to act independently has been questioned by Syracuse and Utica unions. The international officers will have to decide the question, it is believed.

Further conferences are to be held in an endeavor to arrive at an agreement as to the demands to be submitted to James F. Hamilton, president of the New York State Railways.

That the men will ask for a wage increase is certain. The amount of the raise to be sought hinges on the negotiations pending between the unions of the three cities.

Rochester employees believe that a 1-cent fare increase put into effect in their city the first of the year will add weight to their plea for a higher wage. Applications of the company for an advance in fare from 7 to 10 cents in Syracuse and Utica will probably not be acted upon by the State Public Service Commission before the present working contract expires.

News Notes

Sunday Pass System Abolished.—The Trenton & Mercer County Traction Corporation, Trenton, N. J., has abolished the system of selling Sunday passes because the demand for such passes fell off. The tickets were sold for 25 cents and could be used all day Sunday on any division.

Free Transport Before City Council.—Whether policemen and firemen in Seattle, Wash., who now ride free on the Seattle Municipal Railway lines in the city, will be required to pay their fares when off duty is a question on which the city utilities committee is divided. Two reports, one for and the other against the ordinance making the proposed change from free rides, will go to the City Council.

Paving Relief Voted in New Jersey.—The New Jersey House after an unsuccessful attempt earlier passed on March 25 a Senate bill to relieve electric railways from paving obligations. As amended by the House the utility companies would be required only to repair damage done to paving removed in connection with work done by them to their own tracks. The Senate recently passed the bill after also defeating it several weeks ago.

Operation for a Trial Period.—The Wheeling Traction Company has agreed to operate the hillside line on 90 days trial, with the option of returning it to the city of Wheeling at the end of that time. The Mozart Park (hillside) line was taken over by the city when the City Traction Company refused to continue operation at the old fares.

Purchases Right-of-Way.—The sum of $9,500 has been agreed upon by the Northampton County Commissioners as the price to be paid for the purchase of the right-of-way of the Bangor & Portland Transit Company between East Bangor, Pa., and Portland. The purchase of the right-of-way by the county will make it possible to develop a new road between the two towns.

Opposes One-Man Cars.—The City Council of Niagara Falls, Ont., is opposed to the operation of the one-man cars which the Canadian National Railway has announced will be put in operation on the local lines in April. The company says the cars are necessary, due to financial loss in operation of the lines.

Trainmen in Memphis Rewarded.—Conductors and motormen of the Memphis Street Railway, Memphis, Tenn., earned for themselves the sum of $8,416 in extra pay during the past three months, according to figures recently made public. The amount will be distributed among the men on March 22, each receiving a proportion based upon the number of hours worked within the period. For the year ended Feb. 28 the men earned for themselves extra compensation totaling $35,320. During the corresponding twelve months of the year before the men had earned $35,071. The plan was adopted by the Memphis Street Railway in 1923.

Recent Bus Developments

An Overambitious Project

Events in the History of the Indianapolis Bus Terminal and the Red Ball Lines

"For Rent" is in effect the sign that has been hung on the "world's largest bus terminal," erected in Indianapolis at a cost of $250,000 for the accommodation of intercity buses. So the end has been marked of an experiment in interurban transportation which, less than a year ago, attracted attention all over the country. The terminal was opened with a public celebration on May 19, 1925. It accommodated 28 different bus lines operated in competition with the electric railways. When the doors were closed there were only three independent lines left in competition with the electric lines. The others had either been sold to the electric railways or abandoned.

One of the systems using the station was the Red Ball Lines. As noted previously in the ELECTRIC RAILWAY JOURNAL it went into the hands of a receiver last December and has since passed to the ownership of the Terre Haute, Indianapolis & Eastern Traction Company and the Union Traction Company. The receiver of the company was Fred I. Jones. He lost no time in finding out what the matter was. The fares had been too low. More about that later. It is the philosophy expounded by the receiver after his study of the matter that is of interest. Mr. Jones said:

> It is apparent, that the operation of buses must be co-ordinated with existent steam and electric forms of transportation. This is particularly true in Indiana, which is covered by such a network of steam and interurban railways, serving the population fairly satisfactorily. The buses find it impossible to stand alone, but are logically indispensable in rounding out a complete and unified transportation system.

In giving the current news on the situation the risk is run of repeating some things that have been said before. Still it is better to do that than to leave a hiatus in the sequence of recent events.

At the time the receiver was appointed it was evident that while business seemed to be satisfactory, the receipts were not sufficient to take care of operating expenses and depreciation. These receipts fell far short of providing in addition any return on the investment. As one of his first acts the receiver petitioned the Public Service Commission for an increase in fares. This petition was filed and heard and an increase granted. The increase, however, did not prove satisfactory from an operating standpoint, and the receipts were not sufficient to meet operating expenses and depreciation.

In consequence the receiver faced two alternatives. One was to continue the lines at an operating loss until the assets in the hands of the receiver were dissipated, and the other was to sell the certificates and rights to operate to the traction companies. It is apparent to Mr. Jones that the first course would result in the dissipation of all funds so that the creditors of the Indiana Red Ball lines would receive practically no dividend. On the other hand sale to the traction companies promised to bring additional money into the trust so that the creditors will receive some payment on their claims. The latter, therefore, seemed to Mr. Jones to be the proper course to follow. This he did.

But to get back to the terminal. When it was opened most of the bus lines were being operated on a basic fare of less than 2 cents a mile. The lines that survived were the ones whose operators had sought and received permission to increase fares to the basic 3 cents a mile, which is the rate charged by the railways.

From an annex to the electric railway terminal in Indianapolis buses are now alternating with interurban trains, paralleling their rights-of-way but not competing, for the rates are practically the same and the running time is not materially different.

The co-ordination of buses with interurban lines involves the establishment of new fare schedules on almost all lines, including those whose owners have recently received permission to increase rates to the level of the electric railway rates.

Brooklyn Wants 77 Miles of Bus Routes

Railways Prepared to Install 20 Routes on Service-at-Cost Basis Starting at 5 Cents—Excellent Statement of Place of Bus in Transportation Scheme

THE Brooklyn-Manhattan Transit Corporation and the Brooklyn City Railroad, operating practically all the surface lines in Brooklyn, applied on March 20 to the Board of Estimate for a franchise to operate 21 bus routes, of a total length of about 77 miles, in that borough.

The application was made by the C. I. & G. Bus Corporation, of which William S. Menden, president of the B.-M. T., is president. This company offered to start operation of all the proposed lines at a 5-cent fare, except the Ocean Parkway-Lafayette Avenue line, for which a 10-cent fare was asked, on condition that the franchise contract should contain a provision for cost of service and enable adjustments by which the rate of fare should from time to time be fixed to cover this cost. The company offers the city a return of 3 per cent of its gross receipts.

The bus corporation offered free transfer privileges between all bus lines, except the Rockaway Ferry line and the Ocean-Parkway-Lafayette Avenue line. It also offered free transfers to and from surface cars at 21 points and undertook to obtain the consent of all the surface railroads in Brooklyn to the establishment of such bus routes as might be competitive.

In regard to the general effect of bus operation, abandonment of surface lines, fare and terms of franchise and compensation to the city, the application read in part:

> Bus operations can be mainly of benefit only as feeder lines for outlying sections and for crosstown service where existing facilities do not cover the territory adequately. Buses cannot be relied on exclusively to care for the traffic in business districts or other congested areas. The surface systems are vital and essential parts of the transit facilities of Brooklyn, whatever may be the situation elsewhere. To confirm this, it is sufficient to point out that in the year ended June 30, 1925, the surface lines of the B.-M. T. and of the Brooklyn City Railroad carried 512,492,371 passengers and that the B.-M. T. rapid transit lines in Brooklyn, Manhattan and Queens carried 591,983,639 passengers. In other words, the surface lines, carrying approximately 50 per cent of the total of the borough, are so essential that they must remain to do their full share of the transit requirements of the borough. Both surface lines and rapid transit lines, however, can be supplemented by bus lines as herein indicated.

According to the company a rate of fare which does not cover the cost of service is not in the interest of the public because the grantee cannot, under such circumstances, render the service the public demands.

The company holds to the opinion that the best service to the public can be rendered under franchises granted for a reasonably long period. The bus corporation suggests 25 years, with the right in the city to terminate at any time upon one year's notice, upon payment of the unamortized investment and with provisions whereby bus franchises may be shifted to other routes whenever the completion of rapid transit facilities or other conditions justify.

The bus corporation is assured ample capital to equip and operate such borough-wide system of bus routes with the most modern and efficient equipment.

In short, the franchise is intended to cover bus operation in Brooklyn, based on co-ordinating buses with the existing transportation lines. The application proposes to substitute buses for street cars only in the cases of three little shuttle lines which operate in the outlying districts and none of which has ever earned operating expenses.

Howe Buffalo Proposal Rejected

By a vote of three to two, the City Council of Buffalo, N. Y., has rejected the application of Ernest M. Howe, Detroit, and the American National Omnibus Corporation for permission to operate 5-cent gas-electric buses over 71.5 miles of streets on thirteen routes under a twenty-year franchise. The Council felt that in view of the failure of Mr. Howe and his associates to perfect the financing plans of the new company no more consideration should be given to his proposals, which have delayed the solution of Buffalo's trans-

Digitized by Google

portation problem for almost six months.

Consideration now will be given by the Buffalo City Council to the proposals of the International Railway and its subsidiary, the International Bus Corporation, for a unified traction-bus system covering all parts of the city. Three members of the City Council have taken a favorable stand toward the proposals of the International, which already has the support of the Buffalo Chamber of Commerce, Federation of Business Men's Associations and other organizations of the city.

Adoption of Uniform Franchise in New York Expected by April 1

Acting Mayor Joseph V. McKee of New York City, chairman of Mayor Walker's transit conference which has been considering bus routes and franchises, announced on March 24 that he expected the way to be cleared within two weeks for the Board of Estimate to prepare for the awarding of bus franchises throughout the city, according to the tentative routes already laid out. He said:

> There will be virtually a uniform form of franchise for the entire city. It will stipulate the terms and conditions under which the various companies may proceed to operate bus lines. We have not yet reached any definite conclusion upon a uniform rate of fare. In come instances we may have to establish a zone system with fares in excess of 5 cents for long-distance rides. But we are bargaining with the several bidders with the sole purpose of getting for the city the best possible terms and the most efficient and responsible service.

The discussion on March 24 was of a general nature, but, according to Mr. McKee, the opinions expressed were so unanimous that he felt there was no doubt that the few remaining minor differences would be ironed out in a final meeting of the special committee set for March 27.

It is believed, therefore, that the committee on March 31 will be in position to report to Mayor Walker and his associates of the Board of Estimate its recommendations concerning franchise terms, as well as routes.

Proposal Includes Both Bus and Rapid Transit for Cincinnati

Suggestions covering proposed use of the bus in several communities and a forecast of the utilization of the rapid transit system in the near future are embodied in a proposal submitted to the city administration of Cincinnati, Ohio, by Walter A. Draper, president of the Cincinnati Street Railway. The opportunity is presented in alternative plans for transportation on that portion of Ludlow Avenue to be improved. It concerns the Clifton-Ludlow line in whole or in part, according to the plans adopted. The Clifton-Ludlow question is linked with the larger question of the rapid transit problem because there is a station of the system at Ludlow Avenue. One of the alternative plans provides for a bus service from Clifton to and from this station where passengers would be transferred from buses to cars of the rapid transit system.

On the question of the rapid transit line Mr. Draper referred to the company's report to the stockholders at the annual meeting held on Jan. 27. Herein it was stated that the officials would endeavor to present the point from which they must view the possibility of its operation, viz., how the rapid transit line could be operated so that the resultant transportation system could be made to provide adequate and dependable transportation facilities for the metropolitan area of Cincinnati at a reasonable rate of fare, yet one that would make the project self-sustaining.

Opposition Develops to Bill to Regulate Interstate Bus Traffic

Considerable opposition developed at the hearings before the Senate committee on interstate and foreign commerce at Washington on March 22-25 on the part of motor truck operators and others not only to the Cummins bill but to any form of regulation at this time. The Minnesota regulatory commission opposed relinquishing control over bus lines that used the state highways on the grounds that only a small part of the routes operated extended beyond the state boundaries and that if the present bill was enacted the commission would lose control of its power of regulation over strictly intrastate lines.

The bus men favored regulation as an abstract theory, but they were not in favor of the bill as introduced. The railroads, both steam and electric, favored the bill, as did the National Association of Railroad and Utilities Commissioners, although in conference prior to the opening of the hearing they conceded a part of the amendments desired by the bus operators represented by the legislative committee of the Bus Division of the American Automobile Association.

The constitutionality of delegating federal authority to state regulatory commissions was questioned, as was the fact that contract carriers and private facilities did not come under the provisions of the bill. Witnesses also protested that ostensible competitors were attempting to prevent the further development of the motor carrier industry.

The truckmen called attention to the lack of power of the state regulatory bodies to function under the bill even if passed until enabling legislation had been enacted. In the meantime all the work of regulation would be thrown upon the Interstate Commerce Commission, now overburdened.

Members of the committee on interstate and foreign commerce were not in agreement on the necessity and advisability of such regulation, if the questions asked witnesses are any criterion.

Will Experiment with Buses on Branch Lines.—President Wesley W. Sargent of the Fitchburg & Leominster Street Railway, Fitchburg, Mass., announced recently that the company was considering replacing trolleys with buses on the short branch lines. The railway now runs buses in conjunction with the car service on the main lines, but desires to experiment with the buses on the short branch lines.

Safe Drivers Rewarded.—Drivers of the Brown bus line of the Twin City Rapid Transit Company, Minneapolis, Minn., who have served more than a year without accident have been presented with a careful driving certificate and an arm insignia marked "Safe Driver" in gold letters on black background to be worn on the right arm. Two of the men had a record of three years. Twelve drivers were given the reward of merit.

Interstate Line Ordered Not to Do Intrastate Business.—The Public Utility Commission of New Jersey on March 20 granted an order sought by the Erie Railroad and the Public Service Railway directing the Fontanella Bus Company, operating a Paterson-New York line, to stop doing an intra-State business in New Jersey.

Railways Oppose Bus Applications.—Attorneys for the Rochester & Eastern Railway and the Ontario Motor Bus Lines, Inc., subsidiaries of the New York Central Railroad, at a hearing held in Rochester, N. Y., on March 12 opposed an application for an operating certificate for a bus line from Canandaigua to Geneva, N. Y., by way of Hopewell. The hearing was conducted by Public Service Commissioner Charles Van Voorhis. The railways contended that the proposed bus line would parallel their routes, which, they claim, give adequate service to the territory.

Ohio Company Secures Control of Bus Company.—The Lorain-Amherst-South Amherst bus line has been obtained by the Southwestern Bus Company of Cleveland, incorporated in Columbus on March 18. Its backers are officers or persons interested in the Cleveland, Southwestern Railway & Light Company—F. H. Wilson, president, who is head of the Southwestern Railway; C. J. Mayers, secretary and treasurer; Gardner Abbott, attorney; J. A. Nestor, and E. L. Hukill. The Lorain-South Amherst bus ran parallel to the railway's tracks through a "section that could support one line but not two," according to President Wilson.

Would Replace Cars with Buses.—The East St. Louis & Suburban Railway has applied to the City Council of Belleville, Ill., for permission to abandon its two city railway divisions and replace them with bus service. Interurban service would not be changed under the plan. Two street cars now operate on the Illinois Street division and one car on the Louisville & Nashville depot division. The bus service will be extended into additional territory if the application is granted.

Seeks New Bus Certificate.—The Los Angeles Railway has applied to the California Railroad Commission for a certificate to operate motor coach service along Manchester Avenue in the city of Inglewood to Manchester Avenue and Compton Avenue in the county of Los Angeles.

New Service Arranged.—Faster and more direct railway-bus passenger service will be provided by the Wisconsin Motor Bus Lines to Elkhorn, Delevan and Beloit. There will be through bus line service from Racine to Beloit connecting at Burlington with interurban trains of the Milwaukee Electric Railway & Light Company. Scheduled running time between Milwaukee and Beloit will be cut 40 minutes under this arrangement.

Financial and Corporate

270-Mile Texas Road Reports

Earnings of Texas Electric Railway, Operating Interurban and City Systems, Hold Up Well

Gross earnings of the Texas Electric Railway, Dallas, Tex., from operation for the year ended Dec. 31, 1925, were $2,362,114. The operating expenses and taxes for the year totaled $1,524,615. Regular dividends on first and second preferred stocks were paid at the rate of 7 per cent per annum. The dividends upon common stock were paid at the rate of 1 per cent a quarter for the first half of the year. During the year the company spent $389,915 on the physical property, or $35,598 in excess of the mortgage requirement. Since 1917 it has spent for these purposes $4,139,892, or $692,926 in excess of what its mortgage required it to spend. The management has set aside, with approval of the directors, an additional sum of $100,000 from surplus into renewal and replacement reserve, to be used as found necessary and advisable for further maintenance and upbuilding of the property.

Since its organization the company has constantly followed the policy of reinvesting its surplus earnings and reserves in the improvement of the property. During this time it has so invested $1,974,384. Of this amount, $878,775 represents fundable investments, against which new securities have not been sold. In addition, it has expended approximately $275,000 in terminal properties in Dallas and Waco and improvements thereon, which will become fundable upon the payment of the balance due upon the purchase price thereof. There was expended during the year for additions and improvements to the property the sum of $142,169.

During 1925 the passenger service was substantially improved. A large quantity of ballast was distributed and tracks otherwise bettered. Additional substations were provided, with great advantage to power distribution. The train schedules upon all divisions were shortened. During the year street car service to certain sections of both Denison and Sherman was discontinued and bus service substituted therefor. These abandoned lines were largely upon unpaved streets and the tracks have been removed therefrom.

In the estimate of receipts and expenditures for 1926 submitted by Mr. Martin, vice-president and general manager, a special effort was made to be conservative. Under this estimate the income will be sufficient to provide for all operating expenses, taxes, interest, dividends upon preferred stocks, the transfer of the usual $100,000 to renewal and replacement reserve and a substantial addition to surplus. The drought of 1925 has been broken by abundant winter rains. This greatly improves the outlook in this section of Texas and in the words of the management it justifies the hope that the actual earnings for the year will exceed this advance estimate.

On Jan. 1, 1925, bus competition with the company's lines existed only between Hillsboro and Waco, a distance of 34 miles. During March, 1925, bus service was installed between Dallas and McKinney, a distance of 32 miles. Just at the close of the year bus line service was established between Dallas and Waco by way of Alvarado to Hillsboro, and paralleling the line between Hillsboro and Waco. A careful check made from time to time of these bus lines discloses that their average gross earnings fall far short of actual operating and maintenance costs, and it is not believed that this competition will be permanent.

INCOME ACCOUNT OF TEXAS ELECTRIC RAILWAY FOR THE YEAR ENDED DEC. 31, 1925, AND SUMMARY OF SURPLUS ACCOUNT

INCOME ACCOUNT

Gross earnings from operations		$2,362,114
Operating expenses and taxes		1,524,615
Net earnings from operations		$837,498
Add: Interest on bank balances, etc.		586
Total net earnings before depreciation		$838,084
Interest deductions		426,321
Surplus net income before depreciation		$411,763

SUMMARY OF SURPLUS ACCOUNT

Balance January 1, 1925, per previous report		$1,444,861
Add: Surplus net income for the year ended Dec. 31, 1925, as above	$411,763	
Sundry Surplus Credits:		
Refund of 1921 and 1922 federal taxes with interest, less expenses in connection therewith	31,645	
Profit on sale of real estate	22,475	465,884
		$1,910,745
Deduct: Provision for renewals and replacements	$100,000	
Dividends Declared:		
On first preferred stock	$119,635	
On second preferred stock	210,000	
On common stock	120,000	
Sundry Surplus Charges:		
Additional provision for 1924 federal taxes	$2,500	
Loss on investments written down to nominal values	3,996	556,131
Surplus balance, Dec. 31, 1925, per balance sheet		$1,354,614

The cities of Denison, Sherman, McKinney and Waxahachie have passed ordinances to regulate and restrict the operation of buses through these municipalities. The feeling of the management is that while these municipal ordinances are helpful, they do not fully meet the situation. This can be most effectively done by state legislation.

As usual, most of the accident of consequence resulted from collisions with automobiles at highway crossings. With the enforcement of the law against excessive speed practically suspended, and with no law requiring vehicles to stop or reduce speed before going over railroad crossings, autos continue to race across places of danger in flagrant disregard of all rules of safety. Jack Beall, president of the interurban, says that in spite of all the "Safety First" crusades, in spite of all the glaring newspaper headlines telling of the grisly harvest of death upon the highways, and in spite of the knowledge that more people were killed by automobiles last year in the United States than now live in some of the populous counties of Texas, and more people injured than now live in the city of Dallas, this tournament with death goes on. He says that something should be done, and done at the earliest possible time, to stop this destructive waste of human life and human efficiency. It should be done not to save the expense of such accidents to the railroad companies, but for the higher and better purpose of protecting those who will become the victims of these road tragedies.

Rochester Appraisal Suit Set for April 1

Trial of the suit of the city of Rochester for a revaluation of the Rochester lines of the New York State Railways is set for April 1 in the Supreme Court, Justice Adolph J. Rodenbeck presiding. It had previously been scheduled for March 3. The valuation as fixed by the service-at-cost contract under which the lines are operated is $19,216,000. The traction company contends that the city forfeited its right to obtain a review because it failed to oppose the appraisal figures when the matter came before the Public Service Commission. The present valuation was fixed by three appraisers in 1921. The city maintains that the valuation is too high.

Suit to Establish Status of St. Louis 4s

Milton Von Boston has carried to the United States Supreme Court his fight to have the $30,000,000 of general 4s of the United Railways, St. Louis, Mo., declared either due and payable or in default so that foreclosure of the mortgage securing the bonds may be had. He wants a writ of certiorari to review the finding of the United States Circuit Court of Appeals. The District Court dismissed Von Boston's petition and the Circuit Court of Appeals sustained that ruling, holding that no defaults existed under the general 4s mortgage. The reorganization plans for the United Railways contemplate leaving the $30,000,000 mortgage undisturbed. Should the high court decide to review the case it will not delay the reorganization, attorneys declare.

New Company Takes Over Properties at Lincoln, Neb.

Unification of all heat and electric properties of the Lincoln Traction Company and all gas and electric properties of the Lincoln Gas & Electric Light Company, Lincoln, Neb., into a new corporation has been authorized by an order of the Nebraska Railway Commission. The new corporation will be known as the Lincoln Public Service Company. Under the terms of the order the Lincoln Gas & Electric Light

Digitized by Google

Company will cease to do business, but the Lincoln Traction Company will continue to operate the traction system.

The operating officials of the new company are: B. J. Denman, president; C. N. Chubb, vice-president; O. J. Shaw, vice-president and general manager, and O. R. Mallat, assistant secretary.

The budget for the year for these properties is $1,352,157. A substantial portion of this amount is to be spent on railway construction. Traffic experts connected with the United Light & Railways Company, by which the Lincoln properties are controlled, have been making a thorough study of the Lincoln street railway situation for many weeks to the end that greater economy of operation and greater efficiency and better service may be achieved.

New Financial Control for California Road

Control of the Central California Traction Company, Stockton, Cal., by either the Southern Pacific or the Santa Fé would not be in the public interest. This is the opinion of Ralph R. Holster, an examiner for the Interstate Commerce Commission. In a report to the commission he recommends that the proceeding be held open to afford an opportunity to formulate a plan whereby the traction company can be taken over jointly by the two railroads mentioned and the Western Pacific. The Central California Company operates 70 miles of overhead trolley and third rail line in service akin to that performed by the steam railroads in the same territory.

Another Customer-Ownership Campaign in New Jersey

The Public Service Corporation of New Jersey plans another campaign of stock selling through its employees on April 1, when 50,000 shares of 6 per cent cumulative preferred will be offered at $100 a share and accrued dividend, either for cash or on terms of $10 down and $10 a share per month, the amount of accrued dividend to be included in the last installment paid. Interest at the rate of 6 per cent annually will be paid on such installments, adjustments being made when the stock is delivered.

Net Income on New York State Railways Lower

The net income of the New York State Railways, Rochester, N. Y., for the year ended Dec. 31, 1925, was $760,139, against $1,036,407 for the year ended Dec. 31, 1924. The comparative statement for the years 1925 and 1924 are shown in the accompanying statement.

SUMMARY OF OPERATIONS OF NEW YORK STATE RAILWAYS—YEARS ENDED DEC. 31

	1925		1924	
Railway operating revenues		$10,027,906		$10,358,198
Railway operating expenses (including depreciation)		7,199,139		7,257,744
Net revenue railway operations		$2,828,766		$3,100,453
Net revenue auxiliary operations		1,247		665
Net operating revenue		$2,830,014		$3,101,119
Taxes assignable to railway operations		695,146		711,305
Operating income		$2,134,868		$2,389,814
Non-operating income		132,942		125,071
Gross income		$2,267,810		$2,514,886
Deductions from gross income		1,507,671		1,478,478
Net income		$760,138		$1,036,407
Sinking fund appropriations		32,664		34,636
Dividends preferred stock (see note)	(5%)	193,125	(5%)	193,125
Earned on common stock	(2.68%)	$534,349	(4.05%)	$808,645

Note—2½ per cent was paid in 1925.

Foreclosure of Hartford & Springfield Set for April 27

An order has been issued to foreclose the property of the Hartford & Springfield Street Railway, Warehouse Point, Conn. The foreclosure is based on default of the payment of $600,000 of bonds standing against the property. In addition $260,000 in interest is in default.

Lucius F. Robinson, who presented the case, and Judge Christopher L. Avery, who signed the foreclosure papers, were bitter in their criticism of the present condition, under which interstate bus companies are permitted to operate in the State of Connecticut without being subject to the control of the Public Utilities Commission. Judge Avery said the condition was intolerable.

Mr. Robinson said that six months ago the future of the Hartford & Springfield Street Railway seemed to be most promising, but that wholesale competition in interstate service has been a severe blow.

Present plans are to sell the property on April 27 at public auction. Arthus Perkins, Hartford, will be in charge. It is expected A. William Sperry, New Haven; Walter P. Schwabe and James Turnbull will appraise the property.

Before the sale takes place the bondholders' protective committee will reorganize. Receiver Harrison B. Freeman has operated the road since 1918. Mr. Robinson states these is no assurance that reorganization can be effected.

During the past year $100,000 was spent by Mr. Freeman for fourteen new buses. An effort will be made to get an abatement of the $79,000 gross revenue taxes due the state.

Bonds of Detroit United in Demand

Heavy buying of the 4½ per cent first consolidated bonds of the Detroit United Railway, Detroit, Mich., now in receivership, was the feature of bond trading on March 18. These bonds advanced to 96½, a new high price since 1923, and closed at 95, up four points on the day. According to the *Wall Street Journal* there were many rumors afloat that the company would be out of receivership at an early date, but persons familiar with the situation declared this was improbable. As that paper sees it the real basis for the advance is probably due to the fact that the city of Detroit, which has pledged itself to

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 144 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

pay the company $500,000 semi-annually for certain property purchased, has made a payment which according to agreement must be used to retire $500,000 face amount of the 4½ per cent bonds.

Preferred Stock Sold to New Orleans Customers

Thirty-two thousand shares of preferred stock of the New Orleans Public Service, Inc., New Orleans, La., were offered on March 17 to consumers and employees of the company. The stock has been authorized by the Commission Council of New Orleans, and the funds derived from the sale are to be used in paying for the properties of the Consumers and the Citizens companies, which were acquired by the New Orleans Public Service last December. In speaking of the matter, Herbert B. Flowers, president of the company, said:

A year and a half ago Public Service, mainly through its employees, disposed of 15,000 shares of preferred stock to New Orleans residents. The stock was offered at $96 and then at $97 a share. It is now quoted at $102 a share.

We could dispose of this entire block of new preferred stock in the East, but we want local consumers to become interested in the properties as owners, and are offering it for sale to our customers and employees.

Protective Committees for Indianapolis & Cincinnati Holders

Committees were appointed on March 18 to represent the interests of holders of $2,600,000 of outstanding bonds of the Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., and its underlying companies. The first meeting was in the interest of the holders of $586,000 of bonds of the Indianapolis & Southeastern Traction Company. This group appointed a committee made up of George A. Ball, Frederick D. Rose and Lloyd Kimbrough, all of Muncie; Fletcher M. Durbin, Chicago, and Fred C. Dickson, Indianapolis. The Indiana Trust Company, Indianapolis, was named as the depository.

Later a second group, representing holders of $414,000 of bonds of the Indianapolis, Shelbyville & Southeastern Traction Company, met and elected a committee composed of George C. Forrey, Indianapolis; James A. Sigafoose, Moundsville, W. Va.; Frank Bopp, Indianapolis; L. A. Coleman, Wheeling, W. Va., and C. E. Frantzen, Dunkirk, N. Y. This group named the Fletcher American National Bank as depository.

A third group representing the Indianapolis & Cincinnati Traction Company, owner of the two underlying companies and also of the Connersville line, met in the afternoon and named the following committee: George A. Ball, F. D. Rose and J. L. Kimbrough, Muncie; John J. Appel, Indianapolis; John T. Beasley, Terre Haute; C. L. Asmann, Cleveland, Ohio, representing the General Electric Company, and an unnamed representative of the Westinghouse Electric & Manufacturing Company. The Fletcher Savings & Trust Company was named depository for this committee. The committee represents bonds that are now outstanding to a total of $1,600,000.

Toledo Has Deficit in February

Despite a gain in average daily passenger travel of 4,608 revenue passengers to 144,743 in February the Community Traction Company at Toledo showed a deficit of $8,613. There were 4,052,798 revenue passengers.

The greater part of the loss in revenue was from other than passenger revenue—track rentals and miscellaneous revenues showing a decided decrease as compared with February, 1925. Operating charges totaled $210,077 and ratio of these to gross revenue was 71.35 per cent. During the first two months of 1926 the net deficit was $12.402, compared with a surplus of $12,473 last year.

14 Per Cent Increase in Passengers in Detroit in February

The Department of Street Railways at Detroit, Mich., reports a balance of net income for February, 1926, of $39,331 after the payment of sinking fund charges, compared with $38,461 in February, 1925, so that the past month shows an increase over that of February, 1925, of $870, or 2.3 per cent.

During February, 1926, 41,056,661 passengers were carried by the rail lines and 1,542,257 by the coach lines, a total of 42,598,918 passengers, compared with 37,295,539 passengers carried in February, 1925, divided 36,976,608 rail lines and 318,931 coach lines. In other words 5,303,379, or 14.2 per cent, more passengers were carried in February, 1926, than in February, 1925.

Railway revenue car-miles in February, 1926, were 4,527,663, compared with 3,945,292 in February, 1925, an increase of 582,371 miles, or 14.7 per cent. Coach revenue miles in February, 1926, were 520,689, compared with 123,075 in February, 1925.

The net revenue from all sources in February, 1926, was $458,275, after allowing for railway operating and coach operating expenses, totaling $1,571,512. From the net revenue from all sources $219,474 was deducted for taxes and interest on funded debt.

The net income after deductions for items listed previously is $238,801 for the month. From this amount, total sinking fund provisions are made to the amount of $199,469, leaving a balance of $39,331 for the month.

The ratio of railway operating expenses to railway operating revenue for the month was 75.94 per cent, compared with 68.64 per cent for the similar months in 1925. The ratio of coach operating expenses to coach operating revenue was 111.97 per cent for February, compared with 133.11 per cent for February, 1925. For the year ended Feb. 28, 1926, the ratio of railway operating expenses was 74.51 per cent and the similar ratio for the coaches was 97.54 per cent.

Railway Sells Bus Line to Competitor

R. L. May, operating the Alexandria, Barcroft & Washington Rapid Transit Line and the Columbia Pike Bus Line, purchased on March 25 the equipment and operating rights of the Alexandria Suburban Motor Vehicle Company, which is a subsidiary of the Washington Virginia Railway, extending from Alexandria to Braddock and Washington, and from Alexandria to the Protestant Episcopal Theological Seminary. With the transfer of certificates held in Virginia and the District of Columbia, Mr. May gains a monopoly of the highway transportation system in the territory served. The Alexandria Suburban Motor Vehicle Company will still continue, it is understood, its line from Washington to Falls Church and Fairfax.

A Five-for-One Split Up at Tampa.—A special meeting of stockholders of the Tampa Electric Company, Tampa, Fla., will be held on April 6 to vote on the proposition to change the capital stock from $100 par to no par. It is proposed to exchange the present 62,000 shares of $100 par for 310,000 shares of no par.

Net Income Increases.—For the eight-month period ended Feb. 28, 1926, the total operating revenues of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., was $29,522,318, against $28,384,142 for a similar period ended February, 1925. Total operating expenses increased from $18,608,755 to $19,249,878 for the eight months ended February, 1926. The net income for the current year was $3,648,346, against $3,255,476 for the eight-month period ended Feb. 28, 1925.

Change in Directors of Holding Company.—The directorate of the Georgia Light, Power & Railways Company has been completely changed. Those who resigned were John D. Everitt, president; F. B. Lasher, vice-president, and H. M. Earle, Lloyd Robinson, W. H. Felton and F. W. Leach, directors. Directors elected to succeed them were P. A. Wallace, Henry L. O'Brien, Grover M. Sullivan, George J. Johnstone, Arthur J. Egan and B. M. Shanley. Paul W. Fisher, secretary, was the only director re-elected. The company controls the Macon Railway & Light Company.

Surplus on Interborough for Eight Months.—For the eight months ended Feb. 28, 1926, the total revenue of the Interborough Rapid Transit Company, New York, N. Y., from all sources was $40,468,193, an increase of $1,910,619 over the corresponding period of last year. This increase is partly accounted for by the receipt in July, 1925, of a cash payment of $770,000 as part consideration for the new advertising contract, which became effective Nov. 1, 1925. There was no similar payment in the previous year. Operating expenses, taxes and rentals paid to the city for the old subway increased $478,736. Income deductions increased $259,696. The net result for the eight months was a surplus of $924,486.

Receipts Lower in Seattle.—The receipts of the Seattle Municipal Railway, Seattle, Wash., for January and February of this year were approximately $1,000 a day less than for the similar two months of 1925. During January, 1925, the average daily receipts were $17,993, while for January of this year the average receipts were $16,928. For February last year the daily average was $16.920 and for February, 1926, it was $15,880.

Personal Items

Charles Day a Pennsylvania Director

Charles Day, Philadelphia, was elected a member of the board of directors of the Pennsylvania Railroad on March 24, filling the vacancy which has existed since the death on Feb. 17 last of George Wood.

Mr. Day is president of Day & Zimmermann, Inc., a well-known Philadelphia engineering firm. During the World War he rendered distinguished service as special representative of the Secretary of War on tours and observations through England and France. He was also a member of the Army War Council, a trustee of the United States Shipping Board's Emergency Fleet Corporation, a member of the committee of observation reporting on shipyard conditions, a member of the storage committee of the General Munitions Board and of the depot board appointed by the Secretary of War.

Born in Philadelphia on May 15, 1879, Mr. Day was graduated from the University of Pennsylvania in 1899. After a varied engineering experience he became a member of the firm of Dodge & Day, specializing in engineering, management and construction work.

In 1911 Mr. Day became president of the firm of Day & Zimmermann, Inc. He has done notable work in the construction, equipment and management of industrial and public utility plants, and is an officer and director in a number of public utility properties. For several years he was a lecturer before the graduate schools of business administration at Harvard and Columbia Universities. He is a trustee of the University of Pennsylvania, Franklin Institute and the Williamson Free School of Mechanical Trades. He is a member of the American Society of Mechanical Engineers and the American Institute of Electrical Engineers.

W. H. Lemons, formerly secretary of the Rockford & Interurban Railway, Rockford, Ill., resigned on the formation of the new Rockford Electric Company. His place has been filled by F. A. Lee as general auditor.

H. A. Bentzinger, Sigourney, Iowa, will succeed his brother, Dan D. Bentzinger, as superintendent of the railway division of the Iowa Southern Utilities Company in Burlington, Iowa, when the latter goes to Centerville to take an executive position under Manager Buhlman. H. A. Bentzinger takes up his duties April 5. He has been with the utility company fourteen years.

J. de Rytter Kielland, managing engineer Oslo Street Railway, Oslo, Norway, is on a visit to this country to study American electric railway conditions. The railway system in Oslo (formerly known as Christiania) is one of the largest and most progressive in Scandinavia. Its equipment includes 167 motor cars and 186 trail cars and the system carried about 83,000,000 passengers in 1925. In distinction from most European tramway systems, a flat fare is charged with no transfers. Mr. Kielland expects to be in this country for about a month.

C. F. Handshy President Illinois Association

C. F. Handshy, special representative of the Illinois Traction System, Peoria, Ill., was for the second time in his long and active experience elected president of the Illinois Electric Railway Association at its annual meeting in Springfield, Ill., March 17 and 18. He served a previous term as president of the same organization in 1917.

Practically all of Mr. Handshy's life has been spent in railway work. As a boy in his teens he learned telegraphy, and in 1884 entered the employ of the Wabash Railroad as a telegraph operator. He progressed through the positions of train dispatcher, assistant chief dispatcher and chief dispatcher to trainmaster.

C. F. Handshy

In 1907 he entered electric railway work when he became superintendent of transportation of the interurban lines of the Illinois Traction System. He was later made general superintendent of the interurban lines. In 1913 he became assistant general manager and on Jan. 1, 1921, was promoted to general manager. Recently he has acted as special representative of the company, with headquarters at Springfield.

Mr. Handshy's re-election as president of the Illinois association is a fitting recognition of his long and active interest in the development of the industry in Illinois.

Frank W. Holaday, formerly connected with the Kansas City Railways, Kansas City, Mo., has been selected to succeed A. M. Farrell as district manager of the Oshkosh, Wis., branch and general superintendent of transportation of the Wisconsin Power & Light Company, Oshkosh, Wis.

Adolf Blunk General Superintendent at St. Joseph

Adolf Blunk has been made general superintendent of the railway department of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo. He has been with the company only since last November, going to St. Joseph from the New York office of Henry L. Doherty & Company. His career started as an employee of the Union Pacific Railroad in the maintenance of way department. Then he went to the Toledo Railways & Light Company as a junior engineer.

The war interrupted his work. Following a discharge from the army Mr. Blunk resumed his service with Doherty companies by joining the forces of the Durham Public Service Company, Durham, N. C., as railway engineer. Next came a period with the Toledo & Western Railway at Sylvania, Ohio, as master mechanic, trainmaster and then purchasing agent. Later Mr. Blunk went with the Ohio Public Service Company at Mansfield, Ohio, as railway engineer and superintendent of the gas department. He then became identified with the Portsmouth Public Service Company, Portsmouth, Ohio, as superintendent of railways. It was from Portsmouth that he went to the New York office and thence to St. Joseph. Mr. Blunk is a native of Nebraska. He received his engineering education at the University of Nebraska.

George M. Moore has resigned as electrical engineer for the Grand River Valley Railway, Grand Junction, Col., to join the Denver & Rio Grande Western, a steam railroad.

John T. Porter, master mechanic of the Northern Texas Traction Company, Fort Worth, Tex., has been transferred to the Virginia Electric & Power Company, Richmond, Va. His successor is George Hoskins, formerly general foreman. Both properties are under Stone & Webster management.

John A. Collier, formerly district superintendent of the London County Council Tramways, but lately assistant to the traffic manager of the United Automobile Services, Lowestoft, England, has become assistant to the general manager of the São Paulo Tramway, Light & Power Company. He sailed for Brazil on Feb. 27 after a two weeks tour which included the inspection of the street railways in Toronto, Detroit, Pittsburgh, Cleveland, Philadelphia, Newark and New York. Before he sailed Mr. Collier expressed his appreciation of the courtesies extended to him by the managements in the cities he visited.

Charlton Ogburn, at one time an attorney of Savannah, Ga., has been appointed vice-president by the G. E. Barrett Company, New York, investment bankers. In 1919 he was appointed executive secretary of the Federal Electric Railways Commission. During

Digitized by Google

the war he was in charge of the electric railway division of the National War Labor Board, which fixed wages on 130 electric railways in nearly all the principal cities. In many later wage arbitrations Mr. Ogburn was personal arbitrator, chosen by both the companies and the trainmen. Since 1921 Mr. Ogburn has been engaged in the practice of law in New York.

Obituary

Randal Morgan

Randal Morgan, well known in public utility circles, died at his home in Philadelphia, Pa., on March 20. At the time of his death he was chairman of the executive and finance committee of the United Gas Improvement Company, with holdings in the Charleston Consolidated Railway & Lighting Company, Connecticut Railway & Lighting Company, Georgia Railway & Power Company, Public Service Corporation of New Jersey and other properties. He started his career in the Lancaster Iron Works, but a year later entered the law office of his elder brother, Charles E. Morgan, Jr. In 1877 he was admitted to the bar and later became a member of his brother's firm, Morgan & Lewis. Because of his devotion to cases involving corporation law, in which he acquired a reputation of singular ability, the United Gas Improvement Company in 1882 made him its counsel. In 1892 he was elected third vice-president and general counsel, in 1904 second vice-president and in 1912 first vice-president. Gradually he extended his work until he had assumed a leading part in the corporation's finances, eventually receiving the direction of its affairs as president. He headed the trustees of the University of Pennsylvania, where he had been a student. Mr. Morgan was 72 years old.

Charles W. Richards, for the last seven years general agent of the Denver & Interurban Railroad (Kite Route), operating between Denver and Boulder, Col., died in Denver on March 19. Thirty-five years of his life were devoted to railroading.

James S. Hemingway, formerly president of the Fair Haven & Westville Street Railway, now included in the Connecticut Company, died on March 15 in New Haven, Conn., at the age of 65. He was also a director of the New Haven Gas Light Company, the Security Insurance Company and the Central New England Railroad. At the time of his death Mr. Hemingway was vice-president of the Second National Bank and secretary-treasurer of the New Haven Savings Bank.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

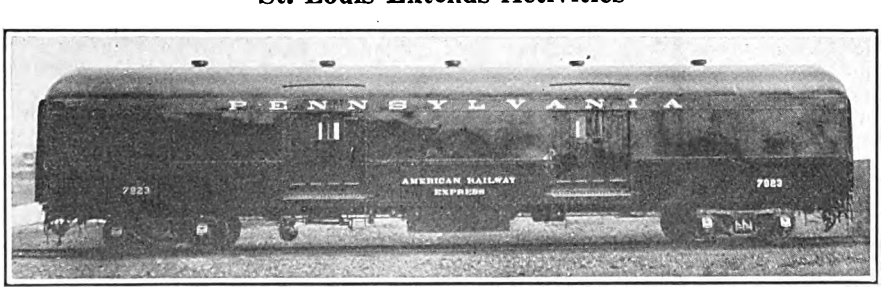
Six-Wheel Company Makes Air Brakes Standard Equipment

Continuing its policy of developing a bus which will conform as closely as possible to the high standards of traction companies, the Six-Wheel Company, Philadelphia, is equipping all Safeway six-wheel motor coaches with Westinghouse air brakes.

In deciding on this step the manufacturers had in mind the necessity of increasing the factor of safety in bus operation. The construction of the Six-Wheel bus, which combines the positive action of four-wheel brakes (all on the rear wheels) and an unusually large braking area, has always appealed strongly to railway men. Now, with the change to air brakes, the retarding ability of the six-wheeler is greatly increased and at the same time the driver is relieved of fatigue caused by continued manipulation of mechanical brakes.

It is also expected that the installation of air brakes will minimize maintenance troubles and will prolong the life of the brakes, an important item where fleets are operated.

St. Louis Extends Activities



The St. Louis Car Company, St. Louis, Mo., has entered the steam railroad field with the construction of twenty all-steel baggage cars for the Pennsylvania Railroad. The cars are 63 ft. 7¼ in. in length, 9 ft. 9¼ in. in width and weigh 87,100 lb. Delivery of the units is now being made.

Brill and Westinghouse Are Hosts at Demonstration

Standing not upon the order of its going, the group of interested spectators which had gathered to participate in the preliminary demonstration run of the Brill-Westinghouse 73-ft. gas-electric car for the Boston & Maine Railroad got off to a flying start from the Brill plant in Philadelphia on Tuesday, March 23. But while the start may have been flying, the balance of the run was anything but that, due to the fact that the Pennsylvania had other plans for its through tracks on that morning. However, speed was no criterion of the value of the trip.

Sped on their way by a farewell wave from J. W. Rawle, vice-president of the J. G. Brill Company, the group present put in the time to good advantage on the run between Philadelphia and Trenton, N. J., in examining the power plant of the 250-hp. car, trying out the Pullman-like comfort of the seats and noting the smooth-riding characteristics of the car itself. Much amusement was occasioned when some one discovered in one of the morning papers the statement that gas-electrics would soon eliminate the "horrible, smoke-belching locomotive."

Vague rumors were heard of large impending purchases of this type of equipment for branch line service on various railroads. The present car, which is the largest yet to be built for use in this country, will seat 92 persons and weighs, without load, 110,000 lb. The Westinghouse Electric & Manufacturing Company furnished the complete motive power equipment, consisting of a Brill-Westinghouse 250-hp., six-cylinder gasoline engine directly connected to a 170-kw. generator which supplies energy for two 140-hp., 600-volt traction motors mounted on the forward truck. The car was completely assembled by the J. G. Brill Company. The body is of light-weight steel. Roller bearings are provided to insure smooth and efficient operation.

Commenting upon the relative advantages of the 72-ft. car as compared with smaller units, T. H. Murphy, general engineer Westinghouse Electric & Manufacturing Company, said:

> The economies of gas-electric car operation are dependent upon several factors. Among these are low weight of equipment and the passenger load ratio. The most desirable and economical field for the gas-electric unit is one where the load capacity required is reasonably small but constant and where the engine power plant can be so designed that the full power is used continuously. Until recently only 60-ft. cars, and smaller ones, have been constructed to meet various service conditions. Such units as these have been built with power plant capacity for either single car or trailer operation. The smaller car when suitable for trailer operation is a very flexible unit, but not the most economical unless the trailer operation is continuous. Where service conditions are such that the loads are small and practically constant, and where the capacity of the 73-ft. car is adequate for the service, there is no doubt that it will prove to be the most economical as its operating costs will prove lower than the single motor car unit with a trailer or the steam train.

The present unit is one of the three purchased by the Boston & Maine Railroad from the Brill and Westinghouse companies, the two other units being standard 60-ft. cars. These have already been delivered.

Walter J. Cummings Says Outlook for Railways Never Brighter

President of Cummings Car & Coach Company Points to Improvement in Basic Conditions in Forecasting Prosperous Future—Money for Development Will be Available When Bankers Understand Situation

AN INTERVIEW

By Charles Gordon

"THE outlook for the electric railway industry has never been brighter," declared Walter J. Cummings, president of the Cummings Car & Coach Company, in discussing the status of the industry. "Its recovery is not a thing for the future. This has already been accomplished in the sense that fundamental conditions necessary for the industry's prosperity have so changed in the last few years that it now remains only for manufacturers and operators to take advantage of the present opportunity.

"I say manufacturers and operators," continued Mr. Cummings, "because this industry is characterized by an unusually close relation between those who manufacture equipment and those who operate it. There is an entirely different relation than that usually found to exist between buyers and sellers in most industries. The long period of severe stress and difficulty through which our industry has come has thrown manufacturers and operators more closely together in meeting common problems.

"There is in this relationship a responsibility for the manufacturer that is clear cut and distinctly appreciated. Through many years there has been built up a confidence in the manufacturing end of the industry that is the greatest asset which the manufacturers possess. Their advice and help have been sought and accepted on many operating problems. They have lived up to their responsibility to the extent of setting aside commercial expediency in the effort to give the industry the benefit of their best judgment and experience."

Both a Manufacturer and Operator

As he continued to develop his thought, I was impressed with the fact that Walter Cummings spoke from the unusual position of both a manufacturer and operator. As president of the Cummings Car & Coach Company he is a manufacturer. As chairman of the board of the Chicago & West Towns Railway he represents the railway owner and operator's viewpoint. He has been consistently an optimist regarding the electric railway industry, and has insisted ever since the railways ran into post-war difficulties that the essential nature of the service rendered makes their position fundamentally sound.

Mr. Cummings' active interest in the electric railway industry dates back some 21 years, when the successful foundry and forging business that had been built up by the Cummings brothers was expanded through the purchase of the McGuire Manufacturing Company, which had earned an enviable reputation as manufacturer of trucks and sweepers. A modern car building plant was constructed at Paris, Ill., a short distance from Chicago. In addition to various types of electric railway cars and trucks, the company manufactures a large proportion of all the snow sweepers used by the industry. Recently, with the addition to its line of products of a gas-electric bus for supplementary railway service, the name of the company was changed from the McGuire-Cummings Manufacturing Company to the Cummings Car & Coach Company.

Walter J. Cummings

THIS is the fourth of a series of interviews with the heads of car building plants and other prominent manufacturers. Rapidly growing interest in the improvement of electric railway equipment throughout the industry makes the views of these manufacturers particularly significant at this time.

"Throughout our experience," commented Mr. Cummings, going back to his initial thought, "we have never found conditions in the industry more fundamentally sound or the future more promising. There seems to be a new spirit in the industry. Managements have acquired renewed courage in attacking such problems as taxes, franchise limitations and paving charges.

"Rapid progress is being made in other directions. Leading operators and manufacturers have united in pointing out the advantages of new, modern equipment to meet the demands of present-day transportation requirements. This has been approached and accepted not as a selfish scheme to build up car sales, but as a co-operative move to stimulate the reduction of operating costs and to improve the standing of electric railway transportation in modern communities. The railways are alert to the situation and have accepted wholeheartedly the spirit in which this subject has been discussed."

Modernization of electric railway cars and the replacement of obsolete equipment suggested the subject of the bus. I asked Mr. Cummings for his views on the place of the bus in the local transportation scheme and its effect on existing rail lines.

"That situation," he replied, "is already working itself out in a way that clearly indicates the economics of the subject. Where there is any considerable volume of traffic to be handled the railway remains the most economical form of local transportation. But the bus adds a new and valuable agency for handling the type of service that does not justify rail construction. It thus permits the railways to meet their obligation of providing complete transportation service to a given community without the heavy expense of constructing rail lines into districts where the volume of riding would not profitably support rail construction.

"Railway companies are rapidly absorbing the bus. With added experience, there is beginning to develop, also, a new point of view relative to the bus. Operation of this new vehicle does not mean unprofitable operation. Bus service can be made to stand on its own feet financially and a rate of fare should be provided to permit of this.

"There is still another phase of bus operation in supplementary and feeder service that is frequently overlooked.

Digitized by Google

Development of new territory through bus operation puts passengers on the rail lines. Credit for this is sometimes overlooked when judging the bus."

There wasn't much room left for doubt as to Mr. Cummings' opinion of the usefulness of this new transportation vehicle. It occurred to me that here again he spoke from the particularly advantageous position of both a manufacturer and operator. Not only has the Cummings Car & Coach Company gone into the manufacture of buses to supplement its car building business, but the railway properties in which Mr. Cummings is interested are operating buses to supplement their service. Results of this operation have borne out his contention that bus operation by electric railways need not be a losing venture when approached from the proper viewpoint.

We touched on the destiny of the interurbans. Here again his view was optimistic.

"There are open to the interurbans two opportunities for development and improvement," he said. "These include the building of freight business and the use of light-weight one-man cars to give a frequent, speedy, comfortable and attractive service that will build passenger business on the one hand and make major reductions in operating and maintenance costs on the other. Light-weight interurban passenger cars are every bit as safe as some of the much heavier equipment that is in use. In fact, there is ample basis for the opinion that in many respects modern light-weight cars are even safer than some of the much heavier equipment that has been in use for many years."

"What about the problem of getting new money for improvements," I asked.

"In these days of plentiful money the opportunities for bankers to invest funds at attractive rates of interest are diminishing rapidly. The banker has a serious problem in finding attractive investments for surplus funds. Today the electric railways offer an attractive market for such funds, once the banker can be made to appreciate the changes in basic conditions which have taken place.

"Confidence in electric railways can and must be re-established among bankers. Once they are made to see the fundamental changes which have been brought about the present difficulty in obtaining funds for improvements will disappear. Several healthy forces are at work. Under modern franchises, electric railways are not assuming many of the unfair burdens that were imposed in the past. Managements are demanding and obtaining the elimination of these unfair burdens on the industry and the car rider. Public enlightenment on the advantages of terminable permits as a means of permitting continuous development of railway facilities is working to eliminate the periodic interruptions to progress that have accompanied the old-fashioned limited term franchise grant.

"The electric railway business is distinct among the utilities as a strictly cash business in which the customer pays for the service as he uses it. There is no way for modern communities to exist without transportation service. The industry rests on the firm foundation of community necessity. When the banker is made to realize this fact, the problems of financing will be solved. It remains only for the industry, manufacturers as well as operators, to seize every opportunity of impressing these basic facts on the bankers of the country."

In summing up his remarks, Mr. Cummings had this to say:

"Prospects, both from the operator's and manufacturer's standpoint, were never brighter for the industry. Fundamental conditions on which its success depends are sound and are improving rapidly. Now is the time for all elements in the industry to take advantage of the situation. Confidence and courage add impetus to every forward movement. Those who apply these qualities in the electric railway industry today may expect to share in the prosperity toward which all signs point."

Manganese Parts on Coast

The Manganese Steel Forge Company, Philadelphia, manufacturer of rolled and forged manganese steel parts, has just received its first order from electric railways on the Pacific Coast. The Sacramento Northern Railroad has ordered 100 journal box liners of ¼-in. manganese plate and 100 pedestal jaw shims of 1/16-in. manganese steel plate for its high-speed equipment. The parts will be shipped to Chico, Cal., where the repair shops are located.

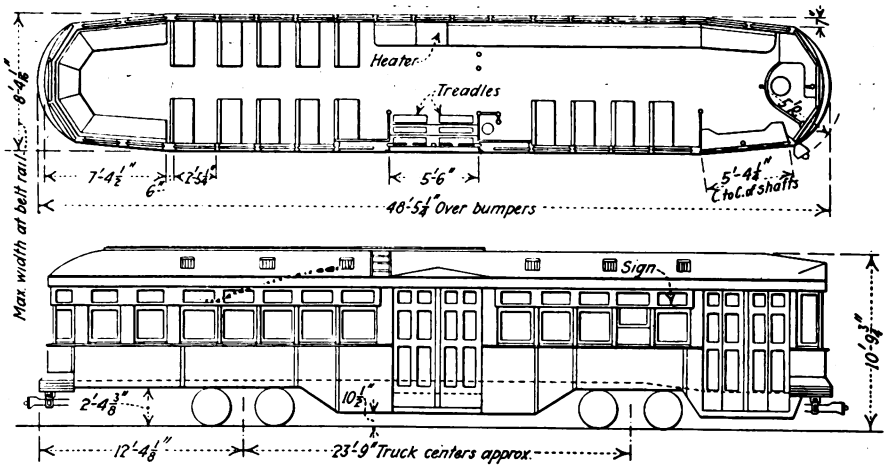
Bids Opened on Detroit Buses

Graham Brothers were low bidders on 125 buses for the city of Detroit. These are 60-passenger vehicles and the order will eventually run to 300. Graham Brothers bid $13,360 each, Yellow Coach bid $13,675, Fageol Motors Company bid $14,136 and Cummings Car & Coach Company, Chicago, bid $14,326.

Pittsburgh's Street Railway Story

Westinghouse interests in and near Pittsburgh, Pa., recently issued a souvenir booklet which was distributed to all who attended the 24th annual convention of the Pennsylvania Street Railway Association, held in Pittsburgh on March 12. The booklet contains many interesting facts and pic-

Peter Witt Cars for Detroit



From 100 to 300 new street cars will probably be purchased by the Department of Street Railways, Detroit, Mich., in the near future. Bids on the new equipment were to be opened and given consideration on March 27. Depending on the prices and terms offered, the authorities of the department will decide to what extent the acquisition of new rolling stock may be carried at the present time.

The cars will be of single-end, front-entrance, center-exit, double-truck Peter Witt type. They are desired for single-end, one-man, two-man city operation and must be adaptable for operation either singly or in trains. Double folding doors will be provided at the front end and two center exit doors are specified. One of these doors will be controlled from the exterior by a street fare-taker's valve. The two center doors will be provided with pneumatic step treadles.

The general specifications follow:

Weight	33,000 lb.
Length over all	48 ft. 5¼ in.
Truck centers	23 ft. 9 in.
Width over all	8 ft. 4 in.
Height, rail to top of roof	10 ft. 5¼ in.
Interior trim	Natural birch stained cherry
Headlining	Agasote or Panelyte, ⅛ in.
Roof	Arch
Bumpers	Elliott anti-climber
Car signal system	Faraday buzzer and bell
Compressor	Westinghouse DH-16 or G.E. CP-27
Control	Type M, lightweight
Couplers	Tomlinson automatic
Curtain fixtures	Motorman's curtain, bathroom type
Curtain material	Pantasote double-faced
Destination signs	Hunter illuminated
Door-operating mechanism	Safety Car Devices, National Pneumatic
Fenders	H-B wheelguards
Gears and pinions	Solid, heat-treated
Hand brakes	Peacock staffless
Heater equipment	Peter Smith
Headlights	Dash type with aluminum reflector
Motors	Four 35-hp., 600-volt interpole, inside hung
Paint	Pratt & Lambert Vitralite enamel
Sanders	Osgood-Bradley sand trap, Ohio Brass, Form 2, diaphragm valve
Sash fixtures	O. M. Edwards or Curtain Supply
Seats	Deep spring type
Seating material	Leather
Step treads	Cast aluminum
Trolley catchers	Ohio Brass No. 13141
Trolley base	Ohio Brass, Form 1
Ventilators	Twelve Railway Utility, Garland or Nichols-Lintern
Wheels	26-in. diameter rolled or forged steel
Special devices, etc.	Sangamo economy meter

Digitized by Google

tures relating to the various electric railway companies with headquarters at Pittsburgh, as well as a summarized list of points of interest in and about the city. Information concerning the various Westinghouse interests was also included in the booklet.

$3,500,000 Power Plant Improvement Planned

Plans have been approved for new equipment to cost $3,500,000 and to approximately double the power output of the West Tenth Street power plant of the Terre Haute, Indianapolis & Eastern Traction Company in Indianapolis. The proposal to increase the capacity of this plant was pushed when the Randal Morgan interests, controlling the Terre Haute, Indianapolis & Eastern Traction Company, and the Insull interests, owning the Central Indiana Power Company, of which the Merchants company is a subsidiary, agreed recently to merge the two companies under the name of the Indiana Electric Corporation.

Dissolution of Storage Battery Company Planned

Action will be taken at the annual meeting of stockholders of the Railway Storage Battery Car Company to be held in Portland, Me., on April 5, 1926, to accomplish the dissolution of the corporation. At a meeting of the board of directors held on Feb. 15, 1926, the following resolution was adopted:

Resolved, That a meeting of stockholders be held to vote upon the dissolution of the corporation and it is recommended that the corporation be dissolved and that the officers of the corporation be, and they hereby are, empowered and directed to do all necessary to accomplish such dissolution, that the funds on hand be applied to paying the expenses of such dissolution.

After the payment of dissolution expenses there will be no assets for distribution.

Delivery Begun on Key System Cars

Six of the 40 new street cars ordered by the Key System Transit Company, Oakland, Cal., are now on their way to the Pacific Coast. They constitute the first shipment of 100 new cars that the company intends to place in service within the next three years, following the recommendation of the recent joint traffic survey conducted by engineers of the city of Oakland, the State Railroad Commission and the Key system. The new cars are of the one-man, two-man type. Thirty-four others will be shipped as quickly as they can be built, making a total of 40 cars for this year. The specifications for these cars were published in the issue of the ELECTRIC RAILWAY JOURNAL for Aug. 22, 1925.

General Electric Earnings Drop Slightly in 1925

For the year 1925 the combined output of the General Electric Company amounted in net sales value to $290,290,165. Although orders received during 1925 were $303,513,380, as compared with $283,107,697 in the year 1924, an increase of 7 per cent, the net sales total was nevertheless under that of the previous year by $8,761,703.

After deducting from earnings all costs of operation, including maintenance and depreciation charges, reserves and provision for all taxes, and after adding miscellaneous income from sources other than sales, the net income for 1925 was $43,170,743. The profit available for dividends after deducting all interest charges, premium on retirement of 5 per cent debentures and additions to general reserve was $38,641,217.

STATEMENT OF EARNINGS OF THE GENERAL ELECTRIC COMPANY

	1925	1924
Net sales billed	$290,290,165	$299,251,869
Less: Cost of sales billed, including operating, maintenance and depreciation charges, reserves and provision for all taxes	257,479,490	264,909,538
Net income from sales	$32,810,675	$34,342,330
Income from other sources	10,360,067	10,793,352
Net income	$43,170,743	$45,135,683
Less: Interest and discount on debentures and other interest payments, premium on retirement of 5 per cent debentures and additions to general reserve	4,529,525	5,900,135
Profit available for dividends	$38,641,217	$39,235,548
Less: 6 per cent cash dividends on special stock	1,735,576	1,195,405
	$36,905,641	$38,040,142
Less: 8 per cent cash dividends on common stock	14,407,544	14,404,980
Surplus in excess of cash dividends	$22,498,097	$23,635,162

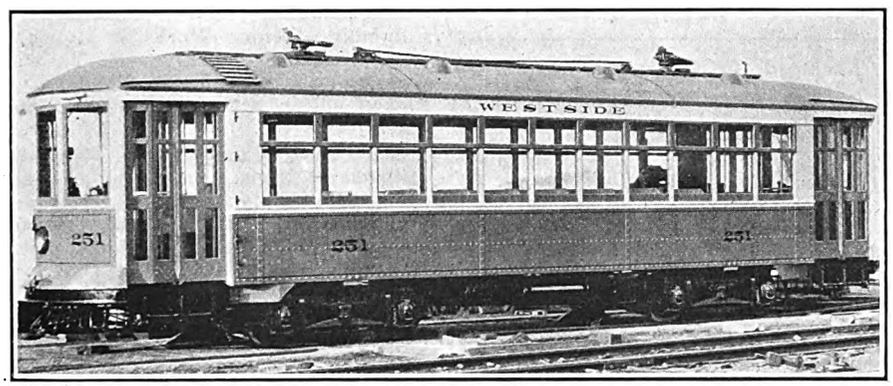
Unfilled orders at the end of the year totaled $77,860,000 in 1925 as compared with $68,958,000 at the end of the previous year.

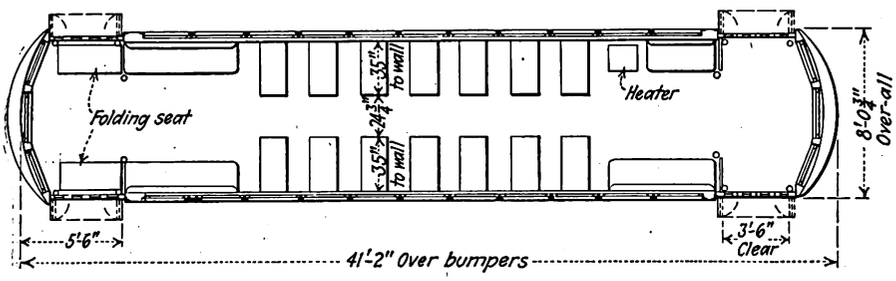
Above are comparative statements of profit and loss for 1924 and 1925.

D. P. Phelps Heads Sales for Johns-Pratt Company

Dwight P. Phelps has been elected vice-president in charge of sales of the Johns-Pratt Company, Hartford, Conn. For many years Mr. Phelps has been

Data on Westside Cars



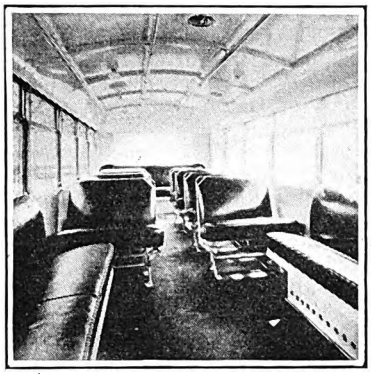


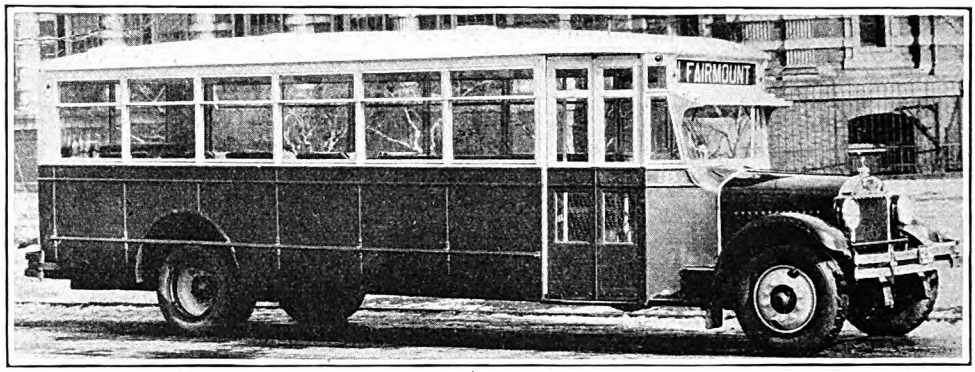
Kuhlman Car Company of Cleveland, Ohio, has constructed six passenger motor cars for the Westside Electric Street Railway of Charleroi, Pa. The cars are of all-steel construction and seat 46 passengers. The principal specifications follow:

Weight:	
Car body	15,080 lb.
Trucks (with motors)	7,280 lb.
Equipment	2,700 lb.
Total	35,060 lb.
Bolster centers, length	19 ft. 0 in.
Length over all	41 ft. 2 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3 in.
Height, rail to trolley base	10 ft. 11½ in.
Body	All steel
Interior trim	Cherry
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse safety-control furnished by railway
Bumpers	Channel
Car signal system	Faraday buzzer and signal system
Car trimmings	Polished bronze
Center and side bearings	Brill
Compressors	Westinghouse DH-20
Control	Westinghouse type 510-A
Curtain fixtures, Motorman's curtain, khaki	
Curtain material. Body No. 63, brackets only	
Destination signs	Hunter illuminated
Door operating mechanism	National Pneumatic
Fare boxes	Furnished by railway
Fenders	Steel pilot
Finish	Enamel
Gears and pinions	Solid, furnished by railway
Hand brakes	Peacock staffless
Heater equipment. Peter Smith No. 2 hot air	
Headlights	Crouse-Hinds incandescent
Lightning arresters	Two, type K3
Motors	Four Westinghouse 510A2, inside hung
Sanders	Ohio Brass
Sash fixtures	Brill—renitent type (body)
Seats	Brill
Seating material	Rattan
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	U. S. No. 20 furnished by railway with electrical equipment
Trucks	Brill 77EX
Ventilators	Eight, Brill
Wheels	26 in. diameter

Digitized by Google

Special Type of Seats in Mack Buses for Cincinnati





Delivery has been started on the 29 Mack buses recently ordered by the Cincinnati Street Railway, Cincinnati, Ohio. These units, which are for city service, are equipped with Mack 225-in. wheelbase chassis and with Bender bodies. They are of 29-passenger capacity. The accompanying interior view shows the special type of seats and the arrangement to provide the maximum of convenience for urban transportation. A "bang-rail" or collision bar is placed along the sides of the buses where a jam is most likely to occur.

sales manager of the Colt Patent Firearms Manufacturing Company, of which the Johns-Pratt Company is an important division.

With the invention of the Noark cartridge inclosed fuse, the Johns-Pratt Company became the pioneer maker of this type of electrical protective device and developed many other electrical protective devices, among them being the Noark meter service system of inclosed meter entrance switch boxes. In recent years the production of molten materials has also been an important feature of this business. Samuel M. Stone is president of the Colt Patent Firearms Manufacturing Company and Johns-Pratt Company.

Rolling Stock

Georgia Railway & Power Company, Atlanta, Ga., has placed an order with the Cincinnati Car Company for 60 cars. These cars will be used for city service. They will be similar to those last purchased, having a capacity for 48 passengers and weighing about 37,-300 lb. This car is known in Atlanta as the "900" type.

Birmingham Electric Company, Birmingham, Ala., expects to purchase twenty side-entrance cars, each with a seating capacity for 64 passengers.

Track and Line

Los Angeles Railway, Los Angeles, Cal., is laying track on the new Macy Street bridge. In addition the entire section from Alameda to San Pedro is to be rebuilt at a cost of approximately $75,000.

Connecticut Company, New Haven, Conn., is planning to start work at once on many track changes on Water Street, Bridgeport, Conn. All tracks will be centered. A system of switches and branch tracks will be laid near the railroad depot for convenience of traffic.

Savannah Electric & Power Company, Savannah, Ga., will relay the Isle of Hope line between Pritchett's Switch in Isle of Hope, a distance of several miles. This improvement will enable the cars to make the trip in 30 minutes instead of 45 minutes as at present.

Power Houses, Shops and Buildings

Rockford City Traction Company, Rockford, Ill., is considering plans for a new garage at Fourth Street and Third Avenue at a cost of $40,000. The bus branch of the company's transportation business is being developed. Six new buses are to be in operation soon and the new garage will have a capacity for sixteen buses.

Lincoln, Neb.—A new shop and storage building is being contemplated for erection on Ninth Street between L and K at an estimated cost of $137,812. This building will house the Lincoln Traction Company storerooms and the meter shops, garage and general storeroom of the Lincoln Public Service Company.

Trade Notes

L. J. Galbreath, until recently engaged in advertising and sales promotion activities for the Bridgeport Brass Company, has joined the American Brown Boveri Corporation to take charge of publicity and sales promotion for that company as assistant to Earl G. Hines, recently appointed general sales manager. Since he was graduated from Cornell University in 1917, Mr. Galbreath has served in executive and publicity capacities with Niles-Bement-Pond Company, New York City, and Columbia Machine Works & Malleable Iron Company, Brooklyn, N. Y., with the exception of time afloat as an engineer officer with the United States Naval Reserves.

Trico Fuse Manufacturing Company, Milwaukee, Wis., has made many changes in its plant. The electrical testing laboratory has been enlarged and rebuilt with latest and best equipment installed. The offices have also been enlarged, and in the factory new lighting equipment has been installed and production facilities considerably increased. Increases have been made in the sales organization by the appointment of Herbert E. Hartstein, Eastern sales manager; Philip Rypinski, central sales manager, and Fred D. Geiler, Western sales manager.

E. O. Shreve, manager of the San Francisco office of the General Electric Company since 1918, has been named manager of the industrial department of the company with headquarters at Schenectady, filling the vacancy caused by the death of A. R. Bush.

Metal, Coal and Material Prices

Metals—New York	March 23, 1926
Copper, electrolytic, cents per lb	14.00
Copper, wire base, cents per lb	16.00
Lead, cents per lb	8.225
Zinc, cents per lb	7.72
Tin, Straits, cents per lb	65.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.40
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	2.00
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons	1.425
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.25
Weatherproof wire base, N.Y., cents per lb.	18.00
Cement, Chicago, net prices, without bags	2.10
Linseed oil (5-bbl. lots), N.Y., cents per lb.	10.70
White lead in oil (100-lb. keg), N. Y., cents per lb	15.50
Turpentine (bbl. lots), N. Y., per gal	$1.01

New Advertising Literature

Morse Twist Drill & Machine Company, New Bedford, Mass., has issued a leaflet setting forth the advantages of Morse high speed drills of either the forged or milled type. It states that with drilling jobs calling for brute force a forged type drill stands up effectively, while for the regular run of shop work, the high-speed milled drill is applicable.

Compressed Air Society, New York, N. Y., has issued the second edition of *Trade Standards* adopted by the society. For convenient reference, a number of tables relating to compressed air have been incorporated in this edition. There has also been added a chapter of general information relating to commercial practices in the industry.

Turning the Storrs Suggestion to Good Use

GOOD use of Mr. Storrs' daily dozen of homely virtues and of Mr. Budd's remarks at the recent meeting at Indianapolis has been made by the state information bureaus and by electric railways here and there. Of course, the daily dozen taken together looks like a formidable program. But it isn't. One company, at least, is publishing one of Mr. Storrs' suggestions, prominently displayed, each month in its house organ. That is a good idea. Strange to say, the management of that company—the Boston Elevated Railway—and its employees were much less in need of having the suggestions reiterated to them than are many others. In many respects the remarks made by Mr. Storrs, Mr. Budd and President Coates at the Indianapolis meeting supplemented each other. All were of interest both within and without the industry. The material in these remarks capable of public use should be repeated again and again. The industry needs just the stimulant they contain.

The Remedy Must Not Be Worse than the Disease

REDUCTION of vehicle speeds has become so common in every large city of this country, and in European cities as well, that it has come to be looked upon as a characteristic evil. Congestion reached the point a number of years ago where it was felt necessary to take steps to remedy it. In fact, traffic regulation has been resorted to in most cases to prevent traffic jams due to lack of co-operation among drivers approaching an intersection, rather than to speed up movement of vehicles.

Hand signals given by the traffic officer in charge of the corner were succeeded by semaphores and signal lights, manually operated. Replacing the hand by a mechanical arm did not tend to speed movement, since it took away the incentive to signal vehicles individually and to depend entirely on the indication displayed. It did remove the opportunity for misunderstanding the signals and prevented accidents. With the exercise of discretion and good judgment on the part of the officers, fairly good results have been obtained with this method.

Some years ago, in an effort to speed traffic on Fifth Avenue, the principal north-and-south vehicle thoroughfare of Manhattan Borough, New York City, a "synchronized signal system" was installed. What this did was merely to take control of the signal lights out of the hands of individual traffic officers and concentrate it at 42d Street, the heaviest intersection. A cycle was worked out to accommodate the traffic in the two directions at that point. The indications were repeated electrically for other points. Naturally different conditions exist at all other intersections, and vehicles are held from moving in either direction at times, cutting down the capacity of the roadways.

Nevertheless, the same system has been adopted on several main thoroughfares in New York, and in a number of other American cities. That the results often are far from advantageous is indicated in an article in this issue. In some instances as much as 15 per cent more time is needed to pass through the congested section when the synchronized lights are used.

In marked contrast, a system of traffic control developed by engineers of the Chicago Surface Lines and installed in the Loop district has permitted speeds considerably higher than had been possible with individual manual control. The results were given in detail in an article in this paper last week, page 536. It is stated that due to the new system, combined with a rerouting of the street cars, speeds have been increased 50 to 80 per cent.

The subject of traffic regulation is under consideration by a committee of the Transportation & Traffic Association. The matter is of such import to operators of transportation systems, as well as to the general public using the streets, that it is to be hoped a real analysis will be made that will lead to improvement of traffic control all over the country.

Engineering Made a Means of Securing Better Public Relations

WHEN Chicago's Loop traffic was speeded up by the new signal system, as mentioned above, it offered an opportunity for co-operation between the street railway and the city that has been much more potent in building good will than any number of abstract statements by the publicity department.

Two years ago traffic conditions in the Loop were bad, with an ever-present congestion of street cars, vehicles and pedestrians. Knowing that something radical would have to be done, the Surface Lines laid out a plan for improving conditions that gave opportunities for joint action on the part of the city and the company. The first move was made by the Surface Lines, which took all left-hand turns of street cars out of the congested area. It involved the expenditure of some $150,000 for new special trackwork. This move was followed by an order on the part of the city prohibiting all vehicular left-hand turns in the same area. Together these two changes made a marked improvement in conditions, but left a great deal to be done.

Far more spectacular from the standpoint of unusual accomplishment has been the pioneer engineering done by the Surface Lines organization in designing and planning the system of traffic lights that have contributed so much to speeding up traffic and reducing congestion in the Loop. Elimination of useless delays, while a very desirable thing from the standpoint of the company and its car riders, is of equal value to everyone who has occasion to do business in the downtown area, either on foot or in a vehicle. The benefit is even more widespread in that for the merchants the street capacity has in effect been increased.

Digitized by Google

Aside from the physical accomplishment of this installation, it is particularly appropriate that the co-operation of the two principal parties affected, the city of Chicago and the Surface Lines, should have resulted in making the system of traffic control a marked success.

Advertising Fundamentals Often Forgotten

ADVERTISING for patronage has been turned to good account in a campaign being conducted by the United Railways & Electric Company, Baltimore, Md., noted in the JOURNAL for March 27. It is a straight appeal with merchandising as its central theme. The campaign is one not only of big space but one with a big purpose. It points a moral both by its directness and its force. The company believes that understanding will do more to solve the transportation problem than will arbitrary rules.

Too many, far too many, advertisements in the electric railway field have been controversial in character, have offended this or that element of the public by their very wording. Others have smacked of braggadocio. In one case that comes to mind stress was laid on the snow-fighting equipment of a particular company. During the winter this company had to suspend service on a number of lines. It did not matter to the public that the storm was unprecedented in its severity. The thought that remained in the minds of the public was that the company itself had indicated that it was prepared for any emergency.

It has been said that the Baltimore campaign is one of merchandising the service. It is. But the advertisement showing Lexington Street on Jan. 20, 1926, not only sells the Baltimore service effectively, it shows the real value of the street car and the conditions against which the company must contend. It does this by suggestion, which is the highest form of advertising art.

There are times when the electric railways need to state their cases against the injustices worked against them, but these instances are not so prevalent. Even where they are, the message should be conveyed subtly and with finesse. This the Baltimore company is doing. The campaign there meets all the fundamentals of what advertising for business should be, but at the same time the opportunity is not being lost to convey an idea of some of the problems against which the company has to contend. Entirely aside from the good that the campaign will do the Baltimore company, there is a lesson in the advertising that should be made to redound to the benefit of the entire industry. It is a campaign that appears to be distinctly worth while.

The Whole Is Greater than Any of Its Parts

OCCASIONALLY a man who "lets not his right hand know what his left hand doeth" may upset tradition and common sense with the scoring of a triumphant success. Generally, however, he arrives at a down-and-out condition with quickness and dispatch. Co-ordination and co-operation of all his faculties are needed if he is ultimately to find his name staring out at him from the pages of "Who's Who." Like man—like railway. One department, one official, cannot hope adequately to cope with all the various problems which arise.

Heretofore railway managements have evinced a disheartening tendency to saddle the entire responsibility for such an important matter as car design upon the mechanical departments. There, as in the analogy drawn above, an occasional instance has occurred in which the engineering staffs have been equal to the situation, have shown a real grasp of passenger-handling requirements and have designed equipment satisfactory in every respect. In most cases, however, the cars obtained in this fashion have left many things to be desired from the standpoint of the transportation department, which has had to merchandise car rides. Cars easy of maintenance but impossible as passenger-handling mediums, or cars fairly well adapted to one type of service but possessing no characteristics recommending them for all-round service have been turned out.

The Pittsburgh Railways was one of the first to realize the fundamental truth of this tenet. For more than two years every major activity of the company has been passed upon by a committee made up of the general manager, the superintendent of equipment, the general superintendent of transportation, the commercial manager and the assistant general manager. Whether it be a matter of specifying new cars or of determining the relative merits of two operating schedules, the ideas of each department are thus capitalized.

Most recently the committee has had to pass on the design of the 50 new cars just ordered by the company. Factors such as the type of door control were considered in the light of passenger-handling efficiency as well as that of mechanical excellence. Thrashing out such matters as these in advance cannot result otherwise than in enormous savings through elimination of costly mistakes in judgment. The viewpoint of each department has much to recommend it to the careful consideration of every other department. Not infrequently the public relations department can throw light on a matter which has been puzzling the best technical brains. The mechanical department, in turn, may often reveal a startling grasp of the problems confronting the merchandising division. That the whole is greater than any of its parts is no mean theorem.

Railways Are Accused of Neglecting Their Own Interests

CHARGES of failure to comply with the common sense program of standardization constantly urged by manufacturers of bus equipment have been lodged against the railway industry. George Scragg of the International Motor Company recently made an address before the National Automobile Chamber of Commerce, the substance of which dealt with the alarming tendency on the part of state legislatures toward over-regulation of bus design and operation. His most startling statement, at the very end of his address, was that very little assistance could be expected from railway companies in coping with this situation since they themselves were notorious offenders in the matter of insistence upon individual requirements in bus design.

The allegation that "those in the traction industry who yell the most about the laws are the ones who are doing the same thing themselves by laying down special specifications" may strike a little too close home for comfort in many cases. It seems that this charge has been heard before and from within the industry itself. Were it not so, operators might conceivably gloss over the terms of the criticism and, with a neat gesture over the shoulder with the right thumb, strike the attitude of the immortal Tweed Ring cartoon by Thomas Nast—"It may be true of the next fellow but it isn't true of

Digitized by Google

me." Unfortunately this complacent attitude cannot be adopted with entire assurance that it will sit prettily upon the shoulders of the industry.

From various sources comes the accusation that traction operators delight in pointing with pride to the individualized cars they have on their road. An operator speaks of "my car," meaning one that he has designed. It is almost with the feeling of complete futility which struck the Prophet Jonah before the gates of Nineveh that Mr. Scragg states "it seems impossible to stir him into action in this matter." Is it then true that the battle against unjustifiable surveillance of bus operation by the various states must be fought out by the manufacturers? Surely the railway companies who operate co-ordinated bus and trolley services are just as seriously affected. They cannot afford to tolerate or encourage a policy of over-legislation against bus operators, since they themselves will be among the first to suffer.

Conditions within the industry with regard to standardization of equipment are slowly but surely showing signs of improvement. Criticism has been based on the grounds of past and perhaps present performances, but there seems hope for the future. The comments which have been made on the tendency toward oppressive bus legislation by the state should meet with intelligent response from every wide-awake railway man. There is a battle to be fought and the traction companies are in a position to plant very effective artillery fire in the ranks of the enemy. It should not be possible for anyone to charge that the railway industry has been guilty of neglecting its own best interests.

Better Method of Exchanging Tokens Is Needed

FOREIGN street car tokens are accumulated in considerable numbers by nearly every electric railway which employs this type of fare collection, and the problem of their disposal is somewhat perplexing. With many of the larger companies, the accumulation is sufficiently rapid to warrant comparatively frequent exchanges. Often this is done in lots of 100 or more, token for token, regardless of value. In the smaller communities, however, the accumulation is slow. While the total number of foreign tokens on hand may be relatively large, there may be no more than ten or twenty from any one other company. Under such circumstances, it seems scarcely worth while to open direct negotiations for their exchange.

A possible solution of this problem is suggested in a letter published this week in the Readers' Forum. C. S. Speed, general manager of the Evanston Railway, proposes that a token clearing house be established to receive and return to the original owners tokens belonging to railways all over the country. His suggestion is that the tokens be accepted by the clearing house in lots of 100, no matter what the issuing company, and credited to the receiving company at 5 cents apiece, regardless of the face value when returned to the original owner; the latter would be debited with the face value.

Such an arrangement would undoubtedly be a convenience to the railways, but it seems unlikely that it could be made financially self-supporting. Only some 150 railways use tokens out of a total of more than 800. While many of the larger railways are included among the token users, the total number of foreign tokens collected during the course of a year probably does not greatly exceed 500,000. Assuming that half of this number, or 250,000 a year, would pass through the clearing house, and the collection of an average charge of 2½ cents per token, the clearing house would take in slightly more than $6,000 a year. This would not pay the cost of a permanent organization to do the work.

There is a real opportunity for the development of a satisfactory plan to handle this matter. Such an activity would seem to fall reasonably within the field of association activity. In the development of any solution, however, care should be taken not to make the remedy more complicated and difficult than the situation which it is intended to cure.

Those Who Cry Loudest Have Studied It the Least

REPLACEMENT of trolleys with buses continues to offer a topic that fires the imagination of news writers—or more particularly writers of news headlines. Over a dispatch from Detroit dated March 31 a prominent Eastern evening paper carries this imaginative head, "End of Trolley Seen in the Bus."

Examination of the article itself reveals it to be a somewhat general discussion of growing bus manufacturing activities in Detroit. Combined with this is a popular "write-up" on the gas-electric type of vehicle. There is no supporting data to justify the heading affixed in the newspaper office.

Nevertheless, thousands of headline readers have been given the impression that new evidence has accumulated to relegate the trolley to the scrap heap. Since the article emanates from Detroit, it may be presumed that it was intended to emphasize the growing importance of bus manufacture as a prospective new market for the "motor city." That the manufacture of buses is only in its infancy, and that the future challenges the imagination in the effort to foresee the magnitude of the operations which may result from the substitution of common carrier highway vehicles for individual transportation, is evident to every student of the subject. But that this development of the bus is dependent on the replacement of electric cars is a fallacy conceived in the mind of the surface thinker who knows little about the subject.

This fact is well expressed by Carl Parker, manager of sales, bus division, Reo Motor Car Company, in a recent article which appeared in the Indianapolis *Star* and is referred to elsewhere in this issue. In discussing the co-ordination of bus and trolley he said: "While the radicals are claiming that buses can efficiently replace the trolley, those who cry it the loudest have studied it the least and know least about it. . . . Don't eliminate the street car—just speed it up. Give it a chance to develop its efficiency. . . . In some cities in the United States the trolley car has never been allowed to develop its greatest efficiency. It is a better vehicle than most of us think it is because we have never had the chance to see it operate at its best. Give the trolley car the chance it has been yearning for and *you automatically put the motor bus in its best environment.*"

Those who herald the passing of the street car with the coming of the bus have adopted a narrow viewpoint indeed. To load the bus down with the burdens and restrictions of a minimum fare mass transportation agency would be fatal to its development. They are not friends of the bus who cry "Trolley Replacement!"

Street Car Operation Hampered by Unscientific Traffic Regulation

Observations Indicate that Usual Methods of Synchronized Control Retard Railway Operation—In Many Cases Sufficient Study Has Not Been Given to Adapting Regulatory Systems to Meet Needs of Particular Situations—Results of Signal Installations in Cleveland, Syracuse, New York City, Newark, Indianapolis, Birmingham and Detroit Are Described

By John A. Miller, Jr.
Associate Editor ELECTRIC RAILWAY JOURNAL

SINCE the original installation of signal lights to control vehicular traffic on a long section of Fifth Avenue, New York City, similar installations have been tried in a large number of other places. In many cases, however, there has been little or no attempt made to adapt the system to the real needs of the individual situation. Consequently the effect of the traffic control lights frequently has been to retard vehicular movement rather than to speed it up. Electric railway operation in particular often has been seriously hampered by the installation of such systems.

Advocates of synchronized traffic control signals claim several advantages for this method of regulation, among them being increased speed of vehicular movement, fewer accidents and reduction in the number of traffic policemen required. The actual experience of a number of important cities, however, casts considerable doubt on the merit of such contentions. That all of these benefits may be expected to follow the installation of signals seems unlikely. Statistics concerning general vehicular movement are difficult to obtain, but careful checks made by electric railways show clearly that the speed of street car operation has been reduced by synchronized traffic control, and there is reason to believe from their statistics of delays that the speed of other vehicles also is adversely affected.

Champing at the Bit—Traffic on Euclid Avenue, Cleveland, Waiting for the Green Light. Twenty Street Cars and Many Other Vehicles Are Held Motionless by the Synchronized Signal System, Although No Cross Traffic Is Moving.

About a year ago it was realized that traffic congestion had become a serious matter in Cleveland and a committee was formed, under the auspices of the Cleveland Automobile Club, to study the problem. After visiting eight other large cities, this committee prepared "A Report on a Traffic System for Cleveland," one section of the report being devoted to a discussion of synchronized signals.

Concerning the result of traffic signals in Syracuse, this report stated: "After 32 intersections had been covered with synchronized signals the street railway company rearranged its schedule, cutting down the running time on some lines by six minutes. In the congested districts street cars were enabled to cut their running time in half." This statement of the committee is contradicted by checks made by the New York State Railways, which show that the running time was increased materially as a result of the installation. A summary of these checks follows:

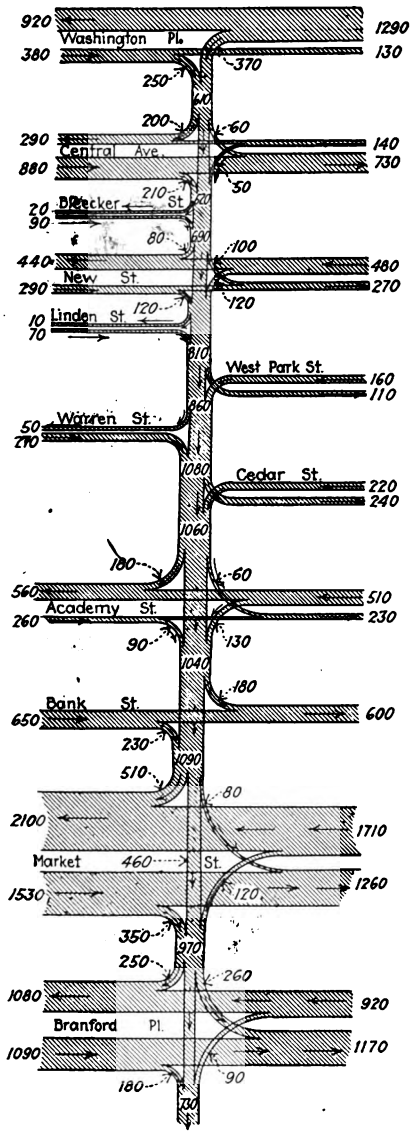
EFFECT OF TRAFFIC SIGNALS ON RAILWAY OPERATION IN SYRACUSE

Line	Running Time Before, Min.	Sec.	After, Min.	Sec.	Increase Sec.	Per Cent
Salina Street	9	14	9	32	18	3.0
Warren Street, James Street, Onondaga Street	9	19	10	09	50	9.0
Fayette Street	5	11	5	48	37	11.9

Recommendations made by this committee that a system of synchronized signals be installed in Cleveland were followed by the city. This was done on Euclid

Digitized by Google

Avenue for a distance of nearly a mile east of the Public Square. Nine blocks are controlled from a tower at the intersection of East Ninth Street. Time intervals are not uniform, but are varied at will by the traffic officer in the tower. The effect on car operation has been similar to that in Syracuse. The Cleveland Railway has added one minute to the running time each way in this district. A noticeable increase in peak power demand caused by the simultaneous starting of so many cars has resulted in an increased demand charge to this company.



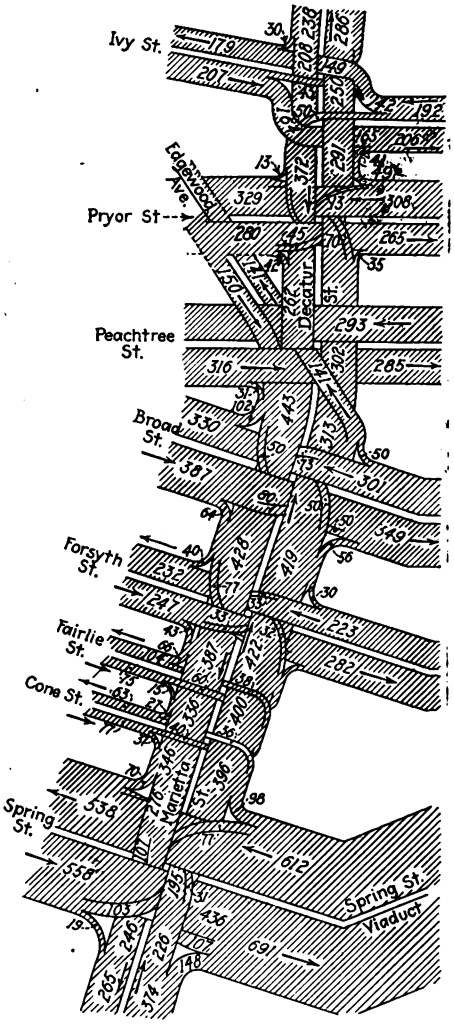
Traffic Flow Is Different on Each Cross Street, the Maximum Being Nearly Double Any Other

Investigation of the operation of cars of the New York Railways on Broadway, New York City, immediately before and after the installation of synchronized signal lights showed a decrease in speed of about 8 per cent. Failure of the control system to allow for the difference in conditions at various locations is the principal cause of trouble. In the opinion of the railway management it would be better to divide the area covered into smaller sections, independently operated.

During the summer of 1925 a system of synchronized traffic control was established on Broad Street, Newark, N. J. A master control tower was erected at Market Street, the busiest intersection, and the movement of all traffic through an area extending about ¾ mile on each side of the light was obliged to conform to its indications. Careful checks made by the Public Service Railway of the running time of its cars on Broad Street before and after the establishment of this system showed a marked reduction in the speed of operation. A summary of the results of this investigation is given in the table in the opposite column.

From this it will be seen that the average total time of delays due to passenger movement on a trip through this area remained approximately the same after installation as it was before. The average total of delays due to waiting for clear traffic signals increased from one minute and five seconds to two minutes and 25 seconds per trip. Results similar to those in Syracuse, New York and Newark are reported from other cities.

Interference with railway operation was the indirect result of the installation of synchronized signals in Indianapolis. Some months ago such a system was installed on North Meridian Street, a principal north and south automobile thoroughfare of that city. There are no electric railway tracks on this street. The normal volume of traffic on North Meridian Street is at least five times greater than the traffic on the intersecting streets, yet the intervals were not arranged in this ratio. Since the installation of the signal lights it is estimated that at least 25 per cent of the traffic that formerly used Meridian Street has been diverted to adjacent parallel thoroughfares. This has added seriously to the congestion already existing on those streets and has hampered the operation of the Indianapolis Street Railway there.



Traffic Flow in Business District of Atlanta, Ga., Showing Great Differences in Conditions at Adjacent Street Intersections

Another instance where synchronized control has caused traffic to be diverted to other streets is reported from Birmingham, Ala. Traffic signals at 24 street intersections in the business district of that city are controlled from a single point. The locations of these lights are shown in an accompanying illustration. Equal time intervals are allowed for movement in each direction with a five-second pause between. The intervals can be changed at will, 30, 35, 40 and 45 seconds being used according to circumstances.

EFFECT OF TRAFFIC SIGNALS ON RAILWAY OPERATION IN NEWARK

Date	Direction	No. of Trips	Average Running Time per Trip Min. Sec.	Average Passenger Delays per Trip Min. Sec.	Average Traffic Delays per Trip Min. Sec.
Without Signals					
June 23, 1924	North	24	13.45	1.40	1.03
June 23, 1924	South	24	13.45	1.41	1.07
Average			13.45	1.41	1.05
With Signals					
Sept. 15, 1925	North	20	15.57	1.26	2.07
Sept. 15, 1925	South	19	15.10	1.44	2.43
Average			15.34	1.35	2.25

Digitized by Google

Placing the signals under control from a single point has had a tendency to delay railway operation unnecessarily because many intersections have lighter traffic than exists at the controlling point and time is wasted in waiting for the cross movements elsewhere to end. On the other hand, this unnecessary waiting makes automobilists avoid the area controlled by signals, thereby relieving congestion and helping the street cars somewhat. It is believed by local observers that on the whole the signal system slows up traffic more than signals operated individually to suit the needs of the various intersections would do.

Approximately 125 traffic signals are now in operation in the city of Detroit. For some years past students of traffic conditions talked about methods of diverting through traffic away from the congested business district. Finally, a so-called "loop plan" was evolved providing a route which skirted the outer edge of the business district. In addition to designated the loop a number of one-way streets were established and signals installed at many locations. This system was placed in operation Feb. 8.

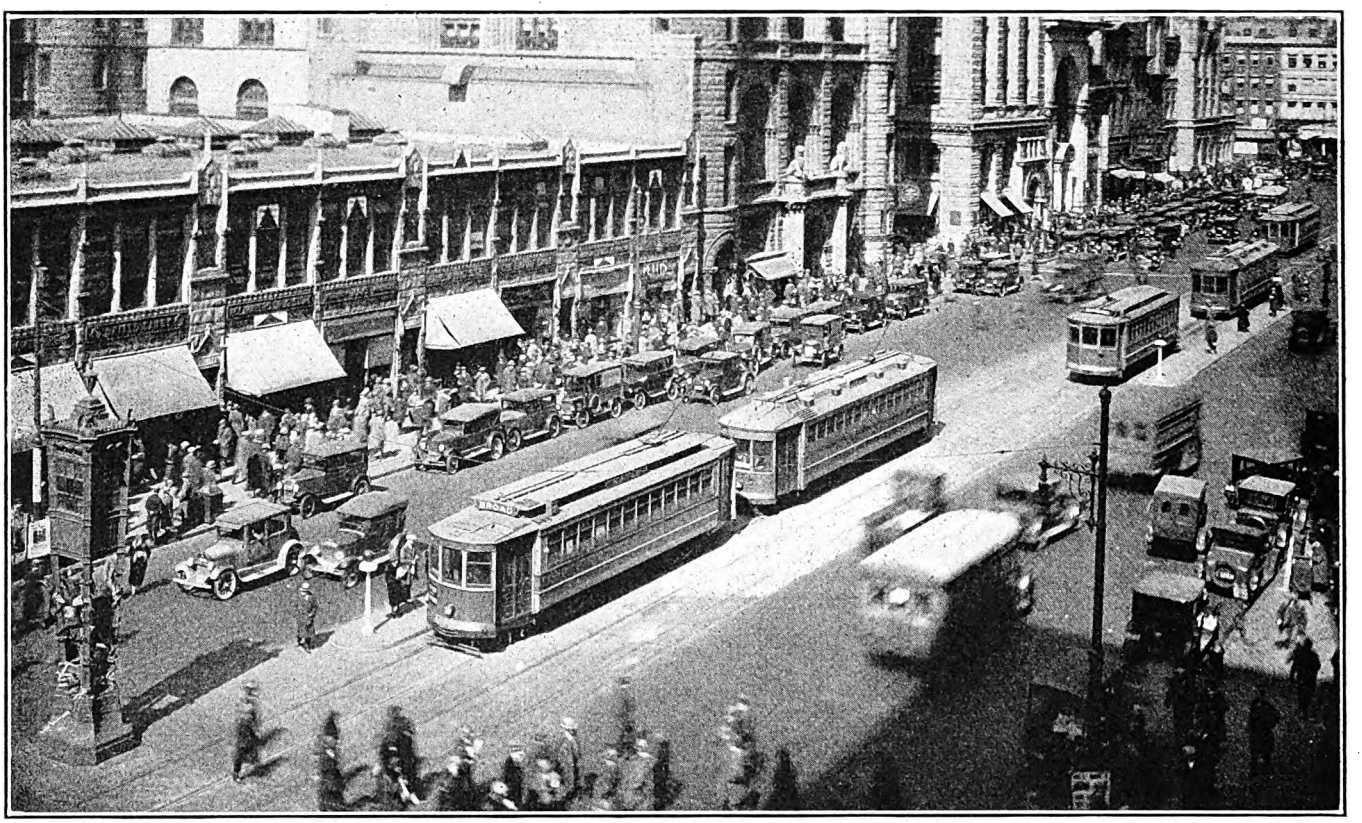
Signals are of the three-light type with red, amber and green lenses arranged perpendicularly on stanchions, located in some instances on one corner, sometimes at two corners and at other times in the center of intersections. The signals are synchronized in groups and in general have intervals of 40 seconds for east and west traffic and 40 seconds for north and south traffic with four seconds for the amber light. Because of the lack of uniformity of location of the signals drivers of vehicles must look in all directions at each intersection to find out what to do. Frequent tie-ups have occurred and congestion at times has been worse than before. Street cars have been delayed from six to eight minutes per trip through this section of the city.

Comment was made by the Detroit *Free Press* on Feb. 13 concerning traffic signal lights as follows: "An obtrusive result so far of the installation of the loop system has been the slowing down of vehicular traffic, sometimes almost to the point of obstruction. The delay is reflected in the movement of both automobiles and street cars and the difficulty in at least a part of the area affected seems to arise as the result of too frequent shifting of lights against movement on the through streets."

In Chicago a system of traffic control, differing in important respects from the usual type, has been put in operation recently. Lights at each street intersection are controlled by an individual relay. These relays are arranged to operate consecutively, so that, in theory, the signals change progressively from "stop" to "go" as traffic proceeds along the principal thoroughfares. Checks made by the Chicago Surface Lines to determine the effect of this system on car operation have shown very favorable results. An article covering this installation and its method of operation appeared in ELECTRIC RAILWAY JOURNAL for March 27, page 536.

Prior to the installation of this system careful investigation and analysis were made by the Chicago Surface Lines of the movements of vehicles on the streets affected and on the intersecting streets. Unfortunately, the task of making such a comprehensive and accurate check of vehicular movement is difficult and expensive and seldom has been undertaken in the past. In most cases where synchronized signals have been installed the installation has been made after only a cursory examination of conditions and results have been disappointing.

Investigation has shown that traffic on comparatively few streets is sufficiently uniform over a considerable distance to permit efficient control by the usual type of



Traffic Tower at Market Street Which Controls Movement for ½ Mile in Each Direction on Broad Street, Newark, N. J.

Digitized by Google

synchronized signals. Traffic on intersecting streets varies so greatly in amount that any arrangement which is satisfactory for one intersection is likely to be unsatisfactory for all the others. Time intervals must be arranged to meet the needs of the intersection having the heaviest traffic. Time allowed for cross traffic is then unnecessarily long elsewhere.

A typical case where the vehicular movement at one cross street is much heavier than at any other nearby intersection is shown in an accompanying traffic flow diagram of a busy one-way street. At the busiest intersection there is a cross movement of nearly 3,000 vehicles per hour, while the second heaviest intersecting street has a cross movement of not much more than half that number. Consequently the maximum intersection requires about twice the period needed for cross movement at any other point.

When all or nearly all of the vehicles move for a long distance on the principal thoroughfare passing by the heaviest intersection it has sometimes been found advantageous to hold vehicles at more remote intersections rather than to allow them to pile up at the point of maximum cross traffic. The usual situation, however, is that many vehicles turn off into side streets before reaching the heaviest intersection. The waits caused by synchronized control constitute an unnecessary loss of time to such vehicles. Examination of the traffic flow diagram already referred to shows that the total number of vehicles turning off into side streets is much larger than the number which continue past the controlling point. Under these circumstances there is no danger of piling up traffic at that point and more expeditious movement is possible without synchronized signals than with them.

Another accompanying traffic flow diagram shows the movement of vehicles along a section of Marietta Street, Atlanta, Ga. These figures were compiled by the Beeler Organization during its study of the transportation situation in that city. Conditions are entirely dissimilar at every one of the intersections shown and it is obvious that synchronized traffic control could not be operated efficiently in these circumstances. Traffic on this street, however, is fairly representative of traffic on many streets in the business district of American cities. Consideration of these various factors, therefore, indicates that the installation of the usual type of synchronized traffic control is unlikely to result in an increase in the speed of vehicular movement.

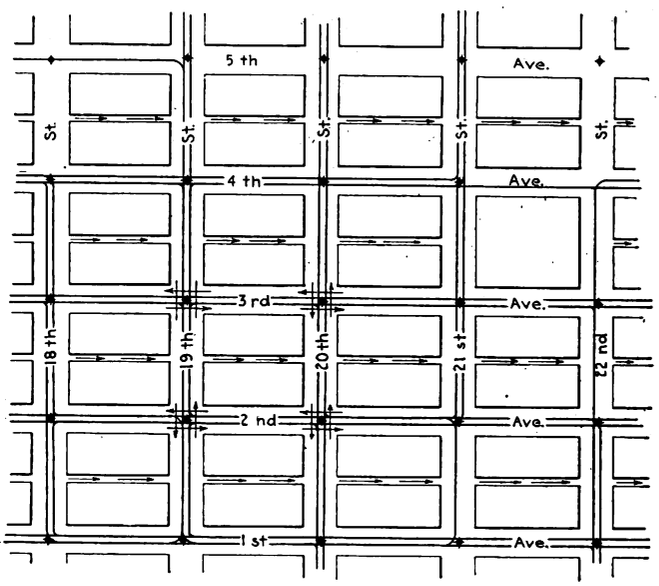
Synchronized Signals No Advantage from Safety Standpoint

The second claim usually made in behalf of synchronized traffic control is that it reduces accidents. There are almost no authentic statistical data to show the effect of signal installations on accidents because few, if any, cities have kept records in a manner to yield such data. It has been stated that accidents on Michigan Avenue, Chicago, within the limits covered by the initial traffic signal installations a couple of years ago, have been materially less than before that installation. Similar opinions have been expressed in other cities that have tried this type of regulation, but actual figures to permit reaching definite conclusions are lacking.

The National Safety Council recently made a special study of conditions in some of the larger cities of this country. One of these cities was Philadelphia, which has a low automobile accident rate. It was the judgment of the engineers who made this survey that effective traffic control was the outstanding factor in reducing accidents in Philadelphia. Both automatic signals and traffic officers are employed and the investigators decided that from the safety standpoint there is little to choose between the two methods of regulation.

That synchronized control reduces the number of traffic policemen required is the third contention of its advocates. This has been accomplished in many instances because pedestrians and automobile drivers as soon as they become accustomed to the working of the system follow its indications without supervision by the police.

Despite the disadvantages of the ordinary synchronized system resulting from the difference in conditions at various street intersections some sort of supervisory control appears to be needed to prevent the confusion which arises when traffic officers at adjacent intersections fail to co-operate properly. A flexible



Layout of Synchronized Signal System in Birmingham, Where 24 Intersections Are Controlled from a Tower at Third Avenue and Twentieth Street

system of traffic control was tried by Gen. Smedley Butler when he was safety director of the city of Philadelphia. Under this scheme the movement of all traffic on Broad and Market Streets was governed by the indication of powerful lights located high up on the four sides of the City Hall tower. As these lights could be seen only by the drivers of vehicles approaching the City Hall it was necessary to retain practically the same number of traffic policemen as had previously been employed. The lights were used primarily to guide the policemen and the drivers of vehicles looked to them for direction. This made it possible for each officer to exercise a certain amount of discretion in controlling traffic at his particular intersection. Regardless of the signal indications, east and west traffic could be allowed to move when there was no north and south traffic, and vice versa. Unnecessary delays due to unequal volumes of traffic on the various cross streets were thus much reduced.

The chief fault of this plan was its failure to give proper information to vehicles going away from the City Hall and to vehicles on cross streets. Not every intersection had a traffic policeman and this lack created much confusion at such points. After a short trial the plan was abandoned in Philadelphia. As sufficient

Digitized by Google

time had not been allowed to demonstrate its possibilities nor to iron out the difficulties connected with its operation, this abandonment can hardly be considered a condemnation of the system. Since then many synchronized sections have been installed.

Signal lights were installed recently on Sixteenth Street, Washington, D. C., according to a plan somewhat similar to that being tried in Chicago. This is a wide boulevard without street cars. At first the signals were synchronized and various timing arrangements were tried out. Crossing this boulevard at right angles is Massachusetts Avenue, another heavily traveled thoroughfare. The difficulty experienced with the synchronized system was that when the lights were set to show green on Sixteenth Street for a sufficient time to permit vehicles to travel any appreciable distance the interval was too long for Massachusetts Avenue, with the result that considerable congestion occurred. On all other cross streets it worked out very satisfactorily.

After various experiments local authorities have developed what they term a "staggered system." This system ties the lights up into two-block series. Starting at the beginning of the street, the first two blocks are green, the second two blocks red, the third two blocks green, and so on. These lights are timed on dry days for 30 seconds and on wet or snowy days for 35 and 40 seconds. An automobile starting at the beginning of the green and traveling at a 22-mile rate of speed (the regular limit) completes the first two blocks just in time for the second two to turn from red to green, and so on through the entire length of the street, making it possible to travel the entire length of Sixteenth Street without stopping and without interference from cross-town travel.

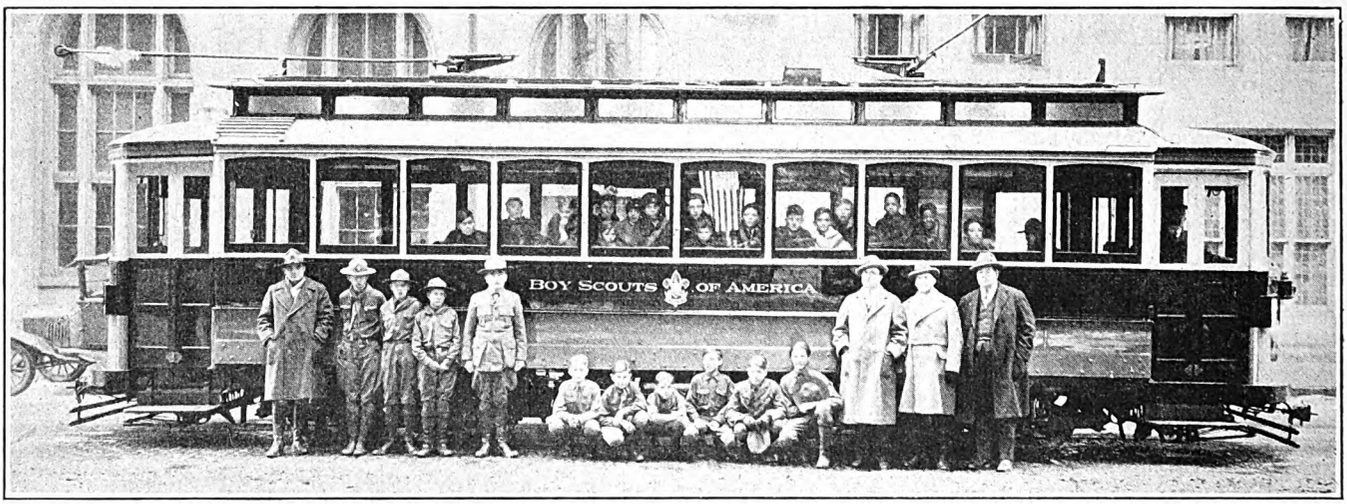
By this system the speed of the vehicle can be controlled. That is to say, by lowering the time of the lights the speed can be increased, and by increasing the time of the lights the speed can be decreased. The result has been almost universal public approval of this system, while only a few weeks previously, under the synchronized system, the public was thoroughly disgusted with traffic lights.

Summarizing the experience of the various cities mentioned in preceding paragraphs, it appears that there are four general requirements for a successful traffic control system: (1) To adapt the system to the needs of the particular local situation; (2) to confine the control to such locations as are seriously congested; (3) to establish interlocking control only at intersections where conditions are similar; (4) to employ a sufficient number of traffic policemen to supplement the working of the mechanical signals by human intelligence, and to allow them wide discretionary powers to give the system flexibility.

Grand Rapids Enlists Support of Boy Scouts

IN AN effort to establish new public relation contacts with local organizations, the Grand Rapids Railway has just inaugurated a new scheme in conjunction with its original car-naming plan. L. J. DeLamarter, general manager of the railway, is experimenting with the plan of adopting organization names that will have far-reaching favorable reactions from the various groups within the city. Previously the names of prominent citizens had been adopted to replace the old style number system.

On Feb. 14, in response to requests from the local council of the Boy Scouts that a car be painted in their colors, bear their insignia and be known as a "Boy Scout car," Mr. DeLamarter adopted this suggestion and presented the boys with a beautifully painted car. Officers of all branches of boy scout work in Grand Rapids responded to the action and, after much publicity, dedicated the new car with special exercises on Saturday afternoon, Feb. 14.



Presentation of Boy Scout Car by General Manager DeLamarter

Resplendent in red, white and blue paint, with the scout insignia done in colors on the side panels, the car was placed on the Pantlind Hotel siding and a public inspection held. Representatives of all the scout troops in town were on hand and Mr. DeLamarter made a presentation address, which was responded to by John M. Brower, president of the Scout Executive Council. The exercises were concluded with three rousing cheers given by the boys for the railway company at the request of Fred B. Pantlind, head of the Sea Scouts, whose boys will share in the use of the car. After the exercises, the boy scouts were taken on a ride about the city in their new car. It is planned to place the car at the disposal of the scouts on all special occasions.

The Grand Rapids Railway has been receiving many letters of commendation for the new car and parents of boy scouts are sending letters in daily telling how their boys are standing at attention as the new car goes by.

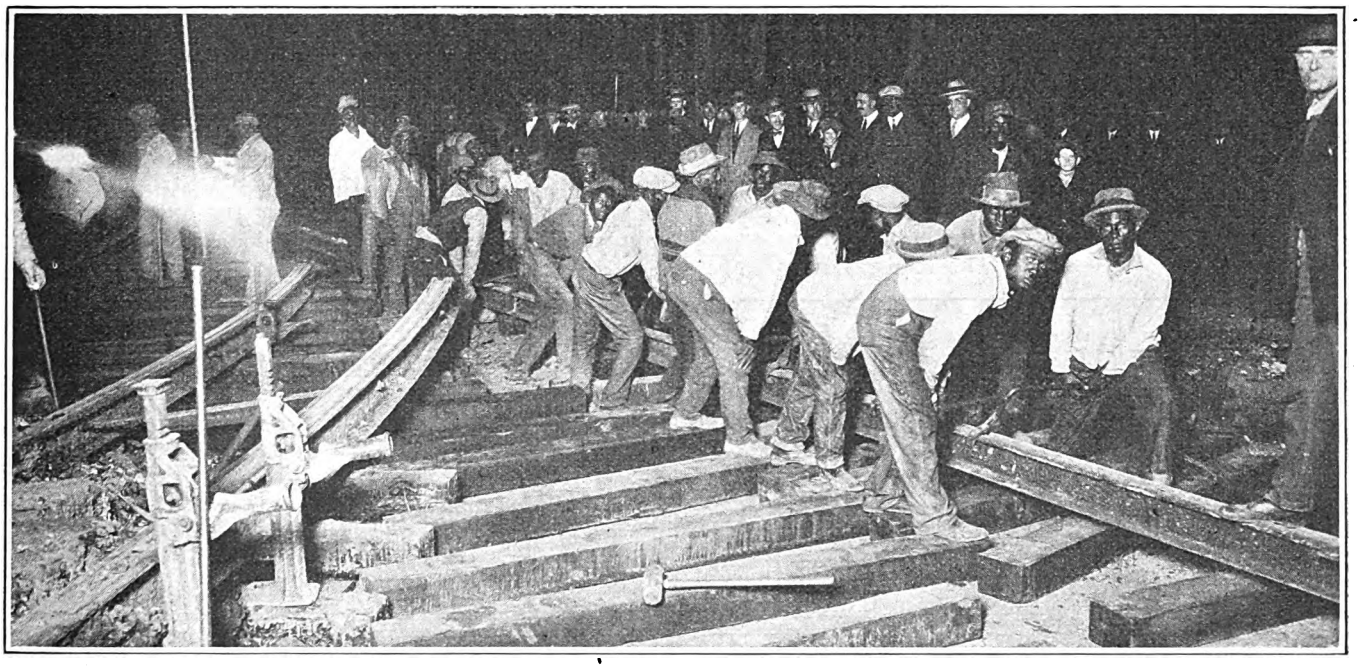
Wide Gaging 4,762 Ft. of Double Track in New Orleans

By E. S. Meyers
Superintendent Way and Structures New Orleans Public Service, Inc.

This Length of Track Was Changed from 4-Ft. 8½-In. Gage to 5-Ft. 2-In. Gage in One Night, so as Not to Delay Traffic—It Forms Part of the Work of Having Only One Track Gage for the New Orleans Public Service Lines



Flashlight Photograph of Overnight Changeover of the Tracks from Standard to Wide Gage on Magazine Street and Jackson Avenue, New Orleans

YEARS ago, when cars were first introduced in New Orleans, it was the prevailing custom to grant a franchise for a car line to the highest bidder. Several companies entered the field, and as time wore on there were as many as eight separate companies operating car lines. As each company was independent no thought was given to a systematic scheme of car routing. The first company to lay its tracks adopted the standard gage 4 ft. 8½ in., and the other companies adopted the wide gage of 5 ft. 2½ in. As a result, when the companies were merged and the New Orleans Public Service, Inc., took over the holdings it was confronted with the problem of rearranging the entire system, and therefore determined on a policy of using only one track gage to permit flexible operation of the cars. Fortunately, out of a total track mileage of 220.48, only 28.48 miles was of the 4-ft. 8½-in. gage. Approximately 2 miles was double gage; that is to say, it had three rails to permit the use of either gage of car. All of the remaining track was of 5-ft. 2½-in. gage.

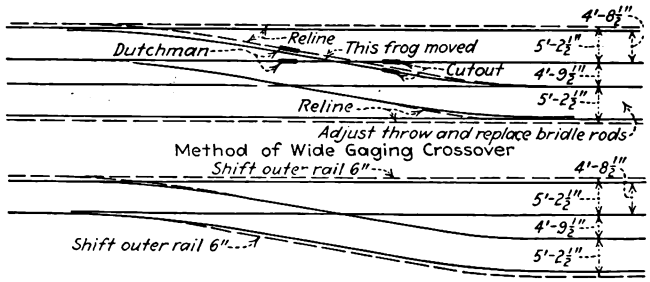
In the latter part of 1925 extensions were built in order to reroute certain car lines. The rerouting involved the Jackson line, which operated on the 4-ft. 8½-in. gage track. Since the extensions were wide gage, the rerouting necessitated wide gaging 4,762 ft. of double track. This it was decided to do in one night, and the night of Wednesday, Oct. 28, was the one selected.

The accompanying map shows the section of track on which the gage had to be widened. As will be seen, before the widening of gage was done, the cars on the Jackson Avenue line turned into Jackson Avenue at St. Charles Avenue, where there was a layout consisting of a double branch-off 4-ft. 8½-in. curve. The double track then extended on Jackson Avenue a distance of about 4,800 ft., crossing two double street car tracks and four single car tracks. At the end of the line there was a turnout, and midway on Jackson Avenue there was one crossover. The rerouting necessitated changing the car housing, and in order to do this, a connected curve branch-off was required at Magazine Street. All of the intersections were paved.

The problems which confronted us in making this change were as follows:

1. Wide-gaging the trucks of a sufficient number of cars to operate the new line.
2. Maintaining the paved roadways for vehicular traffic.
3. Maintaining the operation of the car lines crossing Jackson Avenue, four in number.
4. Wide-gaging the track and special work in one night.

Digitized by Google



Method of Wide-Gaging Crossovers and Turnouts

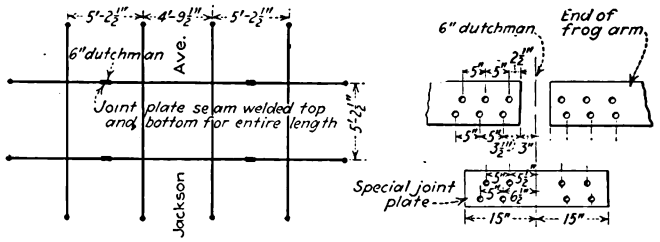


Diagram Showing Method of Wide-Gaging a Crossing

The equipment department took care of wide-gaging the trucks, while the roadway department handled the remaining work. The traffic situation was studied and a plan was worked out showing the manner in which traffic could be diverted without much inconvenience to the public. Six police officers were required to handle the traffic situation. The plan was submitted to the Department of Public Safety, which co-operated with us and carried it out during the period of wide-gaging.

Arrangements were made with the transportation department in regard to the time in which the track could be taken over by the roadway department, and also the manner in which the lines crossing Jackson Avenue could be rerouted, during the period the crossings were being wide-gaged. The roadway department estimated that the work could be done in six hours, but taking into account the possibility of inclement weather, it asked for eight hours. As the transportation department desired to operate the new line at 5 a.m. the following morning, the roadway department asked for the track at 9 p.m. On this basis, the Jackson line was cut at 9 p.m. and the track turned over to the roadway department for wide-gaging.

The work started as planned at 9 p.m. The Prytania Street cars were diverted to the Magazine line, while these double-track crossings were being wide-gaged and vehicular traffic was diverted from one intersection to the next. At 10 p.m. the Prytania Street crossings were wide-gaged and turned over for operation. The Henry Clay-Coliseum line was routed over the Magazine line and the Laurel line was routed over the Tchoupi-

Tearing Up Track Preparatory to Shifting Tracks During the Overnight Changeover from Standard to Wide Gage at the Intersection of Coliseum Street and Jackson Avenue

toulas line, to permit the wide-gaging of these crossings. These crossings were completed by 11 p.m., after which the lines resumed their regular routings. The Magazine line was next rerouted over the Henry Clay-Coliseum line, and the double crossings at this intersection were wide-gaged by about 12.15 a.m. A portion of the curve on Magazine Street was installed a few days prior to wide-gaging, and by 10 p.m. this curve was connected up to the Jackson Avenue track.

As the crossings were being wide-gaged separate track forces were wide-gaging the tracks. The split switch crossover and the turnout were wide-gaged in less than one hour. The entire track was wide-gaged at 1:30 a.m., but it was 2:15 a.m. before a car could go over the line, due to some delay in connecting up at St. Charles Avenue.

Details of Program

The track which was wide-gaged was a double track 4,762 ft. long, equivalent to 9,524 ft. of single track, and was located in a reservation in the middle of the street, known in New Orleans as "neutral ground." All intersections, which occurred at every cross street, were paved with either wood or granite block. The rails were 80-lb. A.S.C.E. Of this stretch, 887 ft. was laid on Carnegie steel ties, imbedded in concrete, as shown in one of the track sections on the opposite page. The remaining portion of the line was constructed of wooden ties imbedded in concrete, as shown in the lower track section.

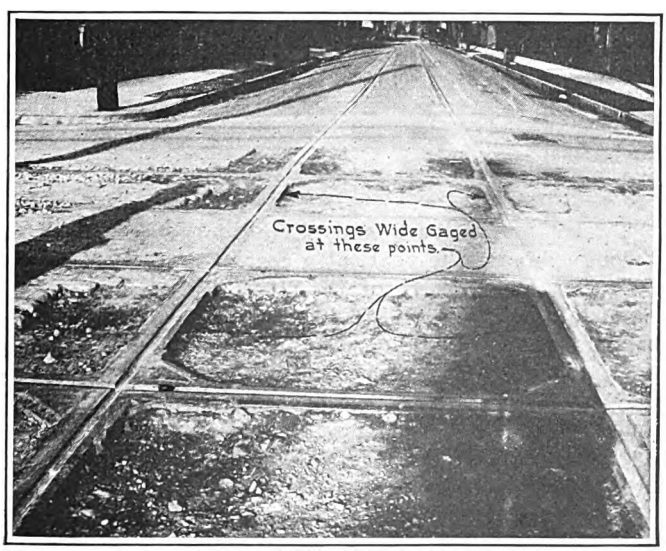
The details of the method and program of wide-gaging were thoroughly studied and worked out in advance after a series of first-hand inspections had been made and information tabulated from records on file. Detail drawings of the work to be done were prepared. Every precaution was exercised to avoid last-minute changes in the program. Track foremen were organized into groups, and each foreman was assigned a certain amount of work and a certain number of men with which to do it. The foremen had both oral and written instructions and then were taken to the job and made acquainted with the work required of them.

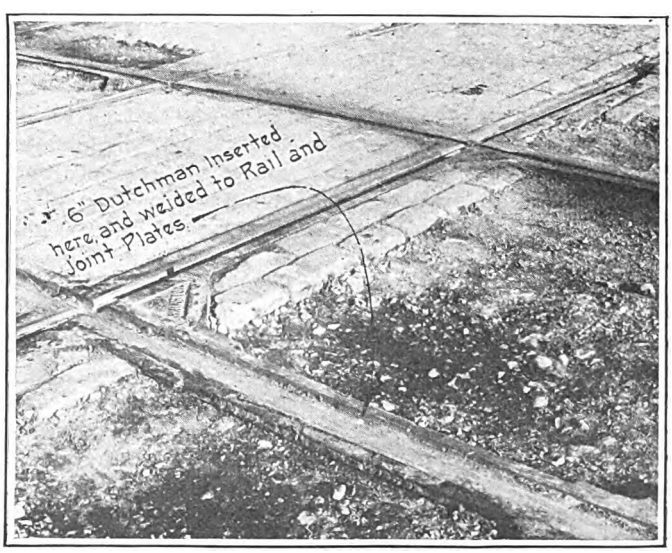
Preparatory Work

The preparatory work consisted of excavating a strip along the outside rails, extending to the end of the tie on both tracks along the entire length of the neutral ground. Where the track crossed paved intersections the pavement was broken for about a foot in width and refilled with slag to allow the passage of vehicles.

The crossings were treated in the same manner, all concrete being removed to the level of the ties and refilled with slag.

The day prior to the wide-gaging, all the rails which





Method of Wide-Gaging Crossings on Jackson Avenue. These Two Views, Taken After the Work Was Done, Show Where the Crossings Were Widened and Where the "Dutchmen" Were Inserted

Digitized by Google

were connected to the arms of crossings were cut 6 in. by an acetylene torch and rebolted with the same plates, each piece cut being used temporarily as a "dutchman."

The steel tie track presented a rather difficult problem as the rails were fastened to the ties by a combination clip and bolt. Matters were somewhat simplified by the fact that the steel ties, which were of the I-beam type, had been punched when originally installed to receive clips that would hold the rail to 5-ft. 2½-in. gage. The old bolts and clips, except on every third tie, were removed. This was done by placing a cold chisel against the bolt head and striking it about six times with a heavy maul. Since the concrete was about an inch higher than the top of the steel tie, it was also necessary to cut this level with the top of the tie to permit the rail to slide over and rest on the tie. To permit the insertion of the bolts and clips in the new holes a small amount of the concrete had to be cut at every hole. A sufficient amount of new clips and bolts were purchased in advance, and these were inserted in the outer wide gage holes and left loose.

The Work of Wide-Gaging

Everything being ready, the work of wide-gaging began. First, the crossings received attention. These were wide-gaged by removing the "dutchman" previously cut off of the connecting rails, so as to leave the crossing arms free, and then spreading the crossings by the use of two jacks. To do this, the jacks were laid in a horizontal position, one end resting against the rail to be spread and the other end blocked against the devil strip rail. The jacks were then "pumped" until half of the crossing had attained the new gage. The new "dutchman" was inserted in the opening and the new long plates were fastened in place. As it was necessary to cut off 6 in. of the rails connected to the crossings, new holes had to be burned in all the connecting rails to fit the fish plates. This was done by the use of acetylene torches on the night of wide-gaging.

As the crossings were being wide-gaged the rails were spread over 6 in. and properly gaged up. All ties were spiked. In the stretch of steel ties the remaining clips were removed. When the rail was thrown over, the weight of the rail caused it to wedge under the new clip which had previously been placed in the outer hole. After the track was gaged up the inside clips were placed and fastened.

The crossover was wide-gaged by making cuts, previously calculated, from joints at the heel of the frog on the main and cross lines and moving the frog along the main line the proper distance. The pieces cut were then dropped in the joints at the toe of the frog to fill the gap. Only one frog was moved. It was then necessary to reline one rail on each end of the crossover by gaging it to the rail that had not been moved. The throws and bridle rods at each end were then readjusted to fit the 5-ft. 2½-in. gage. The process followed with the crossover is shown in a diagram.

The gage of the turnout at the end of the line was changed by simply relining the rails. This caused the outside switch points to be drawn back toward the frog, but the distance was negligible so far as car operation was concerned. As in the case of the crossover, the throws and bridle rods had to be readjusted to the 5-ft. 2½-in gage.

At Magazine Street, where there was a double-track crossing, the connecting curve had previously been installed, except for the turnout on the Jackson Avenue line. This curve had been installed on an 8-in. slab that was poured ten days in advance in order to attain the proper strength before it had to be used. The portion of the Jackson Avenue line where the new special work was to be located had been placed on I-beams to allow the slab to be poured under the track while cars were using it. On the night of wide-gaging, this turnout was installed and the standard gage rail drawn out to meet it.

The new wide gage track for the new route of the line had been brought up to St. Charles Avenue, the street at which the standard gage track turned. The portion of these curves which lay over the new line was excavated and placed on I-beams so that an 8-in. slab for the new line could be poured in advance. At the same time the slab across St. Charles Avenue along the new route was poured. In order not to interfere with vehicular traffic, which is very heavy at this point, the slab was poured with Lumnite cement half way across the street and then immediately bridged with 4-in x 12-in. planks in such a way that there was no weight on the slab. The other half of the street was then excavated and the slab poured. When this slab had attained its proper strength the I-beams under the curves were removed and the track let down on it. On the night of rerouting the old curves were removed by being cut with acetylene torches and the new rail was laid to connect to the new wide-gage track. These rails were immediately brought to the proper line and surfaced on slag. The following morning the track at this intersection was paved with Kentucky rock asphalt, on top of slag. One half of the roadway was paved at a time, so as not to interrupt traffic.

The force consisted of ten foremen, 200 laborers and three acetylene cutters. The equipment consisted of oxyacetylene tanks mounted on motorcycles, a Universal crane mounted on an electric truck, a Brownhoist mounted on a motor car and Differential bottom dump work trains for handling slag. Light clusters were suspended from the trolley wire along the entire length of track.

Improved Tracks in Atlanta

MORE than $600,000 was spent by the Georgia Railway & Power Company in track maintenance and improvements in Atlanta during 1925. Among the heaviest items were the following:

New and rebuilt tracks	$303,000
Track maintenance and repair	145,000
New paving	100,000
Building construction and maintenance	27,000
Cleaning and sanding tracks	25,000
Paving maintenance	10,000
Signal maintenance	6,000

Twelve major track and paving jobs were carrried through during the year, at a cost of more than $345,000. Double-tracking of the River line was the most important job, costing $76,000. Other expensive undertakings were rebuilding and special work on Ponce de Leon Avenue, costing $76,000; double-tracking McDaniel Street, at a cost of $46,000; double-tracking and rebuilding the Soldiers' Home line, at a cost of $42,000, and new track on Mitchell Street, constructed at a cost of $27,000.

The track department's maintenance account showed a decrease of $34,745, or 18.084 per cent, under the expenditures for 1924.

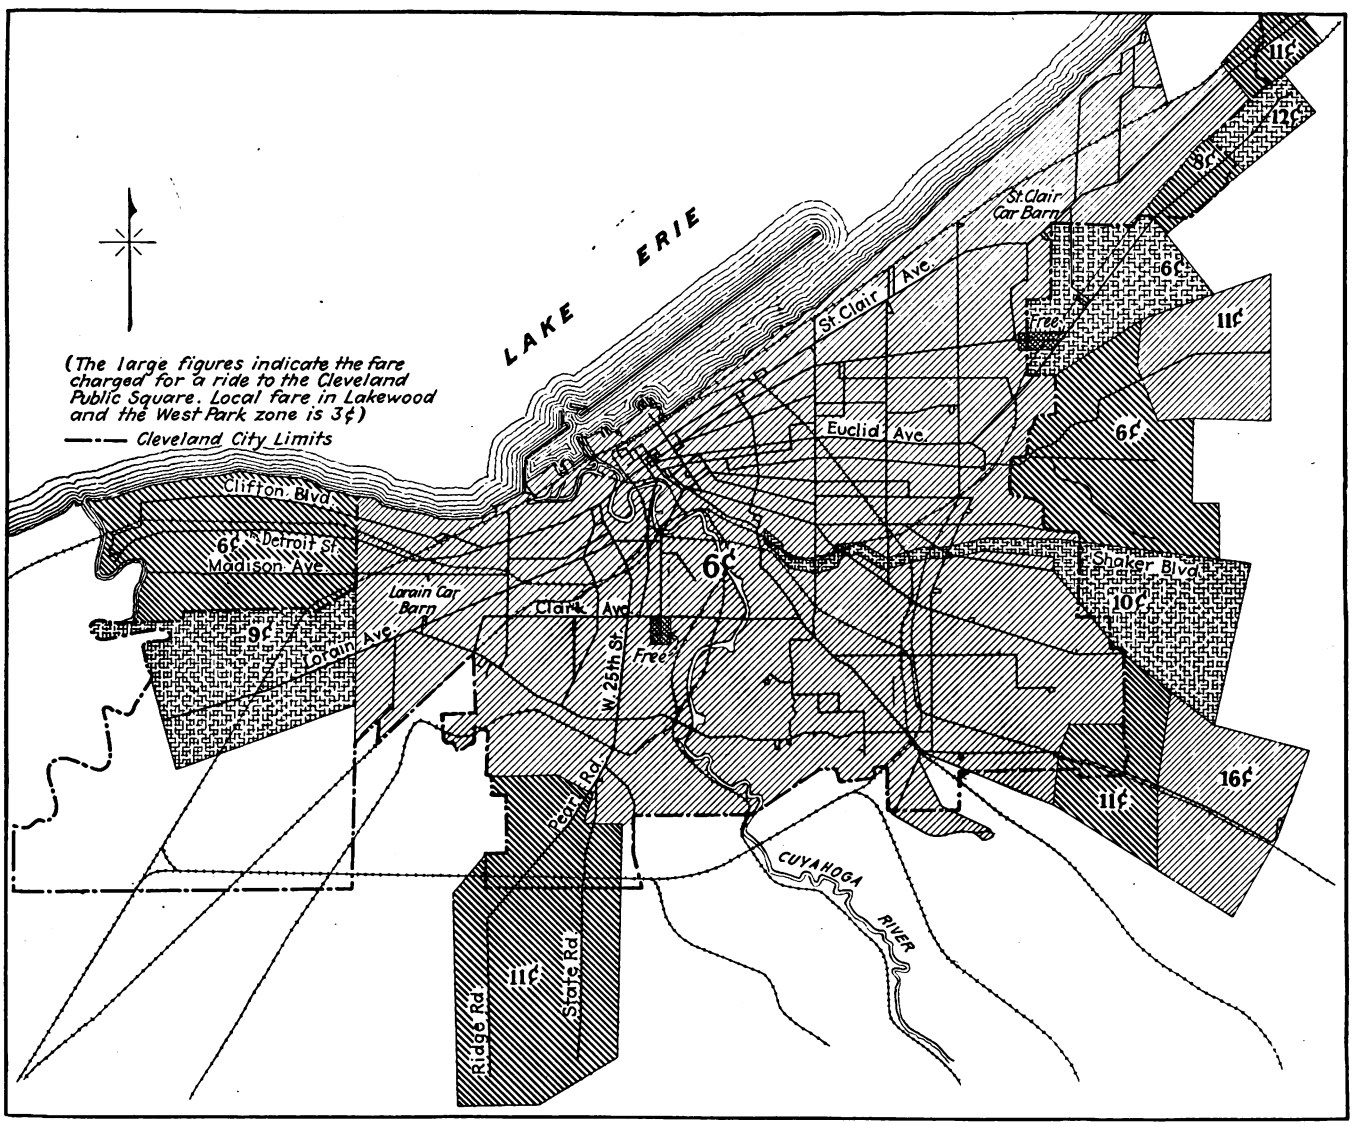
Readjustment Necessary in Cleveland's Tayler Grant

Recent Report of the Greater Cleveland Transportation Committee Recommends Removal of Limitations to Increase Market Price of the Common Stock to Par—Present Operation by Company Is Commended—Construction of Subways Should Be Deferred

CERTAIN difficulties have arisen in recent years in the operation of the Cleveland Railway under the provisions of the Tayler grant, which first became effective March 1, 1910. Most important of these has been the question of providing new money since the close of the war. The natural provision for financing has been through the sale of additional blocks of common stock, which, according to the Tayler grant, must be sold at par. The dividend rate is likewise limited to 6 per cent. While there has been ample investment money available in recent years, market conditions have been such that the Cleveland Railway common stock could not be sold at par, thereby effectively cutting off the source of new money in this natural channel. During the past five years the Cleveland Railway has expended more than $5,000,000 for new property, about one-half of which was provided by special allowances and the other half through the operation of the regular maintenance allowance for replacing equipment. The special allowances were made available from authorizations by the city to pay for the new property as a replacement of older property regarded as obsolete.

Such practices are regarded by the Greater Cleveland Transportation Committee as "financing through the fare box." This committee, whose report was released late last year, was appointed under the authority of a resolution of the metropolitan council and consisted of



Transportation Committee Decries the Present Inequality of Fares of the Cleveland Railway and Recommends Local Changes that Are Estimated to Increase Gross Revenue $1,000,000 Annually. The Present Fares to and from the Public Square Are Shown on the Map

Digitized by Google

three members of the Cleveland City Council and representatives of Cleveland Heights, the East Cleveland Commission and the city of Lakewood. This committee was instructed to study the entire metropolitan transportation situation and has divided its report into seven sections, abstracted in the following paragraphs:

THE TRANSPORTATION SITUATION

All service, according to the report, must be unified and must be under public regulation and control. The importance of this principle was evidenced by the vigorous action of the city of Cleveland and suburban cities surrounding it, resulting in the repeal of legislation which had placed the control of bus operation in the streets of Greater Cleveland under the State Public Utilities Commission.

The report decries as a folly a recent movement to grant outside interests a bus franchise. From the testimony offered in the public hearings held by this committee several outstanding facts were established. C. J. Spencer, general manager of the Metropolitan Electric Tramways, Ltd., of London, England, said:

> The answer purely on the ground of commercial possibility to the man who suggests that street cars ought to be scrapped or could be scrapped is that the first result of that scrapping would be that you would have to pay a great deal more in fares than you do today.

At the same meeting Alderman Smithson of Leeds, England, reported that after visiting many cities and observing bus and electric car operation the tramways committee of Leeds had decided to recommend an expenditure of $2,500,000 on the city's electric car equipment.

C. E. Smith, consulting engineer for the special survey committee of the St. Louis Board of Aldermen, stated in open hearing that the motor bus does not give faster service and is more expensive for hauling masses of people. He said: "If it were possible to use only buses, the total transportation cost of Cleveland would jump from $17,000,000 annually to $30,000,000. This would mean an increase in fare. There would also be the problem of much greater congestion on the streets because of the large number of buses required."

In order better to inform the riders of Cleveland on transportation matters and to promote the good will of the community the committee recommends that a public relations department be established by the company.

TRAFFIC CONGESTION

The increasing use of automobiles, equaling 17 per cent annually, and the consequent increase in the number of machines entering the central congested area of the city, the committee thinks, may provide its own remedy in the lack of ability to park if not to operate. Street congestion is an inevitable feature of city life. So far as the city of Cleveland is concerned, it is gratifying to know the subject is receiving earnest consideration, through the opening of new traffic arteries.

THE TAYLER GRANT

Conclusion is reached by the committee that the Tayler grant probably represents the most important step that has ever been taken toward reconciling the demands of the populace for adequate transportation service with a natural desire for profits by those who undertake to furnish such service. The Cleveland Railway, through its stockholders, owns the physical property. The routing and frequency of cars, construction of extensions and betterments are directed by the city. Stockholders are entitled to an interest or dividend return of 6 per cent, no more and no less. To obtain this, provision is made for the fluctuation of fare, determined by the rise or fall of a stabilizing fund. If by expiration of time the life of the grant should be reduced to less than fifteen years, then the railway company has the right to charge a maximum rate of fare and the city loses control over the service.

Through the operations under this grant the physical property has been maintained in first class condition. The company today is sound and solvent, the stockholders have received 6 per cent return on the par value of their investment without interruption, and the present rate of fare in Cleveland is 6 cents (5 5/9 cents if tickets are purchased).

While the city does not guarantee the return on the stock, it is in effect insured, and in case the city should exercise its right to purchase, the stock is callable at 110.

As described before, the operation of the grant is defective today in the provision of new money. John J. Stanley, president of the Cleveland Railway, contends that the root of the trouble lies in the 6 per cent limitation of the dividend rate and that 7 per cent would place the market value of the stock at par and hence solve the present difficulty.

In view of other testimony given at the many hearings the committee does not agree with the suggestion of raising the dividend rate, but in its stead makes the following recommendations, which in its opinion will produce a market value of par:

> First—Extend the life of the grant to 1950 (it now expires in 1944).
>
> Second—Amend Section 21 to provide that the rate of fare shall be such that, after deducting operating, maintenance and other allowances specified in the grant, will enable the company to pay 6 per cent interest on its "invested capital."
>
> Third—Raise the "interest fund" originally fixed by Judge Tayler at $500,000, so that the rate of fare will be increased when the fund is depleted to $500,000 and shall not decrease until it reaches $1,100,000. This recommendation is made because the gross earnings of the company are double what they were when the Tayler grant was drafted.
>
> Fourth—To rectify what appears as a defect in the grant, allow the company to pay a commission not exceeding 2 per cent for the selling of new stock.
>
> Fifth—The grant provides that the railway company can charge the maximum rate of fare when the unexpired term of the grant shall be less than fifteen years. The committee recommends that the company at such time be allowed to create a stock retirement fund by charging an additional ½ cent per car ride and 1 cent per motor coach ride, exclusive of transfers. The fund so created would be held in trust to amortize the capital value of the company. This provision is regarded by the committee as practically insuring the permanency of the grant or the return of the capital invested.
>
> Sixth—The committee recommends that the company start to set aside, as an annual sinking fund, 1½ per cent of the gross income received.

SERVICE AT COST

While the committee states that any attempt to provide service at cost for the individual car rider must be at best an approximation, it decries as preposterous that there should be nine different rates of fare now in force in the metropolitan area. The map reproduced shows that some passengers are carried as much as 9 miles in the city limits for the regular fare, while others also within the city limits are being charged 11 cents for a 4½-mile ride. The committee proceeds to

Digitized by Google

make several concrete suggestions of local fare adjustment which it calculates will produce $1,000,000 additional revenue annually.

Operating Economies

Under the service-at-cost principle of the Tayler grant all economies operate for the benefit of the car riders rather than the stockholders. "This so-called lack of incentive for economical operation has received more criticism than any other feature of the grant." The committee has endeavored to develop information that would prove or disprove this criticism and states that no evidence has been presented to it that would justify such criticism.

There is one factor, however, in the cost of operating that makes Cleveland appear in a somewhat unfavorable position. Comparison with other city systems of comparable size indicates that Cleveland is paying a larger amount in the settlement of personal injury claims than five other companies. The cities cited in comparison are St. Louis, 6.83 per cent; Cleveland, 6.7 per cent; Detroit, 3.46 per cent; Pittsburgh, 3.27 per cent; Baltimore, 3.21 per cent; Philadelphia, 3 per cent; Cincinnati, 2.06 per cent.

While recognizing the rights of claimants to receive just and adequate compensation, the fact might well be emphasized that it is the car riders who pay, whether the amount of the jury's award be high or low. The committee was advised that this unfavorable comparison to other cities was not peculiar to the Cleveland Railway alone, but applies to the steam roads and industrial concerns operating in the city of Cleveland and vicinity.

Several other specific operating economies are being made by the company and were reported by the city street railroad commissioner. The installation of watt-hour meters on all motor cars is estimated to save 10 per cent of the energy consumption, totaling $75,000 per year. A simplified form of transfer slip will enable conductors to handle fares more effectively. Adjustment of service to meet seasonal changes in traffic has been more closely scrutinized than in the past. Rerouting of cars on certain west side lines is estimated to save $75,000 a year. Substitution of motor coaches for street cars on three lean routes will reduce the present deficit of $249,000 and may result in profitable operation.

Rapid Transit

In 1919 a rapid transit commission made a report based upon a survey by the firm of Parsons, Klapp, Brinckerhoff & Douglas, recommending the immediate construction of a subway from the Public Square under Euclid Avenue to East 22d Street, Superior Avenue to East Twelfth Street, Ontario Street to the market house, and extending the present west side subway under Superior Avenue to the Public Square. This was estimated at $15,000,000, but now the committee believes the cost would be almost double. In 1919 the question was submitted to the voters of Cleveland and defeated by a decisive margin.

While the committee states that it is possible to build subways in Cleveland, there are some unfavorable conditions that may increase the cost and the question is one of financing.

The Van Sweringen plans for certain additions to rapid transit have not yet been completed. For this reason, and on account of the high cost involved, the committee recommends that subway construction be deferred at least until these local plans have been formulated more definitely.

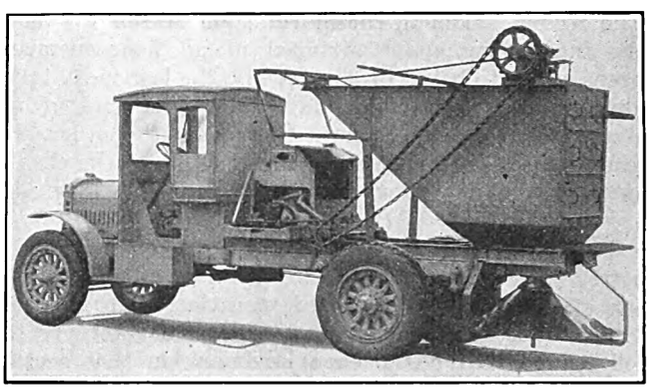
Metropolitan Transportation Board

Because there appears to be no existing agency which is in position to consider from a co-ordinating point of view the many problems of passenger transportation in the Cleveland metropolitan area the committee recommends the formation of a permanent transportation board; the functions of the board would be advisory only; it would hold regular and frequent meetings, and would be certain to develop valuable suggestions and recommendations to the public authorities.

Some of the questions to which the board would direct its attention are betterment of street car service, the most effective co-ordination of street car and motor coach service, the future financing of betterments and extensions by the Cleveland Railway, co-operation among the four municipalities and, lastly, rapid transit lines.

Automatic Sand Spreader Proves Economical

ONE of the problems of bus operation, securing traction on slippery pavement, has been solved by the Public Service Transportation Company, a subsidiary of Public Service Railway, Newark, N. J., by the construction of an automatic sand spreader. In the past it has been the practice of this company to spread sand liberally on grades and asphalt-surfaced roads in wet weather. This spreading was done by hand, and while the method proved satisfactory enough, the labor expense was considerable. Recently two old bus chassis were rehabilitated and equipped with power-operated



Old Bus Chassis Converted by Public Service Transportation Company into a Machine to Spread Sand on Slippery Pavements

sand spreaders. A large bin on the rear part of the body carries the sand. From this bin it is fed down upon a revolving cone mounted below the truck frame. The design is a combination of that of the Public Service Transportation Company and Haiss Company engineers. A separate power plant is used to drive the spreader. This has been found to be more efficient and economical, as the speed of the cone would otherwise be entirely dependent upon the speed of the vehicle. With separate drive, however, it is possible to govern more closely the amount of sand distributed. Two vehicles of this type have been built and are now in use, one on the North Hudson bus routes at Weehawken and the second at Paterson.

An Exchange of Bridges Takes Place in the Beaver Valley

BECAUSE of the desire of the Pennsylvania Railroad to reconstruct its main line between Pittsburgh and Cleveland, in order to avoid passing through the center of New Brighton, and to eliminate some grades, a new right-of-way was constructed. This involved the building of a new bridge crossing the Beaver Valley diagonally between Beaver and New Brighton.

As seen from the pictures, this new bridge involves the destruction of the old structure owned and operated by the Beaver Valley Traction Company and used by it jointly with highway traffic between the communities on either side of the Beaver River.

The pictures show the Pennsylvania Railroad bridge constructed up to the piers immediately on either side of the structures to be destroyed. On Sunday, March 14, the main line of the Beaver Valley Traction Company was cut at this point, connection being made by means of a temporary bus line between the boroughs of New Brighton and Beaver Falls, using the present highway bridge about 2,000 ft. upstream.

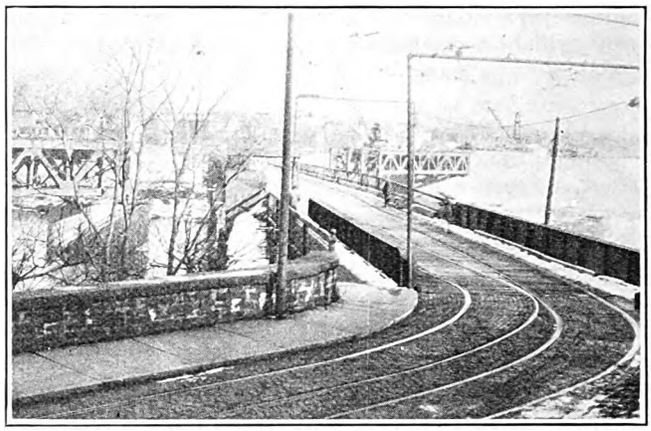
Upon completion of the new Pennsylvania Bridge and trackage circumventing New Brighton, the Pennsylvania Railroad will refloor the present railroad bridge and turn it over for the joint use of highway traffic and the trolley cars.

A very favorable contract was drawn up between the Pennsylvania Railroad and the Beaver Valley Traction Company, the intent of which was that the railroad company would protect and reimburse the Beaver Valley for all expense and losses occasioned by this change. It is estimated that four months will ensue before the cars can use the new route.

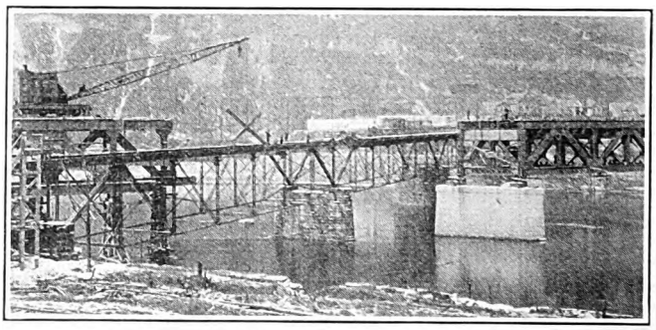
The first view shows the bridge situation on March 9, a few days previous to the close of traffic over it. The second, taken in the morning on March 15, shows the interfering spans stripped of all floor members preparatory to being dropped, while the last view, taken about noon of the same day, shows one end of the structure dropped. Shortly thereafter the other side was dropped. After this the construction of the closing span of the new Pennsylvania Railroad bridge progressed rapidly.

This exchange of bridges, when completed, will give better line and grade to the Pennsylvania Railroad, will effect a slightly improved operation for the Beaver Valley Traction Company and will remove forever the toll bridge that has been a landmark in that section of the country and substitute a free bridge for traffic over the river. An interesting sidelight on the situation will be what measure of success will be possible from the operation of the Beaver Valley Traction Company, cut in its middle and connected by buses.

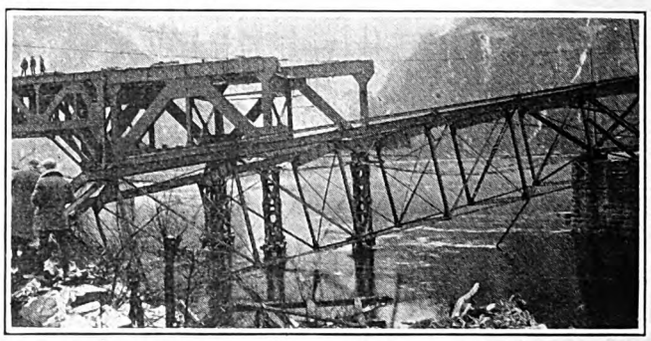
In order to eliminate as far as possible the transfer of local passengers traveling in the zones on either side of the river, the connecting bus route extends from the center of New Brighton paralleling the present track, turning north near the river, crossing the highway bridge over the Beaver River and extending westward for seven blocks to Beaver Falls. Arrangements have been made to connect with all cars. A 10-cent cash fare with free transfers will be charged, except that street car passengers may make this connection with no additional cost, as all forms of street car transportation, including the weekly passes, will be honored, including free transfers to and from the connecting buses.



View No. 1—The Beaver Valley Traction toll bridge over the Beaver River, showing the shore spans erected for the new Pennsylvania Railroad bridge which will cross it at a diagonal. Beaver Valley Traction service and highway traffic were discontinued on Sunday, March 14.



View No. 2—The Beaver Valley Traction bridge stripped of floor members by Monday morning, March 15, and ready to be dropped into the river.



View No. 3—By noon on Monday, the 15th, one end of the interfering span had been dropped. Immediately thereafter the other end of the span was cut and work of completing the river span of the Pennsylvania Railroad bridge was continued.

Removing the Old Beaver Valley Bridge. While Awaiting the New One Passengers Will Be Handled by Buses

The change from rail to operation with the connecting bus line was made easily and without interruption, as indicated by the editorial in the Beaver Valley *News* of March 16, as follows:

Congratulations

Patrons of the Beaver Valley Traction Company in the upper Beaver Valley are today profuse in their expressions of gratitude to the company for the admirable manner in which it is taking care of traffic during the bridge changes. The burden of transportation fell upon the traction company when the period came for dismantling the overgrade bridge to permit of the completion of the new Pennsylvania Lines bridge. With its usual foresight and capable management the traction company took hold of the problem and when the day arrived for action all was set. There were no hitches. Expense of equipment and man power was not considered. In brief, the company "delivered the goods." General Manager C. D. Smith and others of the management, and the car operators and coach drivers are alike to be congratulated.

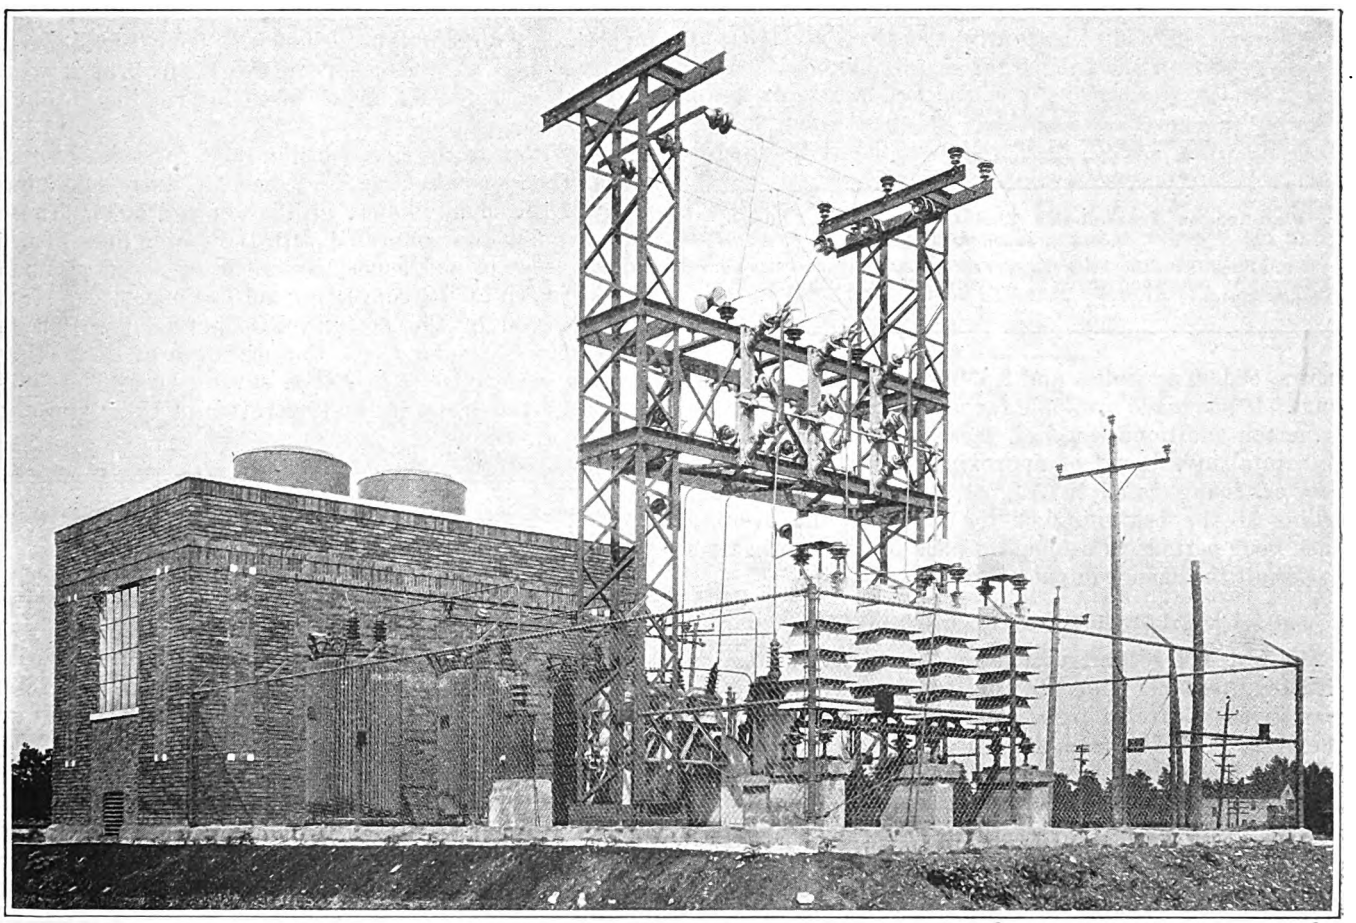
From Receivership to Prosperity in Three Years

FOURTH ARTICLE

Substantial Savings Made in Cost of Power Generation on Chicago, Aurora & Elgin Railroad—Close Control of Heaters Has Reduced Maximum Demand—Three New Substations Built—Advantageous Contract Made with Public Service Company of Northern Illinois



New Automatic Substation at Bellwood. Outdoor Equipment Is Mounted on Pedestals to Avoid Trouble from Snow

IMMEDIATELY upon assuming control of the Chicago, Aurora & Elgin Railroad, the new management engaged C. F. Hirshfeld, director of research of the Detroit Edison Company, to supervise and control the operation of its power plant and substations. After a thorough analysis of the problem, Professor Hirshfeld recommended changes and improvements in the power plant to increase the continuity of power supply and to reduce the cost of generation. As a result of the execution of this program substantial savings in the cost of power generation have been achieved.

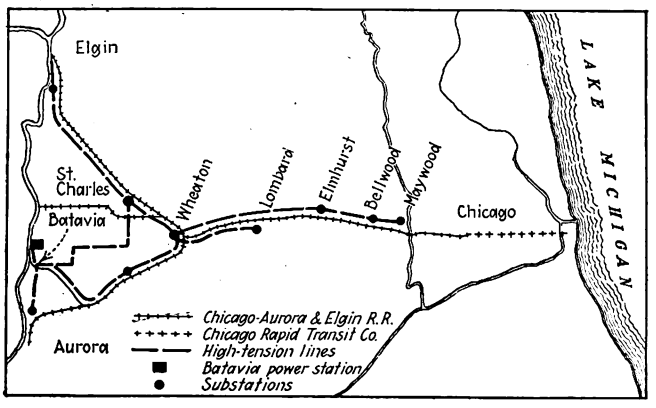
One of the innovations introduced was an unusual method of reducing the central-station and substation demands and kilowatt-hour consumption during the rush-hour periods in the winter months. This railroad has for years used electric heaters in all passenger coaches, in consequence of which the kilowatt-hour consumption and maximum demand rise sharply during the cold winter months. To reduce the heater load without inconvenience to the passengers, men at certain designated stations turn on or off the heat on each train stopping at the station. By this system the control of the matter of heat is taken almost entirely out of the hands of the conductors and brakemen, particularly during the rush hours, and it is possible to make sure that not more than a predetermined number of car heaters will be in use in any given moment. It has been possible to keep the temperature of the cars at a comfortable point, even in most severe winter weather, with only about half the car heaters turned on at any given time. The interval, in minutes, during which heat is turned off is never very long for any particular train. Following this system has saved substantially 1,000 kw. in power demand and has greatly reduced the kilowatt-hour consumption during the winter months.

At the same time careful studies were made to deter-

Digitized by Google

mine the feasibility of cutting down motor loads in the car shops and elsewhere on the property during the rush hours. It was found that, without any reduction in shop efficiency or in the volume of output of the shops or loss through idle labor, it was possible materially to reduce motor loads during the rush-hour periods.

Short service from Chicago to Elmhurst in the rush hours has saved 750 kw. in the demand during the peak hours, 50,000 car-miles and 2,836,000 seat-miles per annum. It has made available for use in rush hour service some ten additional coaches, thereby effecting a saving in capital investment of approximately $330,000. This service, inaugurated in August, 1923, enables several trains at the beginning of the morning and evening rush-hour periods to be doubled back to Chicago in time to permit the same equipment to be used again.



High-Tension Transmission Line Layout of the Chicago, Aurora & Elgin Railroad

Three lines from the Batavia generating station serve the entire system. At Maywood there is a tie-in with the Chicago Rapid Transit System.

DISTRIBUTION SYSTEM OVERHAULED

While track reconstruction work was being done as told in this paper March 6 the entire electrical system was given a careful inspection and defective material removed. High-tension insulators were tested, and where it was necessary they were replaced. For testing high-tension insulators Western Electric 2,200-ohm radio receiving phones were used. One end of the set was connected to a steel peg on a wooden stick, while the other was connected to ground. The steel peg was then brought up against the crossarm at the insulator pin. With the line hot, any defects in the insulator were recorded by means of a buzzing in the test set.

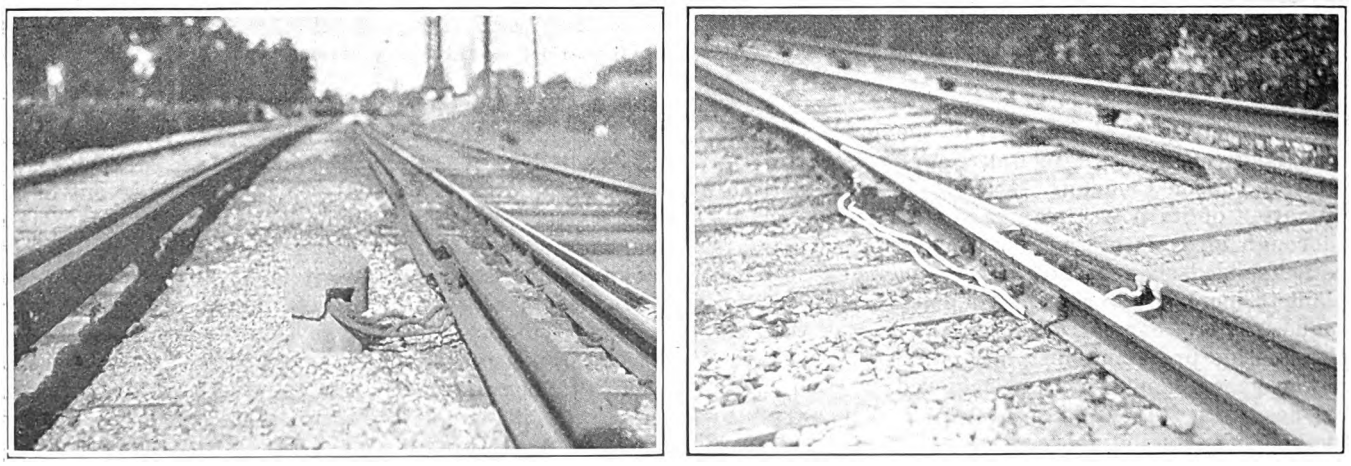
High-tension supply lines have been so planned that a dual feed is provided for all substations between Wheaton and Lombard. One side of this looped high-tension system follows the right of way from Batavia to Batavia Junction on the Aurora line and thence to Wheaton, while the other cuts across country from the power plant at Batavia to Ingalton on the Elgin line, thence to Wheaton. From Wheaton to Lombard the two lines are carried on separate poles, a line on each side of the right-of-way. At Lombard both high-tension lines are connected through the substation. One line continues to Maywood substation, just west of the city limits of Chicago. The Aurora substation is fed by means of a direct high-tension line from the Batavia power house. A substation on the Elgin branch west of Ingalton is fed by means of a line cutting through the Ingalton station.

In addition to the high-tension lines for railway purposes, the company has high-tension lines supplying many of the small villages with power and light. These lines are not interconnected with the power lines of the railway system and hence have little or no effect upon the operation of the converting substations.

Conversion of the 26,400-volt, 25-cycle, three-phase current to 600-volt d.c. for the operation of the rolling stock is accomplished in eleven substations. The location, condition, capacity and operation of these stations are given in the following table:

Location	Condition	Capacity, Kw.	Operation
Aurora	Old	1,000	Manual
Warrenville	Old	500	Automatic
Wheaton	New	1,000	Automatic
Lombard	Old	1,500	Manual
Spring Road	Portable, old	500	(Automatic load limiting) Manual
Bellwood	New	1,000	Automatic
Maywood	Old	1,500	Manual
Maywood	New	500	Manual
Ingalton	Old	1,000	Manual
Clintonville	Old	1,000	Manual
Batavia	Old	500	Manual

There is a tie-in on the d.c. side of the Maywood substation to connect with the Chicago Rapid Transit System at Forest Park. Disconnect switches and meters on the d.c. 600-volt side are located at Laramie Avenue,



Details of Electrical Distribution System on the Aurora-Elgin Line

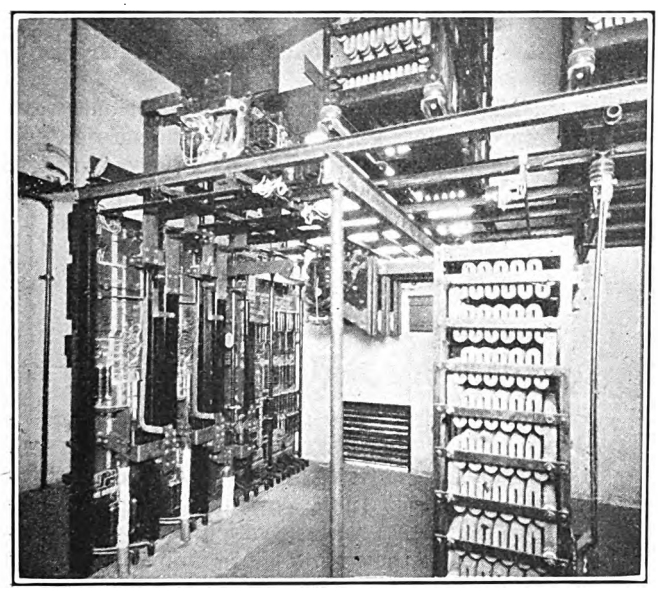
At the left, the standard type of pothead, feeder or jumper connection to the trolley rail. The 1,500,000-circ.mil Kerite cable is incased in a concrete block and the connection between this cable and the three 500,000-circ.mil flexible bonds covered by a concrete removable cap. These bonds are fastened to the base of the trolley rail by a plug terminal. Note in this illustration the drop rail at crossovers and switchpoints to permit the trolley shoe picking up and breaking contact. This type is used in place of inclines quite extensively on the Chicago, Aurora & Elgin Railroad and has proved satisfactory.

At the right, weld terminal copper bonds are used around crossovers and frogs for return circuits.

Digitized by Google

where the Chicago, Aurora & Elgin right-of-way joins the Chicago Rapid Transit right-of-way. These meters are read once a month and the Chicago Rapid Transit Company either bills or credits the Chicago, Aurora & Elgin Railroad for the amount of electricity used or delivered. Sometimes the elevated feeds the Aurora & Elgin and sometimes the Aurora & Elgin feeds the elevated due to failure or shutdowns of adjacent stations.

The new automatic substations at Bellwood and Wheaton are identical in capacity and construction, the only difference being in the feeder circuits, two d.c.



Interior of New Substation Presents a Neat and Tidy Appearance

feeders leaving the Bellwood station and three d.c. feeders leaving the Wheaton station. These feeder circuits have automatic reclosing high-speed circuit breakers. The station itself has full automatic control with General Electric Company's selector type supervisory control from the power supervisor's office at Wheaton. One 1,000-kw., interpole, six-phase, 750-r.p.m. rotary converter is supplied with power from three 350-kva., single-phase outdoor transformers. The high-tension line is cut into the station through FKO-36 oil circuit breakers, which, with the current transformers, power transformers, lightning arresters and other high-tension equipment, are mounted outside of the substation building. Lightning arresters and current transformers have been mounted on concrete piers approximately 3½ ft. high to keep this apparatus out of the snow during the winter months.

The building is of hollow tile construction with pressed brick veneer and is artistically trimmed in limestone. It has a hip roof with concrete channel slabs mounted on steel I-beams. The building is 20 ft. x 30 ft., with the average height of the roof 20 ft. above the floor. The interior of the station is finished with hard cement. An operator's desk of metal construction is located in one corner of the room.

Ventilation is accomplished through openings in the ground directly in front of the building and by two louvres, one in each end wall directly above the floor. Two 4-ft. diameter ventilators are mounted on the roof, these having enough area to take care of all of the air admitted by the openings near the floor. The two openings in front of the building connect with duct lines. One duct leads to an opening directly under the machine and the other to a register in back of the switchboard, directly under the load-limiting resistor units. The air duct to the machine may be closed off by means of a hand-operated shutter, but it is impossible to close the air line to the resistor grids. The louvres in the end walls of the building take care of the air within the building and are so arranged that they may be closed by means of hand-operated shutters.

In addition to the regular automatic equipment mounted on the switchboard, a maximum demand meter connected in the d.c. feeder circuits has been provided in order to keep an hourly record of the station output. The station is visited once a day for the purpose of collecting charge and demand tapes and inspected and cleaned weekly, at which time a report is made.

Negotiations have recently been concluded by the Aurora-Elgin company with the Public Service Company of Northern Illinois for leasing the former's power plant, transmission lines and substations for a long term of years and for the purchase from the power company of the d.c. energy used by the railroad. In addition to receiving a substantial rental for the use of its power facilities leased, the railroad secures the advantages of a large interconnected power system and the provision of its future power requirements at attractive rates for a period of years without the necessity for making any additional investment.

Wage Rates Increase Faster than Cost of Living

WHETHER or not the average wage rate has kept pace with the increased cost of living in this country is the subject of an article in the "Monthly Labor Review" for January, 1926, by Ethelbert Stewart, United States Commissioner of Labor Statistics. His position is that the wage rate has not only kept pace with the cost of living, but within recent years the increase in wages has considerably exceeded the increase in the cost of living.

To make this evident, Mr. Stewart has calculated an index figure to indicate the relative purchasing power of wages as measured in living costs, based on the ratio in 1913 as 100. From these years to 1920 the increase in the cost of living exceeded the index numbers of the rate of wages per hour, but in 1921 the rate of wages increase exceeded the rate of cost of living increase by 15 per cent, and in 1925 the increase was 37.1 per cent. The figures for 1925 cover 717,916 workers, distributed through 66 of the principal cities of the country and cover 78 trades. That the standard of living has materially increased in many of the families of these workers since 1913, the writer says, is hardly open to doubt.

The figures just quoted relate to organized labor and the average wage rate is called the "average union wage rate." To determine whether the same condition applies to labor as a whole, calculations are made of three industries—boot and shoe, woolens and cottons. In these it was found that the purchasing power of wages had increased from 25 per cent to 76 per cent, as compared with 1913.

In view of the extensive use in electric railway wage arbitration of changes of the indexes of the cost of living, these figures are interesting, and may prove valuable.

The Readers' Forum

Annual Maintenance Number Commended

CHICAGO, NORTH SHORE & MILWAUKEE RAILROAD
CHICAGO, ILL., March 26, 1926.

To the Editor:

I wish to congratulate you upon the Annual Maintenance Number of the JOURNAL, dated March 20. To me it is very interesting and instructive, as I am sure it will prove to all railway executives.

The subject of maintenance of track and equipment is one of first importance in the operation of a railroad. The demand of the traveling public is for speed and comfort. To satisfy that demand rolling stock and roadbed must be maintained in the highest degree of perfection attainable.

An easy riding train and a smooth roadbed are the best advertisements for any railroad. I agree with your editorial point of view that railroads in their merchandising efforts should be careful not to economize too strongly on maintenance. It is false economy, and if budgets must be cut down the paring had better be done in other directions.

It is difficult to merchandise inferior goods. Good service is impossible without good equipment and good track and roadbed. I am glad to see the JOURNAL feature so prominently the importance of maintenance.

BRITTON I. BUDD,
President.

KANSAS CITY RAILWAYS
KANSAS CITY, MO., March 27, 1926.

To the Editor:

Permit me to commend the staff of the JOURNAL for the Annual Maintenance Number of March 20, not alone for the information contained, attractive presentation and the subjects covered, but for the way in which the entire maintenance question was tied in with the broad field of transportation merchandising.

It seems to me it is most essential in trying to put the merchandising idea over that we go beyond the transportation department employees. This is about identical with training soldiers who are going to occupy the trenches without at the same time developing the same spirit in the men who furnish the ammunition, food and other supplies from the rear. It is very difficult sometimes to make the fellow greasing curves and cleaning switches understand that he is just as essential a cog in the machinery as the platform men. Every one knows the story of the fellow who tapped car wheels on the railroad for 30 years, and when called into the president's office to be congratulated for his long term of service, and was asked what he tapped wheels for, answered, "Darned if I know."

Maintenance is the very heart of the merchandising proposition, and because the men responsible for proper maintenance work behind the scenes and in a less spectacular position, they are too frequently left out of the merchandising discussions and instruction. Your entire maintenance issue is keyed along the lines of bringing home to every one the vital part that every job plays in the final selling of the finished product.

F. G. BUFFE,
General Manager.

INTERSTATE PUBLIC SERVICE COMPANY
INDIANAPOLIS, IND., March 27, 1926.

To the Editor:

I have read with a great deal of interest the Annual Maintenance Number of the ELECTRIC RAILWAY JOURNAL, dated March 20, which emphasizes the part of the maintenance men in merchandising transportation, and think this number should be read by every one interested in electric railway service.

It is a fact that unless the overhead line, track and equipment are kept in such condition that proper and de luxe service can be given the public will seek some other means of transportation. Modern equipment, well maintained, sanitary and attractive, is most essential today, if the patronage is to be attracted and firmly secured.

Your splendid efforts in stressing the various ways in which improvements may be made in the service, and economies in maintenance effected, are to be commended, as well as the manner in which the manufacturers have reflected this same thought in their advertisements.

HARRY REID,
President.

HENRY L. DOHERTY COMPANY
NEW YORK, March 27, 1926.

To the Editor:

I certainly was pleased to receive the Annual Maintenance Number of the ELECTRIC RAILWAY JOURNAL. This is one branch of our industry which I have always felt has not been given the prominence which it warrants. I feel that the publicity which your paper has given to the work of the maintenance man will be very stimulating to the best interests of the electric railway business.

F. R. COATES.

BOSTON ELEVATED RAILWAY
BOSTON, MASS., March 29, 1926.

To the Editor:

One can have no misgivings as to the fundamental soundness of the fact that railroad men have in these modern days a very vital interest in merchandising transportation. While the transportation men have the show-window problem of delivering the service courteously, with regularity and sufficient to meet all legitimate needs, the physical property with which they must accomplish this can help or harm their efforts. This condition will cultivate a greater degree of intimate cooperation between the two branches of the industry. Ill-advised maintenance economy is just as conducive to poor service as would be demoralized transportation salesmanship.

I congratulate you on the issue of March 20, 1926, and feel confident the maintenance force will appreciate your calling attention to their responsibility as well as their great opportunity.

EDWARD DANA,
General Manager.

Token Clearing House Needed

EVANSTON RAILWAY
EVANSTON, ILL., Nov. 10, 1925.

To the Editor:

If we can find some way to handle the tokens of other companies we receive in our fare boxes it will greatly help the present situation. I have tokens of other companies by the hundred, in many cases only one token of a company, while in others there are from

Digitized by Google

one to 25 or more. It does not pay to write letters and mail these single tokens, for oftentimes the cost is as much as the few tokens are worth, regardless of the bother.

I would suggest that we start a clearing house so that once a month, or as often as necessary, I could mail or express all my foreign tokens and receive a check in return. This would have to be arranged at a set price regardless of the value of the tokens, because it would be impossible to get all companies to pay in a certain amount each year to pay for the cost of handling. I would suggest that we sell them for 5 cents each, in lots of 100. It appears to me that this proposition could best be handled in Chicago because the checks issued would be payable through a Chicago clearing house, in most cases without exchange.

I am, however, at a loss to know who would handle the matter, but if no one else will do it I will assign a clerk to the job and get it started provided you think it is the best way in which it can be done.

CHARLES F. SPEED,
Vice-President and General Manager.

Bus Rumors Grow as the Square of the Distance

MOUNT VERNON, N. Y., March 22, 1926.

To the Editor:

How prophetic were your words: ". . . with the distortion of facts likely to vary with the square of the distance" in your March 13 New York bus story entitled "Transportation Men Must Supply Facts."

Just two days ago the mail brought a letter from Ludwig Spängler, director of the Vienna Municipal Street Railways, asking what truth there was in a cable to the *Vossische Zeitung*, of Berlin, that all of New York's street railways were to be replaced by motor buses!

This reminds me of an old-time German almanac entitled "Der Hinkende Bote" or "The Limping Messenger." Doubtless the data in the almanac were soberer and more truthful than statements on like matters in the country newspapers, but the cover picture of the veteran and his crutch ineluctably lead to the thought, Lies fly, but truth limps.

If the industry wishes to escape a frightful economic waste it will have to do more than lean upon the shoulders of ELECTRIC RAILWAY JOURNAL and the press bureau of the American Electric Railway Association. Such articles as the JOURNAL'S newspaper clipping review of March 13 will justly be acclaimed as "great stuff," but please to remember that these comments will reach only a fraction of the persons who read the original newspapers.

You can't kill a dozen mosquitoes in a swarm without many a severe bite, no matter how you struggle, but you can prevent the birth of thousands with a little crude oil.

What the industry needs is not a denial campaign but an affirmation campaign. Tell the public through real "spreads" in the great magazines and newspapers where buses have proved right and where they have proved wrong; why bus fares are usually higher; how paving and other unfair burdens force railways to give less service at higher fares; and, above all, why no surface-using vehicle—street car, motor bus, taxicab, automobile or truck can refrain from obedience to the "Stop-Stop" which seems always ever so more common than the eagerly sought "Go-Go."

WALTER JACKSON.

European Rail Welding Practice

METAL & THERMIT CORPORATION
NEW YORK CITY, March 4, 1926.

To the Editor:

In the issue of ELECTRIC RAILWAY JOURNAL for Feb. 27 appears an article "Impressions of European Tramways" by James A. Emery, in which, on page 364, the following statement is made: "Heavy flat tie rods are used and no joint welding was observed, although it is understood that welding has been practiced to some extent."

A few paragraphs further down in the same article Mr. Emery particularly calls attention to the fact that, compared with American operation, the cars are almost noiseless, and gives particular credit to the track.

I realize, from the editor's statement, that the impression of Mr. Emery as outlined in this article was more or less of a hasty observation while on a pleasure trip, but in justice to those interested in rail joint welding the impression which he leaves in regard to this particular question of joints should be corrected.

The company with which I am connected has numerous affiliations abroad, and we are very familiar with the practice of joint welding in all of the foreign countries, perhaps more so than any other American organization. The information which we have is considerably at variance with that which seems to be conveyed by this article. Also, the various other articles which have appeared from time to time regarding European practice have all indicated that the standard in track construction abroad is to weld the rails with thermit. This is decidedly borne out by the data which we have.

As a matter of information on this subject, I present the following figures as to the number of thermit joints welded on the European Continent and in the British Isles. It will be noted that the period from 1915 to 1921 inclusive has been omitted, as during this period practically no trackwork was done in any of these countries during the war or immediately thereafter, and the figures would be misleading.

	Number of Thermit Joints
1912	99,800
1913	98,900
1914	96,000
1922	86,800
1923	113,300
1924	187,200

While the figures for 1925 are not available, indications from the records of the first six months are that the number of such welds will run well in excess of 200,000.

When you consider the amount of trackage abroad, it will be readily understood that this number of welded joints must necessarily constitute very close to the entire number required on paved track rehabilitation and extension work. Compared with these records of European practice, we find that in America the thermit joint was used on only about 40 per cent of the new trackage laid during 1925. This proportion has been increasing very rapidly in the last three or four years.

JOHN B. TINNON,
Manager Rail Welding Department.

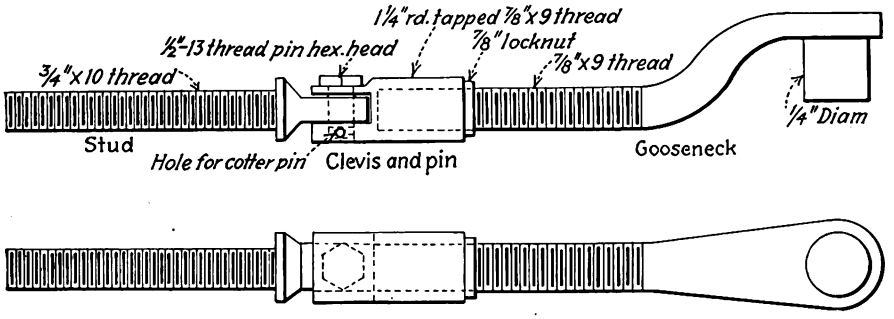
Maintenance Notes

New Connecting Rod Reduces Track Switch Failures

BY H. J. CHARTERS
Portland Electric Power Company, Portland, Ore.

CONNECTING rod troubles amounted to 30 per cent of the total switch failures during the year 1924 on the city lines of the Portland Electric Power Company, Portland, Ore. This created a considerable hazard as a broken rod left the switch point entirely free and might result in a split switch, with consequent derailment of electric cars. As the electric switches are all located at heavy traffic points, it was quite essential to prevent delays.



Connecting Rod for Electric Track Switch

To remedy this condition, a new connecting rod for the company's 23 Cheatham heavy type electric track switches has been developed and is now being installed as rapidly as traffic conditions permit. With the old type construction, the eccentric lever in the track box placed a considerable strain on the rod at the extreme positions of the switch. As a result, the threaded rods soon broke at the switch points. The threaded part was necessary in order to provide linear adjustment. This is necessary since the distance from the switch point to the lever in the track box varies at each location due to the different types of track switches that are in use. The movable connections bent the rod at each movement of the switch and caused the breaking. A scheme of allowing the rod to move slightly at the switch point end was tried, but this was unsatisfactory as the rod tended to revolve unless fastened rigidly.

With the new rod, which is now being installed, the flexible part of the mechanism is placed close to the switch point. This relieves the rod of all strain incidental to the movement of the switch and at the same time provides a means whereby the spring in the track box will keep the point tightly against the sides of the switch to which it is thrown by the magnet. The new rod seats in the track box lever, thus eliminating the link furnished in the previous construction. All wearing parts of the new rod are case hardened to minimize wear. The ½-in. clevis pin is made of chrome vanadium steel, the clevis of cold rolled steel and the stud and gooseneck are of mild steel.

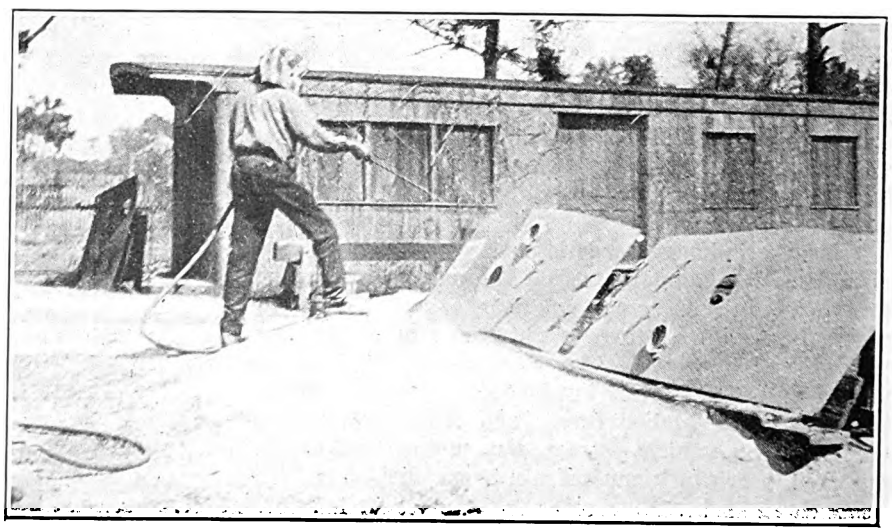
These connecting rods have been installed on Pennsylvania type and also on Buda type switch points, where traffic during rush-hour periods is the heaviest to be encountered on the system and where breakage previously has been about one rod per month. Installation in connection with the Pennsylvania switch provides a very severe test for the rod as the hole in the point of the mallet box pin is considerably nearer the heel of the switch than in other types, thus decreasing the leverage of the track lever.

The connecting rod as shown in the sketch is designed to fit any switch on the city lines, there being four types of switches in use. The stud and gooseneck were made long enough for use on the switch requiring the longest rod. To fit a rod on any other switch it is necessary merely to saw off the stud to the proper length and adjust the gooseneck by means of the threads and locknut. In the case of a very close distance between the switch point and track box lever the threaded part of the gooseneck may be sawed off on the job without any special tools.

The diameter of the clevis is determined by the size of the hole through the switch casting. In the switches used in Portland this hole is 2 in. by 2½ in. and the 1¼-in. diameter of the clevis provides plenty of clearance for free movement of the apparatus.

Removing Paint by Sand Blast

SAND BLASTING with the aid of a home-made outfit has been found very useful by the Mobile Light & Railroad Company. The compressor and supply of sand are housed in an old box car. The rubber hose pipes leading from this com-



Cleaning Dash with Sand Blast in Mobile

Digitized by Google

pressor are about 30 ft. in length, and the sandblasting is done out of doors. The accompanying view shows the sand blast removing paint from car dashers.

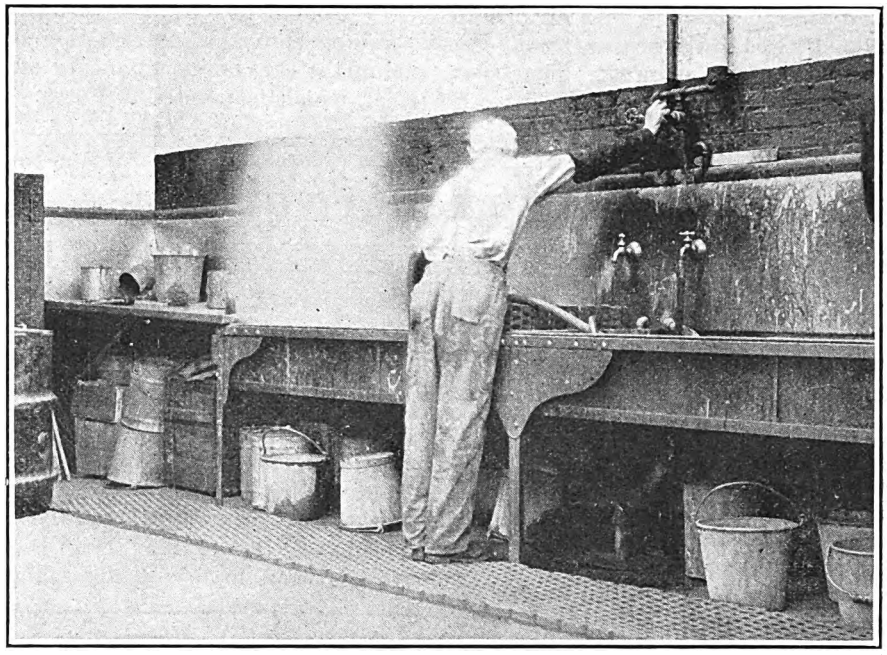
For removing paint in this way, an air pressure of from 80 to 90 lb. per square inch is used. For frosting glass, as for the car numbers on the vestibule sash, the pressure is only from 40 to 50 lb. On the Mobile cars it is the practice to frost the upper vestibule sash to the right of the motorman, as this plan is found to keep out light that might bother him.

A New Use for Old Tires

BY F. J. FOOTE
Superintendent of Motive Power and Equipment Indiana, Columbus & Eastern Traction Company, Springfield, Ohio

USE of heavy pieces of rubber as springs is not new. In fact, the writer can remember many years ago seeing a chunk of rubber 6 in. in diameter and 6 in. high that was used as one of the many truck springs on a steam road car. This rubber, however, was very hard and more like wood than rubber and could not have been very efficient as a spring.

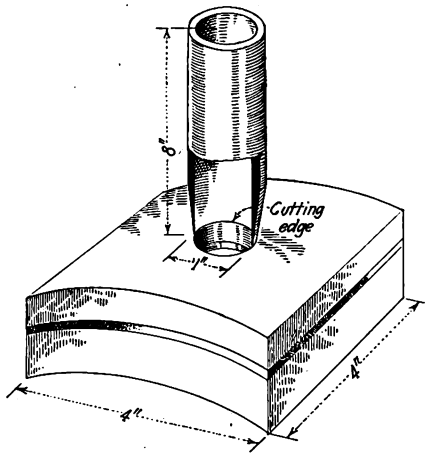
Modern methods of rubber manufacture as applied to tires have produced a product that is comparatively soft and resilient and at the same time stands an enormous amount of wear. About two years ago our company purchased some new cars on which the motors were spring suspended. These springs were about 3 in. in diameter by 3 in. long and were made of ⅝-in. steel rods. After about six months service these springs began to break, due no doubt to the hammering action of the motors on the truck. At this time our company was operating some large buses that used 38 x 7 pneumatic tires. One of these tires failed at the rim, and as the tread was but slightly worn it was cut into blocks about 4 in. square on the bandsaw, and these were strung on the safety bolts of the spring suspension in the same manner as the original springs were. Holes of 1-in. diameter were punched in the center of each block by means of a punch made from a short length of 1-in. pipe. This was pushed through the rubber by an arbor press. In placing these on the safety bolts two, three or four were used at each suspension point as was required to make the necessary length of spring.



Car Mat Cleaning by Steam and Water as Used in the Shop of the Department of Street Railways, Detroit. A Dirty Job Is Made Comparatively Simple and at the Same Time Better Results Are Obtained

These rubber washers have served the purpose of a cushion support admirably and, in fact, have given better results than the steel springs. They have now been in use about eighteen months and seem in as good condition as when first applied. The first cost was practically nothing, as the scrap value of old tires is very small.

The construction of these rubber washers is so simple that sketches seem superfluous. However, I am giving a rough sketch of a completed washer and the punch used for making the holes. A bandsaw is very efficient in cutting these tires, but it must be kept sharp. If the workman is fastidious the corners may be cut off easily or even circular washers made. The curvature, due to the shape of the tire, is not objectionable when used as a spring.



A 1-In. Pipe Is Used to Cut Washers from Old Tires

Washing Car Mats Made Easy in Detroit

CAR mats of the type used in the cars of the Department of Street Railways, Detroit, Mich., get very dirty, particularly in the winter months. A special metal-lined sink has been constructed in which the mats are placed loosely rolled together. A steam and water spray is used to clean them, as shown in the view. The steam not only furnishes pressure to force the dirt from the apertures in the mat but the heat as well aids the loosening of dirt, particularly of an oily nature. This process of cleaning requires only a few moments.

Spray Painting the Bottom of a Car

IN New Orleans it is the practice to spray paint on the under side of steel cars every time that the car goes through the paint shop. This work is done from a pit which is equipped with exhaust pipes to take away the fumes of the paint spray.

The main exhaust pipe from the exhaust fan is connected with 9-in. pipes which enter the side of the pit at a number of points. The outer end of each exhaust pipe in the pit is fitted with a slide so that only those openings near the spray painter need be open.

Before the paint is applied to the bottom of the car, the motors and other parts of the equipment are scraped so as to be free from dirt

Digitized by Google

and are then cleaned with air. Both the bottom of the car and the equipment are painted. The color used is green.

No trouble has been experienced from any spray paint from the bottom of the car coming up on the side panel, which is painted a cream.

New Equipment Available

Prefocused Lamp and Socket

FOR use in railway signals, locomotive headlights and projectors the General Electric Company has developed a prefocused incandescent lamp and special socket. The new lamp has a special base which, when used with the socket, assures the filament of the lamp coming in exactly the same position as that of every other one of the same size and type.

Armored Cap and Cone Insulator

USE of new armored caps and spring steel lock washers developed by the Albert & J. M. Anderson Manufacturing Company is said to overcome two important installation drawbacks to the cap and cone suspension. The objections which have been overcome are the difficulty of pulling the cap up tightly without crushing the insulation and, after tightening, the frequent tendency of the cap to loosen due to the lock washer having become set and therefore ineffective.

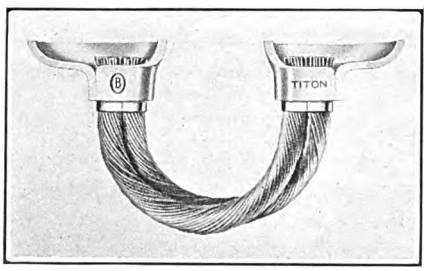
The insulation is molded into the one-piece casting of the armor, together with the steel stud. This insulation, which is stated to be high in both electrical and mechanical strength, is positively bonded to the metal and held permanently in place by fins, which are cast inside and integral with the armored caps. Separation of the insulation from the armor while the cap is being installed is therefore impossible.

It is possible to put great pressure upon the cap. The usual tongs are dispensed with, as the only tool necessary for installation is an ordinary wrench. Where the wrench is used, on the hexagonal top, the armor is the heaviest. The armor is also turned under at the extreme ends and, being metal, a very acute angle is possible; this is of considerable assistance in accelerating drip, thereby greatly minimizing creepage.

With the new hardened spring steel lock washer a positive lock is always assured. It is claimed by the makers that this washer cannot become set or lose its springiness.

Copper Arc Weld Bond

FOR attachment to the railhead by the copper metallic arc welding process, a new type of bond, known as the Titon has been developed and is now being manufactured by the Ohio Brass Company, Mansfield, Ohio. The bond is provided with terminals of heavy steel which support the molten metal as deposited and act as a mechanical protection to the finished weld. These are offset and are large enough to permit the use of an arc drawn from $\frac{3}{8}$ in. to $\frac{1}{2}$ in. without the usual danger of securing a porous or incomplete weld, since the arc is easily directed to the desired welding point. This and the use of the copper metallic arc process with copper alloy as the electrode simplifies as well as expedites installation.



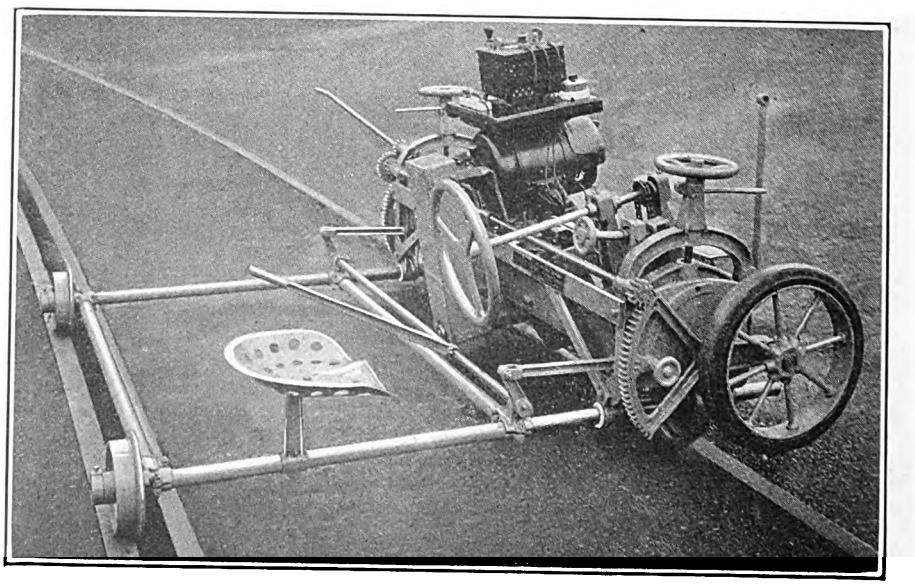
The Titon Bond Has Been Developed for Attachment by Metallic Arc Welding

It is stated that the design of the terminals and the thickness of terminal walls assist in effecting a complete homogeneous fusion of the copper strand terminals and railheads. This insures maximum conductivity and strength of the bond with a minimum use of welding material. During the past two years the Titon bond has been undergoing extensive tests under conditions of actual service.

Rail Grinder

SEVERAL improvements have been made in the Atlas Rail Grinder manufactured by the Railway Trackwork Company, Philadelphia, Pa. A tilting grinding wheel has been provided and the controlling tilting arrangement made simpler in design and more easily operated than was possible in earlier models. With the new arrangement it is necessary only to turn a small handwheel to adjust the grinding carriage to any angle of grinding which may be desired.

The method of changing grinding wheels has also been simplified. It is now necessary only to remove one nut from the emery wheel flange, thus doing away with the removal of the arbor pinion or drive chain. The present model of the grinder may be derailed merely by turning the hand-crank at one end of the machine. This lowers the derail wheels to the pavement and raises the grinder from the track. Thus 90 per cent of the weight of the machine is supported on the two roadway wheels. The operator can then lift the outrigger end of the machine and pull it off the track.



Improved Atlas Rail Grinder Embodies Several New Features

Co-ordinating the Bus with Existing Transportation Facilities*

Latest Methods Developed by Philadelphia Rapid Transit Company in the Operation of Gas-Electric Equipment—Gas Consumption May Be Slightly Higher for This Type of Equipment, but Is Considered Justifiable—Results So Far Show Deficits

BY R. H. HORTON
President Philadelphia Rural Transit Company

UNDOUBTEDLY the few years just past and those in the immediate future are proving the most important in the entire life of the urban transportation enterprise. We electric railway men have only recently discovered that we are not so much operators of electric railways as purveyors of transportation to the public. We have discovered that which the merchant has always known—that the public taste is fickle and changes rapidly, and that where a man wears a cotton shirt today, tomorrow he demands a silk shirt, and the man who stocks only cotton shirts to sell is lost.

Of course we must still sell electric railway transportation, for we all see many instances where nothing else can suffice, but we are awakening to the fact that many different varieties of transportation exist and the public taste for them must be met. This is particularly emphasized by the fact that in 1920 only sixteen electric railway companies were operating motor buses, while in 1925 280 railway companies were using them. So today the industry finds itself in a state of flux and with the problem before it of consolidating and co-ordinating the various methods of transportation. In Philadelphia we have subways, elevateds, street car lines, motor buses and are about to add the taxicabs. All of these should be properly co-ordinated with a view to placing at the service of the community that type of transportation which is best suited for the occasion.

Some of our transportation men view the motor bus as merely a street car on rubber tires and a purely transportation vehicle and are emphatic in the declaration that the deathknell of the rail car has sounded, while the other extreme is fully as emphatically stated by many that the motor bus is but a plaything, a fad of the moment and in a few years will be as hard to find as the old-fashioned bicycle. But is it necessary to make a determination of this question? The exact position of the automotive vehicle in the problem of transportation is to the minds of many not presently solvable, and I must confess that the more study I give to this problem the more confused I find myself becoming. The motor bus has some very definite positions between these extreme views, but the development is now in that anomalous position where the motor bus may operate more cheaply in one location and the electric car in another because of the important variable factors involved, which must be considered in each specific case under consideration.

That the bus can ever take over the entire field of transportation seems to be subject to grave doubt. That surface rail transportation will disappear in some communities seems to be a reasonable assumption. In fact, in a few very small communities it has. On the other hand, in some larger communities, where the bus has attempted to handle the entire business, including the rush-hour load, it has met with failure.

In Philadelphia we are faced with a situation that we have certain streets and boulevards upon which it would not seem to be proper, from an esthetic viewpoint, to plant rails, poles and wires. There is a demand for transportation; the motor bus is available to care for it, and hence these routes are being established. We have some territory sparsely populated and in need of development, which development will be accelerated upon the supplying of transportation. In such cases the broad interest of the community demands that the prime consideration be: Can the community as a whole afford to supply this unprofitable transportation enterprise in order that this one section of the community may benefit? In the past, with only rail lines to depend upon, such services have been difficult to provide and in many instances have proved to be too great a drain upon the community. With the motor bus at hand our task is much simpler, for with a comparatively small investment one or two buses can serve a community, with consequently a smaller amount of loss.

The congestion of our city streets is ample proof of the demand for a quicker and more comfortable kind of transportation, as well as a reflection of the fad of the day to ride on rubber. The passenger automobiles entering and leaving the central business district of Philadelphia on a typical weekday increased 177 per cent in the last six years. There are more than 100,000 additional passenger automobiles daily entering and leaving this narrow district bounded by Arch and Walnut Streets and the two rivers than there were six years ago. On an average these vehicles contain less than two passengers. Such an uneconomic use of the city's streets with the enormous expense of policing and maintaining cannot continue. We find that automobile passengers use 50.4 sq.ft. of street space per passenger in comparison with 8.2 sq.ft. per passenger for surface cars, and an estimate of 7 sq.ft. per passenger for double-deck motor buses, assuming that it is only half full on an average.

The foregoing represents more or less the reasons for the street railway com-

pany establishing a motor bus service and placing an order for 200 vehicles in January, 1925, which was followed by another order for 160 more in January, 1926. These buses were all of the gas-electric type.

During the month of February our over-all speed has been 10.62 m.p.h.; this figure is obtained by dividing the total time the buses are on the street by the total mileage made. The average schedule speed, being the result of dividing the miles operated by the actual running time between terminals, is 12.02 m.p.h. I have not complete figures before me, but I shall be very much surprised to learn of any company that maintains an average speed as high as this, and I might also remark that in these calculations the interurban buses have been eliminated.

The maximum mileage which we have accumulated on any one vehicle is on bus No. 501, which has operated a total of 47,351 miles, commencing in August, 1925. During this period the bus has been pulled in twice: on Nov. 3, 1925, for a broken starter and on Jan. 3, 1926, for a burnt out ignition coil.

Most bus operators have established an inspection every 2,000 miles. When starting our operation here we adopted the same principle and we are now just beginning to study the refinements which will be possible. Our first step has been to increase the period of inspection in one of our garages to 4,000 miles. We have no doubt of its success. Therefore, so far as labor cost is concerned, we have cut our garage maintenance in half. We have just made this first change in our inspection period and therefore cannot give data as to its result. Inspections at intervals of 15,000 to 20,000 or even 25,000 miles do not appear to us to be an unreasonable expectation. The entire principle of inspection, however, we expect to change. We have been working with the manufacturers of electrical apparatus to develop a watt-hour meter for measuring the power output or consumption. Mileage has heretofore been used as a measure of work done, but we submit that miles are extremely variable and that 2,000 miles of operation on one route may represent far more work done than 2,000 miles of operation on another route. By the use of these meters on the buses, however, we shall have a positive index of work done. The meter has three dials, each equipped with a moving and a stationary hand. The stationary hand is set at a point representing the amount of power which may be produced or consumed before inspection is necessary. When the moving indicator coincides with the stationary one, indication is given that inspection is due.

Our accounting department will keep track of the gas consumed by each bus, the mileage operated and the kilowatt-hours used. Kilowatt-hours per gallon of gasoline should be fairly constant and definite after once being determined. The instant that a particular bus shows a reduced number of kilowatt-hours per gallon it is a definite notice that something is wrong with the engine, the generator or the driver. This indication is definite and positive. The number of kilowatt-hours per mile is not so accurate a measure, for in this instance obvious variables must be taken into consideration.

After the inspection and overhaul are completed the bus will be connected to a water rheostat and operated under test with a given quantity of gasoline, probably one gallon. In this test the engine will be gradually accelerated from idling speed and the voltage and amperage read at various revolutions per minute. This will give an index as to whether the generator is functioning properly and producing the correct amount of current at the various revolutions per minute. A more delicate watt-hour meter will be installed here and the total watt-hours for this gallon of gasoline will be determined. Thus at the close of the test, which should not consume more than fifteen minutes, we shall be able to tell whether the inspection and overhaul have put the bus in proper operating condition.

We have been operating in the city of Buffalo six six-cylinder "ZY" type Yellow Coaches which are almost duplicates of the ones operating here, except that they are equipped with a mechanical drive. During the month of October their gasoline consumption averaged 3.98, or say 4 miles per gallon, which is, let us say, 0.7 of a mile per gallon better than our expected minimum. This may be the price which we may have to pay for the advantages of the electric drive, although I am not ready to concede that until after we have made an effort to train our drivers as Buffalo has.

Fundamentally, when we are talking of gasoline consumption we are talking of costs which are about 4½ cents per mile, and when we speak of the advantages of the electric drive we mention first and foremost the high average speed, in which case we are dealing with costs of about 14½ cents a mile for wages alone. Therefore a factor which affects gasoline consumption to the extent of 10 per cent will affect costs to the extent of about 45 mills, but a factor which affects speed to the extent of 10 per cent affects costs to the extent of about 1½ cents for wages alone, and furthermore affects the fixed charges in the same ratio as well as the revenue itself.

The foregoing discussion has concerned gasoline consumption on double-deck buses. I regret that I have no figures of six-cylinder single-deck buses with which to compare our records.

Oil consumption is always a matter of concern to the operator, and in this respect our records have been not only most satisfactory but most surprising. We find the six-cylinder buses in Buffalo averaging during a month about 24 miles per quart of oil, while our gas-electric buses show an average of about 38 miles. This result is obtained because of the lesser peak of revolutions per minute on the electric drive and the lesser number of engine revolutions necessary on this type of vehicle.

Net income to date has been written with red ink, largely due, however, to the fact that we have included a large number of feeder and undeveloped lines in our operation; also that we have not been able to operate on Broad Street because of subway construction, and it is on this route that we expect our most successful operation.

This motor bus is a new development, but the same principles obtain and the greatest joy of its operation comes from the freedom with which it can be routed and rerouted, detoured or turned back, as the traffic demands.

Second Highway Safety Conference Meets

APPROXIMATELY 1,200 men and women from all parts of the country attended the three-day session in Washington, March 23-25, of the second national conference on street and highway safety called by Secretary of Commerce Hoover. The first of these conferences, which met in December, 1924, adopted as the result of numerous committee studies a program of highway traffic relief which has had a considerable influence on the development of highway traffic practice and laws in all parts of the country. The second conference proceeded from the point where the first one left off. Last spring committees were appointed which have had numerous meetings and which presented to the current conference the results of their deliberations and their recommendations.

The purposes of the two conferences have been given as follows: First, to focus public attention on the appalling increase in street and highway accidents, and, second, to develop a comprehensive program for improvement of traffic conditions and reduction of accidents upon which all concerned, including state and municipal officials and others interested, could agree. The six committees which have been working on the program were (1) uniformity of laws, rules and regulations, (2) enforcement, (3) causes of accidents, (4) metropolitan traffic facilities, (5) statistics, and (6) public relations.

The major part of the deliberations of the conference was given over to the adoption of a model motor vehicle law to serve as a general pattern for states and municipalities. The proposed measures, which include registration and title certification acts, a chauffeur license act and a code for vehicle operation, follow in the main the recommendations of the committee of experts, though changed in some minor particulars. The conference also indorsed the report of the committee on enforcement, which recommended measures of organization and procedure to secure better enforcement of the laws and regulations affecting street and highway safety, and approved the report of the committee on causes of accidents. This committee gives such information as is available as to causes of accidents and outlines a program for determining the cause of accidents with a view to their elimination.

The report most interesting to railway men was that of the committee on metropolitan traffic facilities. This report outlines a program for improvement of traffic facilities and recommends suitable plans of organization for its accomplishment. Little discussion was given to this report on the

Digitized by Google

floor and to the report of the committee on statistics, which presented essential facts of the accident record together with its recommendations as to improvement in the collection and analysis of accident statistics.

Central Traffic Association to Hold Special Meeting

IN ACCORDANCE with the action taken at the meeting of the Central Electric Traffic Association held on March 17 and 18 a special meeting of the association will be held at the Keenan Hotel, Fort Wayne, Ind., on Wednesday, April 21, beginning at 9 a.m. This meeting is called for the purpose of conducting the regular business of the association. Being a one-day meeting, the chairmen of the various committees have been requested to call their committees together and have their reports in shape for presentation prior to the time when it is planned to assemble at Fort Wayne.

American Association News

American Executive Committee Meets

Plans for the Cleveland Convention and Various Committee Reports Filled a Busy Session—Membership of Association Increased

REPORTS on the development of plans for the coming annual convention at Cleveland, growth in membership, national relations and progress of various standing committees were made at a regular meeting of the American Electric Railway Association executive committee held at association headquarters in New York on March 26.

As chairman of the membership committee, J. H. Hanna reported an increase in company members from 733 on Jan. 29, 1926, to 736 on March 26. Individual members have increased from 932 to 1,022 during the same period. This, according to Mr. Hanna, represents an increase in individual members of 20 per cent since the present drive for this class of membership was instituted.

Chairman J. P. Barnes of the committee on subjects and meetings outlined a general program which the committee has under consideration for the Cleveland convention next fall. The procedure followed in recent years of setting aside an afternoon for the inspection of exhibits will be repeated. An evening meeting under the auspices of the Advisory Council is also planned. To conserve time and to make room on the program for speakers, committee reports will again be presented in the form of brief abstracts by the various committee chairmen. These tentative plans were approved by the executive committee.

Convention Arrangements Reported

Arrangements for the convention at Cleveland were reported by C. E. Morgan, chairman of the location committee and of the special sub-committee that was appointed at the last meeting with power to act in consummating arrangements for the convention. There will be available at Cleveland 111,000 sq.ft. of indoor exhibit space, in addition to 7,200 sq.ft. of outdoor space for working exhibits of construction equipment and 1,500 lineal feet of track space for the exhibition of cars. The indoor space will be located in the Cleveland Auditorium building and in a temporary building approximately 200 ft. x 400 ft. in gross dimensions. This temporary structure will be connected with the auditorium in a manner to put the entire exhibit in effect under one roof. There will be an 18 ft. net overhead clearance under the roof girders of the temporary building. A price of 75 cents per square foot has been established for inside or outside exhibit space. This is based on the sale of 100,000 sq.ft. A charge of $4 per lineal foot will be made for track space.

It was the opinion of the committee that handling and labor costs for setting up exhibits will be much lower than was the case last year at Atlantic City. On this basis it is expected that the total cost to exhibitors despite the increase in space rates will be less than the amounts expended at Atlantic City last year. No small part of this saving will be effected through lower hotel costs.

Cleveland Committee Organized

Cleveland hotels have underwritten more than 3,000 rooms for the period of the convention. All local arrangements will be handled by a special convention bureau appointed for the purpose. The association will deal directly with this bureau. A special hotel committee headed by Paul E. Wilson, secretary Cleveland Railways, will receive all applications for hotel reservations on special blanks which will be provided for this purpose and distributed to all those expecting to attend the convention.

The Cleveland arrangements will be handled by the following special committee: W. R. Hopkins, city manager of Cleveland; H. K. Hauk, general manager G. C. Kuhlman Car Company; G. W. Lucas, president Cleveland Frog & Crossing Company; T. E. Monks, vice-president Guardian Savings & Trust Company; W. J. Hanley, district manager General Electric Company; W. C. White, president White Motor Company; F. W. Campbell, manager railway section Westinghouse Electric & Manufacturing Company, and John J. Stanley, president Cleveland Railway. J. H. Alexander, Paul E. Wilson and S. J. Cotsworth, chairmen of the exhibit, hotel and entertainment committees, respectively, and C. E. Morgan for the executive committee will represent the association on the Cleveland committee.

Resolutions prepared by the exhibit committee to enlist the co-operation of all manufacturers in avoiding practices that would detract from the regular exhibits were read by F. C. J. Dell. These are to be put in final form and published at a later date.

In the absence of Chairman Reid, Charles L. Henry, attorney for the committee on national relations, reported on developments in Washington. Progress in the hearings on proposed legislation for the regulation of interstate bus operation was outlined. Motor truck interests were the only element reported in direct opposition to the bill.

On a rehearing before the Interstate Commerce Commission, the committee plans to test the question of the jurisdiction of the commission over the electric locomotives of independently operated electric railways. This matter has been raised by the issuance by the commission to all electric railways reporting to it of a pamphlet containing rules and instructions for inspecting and testing of locomotives other than steam.

Various other committee reports were submitted during the meeting. A recommendation by the publicity committee for a contribution of $250 to defray part of the cost of an exhibit of utility advertising at the Philadelphia meeting of the Associated Advertising Clubs of the World was approved. A convenient handbook of prepared addresses on electric railway subjects, which was prepared for the speakers' committee, was distributed among the executive committee for inspection. It is planned to add addresses on other subjects to this handbook.

James P. Barnes reported on the proceedings at the recent national conference on street and highway safety. J. W. Welsh read the report of the Accountants' Association. In the absence of Mr. Stuart, Morrell W. Gaines represented the advisory committee on electric railway financing. J. N. Shannahan commented on the excellent report which was rendered by this committee at the Atlantic City convention last fall and said that the industry is indebted to the committee for its excellent work in the preparation of its report. He said that this valuable contribution to the upbuilding of the industry would be lost unless individual companies follow the advice given in the report.

Publication of the book of railway operating practices compiled by the committee on management and operation was reported by G. C. Hecker. Members of the executive committee subscribed for several hundred copies to aid in the distribution of the book.

G. A. Richardson, chairman of the rapid transit committee reported that the committee's engineer, E. J. McIlraith, whose services were donated by the Chicago Surface Lines, has been in the field collecting the data to be used in the committee's report. G. C. Hecker, chairman of the manufacturers' engineering committee, which has been working on the preparation of recommendations for car sizes and weights to meet the requirements of average

Digitized by Google

electric railway operating conditions, reported progress in the preparation of the committee's report. He said that this report would soon be ready for submission to the manufacturers' executive committee, when that committee, whose appointment was left in the hands of Mr. Storrs, is organized. Mr. Hecker suggested that upon completion of the report an effort be made to enlist operating companies in support of the recommendations made by the committee. H. H. Norris represented the educational committee and distributed several pamphlets that have been prepared to cover various phases of employee educational work. Demonstration of a foremen's conference similar to that recently made by Mr. Norris before the Central Electric Railway Association at Indianapolis is being considered by the program committee for the Cleveland convention.

The following were present at the meeting:

President Frank R. Coates, J. H. Hanna, B. A. Hegeman, Jr., R. P. Stevens, Charles L. Henry, C. E. Morgan, C. R. Harte, H. H. Norris representing Mr. Dana, G. A. Richardson, J. N. Shannahan, S. J. Cotsworth, E. P. Waller, J. P. Barnes, T. A. Kenny, M. B. Lambert, Morrell W. Gaines, L. H. Palmer and Managing Director L. S. Storrs, J. W. Welsh, F. C. Dell, G. C. Hecker and J. W. Colton of association headquarters.

It was decided to hold the next meeting of the committee on May 14, the location to be announced later.

Wednesday Exhibit Day—Outside Demonstrations Barred

WEDNESDAY, Oct. 6, has been set aside for inspection of exhibits at the Cleveland convention, through the following resolution passed by the executive committee of the American Electric Railway Association at its meeting held March 26:

Whereas the practice of setting aside one day during the convention week for the intensive inspection of exhibits by operating members has proved to be a general success during the two previous conventions, and

Whereas, many expressions of appreciation and other favorable comment from both railway and manufacturer members have resulted from this practice, be it

Resolved, That the executive committee in meeting assembled this 26th day of March, 1926, again votes to set aside Wednesday, Oct. 6, 1926, as a day to be devoted exclusively to exhibit inspection, and requests that no meetings of any kind be scheduled for that date.

Resolutions were also passed in disapproval of the practice of holding demonstrations of equipment away from the exhibit buildings. These resolutions follow:

Whereas certain manufacturers of automotive equipment have in past years brought buses to our conventions and parked such vehicles at advantageous points in the vicinity of prominent hotels and extended invitations to delegates to accompany their representatives on demonstration trips, and

Whereas certain other manufacturers in past years have staged exhibits in hotel rooms, and

Whereas such practices tend to defeat the purposes of the exhibition by reason of such railway delegates absenting themselves at various times from the exhibition proper and thus neglecting the study of exhibits of other manufacturers, and

Whereas the action of this committee last year in withholding its approval of such practice proved to be so satisfactory for all exhibitors at the convention, be it

Resolved, That this executive committee in meeting assembled this 26th day of March, 1926, hereby again votes to look with displeasure upon manufacturers having demonstration trips or exhibits at any place other than that designated by the association, and be it further

Resolved, That the secretary be instructed to transmit copy of this resolution to all manufacturer members and through the Cleveland convention committee, to public authorities in the city of Cleveland interested in co-operating with the association; also to the convention board of the Cleveland Chamber of Commerce and the managements of the various hotels in the city of Cleveland with the request that all of those interested lend their kindly assistance and co-operation in seeing that the spirit of this resolution is carried out.

Equipment

FOURTEEN members of the equipment committee of the American Electric Railway Engineering Association spent two busy days in Detroit, Mich., March 22 and 23. The first day was taken up by a business session held at the Book-Cadillac Hotel, and the second day was devoted to inspection trips through the River Rouge plant of the Ford Motor Company and the Highland Park shops of the Department of Street Railways. At the railway shops, in addition to demonstrations of maintenance methods an inspection was made of a large number of cars finished with cellulose lacquer systems.

Those present were P. V. C. See, chairman; W. S. Adams, W. C. Bolt, R. S. Bull, A. T. Clark, R. W. Cost, M. R. Hanna, J. M. Hipple, W. H. McAloney, J. C. McCune, R. B. Smyth, J. P. Staples, C. W. Squier and H. S. Williams.

Work decided upon for existing and new standards included two new brake-shoes for A.R.A. contours, reducing of maximum journal box width $\frac{1}{32}$ in., increasing minimum width of standard journal bearings $\frac{1}{32}$ in. and revision of demensions for journal bearing wedges and bearing and wedge gages. A new specification for wool waste was determined on.

Subject No. 2 included a study of brake equipment. J. C. McCune, chairman of the sub-committee, made recommendations for hand-brake equipment that is to be proposed for standardization, and presented a miscellaneous method and practice to cover the installation and maintenance of air brakes.

In the study of car-painting methods R. S. Bull, chairman of sub-committee No. 3, presented a preliminary report for discussion. This was revised and added to. It is to be rearranged for consideration at the next meeting of the committee. This sub-committee, along with others interested in painting, is to make an inspection in Pittsburgh on April 19 of a large number of cars that have been finished with cellulose lacquer, some of which have been in service for two years.

The sub-committee on motor coach design and maintenance outlined an inspection schedule. This is to be amplified for presentation at the next meeting of the general committee.

A progress report was presented on gearing and gages to determine when gears and pinions are worn out. The committee on desirable changes in the boiler code reported on developments that have taken place looking to a rehearing on certain points unsatisfactory to railways.

A preliminary report by H. S. Williams, chairman of the sub-committee on modernization of car equipment, brought out extended discussion. This report is to be revised and added to for presentation at the next committee meeting. This sub-committee is also making an extensive study of car lighting. R. W. Cost of the Westinghouse Lamp Company outlined various things that should be considered and reported on in this study.

Subject No. 8 includes the development of a miscellaneous method and practice on motor leads, connectors and supports. R. B. Smyth, chairman of the sub-committee, presented a progress report. Some changes were decided upon which will be made so that the final report can be presented for further consideration.

Manufacturers' Engineering Committee

A MEETING of the manufacturers' engineering committee which has been considering sizes, types and weights of cars to meet average city and interurban conditions was held at association headquarters on March 29.

Consideration was given to the draft of a report outlining the purposes and conclusions of the committee. Drawings of typical cars embodying the recommendations of the committee have been prepared. It is planned to include in the report the presentation of data from the experience of various properties showing instances of increased revenue or decreased expense resulting from the operation of improved modern cars. Another section of the report will analyze the age of electric railway equipment now in service.

New Members Elected

ELEVEN company and associate members and 98 individual members were elected at the meeting of the American executive committee held on March 26. The new company and associate members follow:

Operating Companies

Pacific Northwest Traction Company, Everett, Wash.

Wheeling Public Service Company, Wheeling, W. Va.

Associate Members

J. Rowland Bibbins, consulting engineer, Washington, D. C.

Gulick-Henderson Company, Inc., New York, N. Y.

Manufacturer Companies

The Arco Company, Cleveland, Ohio.

Dayton Rubber Manufacturing Company, Dayton, Ohio.

Doyle, Kitchen & McCormick, Inc., New York, N. Y.

Fageol Motors Company, Oakland, Cal.

Mack-International Motor Truck Corporation, New York, N. Y.

Mack Motor Truck Company, New York, N. Y.

Mack Trucks, Inc., New York, N. Y.

The News of the Industry

Utica Fare Issue Aired

Hearing was continued on March 31 by the Public Service Commission on the petition of the Utica Lines of the New York State Railways for permission to charge a 10-cent cash fare and 7½-cent ticket fare.

The entire day was devoted to cross-examination by Milo R. Maltbie, the expert engaged by the city, of H. C. Throop, who made the appraisal of the company's property, and J. M. Joel, the auditor. Mr. Maltbie questioned both witnesses at length on their testimony.

At the opening of the hearing Warnick J. Kernan, representing the company, suggested that the petition of the company for a temporary increase in fare pending determination be held in abeyance for the present, in view of the fact that there seemed to be some doubt as to the power of the commission to grant a temporary rate under the public service commission law.

Corporation Counsel Clarence E. Williams filed with the commission on April 1 an answer to the company's petition for a temporary increase. He argued that it should not be granted until after there had been opportunity for investigation, and that if the temporary increase were granted and it were later found not justified there would be no adequate remedy to recover the increased fares paid in.

Hearings were started on March 10 by the Public Service Commission on the petition of the New York State Railways for permission to increase fares in Syracuse and vicinity to 10 cents cash and 7½ cents for ticket fares. After introduction of testimony by the company to show that the present fare did not yield an adequate return on the investment an adjournment was taken.

Public Ownership of Boston Elevated Suggested

There is considerable doubt on Beacon Hill that the proposed legislation to extend the public control of the Boston Elevated Railway, Boston, Mass., 30 years will be enacted this year. The opposition is strong and may result in reference to the next general court. Winthrop Coffins, who is one of the public trustees, is opposed to the bill. He advises the Legislature to go slow, contending that there is no urgency. The Boston Chamber of Commerce has gone on record in favor of the 30-year extension. Senator Abbott B. Rice of Newton, who is prominent in financial circles, is opposed to the bill. He has a new plan which he presents as follows:

I have always been opposed to public ownership of any business, but this is an extraordinary situation. The state is already in the street railway business, but finds some difficulty in extricating itself; then why not face the situation and make the best of it? Some one may question the above statements. So let me make it perfectly clear. Let the state take over the road by eminent domain. Pay for the road by issuing 30-year bonds on a basis of 3.8 per cent. To continue under state control the carrying charges will be more than 5½ per cent on the capital invested. By using the state's credit, about $1,800,000 is annually saved in the carrying charges on invested capital.

This amount put into a sinking fund at 4 per cent will total $105,000,000 in 30 years. If additional capital goes into the road it will have the same relative result. The sinking fund will practically retire the bond at the end of 35 years and the state will own the Elevated outright, and it will not have cost the commonwealth one dollar.

I offer this solution only as a substitute for a 30-year extension of public control. Knowing these facts, no legislator in my opinion can justify his action in voting for 30 years of state control.

There are many legislators who favor a ten-year extension of public control, provided this extension will yield annually the $1,000,000 additional capital which it is claimed the Elevated must have during the next ten or twelve years.

I suggest the following plan to go into effect as of July 1, 1926, provided that on or before that date the common stock holders agree to accept in place of the present cash dividend of 6 per cent a dividend of 4 per cent in cash and 2 per cent in new stock. The 2 per cent of stock given to the stockholders is paid for out of the fund which is at present set up from earnings to pay the 6 per cent dividend on the common stock. This gives the Elevated $475,000 a year from the sale of new stock. The trustees will have no difficulty in selling an equal amount of bonds on a basis of 5½ per cent or possibly 5 per cent. This plan provides $950,000 a year. The management claims that this new capital is to be used for rolling stock, power and shop equipment, and other miscellaneous items, which will bring about operating economies of $400,000 a year. This saving, treated as new capital, gives the Elevated more than $1,000,000 during the period of public control, and at a rate of less than 6 per cent. This solution of the Elevated problem would be fair to the car rider, to the state and to the stockholder.

The City Council of Boston, Mass., has joined the opposition to the proposed 30-year extension of the public control of the Boston Elevated Railway. The Council has voted to instruct the city law department to oppose the bill before the Massachusetts Legislature.

Competition Unlikely at Des Moines

Council Elected in Iowa City on March 29 Realizes Futility of Competitive Systems—Railway Announces Operation of Bus in Co-ordinated Service—Railway Earnings Now in Red

RE-ELECTION of a majority of the Des Moines City Council at the polls on March 29 practically assures that the Des Moines City Railway will have no bus competition in the next two years. Councilmen Mitchell, Morris and Jenney, who were all returned to the city hall for another term, were members of a Council strongly anti-bus in sentiment, and regardless of the attitude of the two new Councilmen, Fred H. Hunter and Frank Mathis, it is believed that no outside bus concern will stand a show of getting a franchise.

Officers of the Capital City Motor Coach Company, organized last fall, said that application will be made to the new Council for a permit to operate on Des Moines streets not paralleling the street car lines and on highways where car service is not available. However, this is the same organization which abandoned plans to submit its request to the former City Council several months ago after sounding out the views of the members on a similar proposal.

Announcement of F. C. Chambers, president of the traction company, that two cross-town bus lines will be established within the next 30 days, with full transfer privileges between cars and buses, is an added reason for the belief that the Council will sanction no bus service which might even tend to cripple the city railway. City officials and residents in general are of the belief that there is not room in the city for two independent transportation systems, and that no foreign company can furnish service which cannot be better provided by the traction company. A previous experience with street cars and "jitneys" is still fresh in the minds of the people.

The only cloud on the transportation horizon at present is the report that Fred Hunter, Mayor-elect, may appoint H. W. Byers corporation counsel. Byers, who held this position under a former administration, conducted a continuous attack on the railway. One of his hobbies was 5-cent fares. He insisted that the company should have stuck to that figure during the war regardless of the increase in the price of materials, labor and everything that went into traction operation. Byers' appointment would probably be the signal for a fresh onslaught on the traction company.

The railway, after seeing its stabilizing fund sink "into the red" to the extent of $73,000 first with 8 and then with 9-cent carfares, had the pleasure of reporting that the auditor's figures for February showed a balance of about $70 in the fund as of Feb. 28. Ten-cent fares, which went into effect Oct. 1, 1925, are responsible for the change.

No ruling is expected from the Iowa Supreme Court before May on the appeal of the railway from the decision of Judge Joseph Meyer of the Polk County District Court. The court held that the working agreement between the company and the union is binding as regards the clause requiring the company to keep two trainmen, a motorman and a conductor, on each car in service.

Digitized by Google

The company maintained that such an agreement is against public policy, and prevents the company from instituting economies which would result in lower fares. The company is operating four one-man model cars, but maintains a "conductor" on each car to comply with the agreement, although the operator collects the fares.

The recent demand of the union for a 6-cent hourly increase with time and a half for Sunday and holidays was met with a flat refusal on the part of President Chambers. The traction head pointed out that granting the increase would result in increased fares or a decided reduction in service. He emphasized that the company would not go above the present 10-cent fare, neither would it curtail service below the standard demanded by the public. A conference between the union leaders and Mr. Chambers proved fruitless, and no meetings have been scheduled since.

Jamaica Central Railways Will Continue Long Island Service

Plans have been announced for continuation of service on three traction routes in Long Island which it was planned to abandon. The lines to be rescued were controlled by the Long Island Electric Railway. They are the Jamaica to Far Rockaway line; Jamaica to Belmont Park, serving Hollis, Bellaire and Queens Village, and the Jamaica to Brooklyn line, tapping the growing South Ozone Park section.

Some few weeks ago when it was learned that the Long Island Electric Railway had decided to quit service and sell the lines for scrap, Park A. Rowley, vice-president of the Bank of the Manhattan Company, traveled over the lines to establish for himself the place they hold in the growth of the Greater Jamaica district.

Following a series of conferences with H. Pushae Williams, president of the First Mortgage Guaranty Company, Long Island City, it was decided to form the Jamaica Central Railways, Inc., and application for a state charter was promptly granted at Albany, with a capital of $200,000 and Mr. Williams as president.

John H. Hanna Complimented

In transmitting to stockholders the report of the directors of the Capital Traction Company, Washington, D. C., for the year ended Dec. 31, 1925, George E. Hamilton informed them of his retirement from the office of president and paid a very fine compliment to his successor in office, John H. Hanna. Mr. Hamilton said:

> Mr. Hanna needs no introduction to the stockholders. As chief engineer, and for the last ten years as vice-president in charge of operation, he has devoted himself wholeheartedly to the service of the company, and his efforts, ability and integrity in service deserve from you that confidence and support which was so generously extended to me during my term of office.
>
> I feel that all of us can rest content in the knowledge that the onward progress of our company will be, under his administration, advanced to higher levels of useful accomplishment.

As indicated previously in the ELECTRIC RAILWAY JOURNAL Mr. Hamilton continues with the company as chairman of the executive board and as general counsel.

Taxpayers Will Carry to Court Seattle & Rainier Purchase Referendum

Certification to the City Council of Seattle, Wash., of petitions calling for a popular referendum on the purchase of the Seattle & Rainier Valley Railway by the city of Seattle will be held up until six taxpayers who are fighting the submission of the question to the city at large have an opportunity to carry their case to the State Supreme Court.

The six were given an opportunity to appeal their case before the petitions are certified when Superior Judge J. R. Ralston of Clallam County, sitting in Seattle temporarily, modified an order which dissolved a prior order forbidding City Comptroller Harry W. Carroll to certify the petitions. In modifying the order he set forth that the six plaintiffs should have a chance to ask the Supreme Court for a writ of review before the certification was made. The order of dissolution will stand, the judge said, but the clerk has been instructed not to enter it for ten days, this giving the attorneys for the taxpayers time to carry their case to the higher court.

Attacking the referendum petitions as illegal and lacking sufficient signatures, the taxpayers won a temporary order directed at Comptroller Carroll issued last January. The taxpayers' group also attacked the referendum on the ground that the bond issue by which the car lines would be purchased would not be a general obligation of the city, but rather a levy upon the municipal railway. They argued that the City Council, and not the people, was the proper authority to authorize the issue or turn it down.

Plans for Illinois Road Being Matured

Construction work may be begun soon by the Quincy & Northeastern Electric Railway on a line to run from Quincy to Monmouth, Ill. A certificate of convenience and necessity has been issued by the Illinois Commerce Commission. The route covers about 80 miles.

The new company has offices at 104 South Clark Street, Chicago. It was organized a year ago and filed its application with the Illinois commission, but the case was not reached for hearing until last fall and the commission's order has just been issued.

The company was incorporated with a capitalization of $1,200,000, consisting of 4,000 shares of preferred and 8,000 shares of common stock. The incorporators are: Charles H. Petsch, New York; E. C. Helms, New York; Charles V. Howard, Chicago; Edward D. Parmalee, Chicago, and D. E. Brainard, Chicago. Mr. Petsch is president, Mr. Brainard vice-president and Mr. Howard secretary-treasurer.

Mr. Petsch was the chief witness for the company at the hearings before the Illinois commission. The steam railroads serving the territory, principally the Chicago, Burlington & Quincy, opposed the granting of the certificate. Mr. Petsch testified that a complete survey of the proposed line had been made by Guy Lower, Chicago, who had been recommended to the company by the American Association of Engineers. The president also stated that detailed estimates of the construction costs had been made and that this would be approximately $25,000 a mile, exclusive of right-of-way, sidings, stations, etc. He estimated that the completed system, ready for operation, would cost about $3,250,000. He says that the necessary capital had been underwritten by unnamed New York interests. The preliminary work, he testified, had cost $19,042, advanced to the company by him. These expenditures included $3,500 for Mr. Petsch's personal expenses. No subscriptions for stock were to be solicited from the public along the route proposed to be served, he testified.

Mr. Petsch said that no decision had been reached as to the kind of motive power to be used. It is understood, however, that the use of electricity is being considered, with the Keokuk dam as a source of power supply.

Paving Bill in New Jersey Lost

Governor Moore of New Jersey vetoed Senator Abel's paving bill designed to relieve railway companies of paving obligations. The Legislature, on recess now until June 22, failed to repass the measure over the Governor's veto.

Rhode Island Power Companies Reach Agreement

An agreement has been reached by various electric utility interests in Rhode Island under which the way was opened in the Legislature for the creation of the United Electric Power Company to dispose of surplus energy available in the plants of the United Electric Railways, Providence. The measure, as embodied in the Peck bill, had been opposed by utilities in Providence and Newport on the ground that the retail market for electricity might be invaded by the United company under this bill, and the measure was also opposed on the score of possible outside control of local utilities resulting from the granting of wide powers to the United. Counsel for the several companies agreed, however, to the so-called Clifford bill, under which the new company will have the right to sell electricity only to railroad, street railway, electric light, power and transmission companies. A certificate of public necessity will be required before the company can sell electricity at retail.

Indianapolis to Convert 100 Cars

Plans are being developed by the Indianapolis Street Railway, Indianapolis, Ind., to convert 100 semi-obsolete cars into modern carriers. In addition, it is probable that considerable extensions of bus lines will be undertaken, as well as the completion of the bus station at the traction terminal. Conversion of the cars is expected to cost approximately $250,000. Bus development in 1925 cost $200,000, and it is reported that the expenditure on this part of the company's service will in all probability be doubled this year.

Final Hearing on Cleveland Grant Expected on April 5

Cleveland's City Council at its meeting on Monday evening, April 5, is expected to dispose of all proposed amendments to the existing franchise ordinance of the Cleveland Railway.

One of the amendments proposed, which has been before the committee on street railways of the City Council for consideration, would include in the general amending franchise a provision affecting the relations between the company and its employees. The company has stated that it will decline the grant if such an amendment is included. The city law department has rendered an opinion sustaining the position of the company that such a provision has no place in a franchise contract.

W. G. Lee, president of the Brotherhood of Railroad Trainmen, in an interview, gave as his opinion, based on his 30 years official connection with the brotherhood, that any such provision should not be in the contract.

The Council committee on street railways has been considering changes in the railway grant since July of last year. Extended reference will be found on page 589 of this issue of the ELECTRIC RAILWAY JOURNAL to suggestions made regarding readjustments in the terms of the grant.

Coral Gables Rapid Transit Line Scheduled for Operation in April

One of the finest interurban rapid transit systems in America, linking Coral Gables, the "Baby City" of the United States, with downtown Miami, Fla., is finished as far as track laying is concerned. It is expected that next month the system will be in operation delivering passengers from Coral Gables to Flagler Street in Miami in twelve minutes. To this end, F. W. Webster, vice-president and executive manager of the Coral Gables Corporation, as noted previously in the ELECTRIC RAILWAY JOURNAL, placed an order with the St. Louis Car Company for nine de luxe type vehicles. When these cars are delivered at Coral Gables the transportation facilities of the George E. Merrick development will rank among the most modern and luxurious in the world.

The start of the Coral Gables Rapid Transit system marks more than an ordinary rapid city development and an engineering achievement. Four years ago Coral Gables was still a fruit grove, "so far from the city of Miami that nobody will settle there." George Merrick, its founder, visualized what the city was destined to become and decided in his mind the routes of the systems of communication which play so essential a part in any great city or suburban development. Its systems of rapid transit designed and already in operation are fully in keeping with the high standard set by the other factors in the development.

With the rapid transit line, the Flagler Street line, the new station on the Florida East Coast Railroad and the Coral Gables bus system, the city of Coral Gables will shortly be provided with ample transport facilities. In addition to these four systems, the industrial waterway and other arms of the Coral Gables canal network will shortly be in operation, and it is expected that these will carry a large amount of both freight and pleasure craft traffic.

It is after all a mighty significant thing that the installation of an electric railway was regarded as essential to the maturity of the plans for the development of this unusual community undertaking.

Commission Changes in New York

Proposed Departmental Reorganization Will Give Governor Added Power of Removal—Minority Leaders Charge Transit Commission Would Become Merely a Bureau in Department of Public Service Under Plan Suggested

AT THE general election in 1925 the people of the State of New York approved an amendment to the state constitution providing that the 150 or more departments, divisions and bureaus of government should be reorganized into not to exceed twenty civil divisions.

A non-partisan committee, under the chairmanship of Charles Evans Hughes, former Governor of New York State and ex-United States Supreme Court Justice, spent many months mapping out a general plan of reorganization. This plan, as submitted to the Legislature, provides for the ultimate grouping of the civil functions of government into eighteen departments.

The department of public service is to be formed by the consolidation under one administrative head of the present Public Service Commission and the Transit Commission. At present the Transit Commission regulates transit in New York City only, while the Public Service Commission deals with the regulation of other public utilities throughout the state.

The chapter or article dealing with the public service department arranges the organization into two branches or divisions:

The state division, the head of which shall be the present Public Service Commission, consisting of five members, to continue to be appointed for terms of ten years each and to receive an annual salary of $15,000.

The metropolitan division, the head of which shall be the present Transit Commission, or its successors, to consist of three members to serve for nine years each.

As the terms of office of the present transit commissioners all expire on April 16, 1926, and their terms of office are now fixed at five years each, an amendment to the public service commission law has been presented to the Legislature to take effect April 15, providing that the terms of office shall be nine years and that the members shall be so appointed that the term of one will expire at the end of each three years.

Members of both the Public Service Commission (the state division of the new body) and the Transit Commission (the metropolitan division of the new body) are to be appointed by the Governor, by and with the advice and consent of the Senate.

Practically the only change effected by the reorganization is in the term of office of the transit commissioners and the additional removal power vested in the Governor in relation to members of the Public Service Commission. He now has the right to remove a member of the Transit Commission on charges and an opportunity to be heard. In 1921, however, the law was so fixed that a member of the Public Service Commission could be removed only on a two-thirds vote of the Legislature in the same manner as judges are impeached. This privilege was deemed by the Hughes committee to be out of all proportion to the emoluments of the office, so under the provisions of the law creating the new department of public service, the Governor is accorded the right of removal of both the public service commissioners and the transit commissioners, on charges and the right to be heard.

All of the functions, powers and duties and employees of the present Public Service Commission and of the Transit Commission will, when the reorganized plan goes into effect, Jan. 1, 1927, be transferred bodily into the newly created department.

Charging that the Hughes reorganization commission and the Republican leaders have sought to play politics with the transit situation in New York State, Minority Leaders Bernard Downing and Maurice Bloch of the Senate and Assembly have introduced bills to preserve to the city of New York the right to regulate its own transit problems.

One of the measures abolishes outright the present Transit Commission and transfers all of its powers, functions, jurisdiction, appropriations and employees to the Board of Transportation. The other bill transfers all of the powers, duties, functions and employees of the Transit Commission to the Board of Transportation, but does not abolish the Transit Commission itself.

The passage of either bill would give to the Board of Transportation the right to issue permits for the operation of bus lines without going to the Public Service Commission for approval.

Fares in Baltimore an Election Issue

Electric railway fares in Baltimore have been brought into a campaign being waged for the Democratic gubernatorial nomination in Maryland. Gov. Albert C. Ritchie is a candidate for renomination and William Milnes Maloy also is seeking the support of the party. Mr. Maloy is a former chairman of the Maryland Public Service Commission and also served as people's counsel. In his campaign addresses Mr. Maloy is promising, if nominated and elected, to seek lower car fare rates in Baltimore.

Twenty-two Miles Abandoned in New York State

With the approval of the Public Service Commission the Chautauqua Traction Company on March 22 abandoned 22 miles of trackage between Ashville and Mayville, N. Y. The route has been in operation for 23 years, running for some years at a loss. Service between Mayville and Westfield was abandoned last year.

The West Ridge Transportation Company the day after the discontinuance extended its bus line, which has been operating for some time between Westfield and Mayville, to Chautauqua. In addition, the Jamestown Street Railway has started service between Jamestown and Ashville via Celoron and Beechwood. One-man cars will be operated between Jamestown and Ashville as on all the other lines of the Jamestown Street Railway, affiliated with the Chautauqua Traction Company. Buses have been carrying the school children of the Chautauqua school district along the route between Ashville and Chautauqua since March 15. They are operated under contract with the School Board by C. L. Gorman of Ashville.

Holiday Pass Plan Under Consideration in Cincinnati

The Cincinnati Street Railway, Cincinnati, Ohio, has under consideration a proposal to adopt the holiday ticket plan, which is now in vogue in Pittsburgh, Pa. Walter A. Draper, president of the railway, said that he had been watching the Pittsburgh experiment with interest. Recently Mr. Draper received a letter from the Federated Civic Association advocating the adoption of the plan. The association contends that it would serve to introduce more friendly relations between the company and car rider and stimulate business during the lean hours. Whether the Cincinnati company will adopt the Pittsburgh plan in its entirety has not been determined. In that city the railway company sells the tickets for 25 cents, good all day and usable as often on the holiday as bearer wishes.

Connecticut Men May Ask More Pay

Employees of the Connecticut Company, New Haven, Conn., are said to be planning to repeat their petition to the company for the same scale of wages and the working conditions asked last June, a request that was rejected by the board of arbitration called upon to settle the differences between the company and the employees.

The state conference board of the employees' organization has voted to submit the proposed form of agreement to the company in April rather than in June as has been the custom. This will enable hearings to start early and have the question settled before the present contract agreement with the company expires in June.

The proposals to be made to the company are based on an eight-hour day, and provides for the following schedule over a period of one year: the first three months, 70 cents an hour; the next nine months, 72 cents an hour, and thereafter, 75 cents an hour.

The rates now in force provide 53 cents, 56 cents and 60 cents for the operators of two-man cars, with a 7-cent differential for operators of one-man cars, for the same periods during one year.

One-Man Car Case at Dayton Appealed

Appeal has been made from the decree of United States Judge Smith Hickenlooper at Cincinnati, Ohio, enjoining the city of Dayton from enforcing against the City Railway and others the provisions of an ordinance passed by the Dayton City Commission requiring the street railways to operate cars with two men. The decree was entered in the suit of the City Railway and others against the city of Dayton.

The plaintiffs alleged that after the city had passed an ordinance providing for one-man cars and the railways had complied with the provisions, a referendum election was held directing repeal of the permissive legislation and the passage of an ordinance requiring the companies to operate two-man cars and that the effect of this was to deprive the companies of property without due process of law and to infringe upon their contractual rights under the original ordinance.

The city of Dayton in its appeal alleges that Judge Hickenlooper erred in holding that the second ordinance infringed upon the rights of the city railways. It asks the Appellate Court to reverse the decree entered by the court below.

Appeal on Electrification Ordinance in Buffalo

The Buffalo, N. Y., City Council has taken an appeal from the decision of Supreme Court Justice Crosby, who held that the railroad electrification ordinance is invalid. The ordinance does not require the railroad lines entering the city to electrify their roads, but prohibits the use of steam locomotives. Railroads fighting the ordinance say electrification of their lines in the city of Buffalo would be forced upon them if steam locomotives were prohibited. The cost of such electrification, the railroad interests say, would exceed $100,000,000. The case will be argued before the Appellate Division at the spring term. The city may appeal to the New York State Court of Appeals and the Supreme Court, if necessary, to test the validity of the measure.

Artists, Sharpen Your Pencils

Any artist residing in the United States has the opportunity to make a cover to be reproduced in the Sesqui-Centennial number of the "Traveler," published by the Philadelphia Rapid Transit Company, Philadelphia, Pa. The most suitable design carries with it a prize of $500. The design can be either descriptive or pictorial and must possess some theme suggestive of the spirit of city transportation in the year of the Sesqui-Centennial Exposition.

J. Rowland Bibbins Retained in Philadelphia

Mayor Kendrick of Philadelphia has retained J. Rowland Bibbins, Washington, to aid the city in negotiating an operating lease of the Broad Street subway with the Philadelphia Rapid Transit Company. The Mayor made the announcement public along with a communication to Thomas E. Mitten of the railway.

Mr. Bibbins aided the city in its investigation of the transit company's books when it prosecuted a protest against the 8-cent fare, two tokens for 15 cents, before the Public Service Commission.

Mr. Mitten's statement regarding the subway lease was sent to Mayor Kendrick several weeks ago. In it he left an impression he expected to obtain the free use of the subway. In his reply the Mayor said:

> I am still convinced that a proper and satisfactory lease cannot be brought about by public statements or exchange of written communications made in advance of conference table discussion and negotiations.

Associates of Randal Morgan in Indianapolis Mourn His Passing

News of the death of Randal Morgan was received in Indianapolis as a distinct shock. He took a financial interest in the Indianapolis Street Railway in 1899 when he became associated with Philip J. McGowan. This business relation continued until Mr. McGowan's death in 1911. Mr. Morgan was interested in the erection of the Indianapolis Traction Terminal station in 1902. He and his associates then started on a wide scale to develop interurban lines in Indiana. He became interested in the Union Traction Company and the Terre Haute, Indianapolis & Eastern Traction Company. His last visit to Indianapolis was about two years ago. Robert I. Todd, president of the Indianapolis Street Railway, and Joseph A. McGowan, secretary of the company, both issued statements about the death of Mr. Morgan in which they mourned the loss of a friend and business associate.

New York Urged to Abandon Operation of Projected Subways

Mayor Walker of New York has been requested to stop the letting of contracts for the new municipal subway system now under construction by the city and intended to be run by the city in accordance with plans made by former Mayor Hylan. The protestant is the Civic Council of Brooklyn, composed of 96 organizations in that borough. The council wants the Mayor to open negotiations with the Brooklyn-Manhattan Transit Corporation and the Interborough Rapid Transit Company for the operation of the new lines. It suggests that if this is to be done the routing of the new lines into Brooklyn and Queens will have to be changed so that the new system will be connected with and at certain points merged with the existing lines. It also urges that the private companies can probably be induced to equip the new lines if the administration will abandon its plan for municipal operation.

News Notes

Railway Man Honored—Hotel Lowry, named for Horace Lowry, president of the Twin City Rapid Transit Company, is to be erected at a cost of $1,250,000 by the Arcade Investment Company of Minneapolis at Fourth and Wabasha Streets, St. Paul, by 1927. Mr. Lowry is head of the Arcade company, which already operates the large Lowry office building in the same block.

Front-Entrance Plan for St. Louis.—United Railways, St. Louis, Mo., has altered the seating arrangement of 150 cars, to provide operation of the cars under a front-entrance rear-exit plan. The aisles have been widened to facilitate the movement of passengers from the front to the rear of the cars. A longitudinal side seat extending half the length of the car is placed on the right of the front end and a similar seat on the left side at the rear. The regular crosswise seats are maintained on the sides of the car not thus rearranged.

Commission Approves Reduced Baltimore Rates.—A voluntary reduction in some of the rates between Baltimore and Annapolis has been made by the Washington, Baltimore & Annapolis Electric Railroad. The new rates have been filed with the Maryland Public Service Commission and approved by that body. The company reduces the round-trip rates if bought in books of five or ten. The present rate is 90 cents one way or $1.68 round trip. Under the old rates five round trips cost $8.40 and for ten round trips the cost was $16.80. But under the new rates books of five round trips are sold for $7.40, a saving of $1, and books of ten at $14.10, a saving of $2.70. The new tickets are good three months from date of purchase.

Fare Schedule Approved.—The Public Service Commission has approved the passenger service schedule of the New York, Westchester & Boston Railroad on its newly constructed line extending from Larchmont Gardens (Mamaroneck) to Mamaroneck. It has also approved one-way, 46-trip and 60-trip ticket fares provided for transportation between points on the new line and other local points.

Hearing Set on Fare Petition.—The Fresno Traction Company, Fresno, Cal., has applied to the Railroad Commission for an increase in its fares, alleging that it had an operating loss of $4,056 during 1925 as the result of its first year's operation under its resettlement franchise. The present fare is 6 cents. The commission has set the application for hearing before Commissioner Harley W. Brundige at Fresno June 1, when the complaint of the city of Fresno to require the utility to extend its tracks to the Fink-Smith tract will be heard.

Fare Increase in Elkhart Indicated.—John McCardle, chairman of the Indiana Public Service Commission, after a hearing, indicated recently the commission would grant the petition of the Chicago, South Bend & Northern Indiana Railroad to raise its local fare in Elkhart, Ind., from 5 to 7 cents. Statistics were presented to show the company operated at Elkhart last year at a net loss of $10,000, including interest on the capital invested. No objection was made to the petition at the hearing.

Seeks Relief from Resurfacing Costs.—The Wheeling Traction Company, Wheeling, W. Va., has submitted a proposal to the Wellsburg Council looking toward relief of paving costs on Charles Street and the discontinuance of the railway on that thoroughfare. It was a counter proposal and in answer to the proposal which the Wellsburg Council submitted to the traction officials several days ago asking that they pay for seven-thirtieths of the cost of resurfacing the principal street. The first proposition offered by the Wheeling Traction Company was to discontinue its Charles Street line and substitute a bus service. Included in the recent proposition of the traction company was the clause that the company would pour a concrete foundation between the rails and ties to within 2 in. of the surface and that it would weld all the rails.

Group Insurance in Baltimore.—The United Railways & Electric Company, Baltimore, Md., has taken out group insurance on its 5,000 employees, the total amount being $5,000,000. In carrying out the plan the United will pay a part of the premium and the remainder will be paid by the employees. It has been announced, however, that until the employees signify their intention to participate in the plan the entire premium will be paid by the company. Each employee, under the plan, will be insured for $1,000. About 50 per cent of the employees are engaged in occupations that would make it difficult for them to obtain insurance under ordinary circumstances. Neither the pension plan nor the company insurance plan is affected by the new insurance, in which all executives and officials may participate.

Foreign News

Further Electrification in Java Planned

Electrification of the Manggarai-Buitenzorg railway line in Java, Dutch East Indies, has been sanctioned by the government, according to recent reports. Plans for the project are now completed, execution of the work has already been commenced and the necessary material will be ordered soon. It is expected that the electrification of the entire line will be completed in two years. An appropriation of about $40,000 has been made for preliminary work in connection with the electrification of the Poerwakarta-Bandoeng line, which may be electrified next.

Power Station of London Underground Extended

Extensions of London's underground electric railways are necessitating additions to the plant in the power station at Lots Road, Chelsea. This station, one of the largest in Great Britain, contains seven turbo-alternators of 6,000 kw. each and three of 15,000 kw. each. A fourth 15,000-kw. machine is now under construction, and when this is completed the generating capacity of the power station will be 102,000 kw.

The steam generating plant comprises 64 boilers, each capable of producing 16,000 lb. of steam an hour at a pressure of about 200 lb., and eight boilers each having a capacity of 40,000 lb. an hour. Two boilers of about 50,000 lb. an hour capacity are under construction and will be put in operation during the present year.

The present maximum load on the power station is about 70,000 kw. It is estimated that in five years time the total demand will be about 100,000 kw. To provide for this additional load it is planned to install large turbo-alternators of 15,000 kw. each in place of the existing machines of 6,000 kw. each. All the new turbines are designed so that they can at a later date operate with steam at 275 lb., at which pressure all the new boilers will be capable of working. By operating at the higher steam pressure reductions in coal consumption will be effected.

The amount of coal burned at Lots Road during 1925 was about 264,650 tons, this being at the rate of about 2 lb. per kilowatt-hour delivered.

Underground Extension Opened in Spain.—In Madrid, Spain, was completed and opened for traffic recently the Sol Quevado section of the Alphonse XIII underground electric railway. This line is an extension of the Sol-Venta section, the two forming a railway which runs from the east to the west of the city, a distance of nearly 4 miles.

Municipality May Buy Tramway Undertaking.—It was decided recently by the City Council of Newcastle-on-Tyne, England, to purchase the Tyneside Tramways & Tramroads Company at a cost of £96,000. The deal is subject to the Council obtaining Parliamentary power to operate the company's lines. The Tyneside company's tramway lines comprise about 11 miles of track, while those of the Newcastle corporation are about 35 miles. If the purchase is consummated it is expected that the two systems will be co-ordinated.

Subway to Be Constructed at Milan, Italy.—Definite plans for the construction of a subway in Milan, Italy, have been under discussion for some time. Two routes having the approximate lengths of 3.8 miles and 3.6 miles are planned. The total cost of the project is estimated at $8,000,000. In granting the concession, preference will be given to the group which offers not only the most favorable financial conditions but also the greatest frequency of trains.

Recent Bus Developments

Bus Operated Over Former Railway Route in Pennsylvania

Application was made on March 25 to the Public Service Commission by the North Branch Bus Company, a new concern, for a certificate to operate bus lines over routes formerly served by the North Branch Transit Company, Bloomsburg, Pa. Trolley service was suspended on that line on March 2, and a bus service was started by Douglas Ford, formerly connected with the management of the railway. This railway system of 26 miles was bought by the Hazleton Auto-Bus Company at a recent sale. The North Branch Transit Company succeeded the Columbia & Montour Electric Railway in 1911. The line was placed in receiver's hands in 1915.

Oklahoma Railway Fights Competition

Receivers for the Oklahoma Railway on March 25 applied in the federal court in Oklahoma City, Okla., for an order to restrain the People's Transit Company from operating jitneys and buses on the streets of Oklahoma City in competition with the railway. For several weeks the People's Transit Company has been operating several jitneys on the streets of Oklahoma City. It recently secured an injunction in the district court restraining the city authorities from enforcing an ordinance which requires a license fee of $15 a year for each seat in a bus or jitney operated for hire, and prohibits buses from operating on streets where there are street car lines or within two blocks thereof. The ordinance was held invalid by the court. The railway is throwing the matter in the federal court on the grounds that the receivers of the company are officers of the court; that the court also has control of the railway property and should protect it against destructive competition.

As a further means of meeting the jitney situation the Oklahoma Railway began operation, on March 26, of a new bus line which will be in direct competition with cars operated by the People's Transit Company on East Tenth Street. The new line runs from the business section north on Robinson to Broadway Circle and east on Park Place, which is one block south of Tenth Street.

Hearings Held on Bus Bill

Committee of Congress Goes Into Executive Session to Consider Future of Cummings Measure, Designed to Place Interstate Bus and Truck Carriers Under Federal Jurisdiction

HEARINGS on the bill to place interstate bus and truck traffic under the jurisdiction of a federal body were adjourned in Washington on March 29. They may be reopened, but opinion in administration circles appears to be that the Cummings measure is lost for the time being, if not for all time.

At the last session highway interests and the motor haulage people stressed the point that the interstate business was accidental due to the geographical location of industry. To all practical purposes the extent of this traffic was nil compared with the country's total highway tonnage. Counsel for the steam railroads were primed to present their case, but the committee decided to go into executive session before hearing this appeal. That in itself might be considered a bad omen for the progress of the bill.

Provisions of the proposed bill have been heralded far and wide. Still it will do no harm to recapitulate some of the salient points. They follow:

> The bill divides the motor carriers into two main classes. Class A covers carriers operating between fixed termini or over a regular route and Class B the so-called irregular carrier. Under the terms of the bill the state regulatory bodies, acting with concurrent jurisdiction, hear and grant certificates of public convenience and necessity after having given "reasonable consideration, among other pertinent matters, to available transportation service by railroad, or other existing transportation agency; to the character of service to be rendered by the applicant; to the likelihood of the proposed service being adequate, permanent and continuous, and to the effect which such service may have upon any other transportation agency, the continued operation of which is important to the community." Appeal to the Interstate Commerce Commission is provided in case of disagreement between states on a certified record made before the state or joint boards.

Very brief summaries of the testimony on March 22-25 were published in the ELECTRIC RAILWAY JOURNAL for March 27, page 567. Representatives of the electric railways had their inning on the third day. Mr. Storrs said that the electric railways were in accord for the bill, but that if any amendments were presented "we want to reserve the right to speak or file a brief." Among other things he said:

> None can successfully assail the wisdom of government regulation of common carriers, whether local or national in character. Passenger carrying motor vehicles are now under regulation locally in 39 states, while rail lines are universally regulated by the states and nationally. Where engaged in interstate business, they are under regulation similar to that of the steam carriers. We believe that there should be the same regulations for all common carriers. To ask this Congress to permit one class of carriers to proceed unregulated while others are subjected to regulations would be equivalent to setting up a special class. This is contrary to every theory of our government, and I am sure it does not for a single instant meet with the approval of any member of this committee.
>
> The decision of the Supreme Court on March 5, 1925, to the effect that states could not prohibit the operation of interstate motor carriers did much to destroy the efficiency of local transportation.
>
> In so far as this bill relates to the motor truck situation, there has been much false propaganda spread about it. It has been repeatedly stated that if this bill became effective no truck could cross a state line without first having obtained a certificate of convenience and necessity. The fact is that under the provisions of this bill only a small part of the motor truck industry would be affected. That part would be only the common carrier vehicle.
>
> I wish to emphasize particularly, however, the fact that there are now in operation many motor routes which give an essential public service, and these need protection from unregulated competition fully as much as if not more than the rail carriers. The public served by all essential agencies should have assurance that this service may become permanent through fair regulation and reasonable protection.

Among others who spoke on behalf of the electric railways were Dudley Farrand, A. R. Williams and C. B. Hammond. Each of these men told about the need for regulation as he saw it. In order to give an idea of the extent of interstate service by companies operating in territory served by his company Mr. Farrand pointed out that since the latter part of the summer of 1925 fifty-four companies or individuals had taken up this class of transportation service. These operators had 200 buses and covered a total of 2,525 route-miles. Their lines extended not only to New York but to Pennsylvania, with some lines running from Philadelphia to New York. Of this number there now survive 39 routes that total 1,716 miles on which 153 buses are operated.

Further, he said:

> An actual count taken at the ferries between New York City and the Jersey side for a typical day shows that 717 bus trips were operated between New York City and New Jersey points, carrying 6,222 passengers. The average fare of these passengers is approximately 75 cents each, so that the revenue received by these buses a day is approximately $4,700. This means an annual revenue approximating $1,750,000.
>
> Up to the present time interstate bus service between New Jersey and either New York or Philadelphia has been dependent upon the use of ferries, crossing the Hudson or Delaware River, to reach their metropolitan terminals. On July 4 of this year the new Philadelphia-Camden Delaware River bridge will be open for traffic. The vehicular tunnel connecting Jersey City with New York City will likewise be opened for traffic during 1927. The imminence of the availability of these two facilities makes even more necessary the immediate proper regulation of the interstate motor carrier.

Mr. Williams stated there were 146 buses doing interstate business out of Providence over 57 routes. Between Woonsocket and Blackstone there are 32 buses doing the business formerly carried on by a railway line.

The case for the bus men, or at least for the group included in the Bus Division of the American Automobile Association, was presented on March 25 by S. A. Markel, chairman of the Bus Division's legislative committee. In urging the immediate passage of the bill, Mr. Markel said that 38 states are now functioning under regulatory measures. Some of these have had regulation for ten or more years, giving the state commissions ample opportunity to assemble such facts and data as to enable them properly and constructively to regulate motor carriers. There was plenty of experience, he indicated, to warrant the belief that state commissions would function satisfactorily under interstate regulation. The Bus Division had no special interest in trucks, if in the wisdom of the committee it seemed desirable to separate the two forms of regulation.

Mr. Markel then presented a number of amendments. Many of these were merely to clarify the text, but one was intended to be retroactive to permit all operators who on March 3 were giving service to continue doing so.

Another Hearing on Reading's Appeal

Additional evidence in support of the Reading Railroad's application for permission to operate buses between Jenkintown and Wyncote, Montgomery County, and New Hope, Bucks County, in Pennsylvania, was submitted on March 26 to Public Service Commissioner Benn. The matter under consideration was one of several applications which the Reading Company intends to substitute for train service on its branch lines.

Protests were filed by the Philadelphia Rapid Transit Company, the Philadelphia Rural Transit Company, Warwick Township, the Reading Transit Company and individuals who possess certificates to operate buses in that section of the state.

The most important witness examined was E. D. Osterhout, passenger traffic manager of the Reading System. He said that in the last five years the passenger traffic on the suburban trains had decreased 30 per cent, due in a large measure to the individual operation of automobiles. The commutation service, however, had increased, due to the building operations in the vicinity of Willow Grove and at other points.

Officials of the company, considering the falling off in business, decided to withdraw these poorly patronized trains and substitute buses.

Another hearing will be held.

A Remedy Prescribed for Traffic Ills

Curing the ills of traffic congestion does not call for the elimination of the trolley car, according to an article by Carl Parker, manager of sales, bus division, Reo Motor Car Company, which appeared in the Indianapolis *Star* on Feb. 21, but it does call for the skip-stop plan in the majority of American cities. Skipping not just one intersection, but in some cases as many as five to ten, was advocated.

Mr. Parker is a firm believer in coordination of bus and trolley service carried to its logical conclusion. He believes that a policy of rapid transit for street car operation that would actually live up to its name would do much to eliminate the traffic disorders of the body politic in most of the more crowded communities of the country. Then in place of trolley car stops at every corner could be substituted a covering bus service, which would serve to gather up passengers along the right-of-way, transport them to the trolley stops and there permit them to transfer to the faster express service provided by the street car.

Continuing, Mr. Parker says:

> The plan means simply to speed up any carrier that otherwise becomes a stricture in the center of the street and obtain rapid transit, not just simply by increasing the velocity of the vehicles but by decreasing waiting time. To have a bus line intersecting a trolley line is not co-ordination fulfilled to its best advantage. Run the trolley cars as express service and also put buses on the same streets to stop at every intersection—but at the curb.
>
> While the radicals are claiming that buses can efficiently replace the trolley, those who cry it the loudest have studied it comprehensively the least and know the least about it.
>
> Don't eliminate the street car—just speed it up. Give it a chance to develop its efficiency. It has a very definite place in the transportation picture of every city which is proud of its industrial institutions.
>
> In some cities in the United States the trolley car has never been allowed to develop its greatest efficiency. It is a better vehicle than most of us think it it because we have never had the chance to see it operate at its best. Give the trolley car the chance it has been yearning for and you automatically put the motor bus in its best environment.

Bus Program at Buffalo to Proceed

The operation of two new bus lines, the extension of an existing bus line and the scrapping of two railway lines in Buffalo will probably be authorized by the Buffalo City Council during April. This was indicated after a public hearing on the application of the International Bus Corporation, a subsidiary of the International Railway, for permission to operate additional bus routes in the city. The company's application of last summer was revived following the collapse of the Howe 5-cent bus proposals.

Three members of the Buffalo City Council have indicated their approval of the plan of the International Bus Corporation. Final approval of the franchise, however, has been delayed for a short time so negotiations can be carried on between the City Council and representatives of the company over certain terms and conditions. If the franchise is granted, there will probably be no delay in getting the necessary approval from the Public Service Commission.

The new bus routes would operate in Richmond Avenue, replacing the Hoyt Street one-man car line and a crosstown line covering Best-North Streets, replacing the Best Street car line. The present bus route in Bailey Avenue would be lengthened. Double-deck buses would be operated over Richmond Avenue with single-deck buses on the Best-North Street route. The company's plans have the approval of the Buffalo Chamber of Commerce and the Buffalo Business Federation.

Transportation Agencies Unified in Tulsa

An important step toward unification of transportation facilities in Tulsa is involved in the purchase by the Oklahoma Union Railway of the buses and equipment of the Brasier Transportation Company and the People's Transportation Company. The consideration was not divulged, but the value of the equipment is about $250,000.

Duplication of service, which has existed for months under the competitive system, will be eliminated and the extra buses will be placed on routes in sections of the city which have not heretofore had adequate bus or street railway service. Transfers will also be issued from one bus line to another and from the buses to street car lines so as to enable riders to purchase a continuous ride across the city for a single fare. The proposed unification and rerouting plans were approved by the City Commission on March 23.

Bus Bills Progress in New York

The Senate of New York on March 29 passed and sent to the Assembly the two Thayer bills amending the public service commission law in relation to bus lines.

One of these bills amends subdivision 9, Section 2, by including as common carriers persons or corporations publicly transporting persons or property in motor vehicles between fixed terminals or over a regular route. The second bill adds new Article 3-a to the public service commission law, bringing under the supervision of the Public Service Commission stage, omnibus or motor vehicles operating between fixed terminals or over a regular route as common carriers.

Increased Service Sought.—Extension of bus service in the northwest, southwest and southeast sections of the city of Miami, Fla., was asked recently of the Miami Beach Railway, operating the city buses, by H. H. Arnold, traffic director. Mr. Arnold has completed a survey of the territories affected and said that the new routings would be a great convenience to thousands of residents in the outlying communities.

Protects Existing Agencies.—Mayor Nichols of Boston has vetoed the order of the Boston, Mass., City Council authorizing Franklin L. Hart of Dorchester to establish a bus line between Boston and Keene, N. H. The Mayor takes the same view that Mayor Curley held, that the regular transportation agencies, the railroads and street railways should be protected against competition which would cripple them and cause impairment of service.

Would Run Buses in Conjunction with Cars. — The Dover, Somersworth & Rochester Street Railway, Dover, N. H., has petitioned the Public Service Commission of New Hampshire for authority to use buses in co-ordination with its railway lines. It also asks for permission to discontinue trolley service on any or all parts of its system as is found advisable and substitute bus service entirely if necessary. Present plans of the railway are to operate buses over the Dover, Somersworth, Rochester and East Rochester route and over the Somersworth-Rochester route, via the East Side state highway and Rochester Hill. The matter is up for a hearing at Concord, N. H., on April 27.

Bus Line Restrained.—Circuit Judge George A. Crow of Belleville, Ill., has issued an injunction restraining the Community Motor Bus Company of Belleville, Ill., from operating two bus lines until it obtains certificates of convenience from the Illinois Commerce Commission. The injunction was sought by the East St. Louis & Suburban Railway and its bus line subsidiary, the Red Line Motor Bus Company. The Community company is restrained from operating buses between Collinsville and Troy, Ill. This line competes with the Red Line's buses. The other route affected is between East St. Louis and Collinsville, Ill., in competition with the East St. Louis & Suburban Railway.

Financial and Corporate

British Columbia Issue Sold Quickly

Customer-Ownership Campaign Successful—$7,125,300 in Shares Subscribed in Less than Six Days

More than 11,500 applications for $7,125,300 in shares in a period of five and a half days is the record of a customer-ownership campaign just concluded by the British Columbia Electric Railway, Vancouver and Victoria, B. C.

Employees of the company to the number of 1,410 bought shares to the value of $602,000 and brought in 9,441 customer applications for a total of $5,023,300. Local brokers reported applications which are expected to bring the number of shareholders above 11,500 for $1,500,000 more.

The offer made to the public was $2,250,000 of 6 per cent cumulative preference shares of the British Columbia Electric Power & Gas Company, a Canadian company, dividends being guaranteed by the British Columbia Electric Railway, the parent company. Of the amount offered $1,500,000 was underwritten by a syndicate of bond dealers and the remaining $750,000 allotted to employees to buy themselves and sell to the public. The price was 99.

Applications were limited to 50 shares and no applications would be accepted from non-residents of the province of British Columbia. The population of the territory served is 350,000.

It was originally intended to open the sale on March 20, but owing to public demand, arising through the spread of news of the offer, the company was forced to allow brokers and employees to take applications on March 15. It was impossible to push the advertising campaign ahead more than two days or to March 17, but in spite of that brokers sold out their amount in two days and employees their allotment in 24 hours.

On the third day of the sale, when the advertising began to be effective, sales totaled $1,200,000. The closing date had been named in the prospectus as March 31, and when oversubscription was seen to be inevitable this date was pushed ahead to March 20. Applications continued to come in at a rapid rate, although employees were requested to make no new efforts.

COMMENT VERY FAVORABLE

One department of the company in Vancouver, the accounting department, with 187 employees, sold nearly the entire original allotment of $750,000. Employees of the Vancouver railway department to the number of 300 took shares of a total value of $132,700 and this department made no less than 959 sales of a total of $458,000. The city of Victoria with a population of 50,000 bought $1,000,000, par value, of shares.

Newspaper comment declared that the oversubscription indicated the public's confidence in the company and demonstrated public opinion of its integrity. No such public subscriptions had been seen since the days of Victory loans during the war. It is noteworthy that more than 3,000 applications were received for single shares. The shares will be allotted in a slightly increasing scale so as to secure the widest possible distribution. It was intended to offer the remaining $2,750,000 of this issue next autumn, but the entire amount will now be placed.

All financing by the company has hitherto been done in England. George Kidd, president of the company, Vancouver, received congratulations from all quarters on what is believed to be a record accomplishment.

Net Deficit of $107,090 in Toledo

Revenue losses in Toledo due to private automobiles and bus competition resulted in a net deficit of $107,090 to the stabilizing fund of the Community Traction Company for the year ended Dec. 31, 1925. The previous year operation resulted in a net deficit of $209,786. These facts were disclosed in the annual report of the commissioner submitted recently to the City Council at Toledo. Offsetting the 1925 deficit, however, is the credit of $284,149 set aside from revenues for the sinking fund requirements through which car riders are purchasing the properties for the city.

Total operating revenues for the year were $3,610,934, compared with $3,779,289 in 1924. Operating expenses were reduced from $3,029,990 in 1924 to $2,742,484 in 1925. Revenue passengers carried in 1925 totaled 48,377,487, compared with 53,161,617 in 1924. It was brought out in the report that the loss of patronage occurred in the months prior to September when fares were lower and more service was operated than the previous year.

Maintenance, repair and depreciation allowances taken directly from revenues amounted to $816,231. In addition the first railway extension in many years was made in Sylvania Avenue when more than a mile of track was added to the Cherry Line.

Claims and damages, including cost of administration, were cut to $135,346. Automobile accidents showed an increase, indicating that the main thoroughfare ordinance was less effectual than in the preceding year.

Twenty of the 500 type cars were rebuilt and equipped for one-man operation. New motors and trucks were installed along with safety equipment and other improvements. Twelve others not requiring rebuilding were equipped for one-man operation.

Through the sinking fund a total of $984,000 of bonds was retired and the cash balance of the fund was $194,152 at the end of the year.

Acting Commissioner E. L. Graumlich suggests that action which will insure a continuance of the transportation system on a stable basis is imperative.

He cites the fact that the sinking fund weighs heavily upon the revenues and makes fixed charges mount to a point where operation cannot be made to pay. He recommends that restrictions against use of modern equipment be taken away so that transportation may be provided as an aid to development of the whole city. He also suggests protection from competition.

Gross and Net of Market Street Railway, San Francisco, Up

Gross revenue of the Market Street Railway, San Francisco, Cal., showed a gain of $50,539 in 1925 and the balance after operating expenses and taxes was $2,227,959, an increase of 1.4 per cent over 1924. Bond interest and amortization of discount on funded debt was $937,991, an increase of $37,827, or 4.2 per cent, over 1924.

"Income Charges—Other" as it appears in the income account includes the interest on a judgment which the Pacific Gas & Electric Company ob-

tained against the Market Street Railway growing out of additional charges for electrical energy furnished the Market Street Railway, made pursuant to an order of the Railroad Commission. From this order the company appealed to the courts and an appeal from a judgment in the lower court is before the Supreme Court of California.

President Starring says that the reduction of the funded debt in the hands of the public from $13,000,000 on April 1, 1924, to $12,239,000 at Dec. 31, 1925, is worthy of note. He points out that the sinking fund payment of a total of $500,000 per annum, although decreasing the company's available cash, does not decrease its earnings, inasmuch as it correspondingly decreases the funded debt of the company.

Mr. Starring explains that for several years past negotiations have been pending with the city of San Francisco concerning the city's purchasing the railway operative property. In 1925, pursuant to an initiative petition, the question of the city's purchase of the property was submitted to the voters and overwhelmingly defeated.

More than 350 cars were overhauled in the general shops and put in first class condition. Also 24 new cars were built and put into service. A maximum of 673 cars in daily operation was reached in December. In September the company commenced the operation of its first bus. Jitney competition is considerably reduced, but competition of the Municipal Railway is energetic.

Much work was done to the other physical property of the company to keep it to a high standard.

STATEMENT OF INCOME AND PROFIT AND LOSS OF MARKET STREET RAILWAY FOR THE YEAR ENDED DEC. 31, 1925

Operating Revenue:		
Passenger	$9,830,196	
Other	72,572	
Total		$9,902,768
Operating Expenses and Taxes:		
Maintenance of way and structures	648,646	
Maintenance of equipment	648,008	
Power (including disputed charges)	1,331,060	
Transportation and traffic	3,607,856	
Miscellaneous	822,235	
Total	7,057,808	
Taxes (other than Federal income taxes)	617,000	
Total operating expenses and taxes		7,674,808
Net operating revenue		2,227,959
Other Income Credits:		
Interest	34,539	
Other	16,523	
Total		51,062
Gross income		2,279,022
Income Charges:		
Interest on funded debt	882,509	
Discount on funded debt	55,482	
Provision for 1925 federal income tax	106,924	
Depreciation of railroads and properties	500,000	
Other	41,970	
Total		1,586,886
Net income for the year		692,136
Surplus at beginning of year		2,060,069
Profit and loss credits		2,545
Gross surplus		2,754,751
Profit and loss charges—net adjustment of discount on funded debt		29,180
Surplus, Dec. 31, 1925, per balance sheet		$2,725,570

How a Financial Authority Sees It

The toppling of prices of stocks the present month does not indicate the beginning of a period of "depression" in business, but it must be said that it is not a salutary thing for the country. For months, with only a few reverses, quotations of stocks had been continuously rising. Prices in many cases had come to bear no relation to intrinsic values and current earnings. Factors, such as "mergers" and splitting of shares, and combines, have shown very large paper values. And upon a continuation of these factors prices have been enhanced by trading on the exchanges. Their worth was not allowed to prove itself, but was discounted in advance.

As a consequence, under the influence of easy money and the liberal use of Reserve credit, the whole market became speculative. Now, when through some unforeseen element prices fall suddenly, it must be true that tens of thousands of "outsiders" are caught in the slump and lose their all. For this desire to speculate seems to be innate in human nature. Most persons like to "make money" fast, and seeing others "make," albeit the profits are on paper, are induced to buy at the then "top." And these losses bode no good to business, though they do not necessarily mean "depression."

This much is certain in any event, namely, that as a result of the gigantic stock speculation of the last two or three years a vast deal of financial energy has been absorbed in non-productive uses. And it follows that a redundant money supply has been a sustaining element to the detriment of legitimate business. In this view the consequences of a "smash," provided producing business is not disastrously affected, may augur good to the country at large. And this effect, if indeed it eventuate, will be widespread. — *Commercial and Financial Chronicle.*

Arrangements Made to Pay Back Dividends of Republic Railway

Plans have been declared operative under which the accrued dividends on the preferred stock of the Republic Railway & Light Company, New York, amounting to $34.50 will be paid and the exchange of Republic preferred stock will be made for an equal amount of 6 per cent cumulative preferred stock of the Penn-Ohio Securities Corporation. The cash payment is equivalent to the dividends accrued and unpaid on Republic preferred to Jan. 15,1926, and the new preferred of Penn-Ohio Securities is cumulative from that date. A substantial majority of the stock has already been deposited and the new stock and cash will be ready for delivery April 5. The exchange offer, however, will not expire until April 10.

Protective Committee for Chicago Railways

A bondholders' protective committee has been formed for $62,785,000 of Chicago Railways first mortgage bonds which mature on Feb. 1, 1927, the date on which franchise expires. The committee is headed by Albert W. Harris, chairman of board of the Harris Trust & Savings Bank. The statement issued by the committee says:

Notwithstanding the favorable relation between the amount of first mortgage bonds and the acknowledged value of property and favorable relation of annual interest charge to company's earnings available for payment of such interest, the present credit position of the company is such that an ordinary refunding operation appears to be impossible.

Maryland Interurban Reports Surplus in 1925

The Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., reports a deficit in net income in 1925, but on account of profit and loss credits it finished the year with a surplus of $245,243. During the year 4,021,766 revenue passengers were carried, against 4,429,387 in 1924. Car-miles operated totaled 4,582,032. One per cent of the gross operating revenue of the company was credited to "Reserve for Injuries and Damages." The balance in the reserve account as of Dec. 31, 1925, was $125,025. The disbursements in payment of accident claims, suits, judgments and other expenses of the department amounted to 1.32 per cent of the gross operating revenues.

SUMMARY OF INCOME AND PROFIT AND LOSS OF WASHINGTON, BALTIMORE & ANNAPOLIS ELECTRIC RAILROAD FOR YEAR ENDED DEC. 31, 1925

Operating revenue		$2,694,910
Operating expenses prior to provision for depreciation		1,994,723
Net operating revenue prior to provision for depreciation		$700,187
Taxes assignable to railway and other operations		128,867
Operating income prior to provision for depreciation		$571,319
Non-operating income (net)		27,516
Gross income for the year applicable to interest on funded debt		$598,836
Deductions from gross income:		
Interest on funded debt	$518,804	
Amortization of discount on funded debt	47,077	
Provision for depreciation	46,488	
		612,370
Net income for the year		*$13,533
Profit and loss net credits during the year		258,776
Profit and loss gross surplus for the year		$245,242
Dividends paid		None
Profit and loss surplus for the year		$245,242
Profit and loss surplus at beginning of the year		527,837
Profit and loss surplus at close of the year		$773,080

*Deficit.

Bus Plans for Twin City Reviewed in Annual Report

The total railway operating revenue of the Twin City Rapid Transit Company and subsidiary companies of St. Paul and Minneapolis, Minn., for the year ended Dec. 31, 1925, was $12,378,352, a decrease of $326,217 compared with the previous year. Total operating expenses were $9,234,089, an increase of $48,161. These facts were included in the annual statement of Horace Lowry, president of the company, to the stockholders.

The report gives in detail the history of the valuation and fare problems affecting the properties of the Minneapolis Street Railway and the St. Paul City Railway. The various steps in this controversy have been reviewed in the ELECTRIC RAILWAY JOURNAL from time to time.

On the subject of bus competition the report states that in order to protect the railway property it was necessary to take steps to provide for the demands for bus service, properly coordinated with railway service. In order to bring this about the purchase of the Twin City Motor Bus Company was effected, and negotiations were pending for the purchase of the third and last competing bus line in the Twin Cities. Mr. Lowry stated that the management believed it would be to the best interests of the company and the public to have bus service as well as street railway service controlled by one transportation company. No serious difficulty is expected in working out this problem with the cities so that a co-ordinated street railway and bus service would be provided which would not operate to the disadvantage of the company's railway service, "so desirable and essential to the public."

During the year earnings were sufficient to pay regular quarterly dividends at the rate of 7 per cent per annum on its preferred stock and to permit two semi-annual dividends of 2 per cent each to be paid on the common stock.

Discontinuance of Onset Street Railway Suggested

Financial difficulties have overtaken the New Bedford & Onset Street Railway, New Bedford, Mass. The stockholders have voted to inform the holders of bonds which mature next January that "the company is not in position to pay the same and is unable to offer a refunding plan which appears practicable. The directors of the road, therefore, suggest to the bondholders the appointment of a committee to consider what action they may deem best to take in the premises." President Crapo says:

> The confidence of the promoters of the New Bedford & Onset Street Railway has at no time been justified. Until of late, however, it has been able to earn barely a net sufficient for a small amount of depreciation and to pay the interest on its $280,000 of mortgage bonds which were once extended and will come due Jan. 1, 1927.
>
> It would seem that all possible economies of operation have been exhausted and that there is no prospect of a chance for the better. Such being the case and in view of the approaching maturity of the bonds it seems proper to stockholders to take such action as will enable the bondholders to determine whether the railway shall continue to be operated or liquidated.
>
> The explanation of the situation is simply the development of the use of automobiles. The transportation service rendered for 25 years to the communities in which the railway operates without return to the owners has been of a large benefit to the communities. In matters of its continuance these communities manifestly have an interest. What action they may see fit to take is for them to determine.

CONSOLIDATED INCOME STATEMENT OF THE TWIN CITY RAPID TRANSIT COMPANY

	1925	1924
Revenue from transportation	$12,269,156	$12,593,798
